This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, duplication, disclosure, modification, and adaptation shall be subject to the restrictions and license terms set forth in the applicable Government contract, and, to the extent applicable by the terms of the Government contract, the additional rights set forth in FAR 52.227-19, Commercial Computer Software License (December 2007). Oracle America, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

## Contents

<b>Preface</b> .....	ci
Audience.....	ci
Documentation Accessibility .....	ci
Related Documents .....	ci
Conventions .....	cii
<b>What's New in PL/SQL Packages and Types Reference?</b> .....	cv
New Packages .....	cv
Updated Packages .....	cvii
New Types.....	cviii
Updated Types.....	cviii
<b>1 Introduction to Oracle Supplied PL/SQL Packages &amp; Types</b>	
<b>Package Overview</b> .....	1-2
Package Components .....	1-3
Using Oracle Supplied Packages .....	1-4
Creating New Packages .....	1-5
Referencing Package Contents .....	1-8
<b>Summary of Oracle Supplied PL/SQL Packages and Types</b> .....	1-9
<b>2 APEX_CUSTOM_AUTH</b>	
Documentation of APEX_CUSTOM_AUTH .....	2-2
<b>3 APEX_APPLICATION</b>	
Documentation of APEX_APPLICATION .....	3-2
<b>4 APEX_ITEM</b>	
Documentation of APEX_ITEM .....	4-2
<b>5 APEX_UTIL</b>	
Documentation of APEX_UTIL .....	5-2

<b>6</b>	<b>CTX_ADM</b>	
	Documentation of CTX_ADM.....	6-2
<b>7</b>	<b>CTX_CLS</b>	
	Documentation of CTX_CLS.....	7-2
<b>8</b>	<b>CTX_DDL</b>	
	Documentation of CTX_DDL .....	8-2
<b>9</b>	<b>CTX_DOC</b>	
	Documentation of CTX_DOC.....	9-2
<b>10</b>	<b>CTX_ENTITY</b>	
	Documentation of CTX_ENTITY.....	10-2
<b>11</b>	<b>CTX_OUTPUT</b>	
	Documentation of CTX_OUTPUT.....	11-2
<b>12</b>	<b>CTX_QUERY</b>	
	Documentation of CTX_QUERY .....	12-2
<b>13</b>	<b>CTX_REPORT</b>	
	Documentation of CTX_REPORT .....	13-2
<b>14</b>	<b>CTX_THES</b>	
	Documentation of CTX_THES.....	14-2
<b>15</b>	<b>CTX_ULEXER</b>	
	Documentation of CTX_ULEXER .....	15-2
<b>16</b>	<b>DBMS_ADDM</b>	
	Using DBMS_ADDM.....	16-2
	Security Model.....	16-3
	Summary of DBMS_ADDM Subprograms .....	16-4
	ANALYZE_DB Procedure .....	16-5
	ANALYZE_INST Procedure .....	16-6
	ANALYZE_PARTIAL Procedure .....	16-7
	DELETE Procedure .....	16-8
	DELETE_FINDING_DIRECTIVE Procedure.....	16-9
	DELETE_PARAMETER_DIRECTIVE Procedure .....	16-10
	DELETE_SEGMENT_DIRECTIVE Procedure .....	16-11
	DELETE_SQL_DIRECTIVE Procedure .....	16-12
	GET_ASH_QUERY Function .....	16-13

GET_REPORT Function .....	16-14
INSERT_FINDING_DIRECTIVE Procedure .....	16-15
INSERT_PARAMETER_DIRECTIVE Procedure .....	16-16
INSERT_SEGMENT_DIRECTIVE Procedure .....	16-17
INSERT_SQL_DIRECTIVE Procedure .....	16-19
<b>17 DBMS_ADVANCED_REWRITE</b>	
Using DBMS_ADVANCED_REWRITE.....	17-2
Security Model.....	17-3
<b>Summary of DBMS_ADVANCED_REWRITE Subprograms</b> .....	17-4
ALTER_REWRITE_EQUIVALENCE Procedure.....	17-5
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure.....	17-6
DECLARE_REWRITE_EQUIVALENCE Procedures .....	17-7
DROP_REWRITE_EQUIVALENCE Procedure.....	17-9
VALIDATE_REWRITE_EQUIVALENCE Procedure .....	17-10
<b>18 DBMS_ADVISOR</b>	
Using DBMS_ADVISOR.....	18-2
Deprecated Subprograms .....	18-3
Security Model.....	18-4
<b>Summary of DBMS_ADVISOR Subprograms</b> .....	18-5
ADD_SQLWKLD_REF Procedure.....	18-8
ADD_SQLWKLD_STATEMENT Procedure .....	18-9
ADD_STS_REF Procedure .....	18-11
CANCEL_TASK Procedure.....	18-12
COPY_SQLWKLD_TO_STS Procedure .....	18-13
CREATE_FILE Procedure .....	18-14
CREATE_OBJECT Procedure.....	18-15
CREATE_SQLWKLD Procedure .....	18-17
CREATE_TASK Procedures .....	18-18
DELETE_SQLWKLD Procedure .....	18-20
DELETE_SQLWKLD_REF Procedure.....	18-21
DELETE_SQLWKLD_STATEMENT Procedures.....	18-22
DELETE_STS_REF Procedure .....	18-23
DELETE_TASK Procedure.....	18-24
EXECUTE_TASK Procedure .....	18-25
GET_REC_ATTRIBUTES Procedure.....	18-27
GET_TASK_REPORT Function.....	18-28
GET_TASK_SCRIPT Function.....	18-29
IMPLEMENT_TASK Procedure .....	18-31
IMPORT_SQLWKLD_SCHEMA Procedure.....	18-32
IMPORT_SQLWKLD_SQLCACHE Procedure .....	18-34
IMPORT_SQLWKLD_STS Procedure.....	18-36
IMPORT_SQLWKLD_SUMADV Procedure .....	18-38
IMPORT_SQLWKLD_USER Procedure .....	18-40
INTERRUPT_TASK Procedure .....	18-42
MARK_RECOMMENDATION Procedure .....	18-43

QUICK_TUNE Procedure.....	18-44
RESET_SQLWKLD Procedure .....	18-45
RESET_TASK Procedure.....	18-46
SET_DEFAULT_SQLWKLD_PARAMETER Procedures.....	18-47
SET_DEFAULT_TASK_PARAMETER Procedures .....	18-48
SET_SQLWKLD_PARAMETER Procedures.....	18-49
SET_TASK_PARAMETER Procedure.....	18-50
TUNE_MVIEW Procedure.....	18-63
UPDATE_OBJECT Procedure .....	18-65
UPDATE_REC_ATTRIBUTES Procedure .....	18-67
UPDATE_SQLWKLD_ATTRIBUTES Procedure .....	18-69
UPDATE_SQLWKLD_STATEMENT Procedure .....	18-70
UPDATE_TASK_ATTRIBUTES Procedure.....	18-72

## 19 DBMS\_ALERT

<b>Using DBMS_ALERT</b> .....	19-2
Overview .....	19-3
Security Model.....	19-4
Constants .....	19-5
Restrictions .....	19-6
Exceptions .....	19-7
Operational Notes .....	19-8
Examples .....	19-10
<b>Summary of DBMS_ALERT Subprograms</b> .....	19-11
REGISTER Procedure .....	19-12
REMOVE Procedure .....	19-13
REMOVEALL Procedure .....	19-14
SET_DEFAULTS Procedure .....	19-15
SIGNAL Procedure .....	19-16
WAITANY Procedure .....	19-17
WAITONE Procedure .....	19-18

## 20 DBMS\_APPLICATION\_INFO

<b>Using DBMS_APPLICATION_INFO</b> .....	20-2
Overview .....	20-3
Security Model.....	20-4
Operational Notes .....	20-5
<b>Summary of DBMS_APPLICATION_INFO Subprograms</b> .....	20-6
READ_CLIENT_INFO Procedure .....	20-7
READ_MODULE Procedure .....	20-8
SET_ACTION Procedure .....	20-9
SET_CLIENT_INFO Procedure.....	20-10
SET_MODULE Procedure .....	20-11
SET_SESSION_LONGOPS Procedure .....	20-12

---

## 21 DBMS\_APPLY\_ADM

Using DBMS_APPLY_ADM .....	21-2
Overview .....	21-3
Security Model.....	21-4
Operational Notes .....	21-5
<b>Summary of DBMS_APPLY_ADM Subprograms .....</b>	<b>21-6</b>
ADD_STMT_HANDLER Procedure .....	21-8
ALTER_APPLY Procedure .....	21-10
COMPARE_OLD_VALUES Procedure .....	21-16
CREATE_APPLY Procedure .....	21-18
CREATE_OBJECT_DEPENDENCY Procedure.....	21-24
DELETE_ALL_ERRORS Procedure .....	21-25
DELETE_ERROR Procedure.....	21-26
DROP_APPLY Procedure .....	21-27
DROP_OBJECT_DEPENDENCY Procedure .....	21-29
EXECUTE_ALL_ERRORS Procedure .....	21-30
EXECUTE_ERROR Procedure .....	21-31
GET_ERROR_MESSAGE Function .....	21-34
REMOVE_STMT_HANDLER .....	21-36
SET_CHANGE_HANDLER Procedure .....	21-38
SET_DML_HANDLER Procedure.....	21-41
SET_ENQUEUE_DESTINATION Procedure .....	21-46
SET_EXECUTE Procedure .....	21-48
SET_GLOBAL_INSTANTIATION_SCN Procedure.....	21-50
SET_KEY_COLUMNS Procedures .....	21-53
SET_PARAMETER Procedure .....	21-56
SET_SCHEMA_INSTANTIATION_SCN Procedure.....	21-66
SET_TABLE_INSTANTIATION_SCN Procedure .....	21-69
SET_UPDATE_CONFLICT_HANDLER Procedure.....	21-71
SET_VALUE_DEPENDENCY Procedure .....	21-75
START_APPLY Procedure.....	21-77
STOP_APPLY Procedure .....	21-78

## 22 DBMS\_AQ

Using DBMS_AQ .....	22-2
Constants .....	22-3
Data Structures .....	22-5
Operational Notes .....	22-8
<b>Summary of DBMS_AQ Subprograms.....</b>	<b>22-9</b>
BIND_AGENT Procedure .....	22-10
DEQUEUE Procedure.....	22-11
DEQUEUE_ARRAY Function.....	22-14
ENQUEUE Procedure .....	22-16
ENQUEUE_ARRAY Function.....	22-18
LISTEN Procedures.....	22-19
POST Procedure .....	22-21
REGISTER Procedure .....	22-22

UNBIND_AGENT Procedure .....	22-23
UNREGISTER Procedure .....	22-24

## 23 DBMS\_AQADM

<b>Using DBMS_AQADM</b> .....	23-2
Constants .....	23-3
<b>Subprogram Groups</b> .....	23-4
Queue Table Subprograms .....	23-5
Privilege Subprograms .....	23-6
Queue Subprograms .....	23-7
Subscriber Subprograms .....	23-8
Notification Subprograms .....	23-9
Propagation Subprograms .....	23-10
Oracle Streams AQ Agent Subprograms .....	23-11
Alias Subprograms .....	23-12
<b>Summary of DBMS_AQADM Subprograms</b> .....	23-13
ADD_ALIAS_TO_LDAP Procedure .....	23-15
ADD_SUBSCRIBER Procedure .....	23-16
ALTER_AQ_AGENT Procedure .....	23-17
ALTER_PROPAGATION_SCHEDULE Procedure .....	23-18
ALTER_QUEUE Procedure .....	23-19
ALTER_QUEUE_TABLE Procedure .....	23-20
ALTER_SUBSCRIBER Procedure .....	23-21
CREATE_AQ_AGENT Procedure .....	23-22
CREATE_NP_QUEUE Procedure .....	23-23
CREATE_QUEUE Procedure .....	23-24
CREATE_QUEUE_TABLE Procedure .....	23-26
DEL_ALIAS_FROM_LDAP Procedure .....	23-29
DISABLE_DB_ACCESS Procedure .....	23-30
DISABLE_PROPAGATION_SCHEDULE Procedure .....	23-31
DROP_AQ_AGENT Procedure .....	23-32
DROP_QUEUE Procedure .....	23-33
DROP_QUEUE_TABLE Procedure .....	23-34
ENABLE_DB_ACCESS Procedure .....	23-35
ENABLE_JMS_TYPES Procedure .....	23-36
ENABLE_PROPAGATION_SCHEDULE Procedure .....	23-37
GET_WATERMARK Procedure .....	23-38
GRANT_QUEUE_PRIVILEGE Procedure .....	23-39
GRANT_SYSTEM_PRIVILEGE Procedure .....	23-40
MIGRATE_QUEUE_TABLE Procedure .....	23-41
PURGE_QUEUE_TABLE Procedure .....	23-42
QUEUE_SUBSCRIBERS Function .....	23-44
REMOVE_SUBSCRIBER Procedure .....	23-45
REVOKE_QUEUE_PRIVILEGE Procedure .....	23-46
REVOKE_SYSTEM_PRIVILEGE Procedure .....	23-47
SCHEDULE_PROPAGATION Procedure .....	23-48
SET_WATERMARK Procedure .....	23-50

	START_QUEUE Procedure .....	23-51
	STOP_QUEUE Procedure .....	23-52
	UNSCHEDULE_PROPAGATION Procedure .....	23-53
	VERIFY_QUEUE_TYPES Procedure.....	23-54
<b>24</b>	<b>DBMS_AQELM</b>	
	Summary of DBMS_AQELM Subprograms .....	24-2
	SET_MAILHOST Procedure.....	24-3
	SET_MAILPORT Procedure .....	24-4
	SET_SENDFROM Procedure.....	24-5
<b>25</b>	<b>DBMS_AQIN</b>	
	Using DBMS_AQIN .....	25-2
	Overview .....	25-3
<b>26</b>	<b>DBMS_ASSERT</b>	
	Using DBMS_ASSERT .....	26-2
	Operational Notes .....	26-3
	Summary of DBMS_ASSERT Subprograms .....	26-4
	ENQUOTE_LITERAL Function .....	26-5
	ENQUOTE_NAME Function .....	26-6
	NOOP Functions .....	26-7
	QUALIFIED_SQL_NAME Function .....	26-8
	SCHEMA_NAME Function.....	26-9
	SIMPLE_SQL_NAME Function .....	26-10
	SQL_OBJECT_NAME Function.....	26-11
<b>27</b>	<b>DBMS_AUDIT_MGMT</b>	
	Using DBMS_AUDIT_MGMT .....	27-2
	Overview .....	27-3
	Security Model.....	27-4
	Constants .....	27-5
	Views.....	27-7
	Subprogram Groups .....	27-8
	Audit Trail Management Subprograms.....	27-9
	Audit Trail Cleanup Subprograms.....	27-10
	Summary of DBMS_AUDIT_MGMT Subprograms .....	27-11
	CLEAN_AUDIT_TRAIL Procedure .....	27-12
	CLEAR_AUDIT_TRAIL_PROPERTY Procedure .....	27-14
	CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure .....	27-16
	CREATE_PURGE_JOB Procedure.....	27-17
	DEINIT_CLEANUP Procedure.....	27-19
	DROP_PURGE_JOB Procedure.....	27-20
	GET_AUDIT_COMMIT_DELAY Function.....	27-21
	INIT_CLEANUP Procedure .....	27-22
	IS_CLEANUP_INITIALIZED Function.....	27-24

SET_AUDIT_TRAIL_LOCATION Procedure.....	27-25
SET_AUDIT_TRAIL_PROPERTY Procedure .....	27-27
SET_LAST_ARCHIVE_TIMESTAMP Procedure.....	27-30
SET_PURGE_JOB_INTERVAL Procedure .....	27-32
SET_PURGE_JOB_STATUS Procedure.....	27-33
<b>28 DBMS_AUTO_SQLTUNE</b>	
Using DBMS_AUTO_SQLTUNE.....	28-2
Overview .....	28-3
Security Model.....	28-4
<b>Summary of DBMS_AUTO_SQLTUNE Subprograms.....</b>	<b>28-5</b>
EXECUTE_AUTO_TUNING_TASK Function & Procedure .....	28-6
REPORT_AUTO_TUNING_TASK Function .....	28-7
SET_AUTO_TUNING_TASK_PARAMETER Procedures.....	28-9
<b>29 DBMS_AUTO_TASK_ADMIN</b>	
Using DBMS_AUTO_TASK_ADMIN .....	29-2
Constants .....	29-3
<b>Summary of DBMS_AUTO_TASK_ADMIN Subprograms.....</b>	<b>29-4</b>
DISABLE Procedures.....	29-5
ENABLE Procedures.....	29-6
GET_CLIENT_ATTRIBUTES Procedure .....	29-7
GET_P1_RESOURCES Procedure.....	29-8
OVERRIDE_PRIORITY Procedures .....	29-9
SET_CLIENT_SERVICE Procedure.....	29-10
SET_P1_RESOURCES Procedure.....	29-11
<b>30 DBMS_AUTO_TASK_IMMEDIATE</b>	
<b>Summary of DBMS_AUTO_TASK_IMMEDIATE Subprograms .....</b>	<b>30-2</b>
GATHER_OPTIMIZER_STATS Procedure .....	30-3
<b>31 DBMS_AW_STATS</b>	
Using DBMS_AW_STATS .....	31-2
<b>Summary of DBMS_AW_STATS Subprograms.....</b>	<b>31-3</b>
ANALYZE Procedure.....	31-4
CLEAR Procedure.....	31-7
<b>32 DBMS_CAPTURE_ADM</b>	
Using DBMS_CAPTURE_ADM.....	32-2
Overview .....	32-3
Security Model.....	32-4
<b>Summary of DBMS_CAPTURE_ADM Subprograms .....</b>	<b>32-5</b>
ABORT_GLOBAL_INSTANTIATION Procedure .....	32-7
ABORT_SCHEMA_INSTANTIATION Procedure .....	32-8
ABORT_SYNC_INSTANTIATION Procedure.....	32-9

ABORT_TABLE_INSTANTIATION Procedure.....	32-10
ALTER_CAPTURE Procedure .....	32-11
ALTER_SYNC_CAPTURE Procedure .....	32-16
BUILD Procedure .....	32-18
CREATE_CAPTURE Procedure .....	32-19
CREATE_SYNC_CAPTURE Procedure.....	32-29
DROP_CAPTURE Procedure .....	32-31
INCLUDE_EXTRA_ATTRIBUTE Procedure .....	32-33
PREPARE_GLOBAL_INSTANTIATION Procedure.....	32-35
PREPARE_SCHEMA_INSTANTIATION Procedure.....	32-36
PREPARE_SYNC_INSTANTIATION Function .....	32-37
PREPARE_TABLE_INSTANTIATION Procedure.....	32-38
SET_PARAMETER Procedure .....	32-39
START_CAPTURE Procedure.....	32-49
STOP_CAPTURE Procedure .....	32-50

### 33 DBMS\_CDC\_PUBLISH

<b>Using DBMS_CDC_PUBLISH</b> .....	33-2
Overview .....	33-3
Deprecated Subprograms .....	33-4
Security Model.....	33-5
Views.....	33-6
<b>Summary of DBMS_CDC_PUBLISH Subprograms</b> .....	33-7
ALTER_AUTOLOG_CHANGE_SOURCE Procedure .....	33-8
ALTER_CHANGE_SET Procedure .....	33-10
ALTER_CHANGE_TABLE Procedure .....	33-13
ALTER_HOTLOG_CHANGE_SOURCE Procedure .....	33-16
CREATE_AUTOLOG_CHANGE_SOURCE Procedure.....	33-18
CREATE_CHANGE_SET Procedure .....	33-20
CREATE_CHANGE_TABLE Procedure .....	33-23
CREATE_HOTLOG_CHANGE_SOURCE Procedure.....	33-27
DROP_CHANGE_SET Procedure .....	33-29
DROP_CHANGE_SOURCE Procedure.....	33-30
DROP_CHANGE_TABLE Procedure .....	33-31
DROP_SUBSCRIPTION Procedure.....	33-32
GET_DDLOPER Function.....	33-33
PURGE Procedure.....	33-34
PURGE_CHANGE_SET Procedure.....	33-35
PURGE_CHANGE_TABLE Procedure.....	33-36

### 34 DBMS\_CDC\_SUBSCRIBE

<b>Using DBMS_CDC_SUBSCRIBE</b> .....	34-2
Overview .....	34-3
Deprecated Subprograms .....	34-5
Security Model.....	34-6
Views.....	34-7
<b>Summary of DBMS_CDC_SUBSCRIBE Subprograms</b> .....	34-8

ACTIVATE_SUBSCRIPTION Procedure.....	34-9
CREATE_SUBSCRIPTION Procedure .....	34-10
DROP_SUBSCRIPTION Procedure.....	34-12
EXTEND_WINDOW Procedure .....	34-13
PURGE_WINDOW Procedure.....	34-15
SUBSCRIBE Procedure .....	34-16
<b>35 DBMS_COMPARISON</b>	
<b>Using DBMS_COMPARISON</b> .....	35-2
Overview .....	35-3
Security Model.....	35-5
Constants .....	35-6
Views.....	35-8
Operational Notes .....	35-9
<b>Data Structures</b> .....	35-13
COMPARISON_TYPE Record Type .....	35-14
<b>Summary of DBMS_COMPARISON Subprograms</b> .....	35-15
COMPARE Function.....	35-16
CONVERGE Procedure.....	35-18
CREATE_COMPARISON Procedure.....	35-20
DROP_COMPARISON Procedure .....	35-24
PURGE_COMPARISON Procedure .....	35-25
RECHECK Function .....	35-26
<b>36 DBMS_COMPRESSION</b>	
<b>Using DBMS_COMPRESSION</b> .....	36-2
Overview .....	36-3
Security Model.....	36-4
Constants .....	36-5
Views.....	36-6
<b>Summary of DBMS_COMPRESSION Subprograms</b> .....	36-7
GET_COMPRESSION_RATIO Procedure .....	36-8
GET_COMPRESSION_TYPE Function.....	36-10
<b>37 DBMS_CONNECTION_POOL</b>	
<b>Summary of DBMS_CONNECTION_POOL Subprograms</b> .....	37-2
ALTER_PARAM Procedure .....	37-3
CONFIGURE_POOL Procedure .....	37-4
START_POOL Procedure.....	37-6
STOP_POOL Procedure .....	37-7
RESTORE_DEFAULTS Procedure.....	37-8
<b>38 DBMS_CQ_NOTIFICATION</b>	
<b>Using DBMS_CQ_NOTIFICATION</b> .....	38-2
Overview .....	38-3
Security Model.....	38-4

Constants .....	38-5
Operational Notes .....	38-7
Examples .....	38-8
<b>Data Structures</b> .....	38-15
CQ_NOTIFICATION\$_DESCRIPTOR Object Type .....	38-16
CQ_NOTIFICATION\$_QUERY Object Type .....	38-17
CQ_NOTIFICATION\$_QUERY_ARRAY Object (Array) Type .....	38-18
CQ_NOTIFICATION\$_TABLE Object Type .....	38-19
CQ_NOTIFICATION\$_TABLE_ARRAY Object (Array) Type .....	38-20
CQ_NOTIFICATION\$_ROW Object Type .....	38-21
CQ_NOTIFICATION\$_ROW_ARRAY Object (Array) Type .....	38-22
CQ_NOTIFICATION\$_REG_INFO Object Type .....	38-23
<b>Summary of DBMS_CQ_NOTIFICATION Subprograms</b> .....	38-26
CQ_NOTIFICATION_QUERYID Function .....	38-27
DEREGISTER Procedure .....	38-28
ENABLE_REG Procedure .....	38-29
NEW_REG_START Function .....	38-30
REG_END Procedure .....	38-31
SET_ROWID_THRESHOLD Procedure .....	38-32
<b>39 DBMS_CRYPTO</b>	
<b>Using the DBMS_CRYPTO Subprograms</b> .....	39-2
Overview .....	39-3
Security Model .....	39-4
Types .....	39-5
Algorithms .....	39-6
Restrictions .....	39-8
Exceptions .....	39-9
Operational Notes .....	39-10
Examples .....	39-12
<b>Summary of DBMS_CRYPTO Subprograms</b> .....	39-13
DECRYPT Function .....	39-14
DECRYPT Procedures .....	39-15
ENCRYPT Function .....	39-16
ENCRYPT Procedures .....	39-17
HASH Function .....	39-18
MAC Function .....	39-19
RANDOMBYTES Function .....	39-20
RANDOMINTEGER Function .....	39-21
RANDOMNUMBER Function .....	39-22
<b>40 DBMS_CSX_ADMIN</b>	
<b>Using DBMS_CSX_ADMIN</b> .....	40-2
Overview .....	40-3
Security Model .....	40-4
Constants .....	40-5
Examples .....	40-6

<b>Summary of DBMS_CSX_ADMIN</b> .....	40-7
COPYDEFAULTTOKENTABLESET Procedure .....	40-8
GETTOKENTABLEINFO Procedure & Function .....	40-9
GETTOKENTABLEINFOBYTABLESPACE Procedure .....	40-10
NAMESPACEIDTABLE Function .....	40-11
PATHIDTABLE Function .....	40-12
QNAMEIDTABLE Function.....	40-13
REGISTERTOKENTABLESET Procedure .....	40-14
<b>41 DBMS_CUBE</b>	
<b>Using DBMS_CUBE</b> .....	41-2
Security Model.....	41-3
<b>Using SQL Aggregation Management</b> .....	41-4
Subprograms in SQL Aggregation Management .....	41-5
Requirements for the Relational Materialized View .....	41-6
Permissions for Managing and Querying Cube Materialized Views.....	41-7
Example of SQL Aggregation Management .....	41-8
<b>Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g</b> .....	41-12
Correcting Naming Conflicts .....	41-13
Simple Upgrade.....	41-15
Custom Upgrade .....	41-16
<b>Summary of DBMS_CUBE Subprograms</b> .....	41-18
BUILD Procedure .....	41-19
CREATE_EXPORT_OPTIONS Procedure.....	41-31
CREATE_IMPORT_OPTIONS Procedure.....	41-34
CREATE_MVIEW Function.....	41-36
DERIVE_FROM_MVIEW Function.....	41-41
DROP_MVIEW Procedure.....	41-43
EXPORT_XML Procedure.....	41-45
EXPORT_XML_TO_FILE Procedure.....	41-47
IMPORT_XML Procedure.....	41-49
INITIALIZE_CUBE_UPGRADE Procedure.....	41-52
REFRESH_MVIEW Procedure .....	41-54
UPGRADE_AW Procedure .....	41-56
VALIDATE_XML Procedure.....	41-58
<b>42 DBMS_CUBE_ADVISE</b>	
<b>Using DBMS_CUBE_ADVISE</b> .....	42-2
Security Model.....	42-3
<b>Summary of DBMS_CUBE_ADVISE Subprograms</b> .....	42-4
MV_CUBE_ADVICE Function.....	42-5
SET_CNS_EXCEPTION_LOG Procedure .....	42-8
TRACE Procedure .....	42-9
<b>43 DBMS_CUBE_LOG</b>	
<b>Using DBMS_CUBE_LOG</b> .....	43-2

Logging Types .....	43-3
Logging Targets.....	43-4
Verbosity Levels .....	43-5
Security Model.....	43-6
Creating Cube Logs .....	43-7
Cube Build Log.....	43-8
Cube Dimension Compile Log.....	43-10
Cube Operations Log.....	43-11
Cube Rejected Records Log .....	43-12
<b>Summary of DBMS_CUBE_LOG Subprograms .....</b>	<b>43-13</b>
DEFAULT_NAME Function .....	43-15
DISABLE Procedure .....	43-16
ENABLE Procedure .....	43-17
FLUSH Procedure .....	43-19
GET_LOG Procedure.....	43-20
GET_LOG_SPEC Function.....	43-22
GET_PARAMETER Function.....	43-23
LEVEL_HIGH Function .....	43-24
LEVEL_HIGHEST Function .....	43-25
LEVEL_LOW Function.....	43-26

## 82 DBMS\_LOB

<b>Using DBMS_LOB</b> .....	82-2
Overview .....	82-3
Security Model.....	82-4
Constants .....	82-5
Datatypes.....	82-7
Operational Notes .....	82-8
Rules and Limits.....	82-11
Exceptions .....	82-15
<b>Summary of DBMS_LOB Subprograms</b> .....	82-16
APPEND Procedures .....	82-19
CLOSE Procedure .....	82-20
COMPARE Functions.....	82-21
CONVERTTOBLOB Procedure.....	82-23
CONVERTTOCLOB Procedure .....	82-26
COPY Procedures.....	82-29
COPY_DBFS_LINK Procedures.....	82-31
COPY_FROM_DBFS_LINK.....	82-32
CREATETEMPORARY Procedures .....	82-33
DBFS_LINK_GENERATE_PATH Functions .....	82-34
ERASE Procedures .....	82-35
FILECLOSE Procedure .....	82-37
FILECLOSEALL Procedure .....	82-38
FILEEXISTS Function .....	82-39
FILEGETNAME Procedure .....	82-40
FILEISOPEN Function.....	82-41
FILEOPEN Procedure.....	82-42
FRAGMENT_DELETE Procedure .....	82-43
FRAGMENT_INSERT Procedures .....	82-44
FRAGMENT_MOVE Procedure .....	82-45
FRAGMENT_REPLACE Procedures .....	82-46
FREETEMPORARY Procedures.....	82-48
GET_DBFS_LINK Functions .....	82-49
GET_DBFS_LINK_STATE Procedures .....	82-50
GETCONTENTTYPE Functions .....	82-51
GET_STORAGE_LIMIT Function.....	82-52
GETCHUNKSIZE Functions .....	82-53
GETLENGTH Functions .....	82-55
GETOPTIONS Functions .....	82-56
INSTR Functions .....	82-57
ISOPEN Functions .....	82-59
ISTEMPORARY Functions .....	82-60
LOADBLOBFROMFILE Procedure.....	82-61
LOADCLOBFROMFILE Procedure .....	82-63
LOADFROMFILE Procedure .....	82-67
MOVE_TO_DBFS_LINK Procedures .....	82-69
OPEN Procedures .....	82-70

READ Procedures .....	82-72
SET_DBFS_LINK Procedures.....	82-74
SETCONTENTTYPE Procedure.....	82-75
SETOPTIONS Procedures.....	82-76
SUBSTR Functions .....	82-77
TRIM Procedures.....	82-79
WRITE Procedures.....	82-81
WRITEAPPEND Procedures .....	82-83

### 83 DBMS\_LOCK

<b>Using DBMS_LOCK</b> .....	83-2
Overview .....	83-3
Security Model.....	83-4
Constants .....	83-5
Rules and Limits.....	83-6
Operational Notes .....	83-7
<b>Summary of DBMS_LOCK Subprograms</b> .....	83-8
ALLOCATE_UNIQUE Procedure.....	83-9
CONVERT Function .....	83-11
RELEASE Function .....	83-12
REQUEST Function.....	83-13
SLEEP Procedure.....	83-14

### 84 DBMS\_LOGMNR

<b>Using DBMS_LOGMNR</b> .....	84-2
Overview .....	84-3
Security Model.....	84-4
Constants .....	84-5
Views.....	84-7
Operational Notes .....	84-8
<b>Summary of DBMS_LOGMNR Subprograms</b> .....	84-9
ADD_LOGFILE Procedure .....	84-10
COLUMN_PRESENT Function .....	84-12
END_LOGMNR Procedure .....	84-14
MINE_VALUE Function .....	84-15
REMOVE_LOGFILE Procedure .....	84-17
START_LOGMNR Procedure .....	84-18

### 85 DBMS\_LOGMNR\_D

<b>Using DBMS_LOGMNR_D</b> .....	85-2
Overview .....	85-3
Security Model.....	85-4
<b>Summary of DBMS_LOGMNR_D Subprograms</b> .....	85-5
BUILD Procedure .....	85-6
SET_TABLESPACE Procedure.....	85-9

---

## 86 DBMS\_LOGSTDBY

Using DBMS_LOGSTDBY .....	86-2
Overview .....	86-3
Security Model .....	86-4
<b>Summary of DBMS_LOGSTDBY Subprograms .....</b>	<b>86-5</b>
APPLY_SET Procedure .....	86-7
APPLY_UNSET Procedure .....	86-10
BUILD Procedure .....	86-11
INSTANTIATE_TABLE Procedure .....	86-12
IS_APPLY_SERVER Function .....	86-14
MAP_PRIMARY_SCN Function .....	86-15
PREPARE_FOR_NEW_PRIMARY Procedure .....	86-16
PURGE_SESSION Procedure .....	86-18
REBUILD Procedure .....	86-19
SET_TABLESPACE Procedure .....	86-20
SKIP Procedure .....	86-21
SKIP_ERROR Procedure .....	86-29
SKIP_TRANSACTION Procedure .....	86-33
UNSKIP Procedure .....	86-35
UNSKIP_ERROR Procedure .....	86-37
UNSKIP_TRANSACTION Procedure .....	86-39

## 87 DBMS\_METADATA

Using DBMS_METADATA .....	87-2
Overview .....	87-3
Security Model .....	87-4
Rules and Limits .....	87-5
<b>Data Structures - Object and Table Types .....</b>	<b>87-6</b>
<b>Subprogram Groupings .....</b>	<b>87-8</b>
Subprograms for Retrieving Multiple Objects From the Database .....	87-9
Subprograms for Submitting XML to the Database .....	87-10
<b>Summary of All DBMS_METADATA Subprograms .....</b>	<b>87-11</b>
ADD_TRANSFORM Function .....	87-12
CLOSE Procedure .....	87-16
CONVERT Functions and Procedures .....	87-17
FETCH_xxx Functions and Procedures .....	87-19
GET_xxx Functions .....	87-22
GET_QUERY Function .....	87-26
OPEN Function .....	87-27
OPENW Function .....	87-33
PUT Function .....	87-34
SET_COUNT Procedure .....	87-36
SET_FILTER Procedure .....	87-37
SET_PARSE_ITEM Procedure .....	87-47
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures .....	87-50

---

## 88 DBMS\_METADATA\_DIFF

Using DBMS_METADATA_DIFF .....	88-2
Overview .....	88-3
Security Model.....	88-4
<b>Browsing APIs for Fetching and Comparing Objects.....</b>	<b>88-5</b>
<b>Summary of DBMS_METADATA_DIFF Subprograms.....</b>	<b>88-7</b>
OPENC Function.....	88-8
ADD_DOCUMENT Procedure.....	88-9
FETCH_CLOB Functions and Procedures .....	88-10
CLOSE Procedure .....	88-11

## 89 DBMS\_MGD\_ID\_UTL

Using DBMS_MGD_ID_UTL.....	89-2
Security Model.....	89-3
Constants .....	89-4
Exceptions .....	89-5
<b>Summary of DBMS_MGD_ID_UTL Subprograms .....</b>	<b>89-6</b>
ADD_SCHEME Procedure .....	89-7
CREATE_CATEGORY Function.....	89-11
EPC_TO_ORACLE_SCHEME Function .....	89-12
GET_CATEGORY_ID Function .....	89-15
GET_COMPONENTS Function .....	89-16
GET_ENCODINGS Function .....	89-18
GET_JAVA_LOGGING_LEVEL Function .....	89-19
GET_PLSQL_LOGGING_LEVEL Function .....	89-20
GET_SCHEME_NAMES Function .....	89-21
GET_TDT_XML Function .....	89-22
GET_VALIDATOR Function.....	89-24
REFRESH_CATEGORY Function.....	89-28
REMOVE_CATEGORY Procedure.....	89-29
REMOVE_PROXY Procedure.....	89-30
REMOVE_SCHEME Procedure .....	89-31
SET_JAVA_LOGGING_LEVEL Procedure .....	89-32
SET_PLSQL_LOGGING_LEVEL Procedure .....	89-33
SET_PROXY Procedure .....	89-34
VALIDATE_SCHEME Function .....	89-35

## 90 DBMS\_MGWADM

Using DBMS_MGWADM .....	90-2
Deprecated Subprograms .....	90-3
Constants .....	90-4
<b>Data Structures.....</b>	<b>90-7</b>
SYS.MGW_MQSERIES_PROPERTIES Object Type.....	90-8
SYS.MGW_PROPERTIES Object Type.....	90-10
SYS.MGW_PROPERTY Object Type.....	90-12
SYS.MGW_TIBRV_PROPERTIES Object Type.....	90-13

<b>Summary of DBMS_MGWADM Subprograms</b> .....	90-14
ADD_SUBSCRIBER Procedure .....	90-16
ALTER_AGENT Procedures .....	90-20
ALTER_JOB Procedure .....	90-22
ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous .....	90-24
ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ .....	90-25
ALTER_PROPAGATION_SCHEDULE Procedure .....	90-26
ALTER_SUBSCRIBER Procedure .....	90-27
CLEANUP_GATEWAY Procedures .....	90-29
CREATE_AGENT Procedure .....	90-32
CREATE_JOB Procedure.....	90-34
CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous .....	90-38
CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ.....	90-39
DB_CONNECT_INFO Procedure.....	90-40
DISABLE_JOB Procedure.....	90-41
DISABLE_PROPAGATION_SCHEDULE Procedure .....	90-42
ENABLE_JOB Procedure .....	90-43
ENABLE_PROPAGATION_SCHEDULE Procedure .....	90-44
REGISTER_FOREIGN_QUEUE Procedure.....	90-45
REMOVE_AGENT Procedure.....	90-46
REMOVE_JOB Procedure .....	90-47
REMOVE_MSGSYSTEM_LINK Procedure.....	90-48
REMOVE_OPTION Procedure .....	90-49
REMOVE_SUBSCRIBER Procedure .....	90-51
RESET_JOB Procedure .....	90-52
RESET_SUBSCRIBER Procedure .....	90-53
SCHEDULE_PROPAGATION Procedure .....	90-54
SET_LOG_LEVEL Procedures .....	90-56
SET_OPTION Procedure.....	90-57
SHUTDOWN Procedures .....	90-59
STARTUP Procedures .....	90-60
UNREGISTER_FOREIGN_QUEUE Procedure .....	90-61
UNSCHEDULE_PROPAGATION Procedure .....	90-62

## 91 DBMS\_MGWMSG

<b>Using DBMS_MGWMSG</b> .....	91-2
Security Model.....	91-3
Constants .....	91-4
Types .....	91-6
<b>Summary of DBMS_MGWMSG Subprograms</b> .....	91-21
LCR_TO_XML Function.....	91-22
NVARARRAY_ADD Procedure.....	91-23
NVARARRAY_FIND_NAME Function.....	91-24
NVARARRAY_FIND_NAME_TYPE Function.....	91-25
NVARARRAY_GET Function.....	91-26
NVARARRAY_GET_BOOLEAN Function .....	91-27
NVARARRAY_GET_BYTE Function.....	91-28

NVARRAY_GET_DATE Function .....	91-29
NVARRAY_GET_DOUBLE Function.....	91-30
NVARRAY_GET_FLOAT Function .....	91-31
NVARRAY_GET_INTEGER Function.....	91-32
NVARRAY_GET_LONG Function.....	91-33
NVARRAY_GET_RAW Function.....	91-34
NVARRAY_GET_SHORT Function.....	91-35
NVARRAY_GET_TEXT Function.....	91-36
XML_TO_LCR Function.....	91-37

## 92 DBMS\_MONITOR

<b>Summary of DBMS_MONITOR Subprograms .....</b>	<b>92-2</b>
CLIENT_ID_STAT_DISABLE Procedure .....	92-3
CLIENT_ID_STAT_ENABLE Procedure.....	92-4
CLIENT_ID_TRACE_DISABLE Procedure.....	92-5
CLIENT_ID_TRACE_ENABLE Procedure .....	92-6
DATABASE_TRACE_DISABLE Procedure .....	92-7
DATABASE_TRACE_ENABLE Procedure.....	92-8
SERV_MOD_ACT_STAT_DISABLE Procedure.....	92-9
SERV_MOD_ACT_STAT_ENABLE Procedure.....	92-10
SERV_MOD_ACT_TRACE_DISABLE Procedure .....	92-12
SERV_MOD_ACT_TRACE_ENABLE Procedure .....	92-13
SESSION_TRACE_DISABLE Procedure .....	92-15
SESSION_TRACE_ENABLE Procedure .....	92-16

## 93 DBMS\_MVIEW

<b>Using DBMS_MVIEW .....</b>	<b>93-2</b>
Operational Notes .....	93-3
Security Model.....	93-4
Rules and Limits.....	93-5
<b>Summary of DBMS_MVIEW Subprograms .....</b>	<b>93-6</b>
BEGIN_TABLE_REORGANIZATION Procedure .....	93-7
END_TABLE_REORGANIZATION Procedure.....	93-8
ESTIMATE_MVIEW_SIZE Procedure .....	93-9
EXPLAIN_MVIEW Procedure .....	93-10
EXPLAIN_REWRITE Procedure.....	93-11
I_AM_A_REFRESH Function.....	93-13
PMARKER Function .....	93-14
PURGE_DIRECT_LOAD_LOG Procedure .....	93-15
PURGE_LOG Procedure .....	93-16
PURGE_MVIEW_FROM_LOG Procedure.....	93-17
REFRESH Procedures .....	93-18
REFRESH_ALL_MVIEWS Procedure.....	93-20
REFRESH_DEPENDENT Procedures.....	93-21
REGISTER_MVIEW Procedure.....	93-23
UNREGISTER_MVIEW Procedure .....	93-25

<b>94</b>	<b>DBMS_NETWORK_ACL_ADMIN</b>	
	Using DBMS_NETWORK_ACL_ADMIN .....	94-2
	Examples .....	94-3
	<b>Summary of DBMS_NETWORK_ACL_ADMIN Subprograms</b> .....	94-5
	ADD_PRIVILEGE Procedure .....	94-6
	ASSIGN_ACL Procedure .....	94-8
	ASSIGN_WALLET_ACL Procedure .....	94-10
	CHECK_PRIVILEGE Function .....	94-11
	CHECK_PRIVILEGE_ACLID Function .....	94-12
	CREATE_ACL Procedure .....	94-13
	DELETE_PRIVILEGE Procedure .....	94-14
	DROP_ACL Procedure .....	94-15
	UNASSIGN_ACL Procedure .....	94-16
	UNASSIGN_WALLET_ACL Procedure .....	94-17
<b>95</b>	<b>DBMS_NETWORK_ACL_UTILITY</b>	
	Using DBMS_NETWORK_ACL_UTILITY .....	95-2
	Examples .....	95-3
	<b>Summary of DBMS_NETWORK_ACL_UTILITY Subprograms</b> .....	95-4
	CONTAINS_HOST Function .....	95-5
	DOMAIN_LEVEL Function .....	95-6
	DOMAINS Function .....	95-7
	EQUALS_HOST Function .....	95-8
<b>96</b>	<b>DBMS_OBFUSCATION_TOOLKIT</b>	
	Using DBMS_OBFUSCATION_TOOLKIT .....	96-2
	Overview .....	96-3
	Security Model .....	96-4
	Operational Notes .....	96-5
	<b>Summary of DBMS_OBFUSCATION Subprograms</b> .....	96-7
	DES3DECRYPT Procedures and Functions .....	96-8
	DES3ENCRYPT Procedures and Functions .....	96-10
	DES3GETKEY Procedures and Functions .....	96-12
	DESDECRYPT Procedures and Functions .....	96-13
	DESENCRYPT Procedures and Functions .....	96-15
	DESGETKEY Procedures and Functions .....	96-17
	MD5 Procedures and Functions .....	96-18
<b>97</b>	<b>DBMS_ODCI</b>	
	<b>Summary of DBMS_ODCI Subprograms</b> .....	97-2
	ESTIMATE_CPU_UNITS Function .....	97-3
<b>98</b>	<b>DBMS_OFFLINE_OG</b>	
	Documentation of DBMS_OFFLINE_OG .....	98-2

---

## 99 DBMS\_OUTLN

Using DBMS_OUTLN.....	99-2
Overview .....	99-3
Security Model.....	99-4
<b>Summary of DBMS_OUTLN Subprograms .....</b>	<b>99-5</b>
CLEAR_USED Procedure .....	99-6
CREATE_OUTLINE Procedure .....	99-7
DROP_BY_CAT Procedure.....	99-8
DROP_UNUSED Procedure.....	99-9
EXACT_TEXT_SIGNATURES Procedure .....	99-10
UPDATE_BY_CAT Procedure .....	99-11
UPDATE_SIGNATURES Procedure.....	99-12

## 100 DBMS\_OUTPUT

Using DBMS_OUTPUT .....	100-2
Overview .....	100-3
Security Model.....	100-4
Operational Notes .....	100-5
Exceptions .....	100-6
Rules and Limits.....	100-7
Examples .....	100-8
<b>Data Structures.....</b>	<b>100-11</b>
CHARARR Table Type.....	100-12
DBMSOUTPUT_LINESARRAY Object Type .....	100-13
<b>Summary of DBMS_OUTPUT Subprograms .....</b>	<b>100-14</b>
DISABLE Procedure .....	100-15
ENABLE Procedure .....	100-16
GET_LINE Procedure .....	100-17
GET_LINES Procedure.....	100-18
NEW_LINE Procedure .....	100-19
PUT Procedure .....	100-20
PUT_LINE Procedure .....	100-21

## 101 DBMS\_PARALLEL\_EXECUTE

Using DBMS_PARALLEL_EXECUTE.....	101-2
Overview .....	101-3
Security Model.....	101-4
Constants .....	101-5
Views.....	101-6
Exceptions .....	101-7
Examples .....	101-8
<b>Summary of DBMS_PARALLEL_EXECUTE Subprograms.....</b>	<b>101-11</b>
ADM_DROP_CHUNKS Procedure.....	101-12
ADM_DROP_TASK Procedure.....	101-13
ADM_TASK_STATUS Procedure.....	101-14
ADM_STOP_TASK Procedure.....	101-15

CREATE_TASK Procedure.....	101-16
CREATE_CHUNKS_BY_NUMBER_COL Procedure.....	101-17
CREATE_CHUNKS_BY_ROWID Procedure.....	101-18
CREATE_CHUNKS_BY_SQL Procedure.....	101-19
DROP_TASK Procedure.....	101-20
DROP_CHUNKS Procedure.....	101-21
GENERATE_TASK_NAME Function.....	101-22
GET_NUMBER_COL_CHUNK Procedure.....	101-23
GET_ROWID_CHUNK Procedure.....	101-24
PURGE_PROCESSED_CHUNKS Procedure.....	101-25
RESUME_TASK Procedures.....	101-26
RUN_TASK Procedure.....	101-28
SET_CHUNK_STATUS Procedure.....	101-30
STOP_TASK Procedure.....	101-31
TASK_STATUS Procedure.....	101-32

## 102 DBMS\_PCLXUTIL

<b>Using DBMS_PCLXUTIL</b> .....	102-2
Overview .....	102-3
Security Model.....	102-4
Operational Notes .....	102-5
Rules and Limits.....	102-6
<b>Summary of DBMS_PCLXUTIL Subprograms</b> .....	102-7
BUILD_PART_INDEX Procedure .....	102-8

## 103 DBMS\_PIPE

<b>Using DBMS_PIPE</b> .....	103-2
Overview .....	103-3
Security Model.....	103-4
Constants .....	103-5
Operational Notes .....	103-6
Exceptions .....	103-8
Examples .....	103-9
<b>Summary of DBMS_PIPE Subprograms</b> .....	103-18
CREATE_PIPE Function .....	103-19
NEXT_ITEM_TYPE Function .....	103-21
PACK_MESSAGE Procedures .....	103-22
PURGE Procedure.....	103-24
RECEIVE_MESSAGE Function.....	103-25
RESET_BUFFER Procedure .....	103-27
REMOVE_PIPE Function .....	103-28
SEND_MESSAGE Function .....	103-29
UNIQUE_SESSION_NAME Function .....	103-31
UNPACK_MESSAGE Procedures .....	103-32

---

## 104 DBMS\_PREDICTIVE\_ANALYTICS

Using DBMS_PREDICTIVE_ANALYTICS .....	104-2
Overview .....	104-3
Security Model.....	104-4
<b>Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms</b> .....	104-5
EXPLAIN Procedure.....	104-6
PREDICT Procedure .....	104-8
PROFILE Procedure.....	104-10

## 105 DBMS\_PREPROCESSOR

Using DBMS_PREPROCESSOR.....	105-2
Overview .....	105-3
Operating Notes .....	105-4
<b>Data Structures</b> .....	105-5
SOURCE_LINES_T Table Type.....	105-6
<b>Summary of DBMS_PREPROCESSOR Subprograms</b> .....	105-7
GET_POST_PROCESSED_SOURCE Functions.....	105-8
PRINT_POST_PROCESSED_SOURCE Procedures.....	105-10

## 106 DBMS\_PROFILER

Using DBMS_PROFILER .....	106-2
Overview .....	106-3
Security Model.....	106-5
Operational Notes .....	106-6
Exceptions .....	106-8
<b>Summary of DBMS_PROFILER Subprograms</b> .....	106-9
FLUSH_DATA Function and Procedure .....	106-10
GET_VERSION Procedure.....	106-11
INTERNAL_VERSION_CHECK Function.....	106-12
PAUSE_PROFILER Function and Procedure .....	106-13
RESUME_PROFILER Function and Procedure .....	106-14
START_PROFILER Functions and Procedures .....	106-15
STOP_PROFILER Function and Procedure .....	106-16

## 107 DBMS\_PROPAGATION\_ADM

Using DBMS_PROPAGATION_ADM .....	107-2
Overview .....	107-3
Security Model.....	107-4
<b>Summary of DBMS_PROPAGATION_ADM Subprograms</b> .....	107-5
ALTER_PROPAGATION Procedure .....	107-6
CREATE_PROPAGATION Procedure .....	107-8
DROP_PROPAGATION Procedure .....	107-11
START_PROPAGATION Procedure .....	107-13
STOP_PROPAGATION Procedure .....	107-14

REVOKE_SYSTEM_PRIVILEGE Procedure .....	120-6

## 121 DBMS\_RESULT\_CACHE

<b>Using DBMS_RESULT_CACHE</b> .....	121-2
Constants .....	121-3
<b>Summary of DBMS_RESULT_CACHE Subprograms</b> .....	121-4
BYPASS Procedure .....	121-5
FLUSH Function & Procedure .....	121-7
INVALIDATE Functions & Procedures .....	121-8
INVALIDATE_OBJECT Functions & Procedures .....	121-9
MEMORY_REPORT Procedure .....	121-10
STATUS Function .....	121-11

---

## 122 DBMS\_RESUMABLE

Using DBMS_RESUMABLE .....	122-2
Operational Notes .....	122-3
Summary of DBMS_RESUMABLE Subprograms .....	122-4
ABORT Procedure .....	122-5
GET_SESSION_TIMEOUT Function .....	122-6
GET_TIMEOUT Function .....	122-7
SET_SESSION_TIMEOUT Procedure .....	122-8
SET_TIMEOUT Procedure .....	122-9
SPACE_ERROR_INFO Function .....	122-10

## 123 DBMS\_RLMGR

Using DBMS_RLMGR .....	123-2
Security Model .....	123-3
Summary of Rules Manager Subprograms .....	123-4
ADD_ELEMENTARY_ATTRIBUTE Procedures .....	123-6
ADD_EVENT Procedure .....	123-9
ADD_FUNCTIONS Procedure .....	123-11
ADD_RULE Procedure .....	123-12
CONDITION_REF Function .....	123-14
CONSUME_EVENT Function .....	123-15
CONSUME_PRIM_EVENTS Function .....	123-17
CREATE_CONDITIONS_TABLE Procedure .....	123-19
CREATE_EVENT_STRUCT Procedure .....	123-21
CREATE_EXPFIL_INDEXES Procedure .....	123-22
CREATE_INTERFACE Procedure .....	123-24
CREATE_RULE_CLASS Procedure .....	123-26
DELETE_RULE Procedure .....	123-30
DROP_CONDITIONS_TABLE Procedure .....	123-31
DROP_EVENT_STRUCT Procedure .....	123-32
DROP_EXPFIL_INDEXES Procedure .....	123-33
DROP_INTERFACE Procedure .....	123-34
DROP_RULE_CLASS Procedure .....	123-35
EXTEND_EVENT_STRUCT Procedure .....	123-36
GET_AGGREGATE_VALUE Function .....	123-37
GRANT_PRIVILEGE Procedure .....	123-39
PROCESS_RULES Procedure .....	123-40
PURGE_EVENTS Procedure .....	123-42
RESET_SESSION Procedure .....	123-43
REVOKE_PRIVILEGE Procedure .....	123-44
SYNC_TEXT_INDEXES Procedure .....	123-45

## 124 DBMS\_RLS

Using DBMS_RLS .....	124-2
Overview .....	124-3
Security Model .....	124-4

Operational Notes .....	124-5
<b>Summary of DBMS_RLS Subprograms .....</b>	<b>124-6</b>
ADD_GROUPED_POLICY Procedure .....	124-7
ADD_POLICY Procedure .....	124-9
ADD_POLICY_CONTEXT Procedure .....	124-13
CREATE_POLICY_GROUP Procedure .....	124-14
DELETE_POLICY_GROUP Procedure .....	124-15
DISABLE_GROUPED_POLICY Procedure .....	124-16
DROP_GROUPED_POLICY Procedure .....	124-17
DROP_POLICY Procedure .....	124-18
DROP_POLICY_CONTEXT Procedure .....	124-19
ENABLE_GROUPED_POLICY Procedure .....	124-20
ENABLE_POLICY Procedure .....	124-21
REFRESH_GROUPED_POLICY Procedure .....	124-22
REFRESH_POLICY Procedure .....	124-23
<b>125 DBMS_ROWID</b>	
<b>Using DBMS_ROWID .....</b>	<b>125-2</b>
Security Model .....	125-3
Types .....	125-4
Exceptions .....	125-6
Operational Notes .....	125-7
Examples .....	125-8
<b>Summary of DBMS_ROWID Subprograms .....</b>	<b>125-9</b>
ROWID_BLOCK_NUMBER Function .....	125-10
ROWID_CREATE Function .....	125-11
ROWID_INFO Procedure .....	125-12
ROWID_OBJECT Function .....	125-13
ROWID_RELATIVE_FNO Function .....	125-14
ROWID_ROW_NUMBER Function .....	125-15
ROWID_TO_ABSOLUTE_FNO Function .....	125-16
ROWID_TO_EXTENDED Function .....	125-17
ROWID_TO_RESTRICTED Function .....	125-19
ROWID_TYPE Function .....	125-20
ROWID_VERIFY Function .....	125-21
<b>126 DBMS_RULE</b>	
<b>Using DBMS_RULE .....</b>	<b>126-2</b>
Overview .....	126-3
Security Model .....	126-4
<b>Summary of DBMS_RULE Subprograms .....</b>	<b>126-5</b>
CLOSE_ITERATOR Procedure .....	126-6
EVALUATE Procedures .....	126-7
GET_NEXT_HIT Function .....	126-11

---

## 127 DBMS\_RULE\_ADM

<b>Using DBMS_RULE_ADM</b> .....	127-2
Overview .....	127-3
Security Model.....	127-4
<b>Summary of DBMS_RULE_ADM Subprograms</b> .....	127-5
ADD_RULE Procedure .....	127-6
ALTER_EVALUATION_CONTEXT Procedure.....	127-8
ALTER_RULE Procedure.....	127-11
CREATE_EVALUATION_CONTEXT Procedure.....	127-13
CREATE_RULE Procedure.....	127-15
CREATE_RULE_SET Procedure.....	127-17
DROP_EVALUATION_CONTEXT Procedure .....	127-18
DROP_RULE Procedure .....	127-19
DROP_RULE_SET Procedure .....	127-20
GRANT_OBJECT_PRIVILEGE Procedure .....	127-21
GRANT_SYSTEM_PRIVILEGE Procedure .....	127-23
REMOVE_RULE Procedure .....	127-25
REVOKE_OBJECT_PRIVILEGE Procedure .....	127-27
REVOKE_SYSTEM_PRIVILEGE Procedure .....	127-28

## 128 DBMS\_SCHEDULER

<b>Data Structures</b> .....	128-2
JOBARG Object Type.....	128-3
JOB Object Type .....	128-5
JOB_DEFINITION Object Type .....	128-6
JOBATTR Object Type.....	128-10

SET_JOB_ATTRIBUTES Procedure.....	128-149
SET_SCHEDULER_ATTRIBUTE Procedure .....	128-150
STOP_JOB Procedure .....	128-153

## 129 DBMS\_SERVER\_ALERT

<b>Using DBMS_SERVER_ALERT</b> .....	129-2
Security Model.....	129-3
Object Types.....	129-4
Relational Operators.....	129-5
Supported Metrics.....	129-6
<b>Summary of DBMS_SERVER_ALERT Subprograms</b> .....	129-12
EXPAND_MESSAGE Function.....	129-13
GET_THRESHOLD Procedure .....	129-14
SET_THRESHOLD Procedure .....	129-15

## 130 DBMS\_SERVICE

<b>Using DBMS_SERVICE</b> .....	130-2
Overview .....	130-3
Security Model.....	130-4
Deprecated Subprograms .....	130-5
Constants .....	130-6
Exceptions .....	130-8
<b>Summary of DBMS_SERVICE Subprograms</b> .....	130-9
CREATE_SERVICE Procedure.....	130-10
DELETE_SERVICE Procedure .....	130-12
DISCONNECT_SESSION Procedure.....	130-13
MODIFY_SERVICE Procedure .....	130-14
START_SERVICE Procedure.....	130-16
STOP_SERVICE Procedure.....	130-17

## 131 DBMS\_SESSION

<b>Using DBMS_SESSION</b> .....	131-2
Security Model.....	131-3
Operational Notes .....	131-4
<b>Data Structures</b> .....	131-5
INTEGER_ARRAY Table Type.....	131-6
LNAME_ARRAY Table Type.....	131-7

<b>Summary of DBMS_SESSION Subprograms</b> .....	131-8
CLEAR_ALL_CONTEXT Procedure.....	131-9
CLEAR_CONTEXT Procedure.....	131-10
CLEAR_IDENTIFIER Procedure .....	131-11
CLOSE_DATABASE_LINK Procedure.....	131-12
FREE_UNUSED_USER_MEMORY Procedure.....	131-13
GET_PACKAGE_MEMORY_UTILIZATION Procedure .....	131-15
IS_ROLE_ENABLED Function .....	131-16
IS_SESSION_ALIVE Function.....	131-17
LIST_CONTEXT Procedures .....	131-18
MODIFY_PACKAGE_STATE Procedure.....	131-19
SESSION_TRACE_DISABLE Procedure .....	131-23
SESSION_TRACE_ENABLE Procedure .....	131-24
RESET_PACKAGE Procedure .....	131-25
SET_CONTEXT Procedure .....	131-27
SET_EDITION_DEFERRED Procedure .....	131-29
SET_IDENTIFIER Procedure.....	131-30
SET-NLS Procedure.....	131-31
SET_ROLE Procedure.....	131-32
SET_SQL_TRACE Procedure .....	131-33
SWITCH_CURRENT_CONSUMER_GROUP Procedure .....	131-34
UNIQUE_SESSION_ID Function .....	131-36

## 132 DBMS\_SHARED\_POOL

<b>Using DBMS_SHARED_POOL</b> .....	132-2
Overview .....	132-3
Operational Notes .....	132-4
<b>Summary of DBMS_SHARED_POOL Subprograms</b> .....	132-5
ABORTED_REQUEST_THRESHOLD Procedure.....	132-6
KEEP Procedure .....	132-7
MARKHOT Procedure .....	132-9
PURGE Procedure.....	132-10
SIZES Procedure.....	132-12
UNKEEP Procedure.....	132-13
UNMARKHOT Procedure.....	132-14

## 133 DBMS\_SPACE

<b>Using DBMS_SPACE</b> .....	133-2
Security Model.....	133-3
<b>Data Structures</b> .....	133-4
CREATE_TABLE_COST_COLINFO Object Type.....	133-5
ASA_RECO_ROW Record Type.....	133-6
ASA_RECO_ROW_TB Table Type.....	133-7
<b>Summary of DBMS_SPACE Subprograms</b> .....	133-8
ASA_RECOMMENDATIONS Function.....	133-9
CREATE_INDEX_COST Procedure .....	133-10
CREATE_TABLE_COST Procedures .....	133-11

FREE_BLOCKS Procedure.....	133-13
ISDATAFILEDROPPABLE_NAME Procedure.....	133-15
OBJECT_DEPENDENT_SEGMENTS Function.....	133-16
OBJECT_GROWTH_TREND Function.....	133-18
SPACE_USAGE Procedures.....	133-20
UNUSED_SPACE Procedure.....	133-23

## 134 DBMS\_SPACE\_ADMIN

<b>Using DBMS_SPACE_ADMIN</b> .....	134-2
Security Model.....	134-3
Constants.....	134-4
Operational Notes.....	134-6
<b>Summary of DBMS_SPACE_ADMIN Subprograms</b> .....	134-7
ASSM_SEGMENT_VERIFY Procedure.....	134-8
ASSM_TABLESPACE_VERIFY Procedure.....	134-10
DROP_EMPTY_SEGMENTS Procedure.....	134-11
MATERIALIZED_DEFERRED_SEGMENTS Procedure.....	134-12
SEGMENT_CORRUPT Procedure.....	134-13
SEGMENT_DROP_CORRUPT Procedure.....	134-14
SEGMENT_DUMP Procedure.....	134-15
SEGMENT_VERIFY Procedure.....	134-16
TABLESPACE_FIX_BITMAPS Procedure.....	134-17
TABLESPACE_FIX_SEGMENT_STATES Procedure.....	134-18
TABLESPACE_MIGRATE_FROM_LOCAL Procedure.....	134-19
TABLESPACE_MIGRATE_TO_LOCAL Procedure.....	134-20
TABLESPACE_REBUILD_BITMAPS Procedure.....	134-21
TABLESPACE_REBUILD_QUOTAS Procedure.....	134-22
TABLESPACE_RELOCATE_BITMAPS Procedure.....	134-23
TABLESPACE_VERIFY Procedure.....	134-24

## 135 DBMS\_SPM

<b>Using DBMS_SPM</b> .....	135-2
Overview.....	135-3
Security Model.....	135-4
Constants.....	135-5
Examples.....	135-6
<b>Data Structures</b> .....	135-7
NAMELIST Table Type.....	135-8
<b>Summary of DBMS_SPM Subprograms</b> .....	135-9
ALTER_SQL_PLAN_BASELINE Function.....	135-10
CONFIGURE Procedure.....	135-12
CREATE_STGTAB_BASELINE Procedure.....	135-13
DROP_SQL_PLAN_BASELINE Function.....	135-14
EVOLVE_SQL_PLAN_BASELINE Function.....	135-15
LOAD_PLANS_FROM_CURSOR_CACHE Functions.....	135-17
LOAD_PLANS_FROM_SQLSET Function.....	135-19
MIGRATE_STORED_OUTLINE Functions.....	135-20

PACK_STGTAB_BASELINE Function .....	135-22
UNPACK_STGTAB_BASELINE Function .....	135-23

## 136 DBMS\_SQL

<b>Using DBMS_SQL</b> .....	136-2
Overview .....	136-3
Security Model.....	136-4
Constants .....	136-5
Exceptions .....	136-6
Operational Notes .....	136-7
Examples .....	136-12
<b>Data Structures</b> .....	136-25
DESC_REC Record Type.....	136-26
DESC_REC2 Record Type.....	136-27
DESC_REC3 Record Type.....	136-28
BFILE_TABLE Table Type .....	136-29
BINARY_DOUBLE_TABLE Table Type.....	136-30
BINARY_FLOAT_TABLE Table Type .....	136-31
BLOB_TABLE Table Type.....	136-32
CLOB_TABLE Table Type .....	136-33

## Index

---

---

# Preface

This Preface contains these topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Related Documents](#)
- [Conventions](#)

## Audience

*Oracle Database PL/SQL Packages and Types Reference* is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming.

## Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

### Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

## Related Documents

For more information, see the following documents:

- *Oracle Database Advanced Application Developer's Guide*
- *Oracle Database PL/SQL Language Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at

[https://oraclestore.oracle.com/OA\\_HTML/ibeCZzpHome.jsp](https://oraclestore.oracle.com/OA_HTML/ibeCZzpHome.jsp)

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

<http://otn.oracle.com/membership/>

If you already have a username and password for OTN, then you can go directly to the documentation section of the OTN Web site at

<http://otn.oracle.com/documentation/>

## Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- [Conventions in Text](#)
- [Conventions in Code Examples](#)

### Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

Convention	Meaning	Example
<b>Bold</b>	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	When you specify this clause, you create an <b>index-organized table</b> .
<i>Italics</i>	Italic typeface indicates book titles or emphasis.	<i>Oracle Database Concepts</i> Ensure that the recovery catalog and target database do <i>not</i> reside on the same disk.
UPPERCASE monospace (fixed-width) font	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.	You can specify this clause only for a NUMBER column. You can back up the database by using the BACKUP command. Query the TABLE_NAME column in the USER_TABLES data dictionary view. Use the DBMS_STATS.GENERATE_STATS procedure.
lowercase monospace (fixed-width) font	Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values.  <i>Note:</i> Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	Enter sqlplus to start SQL*Plus. The password is specified in the orapwd file. Back up the datafiles and control files in the /disk1/oracle/dbs directory. The department_id, department_name, and location_id columns are in the hr.departments table. Set the QUERY_REWRITE_ENABLED initialization parameter to true. The JReplUtil class implements these methods.

Convention	Meaning	Example
<i>lowercase italic monospace (fixed-width) font</i>	Lowercase italic monospace font represents placeholders or variables.	You can specify the <i>parallel_clause</i> .  Run <i>old_release</i> .SQL where <i>old_release</i> refers to the release you installed prior to upgrading.

### Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL\*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
[ ]	Anything enclosed in brackets is optional.	DECIMAL ( <i>digits</i> [ , <i>precision</i> ])
{ }	Braces are used for grouping items.	{ENABLE   DISABLE}
	A vertical bar represents a choice of two options.	{ENABLE   DISABLE} [COMPRESS   NOCOMPRESS]
...	Ellipsis points mean repetition in syntax descriptions.  In addition, ellipsis points can mean an omission in code examples or text.	CREATE TABLE ... AS <i>subquery</i> ;  SELECT <i>col1</i> , <i>col2</i> , ... , <i>coln</i> FROM employees;
Other symbols	You must use symbols other than brackets ([ ]), braces ({}), vertical bars ( ), and ellipsis points (...) exactly as shown.	acctbal NUMBER(11,2); acct CONSTANT NUMBER(4) := 3;
<i>Italics</i>	Italicized text indicates placeholders or variables for which you must supply particular values.	enter <i>password</i>  DB_NAME = <i>database_name</i>
UPPERCASE	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.	SELECT last_name, employee_id FROM employees; SELECT * FROM USER_TABLES; DROP TABLE hr.employees;
lowercase	Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.  <b>Note:</b> Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	SELECT last_name, employee_id FROM employees; sqlplus hr/hr CREATE USER mjones IDENTIFIED BY ty3MU9;

# What's New in PL/SQL Packages and Types Reference?

The following sections describe the new documentation for Oracle Database 11g Release 1 (11.1) and Release 2 (11.2):

- [New Packages](#)
- [Updated Packages](#)
- [New Types](#)
- [Updated Types](#)

---

---

**Note:** Functionality introduced with Oracle Database 11g Release 2 (11.2.0.2) is flagged within the manual, and also by means of \* in the list of packages that follows.

# Introduction to Oracle Supplied PL/SQL Packages & Types

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
WHERE Owner IN (
  'SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
  'LOGSTDBY_ADMINISTRATOR', 'ORDSYS',
  'ORDPLUGINS', 'OEM_MONITOR', 'MDSYS', 'LBACSYS',
  'DMSYS', 'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
  'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MDDATA',
  'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
AND Object_Type IN ('PACKAGE', 'TYPE')
ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- [Package Overview](#)
- [Summary of Oracle Supplied PL/SQL Packages and Types](#)

**See Also:** *Oracle Database Advanced Application Developer's Guide*  
for information on how to create your own packages

---

## Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

## Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS -- specification (visible part)
    -- public type and item declarations
    -- subprogram specifications
END [name];
```

```
CREATE PACKAGE BODY name AS -- body (hidden part)
    -- private type and item declarations
    -- subprogram bodies
[BEGIN
    -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

## Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have EXECUTE privileges on the function. To select from a view defined with a PL/SQL function, you must have SELECT privileges on the view. No separate EXECUTE privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

## Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL\*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

---

---

**Note:** It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE` just overwrites it with no warning.

---

---

2. Create the package body with the `CREATE PACKAGE BODY` statement.

You can declare and define program objects in the package body.

- You must define public objects declared in the package specification.
- You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

**See Also:**

- *Oracle Database PL/SQL Language Reference*
- *Oracle Database Advanced Application Developer's Guide* for more information on creating new packages
- *Oracle Database Concepts*

for more information on storing and executing packages

## Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

### Creating a New Package: Example

The following example shows a package specification for a package named `EMPLOYEE_MANAGEMENT`. The package contains one stored function and two stored procedures.

```
CREATE PACKAGE employee_management AS
    FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
        mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
        deptno NUMBER) RETURN NUMBER;
    PROCEDURE fire_emp (emp_id NUMBER);
    PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```
CREATE PACKAGE BODY employee_management AS
    FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
        mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
        deptno NUMBER) RETURN NUMBER IS
```

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

```
    new_empno    NUMBER(10);

    BEGIN
        SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
        INSERT INTO emp VALUES (new_empno, name, job, mgr,
            hiredate, sal, comm, deptno);
        RETURN (new_empno);
    END hire_emp;

    PROCEDURE fire_emp(emp_id IN NUMBER) AS
```

The procedure deletes the employee with an employee number that corresponds to the argument `emp_id`. If no employee is found, then an exception is raised.

```
    BEGIN
        DELETE FROM emp WHERE empno = emp_id;
        IF SQL%NOTFOUND THEN
            raise_application_error(-20011, 'Invalid Employee
                Number: ' || TO_CHAR(emp_id));
        END IF;
    END fire_emp;

    PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
```

The procedure accepts two arguments. `Emp_id` is a number that corresponds to an employee number. `Sal_incr` is the amount by which to increase the employee's salary.

```
    BEGIN

        -- If employee exists, then update salary with increase.

        UPDATE emp
            SET sal = sal + sal_incr
            WHERE empno = emp_id;
        IF SQL%NOTFOUND THEN
            raise_application_error(-20011, 'Invalid Employee
```

```
        Number: ' || TO_CHAR(emp_id));  
    END IF;  
END sal_raise;  
END employee_management;
```

---

---

**Note:** If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL\*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence  
      > START WITH 8000 INCREMENT BY 10;
```

---

---

## Referencing Package Contents

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```
package_name.type_name  
package_name.item_name  
package_name.subprogram_name
```

## Summary of Oracle Supplied PL/SQL Packages and Types

Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

---

---

**Caution:**

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
  - Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.
- 
- 

**Table 1–1 Summary of Oracle Supplied PL/SQL Packages**

Package Name	Description
APEX_CUSTOM_AUTH	Provides an interface for authentication and session management
APEX_APPLICATION	Enables users to take advantage of global variables
APEX_ITEM	Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page
APEX_UTIL	Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users
CTX_ADM	Lets you administer servers and the data dictionary
CTX_CLS	Lets you generate CTXRULE rules for a set of documents
CTX_DDL	Lets you create and manage the preferences, section lists and stopgroups required for Text indexes
CTX_DOC	Lets you request document services
CTX_OUTPUT	Lets you manage the index log
CTX_QUERY	Lets you generate query feedback, count hits, and create stored query expressions
CTX_REPORT	Lets you create various index reports
CTX_THES	Lets you to manage and browse thesauri
CTX_ULEXER	For use with the user-lexer
DBMS_ADDM	Facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor
DBMS_ADVANCED_REWRITE	Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite
DBMS_ADVISOR	Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
DBMS_ALERT	Provides support for the asynchronous notification of database events
DBMS_APPLICATION_INFO	Lets you register an application name with the database for auditing or performance tracking purposes
DBMS_APPLY_ADM	Provides administrative procedures to start, stop, and configure an apply process
DBMS_AQ	Lets you add a message (of a predefined object type) onto a queue or to dequeue a message
DBMS_AQADM	Lets you perform administrative functions on a queue or queue table for messages of a predefined object type
DBMS_AQELM	Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP
DBMS_AQIN	Plays a part in providing secure access to the Oracle JMS interfaces
DBMS_ASSERT	Provides an interface to validate properties of the input value
DBMS_AUTO_TASK_ADMIN	Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls
DBMS_AUTO_TASK_IMMEDIATE	Cconsists of one subprogram whose function is to initiate gathering of optimizer statistics without delay
DBMS_AW_STATS	Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions
DBMS_CAPTURE_ADM	Describes administrative procedures to start, stop, and configure a capture process; used in Streams
DBMS_CDC_PUBLISH	Identifies new data that has been added to, modified, or removed from, relational tables and publishes the changed data in a form that is usable by an application
DBMS_CDC_SUBSCRIBE	Lets you view and query the change data that was captured and published with the DBMS_LOGMNR_CDC_PUBLISH package
DBMS_COMPARISON	Provides interfaces to compare and converge database objects at different databases
DBMS_COMPRESSION	Provides an interface to facilitate choosing the correct compression level for an application
DBMS_CONNECTION_POOL	Provides an interface to manage the Database Resident Connection Pool
DBMS_CQ_NOTIFICATION	Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.
DBMS_CRYPT	Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms
DBMS_CSX_ADMIN	Provides an interface to customize the setup when transporting a tablespace containing binary XML data

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
DBMS_CUBE	Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying
DBMS_CUBE_ADVISE	Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite
DBMS_DATA_MINING	Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models
DBMS_DATA_MINING_TRANSFORM	Provides subroutines that can be used to prepare data for Oracle Data Mining
DBMS_DATAPUMP	Lets you move all, or part of, a database between databases, including both data and metadata
DBMS_DBFS_CONTENT	Provides an interface comprising a file system-like abstraction backed by one or more Store Providers
DBMS_DBFS_CONTENT_SPI	Provides the Application Programming Interface (API) specification for DBMS_DBFS_CONTENT service providers
DBMS_DBFS_HS	Provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables
DBMS_DBFS_SFS	Provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package
DBMS_DB_VERSION	Specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions
DBMS_DDL	Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs
DBMS_DEBUG	Implements server-side debuggers and provides a way to debug server-side PL/SQL program units
DBMS_DEFER	Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DEFER_QUERY	Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.
DBMS_DEFER_SYS	Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DESCRIBE	Describes the arguments of a stored procedure with full name translation and security checking
DBMS_DG	Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover
DBMS_DIMENSION	Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
DBMS_DISTRIBUTED_TRUST_ADMIN	Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted
DBMS_EPG	Implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener
DBMS_ERRLOG	Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back
DBMS_EXPFIL	Contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter
DBMS_FGA	Provides fine-grained security functions
DBMS_FILE_GROUP	One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories
DBMS_FILE_TRANSFER	Lets you copy a binary file within a database or to transfer a binary file between databases
DBMS_FLASHBACK	Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)
DBMS_FLASHBACK_ARCHIVE	Contains procedures for disassociation and reassociation of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively.
DBMS_FREQUENT_ITEMSET	Enables frequent itemset counting
DBMS_HM	Contains constants and procedure declarations for health check management
DBMS_HPROF	Provides an interface for profiling the execution of PL/SQL applications
DBMS_HS_PARALLEL	Enables parallel processing for heterogeneous targets access
DBMS_HS_PASSTHROUGH	Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems
DBMS_IOT	Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command
DBMS_JAVA	Provides a PL/SQL interface for accessing database functionality from Java
DBMS_JOB	Schedules and manages jobs in the job queue
DBMS_LDAP	Provides functions and procedures to access data from LDAP servers
DBMS_LDAP_UTL	Provides the Oracle Extension utility functions for LDAP
DBMS_LIBCACHE	Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution
DBMS_LOB	Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILES (read-only)

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
DBMS_LOCK	Lets you request, convert and release locks through Oracle Lock Management services
DBMS_LOGMNR	Provides functions to initialize and run the log reader
DBMS_LOGMNR_D	Queries the dictionary tables of the current database, and creates a text based file containing their contents
DBMS_LOGSTDBY	Describes procedures for configuring and managing the logical standby database environment
DBMS_METADATA	Lets callers easily retrieve complete database object definitions (metadata) from the dictionary
DBMS_METADATA_DIFF	Contains the interfaces for comparing two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the DBMS_METADATA submit interface and the CONVERT API.
DBMS_MGD_ID_UTL	Provides a set of utility subprograms
DBMS_MGWADM	Describes the Messaging Gateway administrative interface; used in Advanced Queuing
DBMS_MGWMSG	Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.
DBMS_MONITOR	Let you use PL/SQL for controlling additional tracing and statistics gathering
DBMS_MVIEW	Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.
DBMS_NETWORK_ACL_ADMIN	Provides the interface to administer the network Access Control List (ACL)
DBMS_NETWORK_UTL	Provides the interface to administer the network Access Control List (ACL)
DBMS_OBFUSCATION_TOOLKIT	Provides procedures for Data Encryption Standards
DBMS_ODCI	Returns the CPU cost of a user function based on the elapsed time of the function
DBMS_OFFLINE_OG	Provides a public interface for offline instantiation of master groups
DBMS_OLAP	Provides procedures for summaries, dimensions, and query rewrites
DBMS_OUTLN	Provides the interface for procedures and functions associated with management of stored outlines Synonymous with OUTLN_PKG
DBMS_OUTPUT	Accumulates information in a buffer so that it can be retrieved later
DBMS_PARALLEL_EXECUTE	Enables the user to incrementally update table data in parallel
DBMS_PCLXUTIL	Provides intra-partition parallelism for creating partition-wise local indexes

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
DBMS_PIPE	Provides a DBMS pipe service which enables messages to be sent between sessions
DBMS_PREDICTIVE_ANALYTICS	Provides subroutines that implement automatic data mining operations for predict, explain, and profile
DBMS_PREPROCESSOR	Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form
DBMS_PROFILER	Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks
DBMS_PROPAGATION_ADM	Provides administrative procedures for configuring propagation from a source queue to a destination queue
DBMS_RANDOM	Provides a built-in random number generator
DBMS_RECTIFIER_DIFF	Provides an interface to detect and resolve data inconsistencies between two replicated sites
DBMS_REDEFINITION	Lets you perform an online reorganization of tables
DBMS_REFRESH	Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time Requires the Distributed Option
DBMS_REPAIR	Provides data corruption repair procedures
DBMS_REPCAT	Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.
DBMS_REPCAT_ADMIN	Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.
DBMS_REPCAT_INSTANTIATE	Instantiates deployment templates. Requires the Replication Option.
DBMS_REPCAT_RGT	Controls the maintenance and definition of refresh group templates. Requires the Replication Option.
DBMS_REPUTIL	Provides routines to generate shadow tables, triggers, and packages for table replication.
DBMS_RESCONFIG	Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource
DBMS_RESOURCE_MANAGER	Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema
DBMS_RESOURCE_MANAGER_PRIVS	Maintains privileges associated with resource consumer groups
DBMS_RESULT_CACHE	Provides an interface to operate on the Result Cache
DBMS_RESUMABLE	Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution
DBMS_RLMGR	Contains various procedures to create and manage rules and rule sessions by the Rules Manager
DBMS_RLS	Provides row level security administrative interface
DBMS_ROWID	Provides procedures to create rowids and to interpret their contents

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
DBMS_RULE	Describes the EVALUATE procedure used in Streams
DBMS_RULE_ADM	Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams
DBMS_SCHEDULER	Provides a collection of scheduling functions that are callable from any PL/SQL program
DBMS_SERVER_ALERT	Lets you issue alerts when some threshold has been violated
DBMS_SERVICE	Lets you create, delete, activate and deactivate services for a single instance
DBMS_SESSION	Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures
DBMS_SHARED_POOL	Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism
DBMS_SPACE	Provides segment space information not available through standard SQL
DBMS_SPACE_ADMIN	Provides tablespace and segment space administration not available through the standard SQL
DBMS_SPM	Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements
DBMS_SQL	Lets you use dynamic SQL to access the database
DBMS_SQLDIAG	Provides an interface to the SQL Diagnosability functionality
DBMS_SQLPA	Provides an interface to implement the SQL Performance Analyzer.
DBMS_SQLTUNE	Provides the interface to tune SQL statements
DBMS_STAT_FUNCS	Provides statistical functions
DBMS_STATS	Provides a mechanism for users to view and modify optimizer statistics gathered for database objects
DBMS_STORAGE_MAP	Communicates with FMON to invoke mapping operations
DBMS_STREAMS	Describes the interface to convert SYS.AnyData objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.
DBMS_STREAMS_ADMIN	Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level
DBMS_STREAMS_ADVISOR_ADM	Provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered
DBMS_STREAMS_AUTH	Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
DBMS_STREAMS_HANDLER_ADM	Provides interfaces to enqueue messages into and dequeue messages from a <code>SYS.AnyData</code> queue
DBMS_STREAMS_MESSAGING	Provides interfaces to enqueue messages into and dequeue messages from a <code>SYS.AnyData</code> queue
DBMS_STREAMS_TABLESPACE_ADM	Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another
DBMS_TDB	Reports whether a database can be transported between platforms using the <code>RMAN CONVERT DATABASE</code> command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.
DBMS_TRACE	Provides routines to start and stop PL/SQL tracing
DBMS_TRANSACTION	Provides access to SQL transaction statements from stored procedures and monitors transaction activities
DBMS_TRANSFORM	Provides an interface to the message format transformation features of Oracle Advanced Queuing
DBMS_TTS	Checks if the transportable set is self-contained
DBMS_TYPES	Consists of constants, which represent the built-in and user-defined types
DBMS_UTILITY	Provides various utility routines
DBMS_WARNING	Provides the interface to query, modify and delete current system or session settings
DBMS_WM	Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions
DBMS_WORKLOAD_CAPTURE	Configures the Workload Capture system and produce the workload capture data.
DBMS_WORKLOAD_REPLAY	Provides an interface to replay and report on a record of a workload on a production or test system
DBMS_WORKLOAD_REPOSITORY	Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines
DBMS_XA	Contains the XA/Open interface for applications to call XA interface in PL/SQL
DBMS_XDB	Describes Resource Management and Access Control interface for PL/SQL
DBMS_XDB_ADMIN	Provides an interface to implement <code>XMLIndex</code> administration operation
DBMS_XDBRESOURCE	Provides an interface to operate on the XDB resource's metadata and contents
DBMS_XDB_VERSION	Describes the versioning interface
DBMS_XDBT	Describes how an administrator can create a <code>ConText</code> index on the XML DB hierarchy and configure it for automatic maintenance
DBMS_XDBZ	Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
DBMS_XEVENT	Provides event-related types and supporting subprograms
DBMS_XMLDOM	Explains access to XMLType objects
DBMS_XMLGEN	Converts the results of a SQL query to a canonical XML format
DBMS_XMLINDEX	Provides an interface to implement asynchronous indexing and apply node referencing
DBMS_XMLPARSER	Explains access to the contents and structure of XML documents
DBMS_XMLQUERY	Provides database-to-XMLType functionality
DBMS_XMLSAVE	Provides XML-to-database-type functionality
DBMS_XMLSCHEMA	Explains procedures to register and delete XML schemas
DBMS_XMLSTORE	Provides the ability to store XML data in relational tables
DBMS_XMLTRANSLATIONS	Provides an interface to perform translations so that strings can be searched or displayed in various languages
DBMS_XPLAN	Describes how to format the output of the EXPLAIN PLAN command
DBMS_XSLPROCESSOR	Explains access to the contents and structure of XML documents
DEBUG_EXTPROC	Lets you debug external procedures on platforms with debuggers that attach to a running process
HTF	Hypertext functions generate HTML tags
HTP	Hypertext procedures generate HTML tags
ORD_DICOM	Supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILES rather than in an ORDDiCOM object type
ORD_DICOM_ADMIN	Used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository
OWA_CACHE	Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications
OWA_COOKIE	Provides an interface for sending and retrieving HTTP cookies from the client's browser
OWA_CUSTOM	Provides a Global PLSQL Agent Authorization callback function
OWA_IMAGE	Provides an interface to access the coordinates where a user clicked on an image
OWA_OPT_LOCK	Contains subprograms that impose optimistic locking strategies so as to prevent lost updates
OWA_PATTERN	Provides an interface to locate text patterns within strings and replace the matched string with another string

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
OWA_SEC	Provides an interface for custom authentication
OWA_TEXT	Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.
OWA_UTIL	Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table
SDO_CS	Provides functions for coordinate system transformation
SDO_CSW_PROCESS	Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)
SDO_GCDR	Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses
SDO_GEOM	Provides functions implementing geometric operations on spatial objects
SDO_GEOR	Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata
SDO_GEOR_ADMIN	Contains subprograms for administrative operations related to GeoRaster.
SDO_GEOR_UTL	Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data
SDO_LRS	Provides functions for linear referencing system support
SDO_MIGRATE	Provides functions for migrating spatial data from previous releases
SDO_NET	Provides functions and procedures for working with data modeled as nodes and links in a network
SDO_NET_MEM	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_OLS	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_PC_PKG	Contains subprograms to support the use of point clouds in Spatial
SDO_SAM	Contains functions and procedures for spatial analysis and data mining
SDO_TIN_PKG	Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial
SDO_TOPO	Provides procedures for creating and managing Spatial topologies
SDO_TOPO_MAP	Contains subprograms for editing Spatial topologies using a cache (TopoMap object)
SDO_TUNE	Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
SDO_UTIL	Provides utility functions and procedures for Oracle Spatial
SDO_WFS_LOCK	Contains subprograms for WFS support for registering and unregistering feature tables
SDO_WFS_PROC	Provides utility functions and procedures for Oracle Spatial
SEM_APIS	Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.
SEM_PERF	Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database
SEM_RDFCTX	Contains subprograms for managing extractor policies and semantic indexes created for documents
SEM_RDFSA	Contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS)
UTL_COLL	Enables PL/SQL programs to use collection locators to query and update
UTL_COMPRESS	Provides a set of data compression utilities
UTL_DBWS	Provides database Web services
UTL_ENCODE	Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts
UTL_FILE	Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O
UTL_HTTP	Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges
UTL_I18N	Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications
UTL_INADDR	Provides a procedure to support internet addressing
UTL_IDENT	Specifies which database or client PL/SQL is running
UTL_LMS	Retrieves and formats error messages in different languages
UTL_MAIL	A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt
UTL_NLA	Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs
UTL_RAW	Provides SQL functions for manipulating RAW datatypes
UTL_RECOMP	Recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallels

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
UTL_REF	Enables a PL/SQL program to access an object by providing a reference to the object
UTL_SMTP	Provides PL/SQL functionality to send emails
UTL_SPADV	Provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment
UTL_TCP	Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world
UTL_URL	Provides escape and unescape mechanisms for URL characters
WPG_DOCLOAD	Provides an interface to download files, both BLOBs and BFILEs
ANYDATA TYPE	A self-describing data instance type containing an instance of the type plus a description
ANYDATASET TYPE	Contains a description of a given type plus a set of data instances of that type
ANYTYPE TYPE	Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions
Oracle Streams AQ Types	Describes the types used in Advanced Queuing
DBFS Content Interface Types	Describes public types defined to support the DBMS_DBFS_CONTENT interface.
Database URI Type	Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package
Expression Filter Types	Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.
JMS TYPES	Describes JMS types so that a PL/SQL application can use JMS queues of JMS types
Oracle Multimedia ORDAudio TYPE	Supports the storage and management of audio data
Oracle Multimedia ORDDicom Type	Supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data
Oracle Multimedia ORDDoc TYPE	Supports the storage and management of heterogeneous media data including image, audio, and video
Oracle Multimedia ORDImage TYPE	Supports the storage, management, and manipulation of image data
Oracle Multimedia SQL/MM Still Image TYPE	Supports the SQL/MM Still Image Standard, which lets you store, retrieve, and modify images in the database and locate images using visual predicates
Oracle Multimedia ORDVideo TYPE	Supports the storage and management of video data
LOGICAL CHANGE RECORD TYPES	Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams

**Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

<b>Package Name</b>	<b>Description</b>
MG_ID Package Types	Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types
RULES TYPES	Describes the types used with rules, rule sets, and evaluation contexts
RULES Manager Types	Rules Manager is supplied with one predefined type and a public synonym
UTL Streams Types	Describes describes abstract streams types used with Oracle XML functionality
XMLType	Describes the types and functions used for native XML support in the server

---

---

## APEX\_CUSTOM\_AUTH

The APEX\_CUSTOM\_AUTH package provides an interface for authentication and session management.

- [Documentation of APEX\\_CUSTOM\\_AUTH](#)

---

## Documentation of APEX\_CUSTOM\_AUTH

For a complete description of this package within the context of APEX, see APEX\_CUSTOM\_AUTH in the *Oracle Application Express API Reference*.

---

---

## APEX\_APPLICATION

The APEX\_APPLICATION package enables users to take advantage of global variables.

- [Documentation of APEX\\_APPLICATION](#)

---

## Documentation of APEX\_APPLICATION

For a complete description of this package within the context of APEX, see APEX\_APPLICATION in the *Oracle Application Express API Reference*.

---

---

## APEX\_ITEM

The APEX\_ITEM package enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.

- [Documentation of APEX\\_ITEM](#)

---

## Documentation of APEX\_ITEM

For a complete description of this package within the context of APEX, see `APEX_ITEM` in the *Oracle Application Express API Reference*.

The APEX\_UTIL package provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.

- [Documentation of APEX\\_UTIL](#)

---

## Documentation of APEX\_UTIL

For a complete description of this package within the context of APEX, see `APEX_UTIL` in the *Oracle Application Express API Reference*.

The CTX\_ADM package lets you administer the Oracle Text data dictionary. Note that you must install this package in order to use it.

- [Documentation of CTX\\_ADM](#)

---

## Documentation of CTX\_ADM

For a complete description of this package within the context of Oracle Text, see CTX\_ADM in the *Oracle Text Reference*.

The CTX\_CLS package enables generation of CTXRULE rules for a set of documents.

- [Documentation of CTX\\_CLS](#)

---

## Documentation of CTX\_CLS

For a complete description of this package within the context of Oracle Text, see CTX\_CLS in the *Oracle Text Reference*.

The CTX\_DDL package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

- [Documentation of CTX\\_DDL](#)

---

## Documentation of CTX\_DDL

For complete description of this package within the context of Oracle Text, see CTX\_DDL in the *Oracle Text Reference*.

The CTX\_DOC package lets you request document services. Note that you must install this package in order to use it.

- [Documentation of CTX\\_DOC](#)

---

## Documentation of CTX\_DOC

For a complete description of this package within the context of Oracle Text, see CTX\_DOC in the *Oracle Text Reference*.

---

---

**Note:** The CTX\_ENTITY package is not available with release 11.2.0.3.

---

---

The CTX\_ENTITY package enables you to search for terms that are unknown to you without specifying a particular search text. It does this by identifying names, places, dates, and other objects when they are mentioned in a document and tagging each occurrence (called a mention) with its type and subtype. This process enables you to produce a structured view of a document that can later be used for text/data mining and more comprehensive intelligence analysis.

- [Documentation of CTX\\_ENTITY](#)

---

## Documentation of CTX\_ENTITY

For complete description of this package within the context of Oracle Text, see CTX\_ENTITY in the *Oracle Text Reference*.

This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

- [Documentation of CTX\\_OUTPUT](#)

---

## Documentation of CTX\_OUTPUT

For a complete description of this package within the context of Oracle Text, see CTX\_OUTPUT in the *Oracle Text Reference*.

This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

- [Documentation of CTX\\_QUERY](#)

---

## Documentation of CTX\_QUERY

For a complete description of this package within the context of Oracle Text, see CTX\_QUERY in the *Oracle Text Reference*.

This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

- [Documentation of CTX\\_REPORT](#)

---

## Documentation of CTX\_REPORT

For a complete description of this package within the context of Oracle Text, see CTX\_REPORT in the *Oracle Text Reference*.

This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

- [Documentation of CTX\\_THES](#)

---

## Documentation of CTX\_THES

For a complete description of this package within the context of Oracle Text, see CTX\_THES in the *Oracle Text Reference*.

This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

- [Documentation of CTX\\_ULEXER](#)

---

## Documentation of CTX\_ULEXER

For a complete description of this package within the context of Oracle Text, see CTX\_ULEXER in the *Oracle Text Reference*.

The DBMS\_ADDM package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

**See Also:**

- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about "Automatic Workload Repository in Oracle Real Application Clusters Environments"
- *Oracle Database Performance Tuning Guide* for more information about "Automatic Performance Diagnostics"

This chapter contains the following topics:

- [Using DBMS\\_ADDM](#)
  - Security Model
- [Summary of DBMS\\_ADDM Subprograms](#)

## Using DBMS\_ADDM

---

- [Security Model](#)

## Security Model

The DBMS\_ADDM package runs with the caller's permission, not the definer's, and then applies the security constraints required by the DBMS\_ADVISOR package.

**See Also:** The [DBMS\\_ADVISOR](#) package for more information about "Security Model".

---

## Summary of DBMS\_ADDM Subprograms

**Table 16–1 DBMS\_ADDM Package Subprograms**

Subprogram	Description
<a href="#">ANALYZE_DB Procedure</a> on page 16-5	Creates an ADDM task for analyzing in database analysis mode and executes it
<a href="#">ANALYZE_INST Procedure</a> on page 16-6	Creates an ADDM task for analyzing in instance analysis mode and executes it.
<a href="#">ANALYZE_PARTIAL Procedure</a> on page 16-7	Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it
<a href="#">DELETE Procedure</a> on page 16-8	Deletes an already created ADDM task (of any kind)
<a href="#">DELETE_FINDING_DIRECTIVE Procedure</a> on page 16-9	Deletes a finding directive
<a href="#">DELETE_PARAMETER_DIRECTIVE Procedure</a> on page 16-10	Deletes a parameter directive
<a href="#">DELETE_SEGMENT_DIRECTIVE Procedure</a> on page 16-11	Deletes a segment directive
<a href="#">DELETE_SQL_DIRECTIVE Procedure</a> on page 16-12	Deletes a SQL directive
<a href="#">GET_ASH_QUERY Function</a> on page 16-13	Returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding
<a href="#">GET_REPORT Function</a> on page 16-14	Retrieves the default text report of an executed ADDM task
<a href="#">INSERT_FINDING_DIRECTIVE Procedure</a> on page 16-15	Creates a directive to limit reporting of a specific finding type.
<a href="#">INSERT_PARAMETER_DIRECTIVE Procedure</a> on page 16-16	Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter
<a href="#">INSERT_SEGMENT_DIRECTIVE Procedure</a> on page 16-17	Creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments
<a href="#">INSERT_SQL_DIRECTIVE Procedure</a> on page 16-19	Creates a directive to limit reporting of actions on specific SQL

## ANALYZE\_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

### Syntax

```
DBMS_ADDM.ANALYZE_DB (
  task_name          IN OUT VARCHAR2,
  begin_snapshot     IN      NUMBER,
  end_snapshot       IN      NUMBER,
  db_id              IN      NUMBER := NULL);
```

### Parameters

**Table 16–2 ANALYZE\_DB Procedure Parameters**

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

### Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

### Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_database_analysis_mode_task';
  DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

## ANALYZE\_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

### Syntax

```
DBMS_ADDM.ANALYZE_INST (
  task_name          IN OUT VARCHAR2,
  begin_snapshot     IN      NUMBER,
  end_snapshot       IN      NUMBER,
  instance_number    IN      NUMBER := NULL,
  db_id              IN      NUMBER := NULL);
```

### Parameters

**Table 16–3 ANALYZE\_INST Procedure Parameters**

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
instance_number	Number of the instance to analyze. By default it is the instance currently connected
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

### Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

### Usage Notes

On single instance systems (when not using Oracle RAC) the resulting task is identical to using the `ANALYZE_DB` procedure.

### Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

## ANALYZE\_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

### Syntax

```
DBMS_ADDM.ANALYZE_PARTIAL (
  task_name          IN OUT VARCHAR2,
  instance_numbers  IN      VARCHAR2,
  begin_snapshot     IN      NUMBER,
  end_snapshot       IN      NUMBER,
  db_id              IN      NUMBER := NULL);
```

### Parameters

**Table 16–4 ANALYZE\_PARTIAL Procedure Parameters**

Parameter	Description
task_name	Name of the task to be created
instance_numbers	Comma separated list of instance numbers to analyze
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

### Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

### Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_partial_analysis_modetask';
  DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

## DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this deletes the local tasks associated with the main task.

### Syntax

```
DBMS_ADDM.DELETE (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 16–5** *DELETE Procedure Parameters*

Parameter	Description
task_name	Name of the task to be deleted

### Examples

```
BEGIN  
    DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');  
END
```

## DELETE\_FINDING\_DIRECTIVE Procedure

This procedure deletes a finding directive.

### Syntax

```
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

### Parameters

**Table 16–6** *DELETE\_FINDING\_DIRECTIVE Procedure Parameters*

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

## DELETE\_PARAMETER\_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks are not affected by this directive.

### Syntax

```
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

### Parameters

**Table 16–7** *DELETE\_PARAMETER\_DIRECTIVE Procedure Parameters*

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

### Examples

```
BEGIN  
    DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL, 'my Parameter directive');  
END;
```

## DELETE\_SEGMENT\_DIRECTIVE Procedure

This procedure deletes a segment directive.

### Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

### Parameters

**Table 16–8** *DELETE\_SEGMENT\_DIRECTIVE Procedure Parameters*

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

## DELETE\_SQL\_DIRECTIVE Procedure

This procedure deletes a SQL directive.

### Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

### Parameters

**Table 16–9** *DELETE\_SQL\_DIRECTIVE Procedure Parameters*

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

## GET\_ASH\_QUERY Function

The function returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding. For most types of findings this identifies the exact rows in ASH corresponding to the finding. For some types of findings the query is an approximation and should not be used for exact identification of the finding's impact or the finding's specific activity.

### Syntax

```
DBMS_ADDM.GET_ASH_QUERY (  
    task_name          IN   VARCHAR2,  
    finding_id         IN   NUMBER)  
RETURN VARCHAR2;
```

### Parameters

**Table 16–10** GET\_ASH\_QUERY Function Parameters

Parameter	Description
task_name	Name of the task
finding	ID of the finding within the task

### Return Values

A VARCHAR containing an ASH query identifying the rows in ASH with impact for the finding

## GET\_REPORT Function

This function retrieves the default text report of an executed ADDM task.

### Syntax

```
DBMS_ADDM.GET_REPORT (  
    task_name          IN VARCHAR2)  
    RETURN CLOB;
```

### Parameters

**Table 16–11** *GET\_REPORT Function Parameters*

Parameter	Description
task_name	Name of the task

### Examples

```
Set long 1000000  
Set pagesize 50000  
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```

## INSERT\_FINDING\_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

### Syntax

```
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  finding_name       IN VARCHAR2,
  min_active_sessions IN NUMBER := 0,
  min_perc_impact    IN NUMBER := 0);
```

### Parameters

**Table 16–12** INSERT\_FINDING\_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
finding_name	Name of an ADDM finding to which this directive applies. All valid findings names appear in the NAME column of view DBA_ADVISOR_FINDING_NAMES.
min_active_sessions	Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.
min_perc_impact	Minimal number for the "percent impact" of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.

### Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of GET\_REPORT shows only an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(
    NULL,
    'Undersized SGA directive',
    'Undersized SGA',
    2,
    10);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

## INSERT\_PARAMETER\_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

### Syntax

```
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (
    task_name          IN VARCHAR2,
    dir_name           IN VARCHAR2,
    parameter_name     IN VARCHAR2);
```

### Parameters

**Table 16–13** *INSERT\_PARAMETER\_DIRECTIVE Procedure Parameters*

Parameter	Description
<code>task_name</code>	Name of the task this directive applies to. If the value is <code>NULL</code> , it applies to all subsequently created ADDM Tasks.
<code>dir_name</code>	Name of the directive. All directives must be given unique names.
<code>parameter_name</code>	Specifies the parameter to use. Valid parameter names appear in <code>V\$PARAMETER</code> .

### Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter `'sga_target'`. The result of `GET_REPORT` does not show these actions.

```
var tname varchar2(60);
BEGIN
    DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
        NULL,
        'my Parameter directive',
        'sga_target');
    :tname := 'my_instance_analysis_mode_task';
    DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

## INSERT\_SEGMENT\_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

### Syntax

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  owner_name        IN VARCHAR2,
  object_name       IN VARCHAR2 := NULL,
  sub_object_name   IN VARCHAR2 := NULL);
```

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  object_number     IN NUMBER);
```

### Parameters

**Table 16–14** *INSERT\_SEGMENT\_DIRECTIVE Procedure Parameters*

Parameter	Description
<code>task_name</code>	Name of the task this directive applies to. If the value is <code>NULL</code> , it applies to all subsequently created ADDM Tasks.
<code>dir_name</code>	Name of the directive. All directives must be given unique names.
<code>owner_name</code>	Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for "like" constraints.
<code>object_name</code>	Name of the main object to be filtered. Again, wildcards are allowed. The default value of <code>NULL</code> is equivalent to a value of <code>'%'</code> .
<code>sub_object_name</code>	Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a <code>'.'</code> ). Again, wildcards are allowed. The default value of <code>NULL</code> is equivalent to a value of <code>'%'</code> .
<code>object_number</code>	Object number of the <code>SEGMENT</code> that this directive is to filter, found in views <code>DBA_OBJECTS</code> or <code>DBA_SEGMENTS</code>

### Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user `SCOTT`. The result of `GET_REPORT` does not show actions for running Segment advisor for segments that belong to `SCOTT`.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
                                     'my Segment directive',
                                     'SCOTT');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

## INSERT\_SQL\_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

### Syntax

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  sql_id             IN VARCHAR2,
  min_active_sessions IN NUMBER := 0,
  min_response_time  IN NUMBER := 0);
```

### Parameters

**Table 16–15** INSERT\_SQL\_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
sql_id	Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'.
min_active_sessions	Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.
min_response_time	Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result.

### Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of GET\_REPORT shows only actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SQL_DIRECTIVE (
    NULL,
    'my SQL directive',
    'abcd123456789',
    2,
    1000000);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

---

---

## DBMS\_ADVANCED\_REWRITE

DBMS\_ADVANCED\_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

**See Also:** *Oracle Database Data Warehousing Guide* for more information about query rewrite

This chapter contains the following topics:

- [Using DBMS\\_ADVANCED\\_REWRITE](#)
  - Security Model
- [Summary of DBMS\\_ADVANCED\\_REWRITE Subprograms](#)

---

## Using DBMS\_ADVANCED\_REWRITE

This section contains topics which relate to using the DBMS\_ADVANCED\_REWRITE package.

- [Security Model](#)

## Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

```
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS\_ADVANCED\_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

```
GRANT CREATE MATERIALIZED VIEW TO er;
```

## Summary of DBMS\_ADVANCED\_REWRITE Subprograms

This table lists all the package subprograms in alphabetical order.

**Table 17-1 DBMS\_ADVANCED\_REWRITE Package Subprograms**

Subprogram	Description
<a href="#">ALTER_REWRITE_EQUIVALENCE</a> Procedure on page 17-5	Changes the mode of the rewrite equivalence declaration to the mode you specify
<a href="#">BUILD_SAFE_REWRITE_EQUIVALENCE</a> Procedure on page 17-6	Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure
<a href="#">DECLARE_REWRITE_EQUIVALENCE</a> Procedures on page 17-7	Creates a declaration indicating that <code>source_stmt</code> is functionally equivalent to <code>destination_stmt</code> for as long as the equivalence declaration remains enabled, and that <code>destination_stmt</code> is more favorable in terms of performance
<a href="#">DROP_REWRITE_EQUIVALENCE</a> Procedure on page 17-9	Drops the specified rewrite equivalence declaration
<a href="#">VALIDATE_REWRITE_EQUIVALENCE</a> Procedure on page 17-10	Validates the specified rewrite equivalence declaration using the same validation method as described with the <code>validate</code> parameter

## ALTER\_REWRITE\_EQUIVALENCE Procedure

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

### Syntax

```
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
    name          VARCHAR2,
    rewrite_mode  VARCHAR2);
```

### Parameters

**Table 17–2 ALTER\_REWRITE\_EQUIVALENCE Procedure Parameters**

Parameter	Description
name	A name for the equivalence declaration to alter. The name can be of the form <code>owner . name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.
rewrite_mode	The following modes are supported, in increasing order of power: <ul style="list-style-type: none"> <li><code>disabled</code>: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration.</li> <li><code>text_match</code>: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations.</li> <li><code>general</code>: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified <code>destination_query</code>.</li> <li><code>recursive</code>: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified <code>destination_query</code> for further performance enhancements whenever it uses the equivalence declaration.</li> </ul> Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

## **BUILD\_SAFE\_REWRITE\_EQUIVALENCE Procedure**

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the `DBMS_ADVISOR.TUNE_MVIEW` procedure. It is required to enable query rewrite and fast refresh when `DBMS_ADVISOR.TUNE_MVIEW` decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the `BUILD_SAFE_REWRITE_EQUIVALENCE` procedure. You should use either the `DBMS_ADVISOR.TUNE_MVIEW` or the `DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE` procedure as appropriate.

## DECLARE\_REWRITE\_EQUIVALENCE Procedures

This procedure creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in `QUERY_REWRITE_INTEGRITY = trusted` and `stale_tolerated` modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in `trusted` and `stale_tolerated` integrity modes.

### Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
    name                VARCHAR2,
    source_stmt         VARCHAR2,
    destination_stmt    VARCHAR2,
    validate            BOOLEAN    := TRUE,
    rewrite_mode        VARCHAR2  := 'TEXT_MATCH');
```

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
    name                VARCHAR2,
    source_stmt         CLOB,
    destination_stmt    CLOB,
    validate            BOOLEAN    := TRUE,
    rewrite_mode        VARCHAR2  := 'TEXT_MATCH');
```

### Parameters

**Table 17–3** *DECLARE\_REWRITE\_EQUIVALENCE Procedure Parameters*

Parameter	Description
<code>name</code>	A name for the equivalence declaration. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name.  Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate <code>CREATE MATERIALIZED VIEW</code> privileges to alter an equivalence declaration.
<code>source_stmt</code>	A sub- <code>SELECT</code> expression in either <code>VARCHAR2</code> or <code>CLOB</code> format. This is the query statement that is the target of optimization.
<code>destination_stmt</code>	A sub- <code>SELECT</code> expression in either <code>VARCHAR2</code> or <code>CLOB</code> format.
<code>validate</code>	A Boolean indicating whether to validate that the specified <code>source_stmt</code> is functionally equivalent to the specified <code>destination_stmt</code> . If <code>validate</code> is specified as <code>TRUE</code> , <code>DECLARE_REWRITE_EQUIVALENCE</code> evaluates the two sub- <code>SELECT</code> s and compares their results. If the results are not the same, <code>DECLARE_REWRITE_EQUIVALENCE</code> does not create the rewrite equivalence and returns an error condition. If <code>FALSE</code> , <code>DECLARE_REWRITE_EQUIVALENCE</code> does not validate the equivalence.

**Table 17-3 (Cont.) DECLARE\_REWRITE\_EQUIVALENCE Procedure Parameters**

Parameter	Description
rewrite_mode	<p>The following modes are supported, in increasing order of power:</p> <ul style="list-style-type: none"> <li>▪ disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration.</li> <li>▪ text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations.</li> <li>▪ general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query.</li> <li>▪ recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration.</li> </ul> <p>Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</p>

## Exceptions

**Table 17-4 DECLARE\_REWRITE\_EQUIVALENCE Procedure Exceptions**

Exception	Description
ORA-30388	Name of the rewrite equivalence is not specified
ORA-30391	The specified rewrite equivalence does not exist
ORA-30392	The checksum analysis for the rewrite equivalence failed
ORA-30393	A query block in the statement did not write
ORA-30396	Rewrite equivalence procedures require the COMPATIBLE parameter to be set to 10.1 or greater

## Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the unrewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's source\_stmt or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's destination\_stmt or the materialized view's container table, respectively.

## DROP\_REWRITE\_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

### Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (  
    name          VARCHAR2);
```

### Parameters

**Table 17–5** *DROP\_REWRITE\_EQUIVALENCE Procedure Parameters*

Parameter	Description
name	A name for the equivalence declaration to drop. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.

## VALIDATE\_REWRITE\_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the `VALIDATE` parameter in "[VALIDATE\\_REWRITE\\_EQUIVALENCE Procedure](#)" on page 17-10.

### Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (  
    name          VARCHAR2);
```

### Parameters

**Table 17–6** *VALIDATE\_REWRITE\_EQUIVALENCE Procedure Parameters*

Parameter	Description
name	A name for the equivalence declaration to validate. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the <code>source_stmt</code> and <code>destination_stmt</code> of the specified equivalence declaration.

---

---

## DBMS\_ADVISOR

DBMS\_ADVISOR is part of the server manageability suite of advisors, a set of expert systems that identifies and helps resolve performance problems relating to database server components.

Some advisors have their own packages. For these advisors, Oracle recommends that you use the advisor-specific package rather than DBMS\_ADVISOR. Each of the following advisors has its own package, tailored to its specific functionality:

- Automatic Database Diagnostic Monitor (DBMS\_ADDM)
- SQL Performance Analyzer (DBMS\_SQLPA)
- SQL Repair Advisor (DBMS\_SQLDIAG)
- SQL Tuning Advisor (DBMS\_SQLTUNE)
- Compression Advisor (DBMS\_COMPRESSION.GET\_COMPRESSION\_RATIO)

SQL Access Advisor and Segment Advisor are the only advisors with common use cases for DBMS\_ADVISOR. Undo Advisor and Compression Advisor do not support DBMS\_ADVISOR subprograms.

### See Also:

- *Oracle Database Performance Tuning Guide* for information regarding SQL Tuning Advisor and SQL Access Advisor
- *Oracle Database 2 Day DBA* and *Oracle Database Administrator's Guide* to learn about Undo Advisor

This chapter contains the following topics:

- [Using DBMS\\_ADVISOR](#)
  - Deprecated Subprograms
  - Security Model
- [Summary of DBMS\\_ADVISOR Subprograms](#)

---

## Using DBMS\_ADVISOR

This section contains topics which relate to using the DBMS\_ADVISOR package.

- [Deprecated Subprograms](#)
- [Security Model](#)

## Deprecated Subprograms

---

---

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

---

The following subprograms are deprecated with Oracle Database 11g:

- [ADD\\_SQLWKLD\\_REF Procedure](#)
- [CREATE\\_SQLWKLD Procedure](#)
- [DELETE\\_SQLWKLD Procedure](#)
- [DELETE\\_SQLWKLD\\_REF Procedure](#)
- [DELETE\\_SQLWKLD\\_STATEMENT Procedures](#)
- [IMPORT\\_SQLWKLD\\_SCHEMA Procedure](#)
- [IMPORT\\_SQLWKLD\\_SQLCACHE Procedure](#)
- [IMPORT\\_SQLWKLD\\_STS Procedure](#)
- [IMPORT\\_SQLWKLD\\_SUMADV Procedure](#)
- [IMPORT\\_SQLWKLD\\_USER Procedure](#)
- [RESET\\_SQLWKLD Procedure](#)
- [SET\\_SQLWKLD\\_PARAMETER Procedures](#)
- [UPDATE\\_SQLWKLD\\_ATTRIBUTES Procedure](#)
- [UPDATE\\_SQLWKLD\\_STATEMENT Procedure](#)

## Security Model

The `ADVISOR` privilege is required to use this package.

## Summary of DBMS\_ADVISOR Subprograms

Table 18–1 summarizes the subprograms in this package. The `Used in` column lists advisors relevant for each subprogram, but excludes ADDM, SQL Performance Analyzer, SQL Repair Advisor, and SQL Tuning Advisor because these advisors have their own packages.

**Table 18–1 DBMS\_ADVISOR Package Subprograms**

Subprogram	Description	Used in
<a href="#">ADD_SQLWKLD_REF Procedure</a> on page 18-8	Adds a workload reference to an Advisor task (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">ADD_SQLWKLD_STATEMENT Procedure</a> on page 18-9	Adds a single statement to a workload	SQL Access Advisor
<a href="#">ADD_STS_REF Procedure</a> on page 18-11	Establishes a link between the current SQL Access Advisor task and a SQL tuning set	SQL Access Advisor
<a href="#">CANCEL_TASK Procedure</a> on page 18-12	Cancels a currently executing task operation	Segment Advisor, SQL Access Advisor
<a href="#">COPY_SQLWKLD_TO_STS Procedure</a> on page 18-13	Copies the contents of a SQL workload object to a SQL tuning set	SQL Access Advisor
<a href="#">CREATE_FILE Procedure</a> on page 18-14	Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports	SQL Access Advisor
<a href="#">CREATE_OBJECT Procedure</a> on page 18-15	Creates a new task object	Segment Advisor
<a href="#">CREATE_SQLWKLD Procedure</a> on page 18-17	Creates a new workload object (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">CREATE_TASK Procedures</a> on page 18-18	Creates a new Advisor task in the repository	Segment Advisor, SQL Access Advisor
<a href="#">DELETE_SQLWKLD Procedure</a> on page 18-20	Deletes an entire workload object (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">DELETE_SQLWKLD_REF Procedure</a> on page 18-21	Deletes an entire workload object (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">DELETE_SQLWKLD_STATEMENT Procedures</a> on page 18-22	Deletes one or more statements from a workload (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">DELETE_STS_REF Procedure</a> on page 18-23	Removes a link between the current SQL Access Advisor task and a SQL tuning set object	SQL Access Advisor
<a href="#">DELETE_TASK Procedure</a> on page 18-24	Deletes the specified task from the repository	SQL Access Advisor
<a href="#">EXECUTE_TASK Procedure</a> on page 18-25	Executes the specified task	Segment Advisor, SQL Access Advisor
<a href="#">GET_REC_ATTRIBUTES Procedure</a> on page 18-27	Retrieves specific recommendation attributes from a task	SQL Access Advisor

**Table 18–1 (Cont.) DBMS\_ADVISOR Package Subprograms**

<b>Subprogram</b>	<b>Description</b>	<b>Used in</b>
<a href="#">GET_TASK_REPORT Function</a> on page 18-28	Creates and returns a report for the specified task	
<a href="#">GET_TASK_SCRIPT Function</a> on page 18-29	Creates and returns an executable SQL script of the Advisor task's recommendations in a buffer	SQL Access Advisor
<a href="#">IMPLEMENT_TASK Procedure</a> on page 18-31	Implements the recommendations for a task	SQL Access Advisor
<a href="#">IMPORT_SQLWKLD_SCHEMA Procedure</a> on page 18-32	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">IMPORT_SQLWKLD_SQLCACHE Procedure</a> on page 18-34	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">IMPORT_SQLWKLD_STS Procedure</a> on page 18-36	Imports data from a SQL tuning set into a SQL workload data object (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">IMPORT_SQLWKLD_SUMADV Procedure</a> on page 18-38	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">IMPORT_SQLWKLD_USER Procedure</a> on page 18-40	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">INTERRUPT_TASK Procedure</a> on page 18-42	Stops a currently executing task, ending its operations as it would at a normal exit, so that the recommendations are visible	Segment Advisor, SQL Access Advisor
<a href="#">MARK_RECOMMENDATION Procedure</a> on page 18-43	Sets the <code>annotation_status</code> for a particular recommendation	Segment Advisor, SQL Access Advisor
<a href="#">QUICK_TUNE Procedure</a> on page 18-44	Performs an analysis on a single SQL statement	SQL Access Advisor
<a href="#">RESET_SQLWKLD Procedure</a> on page 18-45	Resets a workload to its initial starting point (Caution: Deprecated Subprogram)	SQL Access Advisor
<a href="#">RESET_TASK Procedure</a> on page 18-46	Resets a task to its initial state	Segment Advisor, SQL Access Advisor
<a href="#">SET_DEFAULT_SQLWKLD_PARAMETER Procedures</a> on page 18-47	Imports data into a workload from schema evidence	SQL Access Advisor
<a href="#">SET_DEFAULT_TASK_PARAMETER Procedures</a> on page 18-48	Modifies a default task parameter	Segment Advisor, SQL Access Advisor
<a href="#">SET_SQLWKLD_PARAMETER Procedures</a> on page 18-49	Sets the value of a workload parameter	SQL Access Advisor
<a href="#">SET_TASK_PARAMETER Procedure</a> on page 18-50	Sets the specified task parameter value	Segment Advisor, SQL Access Advisor
<a href="#">TUNE_MVIEW Procedure</a> on page 18-63	Shows how to decompose a materialized view into two or more materialized views or to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite	SQL Access Advisor

**Table 18-1 (Cont.) DBMS\_ADVISOR Package Subprograms**

<b>Subprogram</b>	<b>Description</b>	<b>Used in</b>
<a href="#">UPDATE_OBJECT Procedure</a> on page 18-65	Updates a task object	Segment Advisor
<a href="#">UPDATE_REC_ATTRIBUTES Procedure</a> on page 18-67	Updates an existing recommendation for the specified task	SQL Access Advisor
<a href="#">UPDATE_SQLWKLD_ATTRIBUTES Procedure</a> on page 18-69	Updates a workload object	SQL Access Advisor
<a href="#">UPDATE_SQLWKLD_STATEMENT Procedure</a> on page 18-70	Updates one or more SQL statements in a workload	SQL Access Advisor
<a href="#">UPDATE_TASK_ATTRIBUTES Procedure</a> on page 18-72	Updates a task's attributes	Segment Advisor, SQL Access Advisor

## ADD\_SQLWKLD\_REF Procedure

---

**Note:** This procedure is deprecated in Release 11gR1.

---

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use ADD\_STS\_REF instead of ADD\_SQLWKLD\_REF for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

### Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
    task_name          IN VARCHAR2,
    workload_name      IN VARCHAR2,
    is_sts             IN NUMBER :=0);
```

### Parameters

**Table 18–2 ADD\_SQLWKLD\_REF Procedure Parameters**

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure DELETE_REFERENCE.
is_sts	Indicates the type of workload source. Possible values are: <ul style="list-style-type: none"> <li>■ 0 - SQL workload object</li> <li>■ 1 - SQL tuning set</li> </ul>

### Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
END;
```

## ADD\_SQLWKLD\_STATEMENT Procedure

---

---

**Note:** This procedure is deprecated in Release 11gR1.

---

---

This procedure adds a single statement to the specified workload.

### Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  module             IN VARCHAR2,
  action             IN VARCHAR2,
  cpu_time           IN NUMBER := 0,
  elapsed_time       IN NUMBER := 0,
  disk_reads         IN NUMBER := 0,
  buffer_gets        IN NUMBER := 0,
  rows_processed     IN NUMBER := 0,
  optimizer_cost     IN NUMBER := 0,
  executions         IN NUMBER := 1,
  priority           IN NUMBER := 2,
  last_execution_date IN DATE := 'SYSDATE',
  stat_period        IN NUMBER := 0,
  username           IN VARCHAR2,
  sql_text           IN CLOB);
```

### Parameters

**Table 18-3 ADD\_SQLWKLD\_STATEMENT Procedure Parameters**

Parameter	Description
workload_name	The workload name that uniquely identifies an existing workload.
module	An optional business application module that will be associated with the SQL statement.
action	An optional application action that will be associated with the SQL statement.
cpu_time	The total CPU time in seconds that is consumed by the SQL statement.
elapsed_time	The total elapsed time in seconds that is consumed by the SQL statement.
disk_reads	The total disk-read operations that are consumed by the SQL statement.
buffer_gets	The total buffer-get operations that are consumed by the SQL statement.
rows_processed	The average number of rows processed by the SQL statement.
optimizer_cost	The optimizer's calculated cost value.
executions	The total execution count by the SQL statement. This value should be greater than zero.
priority	The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
last_execution_date	The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.

**Table 18–3 (Cont.) ADD\_SQLWKLD\_STATEMENT Procedure Parameters**

Parameter	Description
stat_period	Time interval in seconds from which statement statistics were calculated.
username	The Oracle user name that executed the SQL statement. Because a username is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
sql_text	The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.

## Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) on page 18-46 for directions on setting a task to its initial state.

The ADD\_SQLWKLD\_STATEMENT procedure accepts several parameters that may be ignored by the caller. `cpu_time`, `elapsed_time`, `disk_reads`, `buffer_gets`, and `optimizer_cost` are only used to sort workload data when actual analysis occurs, so actual values are only necessary when the `order_list` task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter `order_list`. The `order_list` parameter accepts any combination of the keys: `buffer_gets`, `optimizer_cost`, `cpu_time`, `disk_reads`, `elapsed_time`, `executions`, and `priority`. A typical setting of `priority`, `optimizer_cost` would indicate the SQL Access Advisor will sort the workload data by `priority` and `optimizer_cost` and process the highest cost statements first. Any statements added to the workload would need to include appropriate `priority` and `optimizer_cost` values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the `order_list` task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

## Examples

```

DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales');
END;
/

```

## ADD\_STS\_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL tuning set. The link enables an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL tuning set is made, the STS is protected from removal or modification.

Use ADD\_STS\_REF for any STS-based advisor runs. The older method of using ADD\_SQLWKLD\_REF with parameter IS\_STS=1 is only supported for backward compatibility. Furthermore, the ADD\_STS\_REF function accepts a SQL tuning set owner name, whereas ADD\_SQLWKLD\_REF does not.

### Syntax

```
DBMS_ADVISOR.ADD_STS_REF (
    task_name      IN VARCHAR2 NOT NULL,
    sts_owner      IN VARCHAR2,
    workload_name  IN VARCHAR2 NOT NULL);
```

### Parameters

**Table 18–4 ADD\_STS\_REF Procedure Parameters**

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.
workload_name	The name of the workload to be linked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set.  After a workload has been linked to a task, it becomes read-only and cannot be deleted.  There is no limit to the number of links to workloads.  To remove the link to the workload, use the procedure DBMS_ADVISOR.DELETE_STS_REF.

### Examples

```
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My Workload');
```

## CANCEL\_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as `Ctrl-C`. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

### Syntax

```
DBMS_ADVISOR.CANCEL_TASK (  
    task_name      IN  VARCHAR2);
```

### Parameters

**Table 18–5** CANCEL\_TASK Procedure Parameter

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.

### Usage Notes

A cancel command restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

### Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
    workload_name := 'My Workload';  
  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
    DBMS_ADVISOR.CANCEL_TASK('My Task');  
END;  
/
```

## COPY\_SQLWKLD\_TO\_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL tuning set.

### Syntax

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

```
DBMS_ADVISOR.COPY_SQLWKLD_TO_STS (
  workload_name      IN VARCHAR2,
  sts_name           IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW');
```

### Parameters

**Table 18–6 COPY\_SQLWKLD\_TO\_STS Procedure Parameter**

Parameter	Description
workload_name	The SQL Workload object name to copy.
sts_name	The SQL tuning set name into which the SQL Workload object will be copied.
import_mode	Specifies the handling of the target SQL tuning set. Possible values are: <ul style="list-style-type: none"> <li>▪ APPEND Causes SQL Workload data to be appended to the target SQL tuning set.</li> <li>▪ NEW Indicates the SQL tuning set can only contain the copied contents. If the SQL tuning set exists and has data, an error will be reported.</li> <li>▪ REPLACE Causes any existing data in the target SQL tuning set to be purged prior to the workload copy.</li> </ul> In all cases, if the specified SQL tuning set does not exist, it will be created.

### Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

### Examples

```
BEGIN
  DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/
```

## CREATE\_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE\_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

### Syntax

```
DBMS_ADVISOR.CREATE_FILE (
    buffer      IN  CLOB,
    location    IN  VARCHAR2,
    filename    IN  VARCHAR2);
```

### Parameters

**Table 18–7 CREATE\_FILE Procedure Parameters**

Parameter	Description
buffer	A CLOB buffer containing report or script information.
location	Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.
filename	Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form filename.filetype.

### Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

### Examples

```
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                        100,400,5041,103,640445,680000,2,
                                        1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                        FROM sh.sales');

    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),
        'MY_DIR','script.sql');

END;
/
```

## CREATE\_OBJECT Procedure

This procedure creates a new task object.

### Syntax

```
DBMS_ADVISOR.CREATE_OBJECT (
  task_name          IN VARCHAR2,
  object_type        IN VARCHAR2,
  attr1              IN VARCHAR2 := NULL,
  attr2              IN VARCHAR2 := NULL,
  attr3              IN VARCHAR2 := NULL,
  attr4              IN CLOB      := NULL,
  object_id          OUT NUMBER);
```

```
DBMS_ADVISOR.CREATE_OBJECT (
  task_name          IN VARCHAR2,
  object_type        IN VARCHAR2,
  attr1              IN VARCHAR2 := NULL,
  attr2              IN VARCHAR2 := NULL,
  attr3              IN VARCHAR2 := NULL,
  attr4              IN CLOB      := NULL,
  attr5              IN VARCHAR2 := NULL,
  object_id          OUT NUMBER);
```

### Parameters

**Table 18–8 CREATE\_OBJECT Procedure Parameters**

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.
object_type	Specifies the external object type.
attr1	Advisor-specific data.
attr2	Advisor-specific data.
attr3	Advisor-specific data.
attr4	Advisor-specific data.
attr5	Advisor-specific data.
object_id	The advisor-assigned object identifier.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

### Return Values

Returns the new object identifier.

### Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or

LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

## Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL,
                              'SELECT * FROM SH.SALES', obj_id);

END;
/
```

## CREATE\_SQLWKLD Procedure

---

**Note:** This procedure is deprecated in Release 11gR1.

---

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

### Syntax

```
DBMS_ADVISOR.CREATE_SQLWKLD (
    workload_name      IN OUT VARCHAR2,
    description        IN VARCHAR2 := NULL,
    template           IN VARCHAR2 := NULL,
    is_template        IN VARCHAR2 := 'FALSE');
```

### Parameters

**Table 18–9 CREATE\_SQLWKLD Procedure Parameters**

Parameter	Description
workload_name	A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.
description	Specifies an optional workload description. Descriptions can be up to 256 characters.
template	An optional SQL Workload name of an existing workload data object or data object template.
is_template	An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.

### Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

### Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

After a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD\_SQLWKLD\_REF procedure.

### Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/
```

## CREATE\_TASK Procedures

This procedure creates a new Advisor task in the repository.

### Syntax

```
DBMS_ADVISOR.CREATE_TASK (
  advisor_name      IN VARCHAR2,
  task_id           OUT NUMBER,
  task_name         IN OUT VARCHAR2,
  task_desc         IN VARCHAR2 := NULL,
  template          IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := 'FALSE',
  how_created       IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.CREATE_TASK (
  advisor_name      IN VARCHAR2,
  task_name         IN VARCHAR2,
  task_desc         IN VARCHAR2 := NULL,
  template          IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := 'FALSE',
  how_created       IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.CREATE_TASK (
  parent_task_name  IN VARCHAR2,
  rec_id            IN NUMBER,
  task_id           OUT NUMBER,
  task_name         IN OUT VARCHAR2,
  task_desc         IN VARCHAR2,
  template          IN VARCHAR2);
```

### Parameters

**Table 18–10 CREATE\_TASK Procedure Parameters**

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
task_id	A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.
task_name	Specifies a new task name. Names must be unique among all tasks for the user.  When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.
task_desc	Specifies an optional task description. Descriptions can be up to 256 characters in length.
template	An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.
is_template	An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.
how_created	An optional value that identifies how the source was created.

### Return Values

Returns a unique task ID number and a unique task name if one is not specified.

## Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier `DBMS_ADVISOR.SQLACCESS_ADVISOR` as the `advisor_name`.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- `DBMS_ADVISOR.SQLACCESS_OLTP`  
Parameters are preset to favor an OLTP application environment.
- `DBMS_ADVISOR.SQLACCESS_WAREHOUSE`  
Parameters are preset to favor a data warehouse application environment.
- `DBMS_ADVISOR.SQLACCESS_GENERAL`  
Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

## Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```

## DELETE\_SQLWKLD Procedure

---

---

**Note:** This procedure is deprecated in Release 11gR1.

---

---

This procedure deletes an existing SQL Workload object from the repository.

### Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (
    workload_name          IN VARCHAR2);
```

### Parameters

**Table 18–11** *DELETE\_SQLWKLD Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the [RESET\\_TASK Procedure](#) on page 18-46 to set a task to its initial state.

### Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

## DELETE\_SQLWKLD\_REF Procedure

---

**Note:** This procedure is deprecated in Release 11gR1.

---

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

Users should use DELETE\_STS\_REF instead of DELETE\_SQLWKLD\_REF for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

### Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
  task_name          IN VARCHAR2,
  workload_name      IN VARCHAR2,
  is_sts             IN NUMBER :=0);
```

### Parameters

**Table 18–12** *DELETE\_SQLWKLD\_REF Procedure Parameters*

Parameter	Description
task_name	The SQL Access task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name.
is_sts	Indicates the type of workload source. Possible values are: <ul style="list-style-type: none"> <li>■ 0 - SQL workload object</li> <li>■ 1 - SQL tuning set</li> </ul>

### Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```

## DELETE\_SQLWKLD\_STATEMENT Procedures

This procedure has been deprecated.

This procedure deletes one or more statements from a workload.

### Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
    workload_name    IN VARCHAR2,
    sql_id           IN NUMBER);
```

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
    workload_name    IN VARCHAR2,
    search           IN VARCHAR2,
    deleted          OUT NUMBER);
```

### Parameters

**Table 18–13** *DELETE\_SQLWKLD\_STATEMENT Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant <code>ADVISOR_ALL</code> .
search	Disabled.
deleted	Returns the number of statements deleted by the searched deleted operation.

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the [RESET\\_TASK Procedure](#) on page 18-46 to set a task to its initial state.

### Examples

```
DECLARE
    workload_name VARCHAR2(30);
    deleted NUMBER;
    id NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                       100,400,5041,103,640445,680000,2,
                                       1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                       FROM sh.sales');

    SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
    WHERE workload_name = 'My Workload';

    DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

## DELETE\_STS\_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL tuning set.

Use DELETE\_STS\_REF for any STS-based advisor runs. The older method of using DELETE\_SQLWKLD\_REF with parameter IS\_STS=1 is only supported for backward compatibility. Furthermore, the DELETE\_STS\_REF function accepts an STS owner name, whereas DELETE\_SQLWKLD\_REF does not.

### Syntax

```
DBMS_ADVISOR.DELETE_STS_REF (
    task_name      IN VARCHAR2 NOT NULL,
    sts_owner      IN VARCHAR2,
    workload_name  IN VARCHAR2 NOT NULL);
```

### Parameters

**Table 18–14** DELETE\_STS\_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.
workload_name	The name of the workload to be unlinked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set.  The wildcard % is supported as a workload name. The rules of use are identical to the SQL LIKE operator. For example, to remove all links to SQL tuning set objects, use the wildcard % as the STS_NAME.

### Examples

```
DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My workload');
```

## DELETE\_TASK Procedure

This procedure deletes an existing task from the repository.

### Syntax

```
DBMS_ADVISOR.DELETE_TASK (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 18–15** *DELETE\_TASK Procedure Parameters*

Parameter	Description
task_name	A single Advisor task name that will be deleted from the repository.  The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME.  If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.

### Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
    DBMS_ADVISOR.DELETE_TASK(task_name);  
END;  
/
```

## EXECUTE\_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

### Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (
    task_name          IN VARCHAR2);

DBMS_ADVISOR.EXECUTE_TASK (
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2          := NULL,
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL,
    RETURN VARCHAR2;
```

### Parameters

**Table 18–16 EXECUTE\_TASK Procedure Parameters**

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
execution_type	The type of action to be performed by the function. If NULL, it will default to the value of the <code>DEFAULT_EXECUTION_TYPE</code> parameter.  As an example, the SQL Performance Analyzer accepts the following possible values: <ul style="list-style-type: none"> <li>EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an <code>EXPLAIN PLAN</code> command. The resulting plans will be stored in the advisor framework in association with the task.</li> <li>TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework.</li> <li>ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan.</li> </ul>
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function.
execution_params	A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for.  As an example, consider the following: <code>DBMS_ADVISOR.ARGLIST('time_limit', 12, 'username', 'foo')</code>
execution_desc	A 256-length string describing the execution.

## Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA\_ADVISOR\_LOG table for the execution status.

## Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKL_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

## GET\_REC\_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

### Syntax

```
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
  workload_name      IN VARCHAR2,
  rec_id             IN NUMBER,
  action_id          IN NUMBER,
  attribute_name     IN VARCHAR2,
  value              OUT VARCHAR2,
  owner_name         IN VARCHAR2 := NULL);
```

### Parameters

**Table 18–17** *GET\_REC\_ATTRIBUTES Procedure Parameters*

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Specifies the attribute to change.
value	The buffer to receive the requested attribute value.
owner_name	Optional owner name of the target task. This permits access to task data not owned by the current user.

### Return Values

The requested attribute value is returned in the VALUE argument.

### Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/
```

## GET\_TASK\_REPORT Function

This function creates and returns a report for the specified task.

### Syntax

```
DBMS_ADVISOR.GET_TASK_REPORT (  
    task_name      IN VARCHAR2,  
    type           IN VARCHAR2 := 'TEXT',  
    level          IN VARCHAR2 := 'TYPICAL',  
    section        IN VARCHAR2 := 'ALL',  
    owner_name     IN VARCHAR2 := NULL,  
    execution_name IN VARCHAR2 := NULL,  
    object_id      IN NUMBER   := NULL)  
RETURN CLOB;
```

### Parameters

**Table 18–18** GET\_TASK\_REPORT Function Parameters

Parameter	Description
task_name	The name of the task from which the script will be created.
type	The only valid value is TEXT.
level	The possible values are BASIC, TYPICAL, and ALL.
section	Advisor-specific report sections.
owner_name	Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

### Return Values

Returns the buffer receiving the script.

## GET\_TASK\_SCRIPT Function

This function creates a SQL\*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

### Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (
  task_name          IN VARCHAR2
  type               IN VARCHAR2 := 'IMPLEMENTATION',
  rec_id             IN NUMBER   := NULL,
  act_id             IN NUMBER   := NULL,
  owner_name         IN VARCHAR2 := NULL,
  execution_name     IN VARCHAR2 := NULL,
  object_id          IN NUMBER   := NULL)
RETURN CLOB;
```

### Parameters

**Table 18–19** GET\_TASK\_SCRIPT Function Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
type	Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.
rec_id	An optional recommendation identifier number that can be used to extract a subset of the implementation script.  A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.
act_id	Optional action identifier number that can be used to extract a single action as a DDL command.  A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.
owner_name	An optional task owner name.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

### Return Values

Returns the script as a CLOB buffer.

### Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

### Examples

```
DECLARE
  task_id NUMBER;
```

```
task_name VARCHAR2(30);
workload_name VARCHAR2(30);
buf CLOB;
BEGIN
task_name := 'My Task';
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
100,400,5041,103,640445,680000,2,
1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales');
DBMS_ADVISOR.EXECUTE_TASK(task_name);
buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

## IMPLEMENT\_TASK Procedure

This procedure implements the recommendations of the specified task.

### Syntax

```
DBMS_ADVISOR.IMPLEMENT_TASK (  
  task_name          IN VARCHAR2,  
  rec_id             IN NUMBER := NULL,  
  exit_on_error      IN BOOLEAN := NULL);
```

### Parameters

**Table 18–20** *IMPLEMENT\_TASK Procedure Parameters*

Parameter	Description
task_name	The name of the task.
rec_id	An optional recommendation ID.
exit_on_error	An optional boolean to exit on the first error.

## IMPORT\_SQLWKLD\_SCHEMA Procedure

---

---

**Note:** This procedure is deprecated in Release 11gR1.

---

---

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

### Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

### Parameters

**Table 18–21** *IMPORT\_SQLWKLD\_SCHEMA Procedure Parameters*

Parameter	Description
<code>workload_name</code>	The workload object name that uniquely identifies an existing workload.
<code>import_mode</code>	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> <li>▪ <code>APPEND</code> Indicates that the collected workload will be added to any existing workload in the task.</li> <li>▪ <code>NEW</code> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li> <li>▪ <code>REPLACE</code> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li> </ul> The default value is <code>NEW</code> .
<code>priority</code>	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
<code>failed_rows</code>	Returns the number of rows that were not saved due to syntax or validation errors.
<code>saved_rows</code>	Returns the number of rows actually saved in the repository.

### Return Values

This call returns the number of rows saved and failed as output parameters.

### Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the `VALID_TABLE_LIST` parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

## Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKL(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKL_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKL_SCHEMA(workload_name, 'REPLACE', 1, saved,
    failed);
END;
/
```

## IMPORT\_SQLWKLD\_SQLCACHE Procedure

---

**Note:** This procedure is deprecated in Release 11gR1.

---

This procedure creates a SQL workload from the current contents of the server's SQL cache.

### Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

### Parameters

**Table 18–22** *IMPORT\_SQLWKLD\_SQLCACHE Procedure Parameters*

Parameter	Description
<code>workload_name</code>	The workload object name that uniquely identifies an existing workload.
<code>import_mode</code>	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> <li>▪ <code>APPEND</code> Indicates that the collected workload will be added to any existing workload in the task.</li> <li>▪ <code>NEW</code> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li> <li>▪ <code>REPLACE</code> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li> </ul> The default value is <code>NEW</code> .
<code>priority</code>	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.
<code>saved_rows</code>	Returns the number of rows saved as output parameters.
<code>failed_rows</code>	Returns the number of rows that were not saved due to syntax or validation errors.

### Return Values

This call returns the number of rows saved and failed as output parameters.

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) on page 18-46 to set a task to its initial state.

### Examples

```
DECLARE
```

```
workload_name VARCHAR2(30);
saved NUMBER;
failed NUMBER;
BEGIN
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_SQLWKL(workload_name, 'My Workload');
DBMS_ADVISOR.SET_SQLWKL_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
DBMS_ADVISOR.IMPORT_SQLWKL_SQLCACHE(workload_name, 'REPLACE', 1, saved,
failed);
END;
/
```

## IMPORT\_SQLWKLD\_STS Procedure

---

**Note:** This procedure is deprecated in Release 11gR1.

---

This procedure loads a SQL workload from an existing SQL tuning set. A SQL tuning set is typically created from the server workload repository using various time and data filters.

### Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
  workload_name      IN VARCHAR2,
  sts_name           IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
  workload_name      IN VARCHAR2,
  sts_owner          IN VARCHAR2,
  sts_name           IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

### Parameters

**Table 18–23** *IMPORT\_SQLWKLD\_STS Procedure Parameters*

Parameter	Description
<code>workload_name</code>	The workload object name that uniquely identifies an existing workload.
<code>sts_owner</code>	The optional owner of the SQL tuning set.
<code>sts_name</code>	The name of an existing SQL tuning set workload from which the data will be imported. If the <code>sts_owner</code> value is not provided, the owner will default to the current user.
<code>import_mode</code>	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> <li>▪ <code>APPEND</code> Indicates that the collected workload will be added to any existing workload in the task.</li> <li>▪ <code>NEW</code> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li> <li>▪ <code>REPLACE</code> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li> </ul> <p>The default value is <code>NEW</code>.</p>
<code>priority</code>	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.
<code>saved_rows</code>	Returns the number of rows actually saved in the repository.

**Table 18–23 (Cont.) IMPORT\_SQLWKLD\_STS Procedure Parameters**

Parameter	Description
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

## Return Values

This call returns the number of rows saved and failed as output parameters.

## Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) on page 18-46 to set a task to its initial state.

## Examples

```

DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
    saved, failed);
END;
/

```

## IMPORT\_SQLWKLD\_SUMADV Procedure

---

**Note:** This procedure is deprecated in Release 11gR1.

---

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist Oracle9i Database Summary Advisor users in the migration to SQL Access Advisor.

### Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  sumadv_id          IN NUMBER,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

### Parameters

**Table 18–24** *IMPORT\_SQLWKLD\_SUMADV Procedure Parameters*

Parameter	Description
<code>workload_name</code>	The workload object name that uniquely identifies an existing workload.
<code>import_mode</code>	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> <li>▪ <code>APPEND</code> Indicates that the collected workload will be added to any existing workload in the task.</li> <li>▪ <code>NEW</code> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li> <li>▪ <code>REPLACE</code> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li> </ul> The default value is <code>NEW</code> .
<code>priority</code>	Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
<code>sumadv_id</code>	Specifies the Summary Advisor workload identifier number.
<code>saved_rows</code>	Returns the number of rows actually saved in the repository.
<code>failed_rows</code>	Returns the number of rows that were not saved due to syntax or validation errors.

### Return Values

This call returns the number of rows saved and failed as output parameters.

## Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) on page 18-46 to set a task to its initial state.

## Examples

```
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
    sumadv_id NUMBER;
BEGIN
    workload_name := 'My Workload';
    sumadv_id := 394;

    DBMS_ADVISOR.CREATE_SQLWKL(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKL_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKL_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
        saved, failed);
END;
/
```

## IMPORT\_SQLWKLD\_USER Procedure

---

---

**Note:** This procedure is deprecated in Release 11gR1.

---

---

This procedure collects a SQL workload from a specified user table.

### Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  owner_name         IN VARCHAR2,
  table_name         IN VARCHAR2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

### Parameters

**Table 18–25** *IMPORT\_SQLWKLD\_USER Procedure Parameters*

Parameter	Description
<code>workload_name</code>	The workload object name that uniquely identifies an existing workload.
<code>import_mode</code>	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> <li>▪ <code>APPEND</code> Indicates that the collected workload will be added to any existing workload in the task.</li> <li>▪ <code>NEW</code> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li> <li>▪ <code>REPLACE</code> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li> </ul> The default value is <code>NEW</code> .
<code>owner_name</code>	Specifies the owner name of the table or view from which workload data will be collected.
<code>table_name</code>	Specifies the name of the table or view from which workload data will be collected.
<code>saved_rows</code>	Returns the number of rows actually saved in the workload object.
<code>failed_rows</code>	Returns the number of rows that were not saved due to syntax or validation errors.

### Return Values

This call returns the number of rows saved and failed as output parameters.

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) on page 18-46 to set a task to its initial state.

## Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKL(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKL_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKL_USER(workload_name, 'REPLACE', 'SH',
    'USER_WORKLOAD', saved, failed);
END;
/
```

## INTERRUPT\_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

### Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 18–26** *INTERRUPT\_TASK Procedure Parameters*

Parameter	Description
task_name	A single Advisor task name that will be interrupted.

### Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
    DBMS_ADVISOR.EXECUTE_TASK(task_name);  
END;  
/
```

While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN  
    DBMS_ADVISOR.INTERRUPT_TASK('My Task');  
END;  
/
```

## MARK\_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

### Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (
  task_name      IN VARCHAR2
  id             IN NUMBER,
  action        IN VARCHAR2);
```

### Parameters

**Table 18–27** *MARK\_RECOMMENDATION Procedure Parameters*

Parameter	Description
task_name	Name of the task.
id	The recommendation identifier number assigned by the Advisor.
action	The recommendation action setting. The possible actions are: <ul style="list-style-type: none"> <li>▪ ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts.</li> <li>▪ IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script.</li> <li>▪ REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.</li> </ul>

### Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

### Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
  rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  rec_id := 1;
  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
```

## QUICK\_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

### Syntax

```
DBMS_ADVISOR.QUICK_TUNE (
    advisor_name      IN VARCHAR2,
    task_name         IN VARCHAR2,
    attr1             IN CLOB,
    attr2             IN VARCHAR2 := NULL,
    attr3             IN NUMBER := NULL,
    task_or_template  IN VARCHAR2 := NULL);
```

### Parameters

**Table 18–28 QUICK\_TUNE Procedure Parameters**

Parameter	Description
advisor_name	Name of the Advisor that will perform the analysis.
task_name	Name of the task.
attr1	Advisor-specific attribute in the form of a CLOB variable.
attr2	Advisor-specific attribute in the form of a VARCHAR2 variable.
attr3	Advisor-specific attribute in the form of a NUMBER.
task_or_template	An optional task name of an existing task or task template.

### Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of `SQLACCESS_GENERAL`. The workload will only contain the specified statement, and all task parameters will be defaulted.

`attr1` must be the single SQL statement to tune. For the SQL Access Advisor, `attr2` is the user who would execute the single statement. If omitted, the current user will be used.

### Examples

```
DECLARE
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
        'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/
```

## RESET\_SQLWKLD Procedure

---

---

**Note:** This procedure is deprecated in Release 11gR1.

---

---

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

### Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (
    workload_name          IN VARCHAR2);
```

### Parameters

**Table 18–29** *RESET\_SQLWKLD Procedure Parameters*

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.

### Usage Notes

RESET\_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

### Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                        100,400,5041,103,640445,680000,2,
                                        1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                        FROM sh.sales WHERE promo_id = 10');

    DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```

## RESET\_TASK Procedure

This procedure resets a task to its initial state. All intermediate and recommendation data will be removed from the task. The task status will be set to `INITIAL`.

### Syntax

```
DBMS_ADVISOR.RESET_TASK (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 18–30** *RESET\_TASK Procedure Parameters*

Parameter	Description
task_name	The task name that uniquely identifies an existing task.

### Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
    workload_name := 'My Workload';  
  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);  
    DBMS_ADVISOR.EXECUTE_TASK(task_name);  
    DBMS_ADVISOR.RESET_TASK(task_name);  
END;  
/
```

## SET\_DEFAULT\_SQLWKLD\_PARAMETER Procedures

---

**Note:** This procedure is deprecated in Release 11gR1.

---

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

### Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
  parameter          IN VARCHAR2,
  value              IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
  parameter          IN VARCHAR2,
  value              IN NUMBER);
```

### Parameters

**Table 18–31** SET\_DEFAULT\_SQLWKLD\_PARAMETER Procedure Parameters

Parameter	Description
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

### Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

### Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST', 'SH.%');
END;
/
```

## SET\_DEFAULT\_TASK\_PARAMETER Procedures

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET\_TASK\_PARAMETER sets the local value only. Thus, SET\_DEFAULT\_TASK\_PARAMETER has no effect on an existing task.

### Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
    advisor_name      IN VARCHAR2
    parameter         IN VARCHAR2,
    value             IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
    advisor_name      IN VARCHAR2
    parameter         IN VARCHAR2,
    value             IN NUMBER);
```

### Parameters

**Table 18–32** SET\_DEFAULT\_TASK\_PARAMETER Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number.

### Examples

```
BEGIN
    DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
        'VALID_TABLE_LIST', 'SH.%');
END;
/
```

## SET\_SQLWKLD\_PARAMETER Procedures

---

---

**Note:** This procedure is deprecated in Release 11gR1.

---

---

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

### Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
  workload_name      IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
  workload_name      IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN NUMBER);
```

### Parameters

**Table 18–33** SET\_SQLWKLD\_PARAMETER Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

### Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

### Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
END;
/
```

## SET\_TASK\_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

### Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
  task_name          IN VARCHAR2
  parameter          IN VARCHAR2,
  value              IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
  task_name          IN VARCHAR2
  parameter          IN VARCHAR2,
  value              IN NUMBER);
```

### Parameters

**Table 18–34** SET\_TASK\_PARAMETER Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number. If the value is <code>DEFAULT</code> , the value will be reset to the default value.

### Usage Notes

A task cannot be modified unless it is in its initial state. See [RESET\\_TASK Procedure](#) on page 18-46 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

### SQL Access Advisor Task Parameters

[Table 18–35](#) lists SQL Access Advisor task parameters.

**Table 18–35 SQL Access Advisor Task Parameters**

Parameter	Description
ANALYSIS_SCOP E	<p>A comma-separated list that specifies the tuning artifacts to consider during analysis.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ ALL Short name for specifying INDEX, MVIEW, TABLE, and PARTITION.</li> <li>▪ EVALUATION Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone.</li> <li>▪ INDEX Allows the SQL Access Advisor to recommend index structure changes.</li> <li>▪ MVIEW Allows the SQL Access Advisor to recommend materialized view and log changes.</li> <li>▪ PARTITION Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the INDEX, MVIEW, and TABLE options.</li> <li>▪ TABLE Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning.</li> </ul> <p>Using the new keywords, the following combinations are valid:</p> <ul style="list-style-type: none"> <li>▪ INDEX</li> <li>▪ MVIEW</li> <li>▪ INDEX, PARTITION</li> <li>▪ INDEX, MVIEW, PARTITION</li> <li>▪ INDEX, TABLE, PARTITION</li> <li>▪ MVIEW, PARTITION</li> <li>▪ MVIEW, TABLE, PARTITION</li> <li>▪ INDEX, MVIEW, TABLE, PARTITION</li> <li>▪ TABLE, PARTITION</li> <li>▪ EVALUATION</li> </ul> <p>The default value is INDEX. The datatype is STRINGLIST.</p>
CREATION_COST	<p>When set to <code>true</code> (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to <code>false</code>, the cost of creation is ignored. The datatype is STRING.</p>
DAYS_TO_EXPIR E	<p>Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation.</p> <p>Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. The datatype is NUMBER.</p> <p>Once the task expires, it becomes a candidate for removal by an automatic purge operation.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ an integer in the range of 0 to 2147483647</li> <li>▪ ADVISOR_UNLIMITED</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is 30.</p>
DEF_EM_TEMPLA TE	<p>Contains the default task or template name from which the Enterprise Manager SQL Access Advisor Wizard reads its initial values.</p> <p>The default value is SQLACCESS_EMTASK. The datatype is STRING.</p>
DEF_INDEX_OWNE R	<p>Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>▪ Existing schema name. Quoted identifiers are supported.</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is STRING.</p>

**Table 18–35 (Cont.) SQL Access Advisor Task Parameters**

Parameter	Description
DEF_INDEX_TABLESPACE	<p>Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>Existing tablespace name. Quoted identifiers are supported.</li> <li>ADVISOR_UNUSED No tablespace clause will be present in the script for indexes.</li> </ul> <p>The default value is <code>ADVISOR_UNUSED</code>. The datatype is <code>STRING</code>.</p>
DEF_MVIEW_OWNER	<p>Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>Existing schema name. Quoted identifiers are supported.</li> <li>ADVISOR_UNUSED</li> </ul> <p>The default value is <code>ADVISOR_UNUSED</code>. The datatype is <code>STRING</code>.</p>
DEF_MVIEW_TABLESPACE	<p>Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>Existing tablespace name. Quoted identifiers are supported.</li> <li>ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs.</li> </ul> <p>The default value is <code>ADVISOR_UNUSED</code>. The datatype is <code>STRING</code>.</p>
DEF_MVLOG_TABLESPACE	<p>Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>Existing tablespace name. Quoted identifiers are supported.</li> <li>ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs.</li> </ul> <p>The default value is <code>ADVISOR_UNUSED</code>. The datatype is <code>STRING</code>.</p>
DEF_PARTITION_TABLESPACE	<p>Specifies the default tablespace for new partitioning recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>Existing tablespace name. Quoted identifiers are supported.</li> <li>ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized views.</li> </ul> <p>The default value is <code>ADVISOR_UNUSED</code>. The datatype is <code>STRING</code>.</p>
DML_VOLATILITY	<p>When set to <code>TRUE</code>, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DMLs on a column, then it may favor a B-tree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The datatype is <code>STRING</code>.</p> <p>See the related parameter <code>refresh_mode</code>.</p>
END_TIME	<p>Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of <code>MM-DD-YYYY HH24:MI:SS</code>, where:</p> <ul style="list-style-type: none"> <li>DD is the numeric date</li> <li>MM is the numeric month</li> <li>YYYY is the numeric year</li> <li>HH is the hour in 24 hour format</li> <li>MI is the minute</li> <li>SS is the second</li> </ul> <p>The datatype is <code>STRING</code>.</p>

**Table 18–35 (Cont.) SQL Access Advisor Task Parameters**

Parameter	Description
EVALUATION_ON LY	<p>This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter.</p> <p>If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>▪ FALSE</li> <li>▪ TRUE</li> </ul> <p>The default value is FALSE. The datatype is STRING.</p>
EXECUTION_TYP E	<p>This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter.</p> <p>The translated values are:</p> <ul style="list-style-type: none"> <li>▪ FULL =&gt; FULL</li> <li>▪ INDEX_ONLY =&gt; INDEX</li> <li>▪ MVIEW_ONLY =&gt; MVIEW</li> <li>▪ MVIEW_LOG_ONLY =&gt; MVIEW_LOG_ONLY</li> </ul> <p>The type of recommendations that is desired. Possible values:</p> <ul style="list-style-type: none"> <li>▪ FULL All supported recommendation types will be considered.</li> <li>▪ INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations.</li> <li>▪ MVIEW_ONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations.</li> <li>▪ MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations.</li> </ul> <p>The default value is FULL. The datatype is STRINGLIST.</p>
IMPLEMENT_EXI T_ON_ERROR	<p>When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ TRUE</li> <li>▪ FALSE</li> </ul> <p>The default value is TRUE. The datatype is STRING.</p>
INDEX_NAME_TE MPLATE	<p>Specifies the method by which new index names are formed.</p> <p>If the TASK_ID is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the TASK_ID in the template. Once formatted, the maximum size of a name is 30 characters.</p> <p>Valid keywords are:</p> <ul style="list-style-type: none"> <li>▪ Any literal value up to 22 characters.</li> <li>▪ TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit.</li> <li>▪ TASK_ID Causes the current task identifier number to be inserted in hexadecimal form.</li> <li>▪ SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.</li> </ul> <p>The default template is &lt;TABLE&gt;_IDX\$\$_&lt;TASK_ID&gt;&lt;SEQ&gt;. The datatype is STRING.</p>
INVALID_ACTIO N_LIST	<p>Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ single action</li> <li>▪ comma-delimited action list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>

**Table 18–35 (Cont.) SQL Access Advisor Task Parameters**

Parameter	Description
INVALID_MODULE_LIST	<p>Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ single application</li> <li>▪ comma-delimited module list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
INVALID_SQLSTRING_LIST	<p>Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ single string</li> <li>▪ comma-delimited string list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
INVALID_USERNAME_LIST	<p>Contains a fully qualified list of usernames that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a task execution, if a SQL statement's username matches a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ single username</li> <li>▪ comma-delimited username list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
JOURNALING	<p>Controls the logging of messages to the journal (DBA_ADVISOR_JOURNAL and USER_ADVISOR_JOURNAL views). The higher the setting, the more information is logged to the journal.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>▪ UNUSED: no journal messages</li> <li>▪ FATAL: explanation of fatal conditions</li> <li>▪ ERROR: explanation of errors</li> <li>▪ WARNING: explanation of warnings</li> <li>▪ INFORMATION: information message</li> <li>▪ INFORMATION2: common information</li> <li>▪ INFORMATION3: common information</li> <li>▪ INFORMATION4: common information</li> <li>▪ INFORMATION5: common information</li> <li>▪ INFORMATION6: common information</li> </ul> <p>Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository.</p> <p>INFORMATION6 represents the most thorough message recording and UNUSED is the least.</p> <p>The default value is INFORMATION. The datatype is NUMBER.</p>

**Table 18–35 (Cont.) SQL Access Advisor Task Parameters**

Parameter	Description
LIMITED_PARTITION_SCHEMES	<p>User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>■ An integer in the range of 1 to 10</li> <li>■ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is NUMBER.</p>
MAX_NUMBER_PARTITIONS	<p>Limits the number of partitions the advisor will recommend for any base table, index, or materialized view.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>■ An integer in the range of 1 to 4294967295</li> <li>■ ADVISOR_UNLIMITED</li> <li>■ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.</p>
MODE	<p>Specifies the mode by which Access Advisor will operate during an analysis.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>■ LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality.</li> <li>■ COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality.</li> </ul> <p>The default value is COMPREHENSIVE. The datatype is STRING.</p>
MVIEW_NAME_TEMPLATE	<p>Specifies the method by which new materialized view names are formed.</p> <p>If the <i>TASK_ID</i> is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the <i>TASK_ID</i> in the template.</p> <p>The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters.</p> <p>Valid tokens are:</p> <ul style="list-style-type: none"> <li>■ Any literal value up to 22 characters.</li> <li>■ <i>TASK_ID</i> Causes the current task identifier number to be inserted in hexadecimal form.</li> <li>■ <i>SEQ</i> Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.</li> </ul> <p>The default template is: <code>MV\$\$_&lt;TASK_ID&gt;&lt;SEQ&gt;</code>. The datatype is STRING.</p>
ORDER_LIST	<p>This parameter has been deprecated.</p> <p>Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using <i>ORDER_LIST</i> values. A comma must separate multiple order keys.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>■ BUFFER_GETS Sets the order using the SQL statement's buffer-get count value.</li> <li>■ CPU_TIME Sets the order using the SQL statement's CPU time value.</li> <li>■ DISK_READS Sets the order using the SQL statement's disk-read count value.</li> <li>■ ELAPSED_TIME Sets the order using the SQL statement's elapsed time value.</li> <li>■ EXECUTIONS Sets the order using the SQL statement's execution frequency value.</li> <li>■ OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value.</li> <li>■ I/O Sets the order using the SQL statement's I/O count value.</li> <li>■ PRIORITY Sets the order using the user-supplied business priority value.</li> </ul> <p>All values are accessed in descending order, where a high value is considered more interesting than a low value.</p> <p>The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.</p>

**Table 18–35 (Cont.) SQL Access Advisor Task Parameters**

Parameter	Description
PARTITION_NAME_TEMPLATE	<p>Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters.</p> <p>Valid tokens are:</p> <ul style="list-style-type: none"> <li>Any literal value up to 22 characters.</li> <li>&lt;TABLE&gt; Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit.</li> <li>&lt;TASK_ID&gt; Causes the current task identifier number to be inserted in hexadecimal form.</li> <li>&lt;SEQ&gt; Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.</li> </ul> <p>The default template is PTN\$\$&lt;TABLE&gt;_&lt;TASK_ID&gt;&lt;SEQ&gt;. The datatype is <i>STRING</i>.</p>
PARTITIONING_GOAL	<p>Specifies the approach used to make partitioning recommendations. One possible value is <i>PERFORMANCE</i>, which is the default. The datatype is <i>STRING</i>.</p>
PARTITIONING_TYPES	<p>Specifies the type of partitioning used. Possible values are <i>RANGE</i> and <i>HASH</i>. The datatype is <i>STRING</i>.</p>
RANKING_MEASURE	<p>Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using <i>RANKING_MEASURE</i> values. A comma must separate multiple order keys.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li><i>BUFFER_GETS</i> Sets the order using the SQL statement's buffer-get count value.</li> <li><i>CPU_TIME</i> Sets the order using the SQL statement's CPU time value.</li> <li><i>DISK_READS</i> Sets the order using the SQL statement's disk-read count value.</li> <li><i>ELAPSED_TIME</i> Sets the order using the SQL statement's elapsed time value.</li> <li><i>EXECUTIONS</i> Sets the order using the SQL statement's elapsed time value.</li> <li><i>OPTIMIZER_COST</i> Sets the order using the SQL statement's optimizer cost value.</li> <li><i>PRIORITY</i> Sets the order using the user-supplied business priority value.</li> </ul> <p>All values are accessed in descending order, where a high value is considered more interesting than a low value.</p> <p>The default value is <i>PRIORITY, OPTIMIZER_COST</i>. The datatype is <i>STRINGLIST</i>.</p>
RECOMMEND_MV_EXACT_TEXT_MATCH	<p>When considering candidate materialized views, exact text match solutions will only be included if this parameter contains <i>TRUE</i>.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li><i>TRUE</i></li> <li><i>FALSE</i></li> </ul> <p>The default value is <i>TRUE</i>. The datatype is <i>STRING</i>.</p>
RECOMMENDED_TABLESPACES	<p>Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li><i>TRUE</i></li> <li><i>FALSE</i> (the default)</li> </ul> <p>The datatype is <i>STRING</i>.</p>
REFRESH_MODE	<p>Specifies whether materialized views are refreshed <i>ON_DEMAND</i> or <i>ON_COMMIT</i>. This will be used to weigh the impact of materialized view refresh when the parameter <i>dml_volatility</i> is set to <i>TRUE</i>.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li><i>ON_DEMAND</i></li> <li><i>ON_COMMIT</i></li> </ul> <p>The default value is <i>ON_DEMAND</i>. The datatype is <i>STRING</i>.</p>
REPORT_DATE_FORMAT	<p>This is the default date and time formatting template. The default format is <i>DD/MM/YYYYHH24:MI</i>. The datatype is <i>STRING</i>.</p>

**Table 18–35 (Cont.) SQL Access Advisor Task Parameters**

Parameter	Description
SHOW_RETAINS	<p>Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>■ TRUE</li> <li>■ FALSE</li> </ul> <p>The default value is TRUE. The datatype is STRING.</p>
SQL_LIMIT	<p>Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements.</p> <p>When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>■ an integer in the range of 1 to 2147483647</li> <li>■ ADVISOR_UNLIMITED</li> <li>■ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is NUMBER.</p>
START_TIME	<p>Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:</p> <ul style="list-style-type: none"> <li>■ DD is the numeric date</li> <li>■ MM is the numeric month</li> <li>■ YYYY is the numeric year</li> <li>■ HH is the hour in 24 hour format</li> <li>■ MI is the minute</li> <li>■ SS is the second</li> </ul> <p>The datatype is STRING.</p>
STORAGE_CHANGE	<p>Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL.</p> <p>When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>■ Any valid integer including negative values, zero and positive values.</li> </ul> <p>The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.</p>
TIME_LIMIT	<p>Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>■ An integer in the range of 1 to 10,000</li> <li>■ ADVISOR_UNLIMITED</li> </ul> <p>The default value is 720 (12 hours). The datatype is NUMBER.</p> <p>Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes.</p>

**Table 18–35 (Cont.) SQL Access Advisor Task Parameters**

Parameter	Description
VALID_ACTION_LIST	<p>Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ single action</li> <li>▪ comma-delimited action list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
VALID_MODULE_LIST	<p>Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ single application</li> <li>▪ comma-delimited module list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
VALID_SQLSTRING_LIST	<p>Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ single string</li> <li>▪ comma-delimited string list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>

**Table 18–35 (Cont.) SQL Access Advisor Task Parameters**

Parameter	Description
VALID_TABLE_LIST	<p>Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters.</p> <p>When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid.</p> <p>The valid syntax for a table reference is:</p> <ul style="list-style-type: none"> <li>▪ schema.table</li> <li>▪ schema</li> <li>▪ schema.% (equivalent to schema)</li> <li>▪ comma-delimited action list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ single table reference</li> <li>▪ comma-delimited reference list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is TABLELIST.</p>
VALID_USERNAME_LIST	<p>Contains a fully qualified list of usernames that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a task execution, if a SQL statement's username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>▪ single username</li> <li>▪ comma-delimited username list</li> <li>▪ ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
WORKLOAD_SCOPE	<p>Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL.</p> <p>FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables.</p> <p>PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables.</p> <p>The datatype is STRING.</p>

## Segment Advisor Parameters

Table 18–36 lists the input task parameters that can be set in the Segment Advisor using the SET\_TASK\_PARAMETER procedure.

**Table 18–36 Segment Advisor Task Parameters**

Parameter	Description
MODE	<p>The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are:</p> <ul style="list-style-type: none"> <li>▪ LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository</li> <li>▪ COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics</li> </ul>
TIME_LIST	<p>The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED.</p>

**Table 18–36 (Cont.) Segment Advisor Task Parameters**

Parameter	Description
RECOMMEND_ALL	Whether to generate recommendations for all segments.  The default value is TRUE. If set to TRUE, it generates recommendations all segments specified by the user. If set to FALSE, it generates recommendations for only those objects that are eligible for shrink.

## Examples

```

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
        'SH.%,SCOTT.EMP');
END;
/

```

## Undo Advisor Task Parameters

Table 18–37 lists the input task parameters that can be set in the Undo Advisor using the SET\_TASK\_PARAMETER procedure.

**Table 18–37 Undo Advisor Task Parameters**

Parameter	Description
TARGET_OBJECTS	The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
BEGIN_TIME_SEC	The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.
END_TIME_SEC	The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.

## Examples

```

DECLARE
    tname VARCHAR2(30);
    oid NUMBER;
BEGIN
    DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
    DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);

```

```

DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/

```

## Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 18–38 lists the input task parameters that can be set in ADDM using the SET\_TASK\_PARAMETER procedure. See *Oracle Database Performance Tuning Guide* for more information on using these parameters.

**Table 18–38** ADDM Task Parameters

Parameter	Description
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
DB_ID	The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.
INSTANCE	The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.
INSTANCES	If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, "1, 3, 5"). By default, all instances are analyzed.
DBIO_EXPECTED	The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.

## Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or an Oracle RAC database.

```

DECLARE
  tid      NUMBER;
  tname    VARCHAR2(30) := 'ADDM_TEST';
BEGIN
  DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
  DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/

```

**See Also:**

- *Oracle Database Performance Tuning Guide* for more information regarding ADDM usage

**SQL Tuning Advisor Task Parameters**

See the [DBMS\\_SQLTUNE](#) package on page 139-1 and *Oracle Database Performance Tuning Guide* for more information.

## TUNE\_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

### Syntax

```
DBMS_ADVISOR.TUNE_MVIEW (
  task_name IN OUT VARCHAR2,
  mv_create_stmt IN [CLOB | VARCHAR2]);
```

### Parameters

**Table 18–39 TUNE\_MVIEW Procedure Parameters**

Parameter	Description
task_name	The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.
mv_create_stmt	The original materialized view creation statement.

**See Also:** *Oracle Database Performance Tuning Guide* for more information about using the TUNE\_MVIEW procedure

### Usage Notes

Executing TUNE\_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER\_TUNE\_MVIEW and DBA\_TUNE\_MVIEW views. You can also use DBMS\_ADVISOR.GET\_TASK\_SCRIPT and DBMS\_ADVISOR.CREATE\_FILE to output the TUNE\_MVIEW results into a script file for later execution.

#### USER\_TUNE\_MVIEW and DBA\_TUNE\_MVIEW Views

These views are to get the result after executing the TUNE\_MVIEW procedure.

**Table 18–40 USER\_TUNE\_MVIEW and DBA\_TUNE\_MVIEW Views**

Column Name	Column Description
OWNER	The materialized view owner's name.
TASK_NAME	The task name as a key to access the set of recommendations
SCRIPT_TYPE	Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.
ACTION_ID	Action ID used as the command order number.
STATEMENT	For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options: <ul style="list-style-type: none"> <li>■ CREATE MATERIALIZED VIEW LOG</li> <li>■ ALTER MATERIALIZED VIEW LOG FORCE</li> <li>■ [CREATE   DROP] MATERIALIZED VIEW</li> </ul>

## Examples

```
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');
```

The following is an example to show how to use TUNE\_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV
REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7
GROUP BY C2');
```

You can view the CREATE output results by querying USER\_TUNE\_MVIEW or DBA\_TUNE\_MVIEW as the following example:

```
SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND
SCRIPT_TYPE='CREATE';
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS AS  '/myscript_dir' ;
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE
DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_task'), -
'/homes/tune','my_tune_mview_create.sql');
```

The preceding statement will save the CREATE output results in /myscript\_dir/my\_tune\_mview\_create.sql.

## UPDATE\_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

### Syntax

```
DBMS_ADVISOR.UPDATE_OBJECT (
  task_name      IN VARCHAR2
  object_id      IN NUMBER,
  attr1         IN VARCHAR2 := NULL,
  attr2         IN VARCHAR2 := NULL,
  attr3         IN VARCHAR2 := NULL,
  attr4         IN CLOB := NULL,
  attr5         IN VARCHAR2 := NULL);
```

### Parameters

**Table 18–41 UPDATE\_OBJECT Procedure Parameters**

Parameter	Description
task_name	A valid advisor task name that uniquely identifies an existing task.
object_id	The advisor-assigned object identifier.
attr1	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr2	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr3	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr4	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr5	Advisor-specific data. If set to null, there will be no effect on the target object.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

### Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

### Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
```

```
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL,
                              'SELECT * FROM SH.SALES', obj_id);
  DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id, NULL, NULL, NULL,
                              'SELECT count(*) FROM SH.SALES');
END;
/
```

## UPDATE\_REC\_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

### Syntax

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (
  task_name          IN VARCHAR2
  rec_id             IN NUMBER,
  action_id          IN NUMBER,
  attribute_name     IN VARCHAR2,
  value              IN VARCHAR2);
```

### Parameters

**Table 18–42 UPDATE\_REC\_ATTRIBUTES Procedure Parameters**

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Name of the attribute to be changed. The valid values are: <ul style="list-style-type: none"> <li>▪ owner The new owner of the object.</li> <li>▪ name The new name of the object.</li> <li>▪ tablespace The new tablespace for the object.</li> </ul>
value	Specifies the new value for the recommendation attribute.

### Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

### Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
    100,400,5041,103,640445,680000,2,
    1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
    FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  attribute := 'SH';
```

```
    DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);  
END;  
/
```

## UPDATE\_SQLWKLD\_ATTRIBUTES Procedure

---

**Note:** This procedure is deprecated in Release 11gR1.

---

This procedure changes various attributes of a SQL Workload object or template.

### Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
  workload_name      IN VARCHAR2,
  new_name           IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL,
  read_only         IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := NULL,
  how_created       IN VARCHAR2 := NULL);
```

### Parameters

**Table 18–43** UPDATE\_SQLWKLD\_ATTRIBUTES Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
new_name	The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.
description	A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Set to TRUE so it cannot be changed.
is_template	TRUE if workload is to be used as a template.
how_created	Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

### Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

## UPDATE\_SQLWKLD\_STATEMENT Procedure

---

---

**Note:** This procedure is deprecated in Release 11gR1.

---

---

This procedure updates an existing SQL statement in a specified SQL workload.

### Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
    workload_name    IN VARCHAR2,
    sql_id           IN NUMBER,
    application      IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL,
    priority         IN NUMBER := NULL,
    username        IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
    workload_name    IN VARCHAR2,
    search           IN VARCHAR2,
    updated          OUT NUMBER,
    application      IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL,
    priority         IN NUMBER := NULL,
    username        IN VARCHAR2 := NULL);
```

### Parameters

**Table 18–44 UPDATE\_SQLWKLD\_STATEMENT Procedure Parameters**

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant <code>DBMS_ADVISOR.ADVISOR_ALL</code> .
updated	Returns the number of statements changed by a searched update.
application	Specifies a business application name that will be associated with the SQL statement. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.
action	Specifies the application action for the statement. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.
priority	The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW.  If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.
username	The Oracle user name that executed the SQL statement. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.  Because a username is an Oracle identifier, the username value must be entered exactly like it is stored in the server. For example, if the user <code>SCOTT</code> is the executing user, then you must provide the user identifier <code>SCOTT</code> in all uppercase letters. It will not recognize the user <code>scott</code> as a match for <code>SCOTT</code> .

**Table 18-44 (Cont.) UPDATE\_SQLWKLD\_STATEMENT Procedure Parameters**

Parameter	Description
search	Disabled.

## Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) on page 18-46 to set a task to its initial state.

## Examples

```

DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

  SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
  WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/

```

## UPDATE\_TASK\_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

### Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (
  task_name      IN VARCHAR2
  new_name       IN VARCHAR2 := NULL,
  description    IN VARCHAR2 := NULL,
  read_only     IN VARCHAR2 := NULL,
  is_template    IN VARCHAR2 := NULL,
  how_created   IN VARCHAR2 := NULL);
```

### Parameters

**Table 18–45** UPDATE\_TASK\_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
new_name	The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.
description	A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
is_template	Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
how_created	Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

### Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name, 'New Task Name');
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name', NULL, 'New description');
END;
/
```

DBMS\_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- [Using DBMS\\_ALERT](#)
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Exceptions
  - Operational Notes
  - Examples
- [Summary of DBMS\\_ALERT Subprograms](#)

## Using DBMS\_ALERT

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

## Overview

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (`WAITONE`) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (`SIGNAL`) whenever the trigger is fired.

## Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package.

## Constants

The DBMS\_ALERT package uses the constants shown in [Table 19-1](#):

**Table 19-1** DBMS\_ALERT Constants

Name	Type	Value	Description
MAXWAIT	INTEGER	86400000	The maximum time to wait for an alert (1000 days which is essentially forever).

## Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

## Exceptions

DBMS\_ALERT raises the application error -20000 on error conditions. [Table 19-2](#) shows the messages and the procedures that can raise them.

## Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.
- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

**See Also:** [Chapter 103, "DBMS\\_PIPE"](#)

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the *prior* alert, but before the data was read for that *prior* alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
  - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the `SET_DEFAULTS` procedure.
  - `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

**Table 19-2** *DBMS\_ALERT* Error Messages

Error Message	Procedure
ORU-10001 lock request error, status: N	SIGNAL
ORU-10015 error: N waiting for pipe status	WAITANY
ORU-10016 error: N sending on pipe 'X'	SIGNAL
ORU-10017 error: N receiving on pipe 'X'	SIGNAL
ORU-10019 error: N on lock request	WAIT
ORU-10020 error: N on lock request	WAITANY

**Table 19-2 (Cont.) DBMS\_ALERT Error Messages**

<b>Error Message</b>	<b>Procedure</b>
ORU-10021 lock request error; status: N	REGISTER
ORU-10022 lock request error, status: N	SIGNAL
ORU-10023 lock request error; status N	WAITONE
ORU-10024 there are no alerts registered	WAITANY
ORU-10025 lock request error; status N	REGISTER
ORU-10037 attempting to wait on uncommitted signal from same session	WAITONE

## Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```
DBMS_ALERT.REGISTER('emp_table_alert');
<<readagain>>:
/* ... read the emp table and graph it */
DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
if status = 0 then goto <<readagain>>; else
/* ... error condition */
```

The EMP table would have a trigger similar to this:

```
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
BEGIN
    DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
END;
```

When the application is no longer interested in the alert, it makes this request:

```
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

---

## Summary of DBMS\_ALERT Subprograms

**Table 19–3** *DBMS\_ALERT Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">REGISTER Procedure</a> on page 19-12	Receives messages from an alert
<a href="#">REMOVE Procedure</a> on page 19-13	Disables notification from an alert
<a href="#">REMOVEALL Procedure</a> on page 19-14	Removes all alerts for this session from the registration list
<a href="#">SET_DEFAULTS Procedure</a> on page 19-15	Sets the polling interval
<a href="#">SIGNAL Procedure</a> on page 19-16	Signals an alert (send message to registered sessions)
<a href="#">WAITANY Procedure</a> on page 19-17	Waits <code>timeout</code> seconds to receive alert message from an alert registered for session
<a href="#">WAITONE Procedure</a> on page 19-18	Waits <code>timeout</code> seconds to receive message from named alert

## REGISTER Procedure

This procedure lets a session register interest in an alert.

### Syntax

```
DBMS_ALERT.REGISTER (  
    name      IN  VARCHAR2,  
    cleanup   IN  BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 19–4** REGISTER Procedure Parameters

Parameter	Description
name	Name of the alert in which this session is interested
cleanup	Specifies whether to perform cleanup of any extant orphaned pipes used by the <code>DBMS_ALERT</code> package. This cleanup is only performed on the first call to <code>REGISTER</code> for each package instantiation. The default for the parameter is <code>TRUE</code> .

---

---

**Caution:** Alert names beginning with 'ORA\$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

---

---

### Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling `REMOVE`.

## REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

### Syntax

```
DBMS_ALERT.REMOVE (  
    name IN VARCHAR2);
```

### Parameters

**Table 19–5 REMOVE Procedure Parameters**

Parameter	Description
name	Name of the alert (case-insensitive) to be removed from registration list.

### Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

## REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

### Syntax

```
DBMS_ALERT.REMOVEALL;
```

## SET\_DEFAULTS Procedure

In case a polling loop is required, use the `SET_DEFAULTS` procedure to set the polling interval.

### Syntax

```
DBMS_ALERT.SET_DEFAULTS (  
    sensitivity IN NUMBER);
```

### Parameters

**Table 19–6** *SET\_DEFAULTS Procedure Parameters*

Parameter	Description
<code>sensitivity</code>	Polling interval, in seconds, to sleep between polls. The default interval is five seconds.

## SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

### Syntax

```
DBMS_ALERT.SIGNAL (
    name      IN  VARCHAR2,
    message   IN  VARCHAR2);
```

### Parameters

**Table 19–7** *SIGNAL Procedure Parameters*

Parameter	Description
name	Name of the alert to signal.
message	Message, of 1800 bytes or less, to associate with this alert.  This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.

## WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

### Syntax

```
DBMS_ALERT.WAITANY (
  name      OUT  VARCHAR2,
  message   OUT  VARCHAR2,
  status    OUT  INTEGER,
  timeout   IN   NUMBER DEFAULT MAXWAIT);
```

### Parameters

**Table 19–8** *WAITANY Procedure Parameters*

Parameter	Description
name	Returns the name of the alert that occurred.
message	Returns the message associated with the alert.  This is the message provided by the <code>SIGNAL</code> call. If multiple signals on this alert occurred before <code>WAITANY</code> , the message corresponds to the most recent <code>SIGNAL</code> call. Messages from prior <code>SIGNAL</code> calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert.  If no alert occurs before <code>timeout</code> seconds, this returns a status of 1.

### Usage Notes

An implicit `COMMIT` is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, `DBMS_LOCK.REQUEST` (which is called by `DBMS_ALERT`) returns status 4.

### Exceptions

-20000, ORU-10024: there are no alerts registered.

## WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit `COMMIT` is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, `DBMS_LOCK.REQUEST` (which is called by `DBMS_ALERT`) returns status 4.

### Syntax

```
DBMS_ALERT.WAITONE (
    name      IN   VARCHAR2,
    message   OUT  VARCHAR2,
    status    OUT  INTEGER,
    timeout   IN   NUMBER DEFAULT MAXWAIT);
```

### Parameters

**Table 19–9** WAITONE Procedure Parameters

Parameter	Description
<code>name</code>	Name of the alert to wait for.
<code>message</code>	Returns the message associated with the alert.  This is the message provided by the <code>SIGNAL</code> call. If multiple signals on this alert occurred before <code>WAITONE</code> , the message corresponds to the most recent <code>SIGNAL</code> call. Messages from prior <code>SIGNAL</code> calls are discarded.
<code>status</code>	Values returned: 0 - alert occurred 1 - timeout occurred
<code>timeout</code>	Maximum time to wait for an alert.  If the named alert does not occur before <code>timeout</code> seconds, this returns a status of 1.

---

---

## DBMS\_APPLICATION\_INFO

Application developers can use the `DBMS_APPLICATION_INFO` package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- [Using DBMS\\_APPLICATION\\_INFO](#)
  - Overview
  - Security Model
  - Operational Notes
- [Summary of DBMS\\_APPLICATION\\_INFO Subprograms](#)

---

## Using DBMS\_APPLICATION\_INFO

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

## Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the V\$SESSION and V\$SQLAREA views.

## Security Model

---

---

**Note:** The public synonym for `DBMS_APPLICATION_INFO` is not dropped before creation so that you can redirect the public synonym to point to your own package.

---

---

No further privileges are required. The `DBMSAPIN.SQL` script is already run as a part of standard database creation .

## Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the *SYS* version of the package. The public synonym for *DBMS\_APPLICATION\_INFO* can then be changed to point to the *DBA*'s version of the package.

## Summary of DBMS\_APPLICATION\_INFO Subprograms

**Table 20–1** *DBMS\_APPLICATION\_INFO Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">READ_CLIENT_INFO Procedure</a> on page 20-7	Reads the value of the <code>client_info</code> field of the current session
<a href="#">READ_MODULE Procedure</a> on page 20-8	Reads the values of the <code>module</code> and <code>action</code> fields of the current session
<a href="#">SET_ACTION Procedure</a> on page 20-9	Sets the name of the current action within the current module
<a href="#">SET_CLIENT_INFO Procedure</a> on page 20-10	Sets the <code>client_info</code> field of the session
<a href="#">SET_MODULE Procedure</a> on page 20-11	Sets the name of the module that is currently running to a new module
<a href="#">SET_SESSION_LONGOPS Procedure</a> on page 20-12	Sets a row in the <code>V\$SESSION_LONGOPS</code> table

## READ\_CLIENT\_INFO Procedure

This procedure reads the value of the `client_info` field of the current session.

### Syntax

```
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (  
    client_info OUT VARCHAR2);
```

### Parameters

**Table 20–2** *READ\_CLIENT\_INFO Procedure Parameters*

Parameter	Description
<code>client_info</code>	Last client information value supplied to the <code>SET_CLIENT_INFO</code> procedure.

## READ\_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

### Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (
    module_name OUT VARCHAR2,
    action_name OUT VARCHAR2);
```

### Parameters

**Table 20–3 READ\_MODULE Procedure Parameters**

Parameter	Description
module_name	Last value that the module name was set to by calling SET_MODULE.
action_name	Last value that the action name was set to by calling SET_ACTION or SET_MODULE.

### Usage Notes

Module and action names for a registered application can be retrieved by querying V\$SQLAREA or by calling the READ\_MODULE procedure. Client information can be retrieved by querying the V\$SESSION view, or by calling the [READ\\_CLIENT\\_INFO Procedure](#).

### Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V\$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
-----
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

## SET\_ACTION Procedure

This procedure sets the name of the current action within the current module.

### Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
    action_name IN VARCHAR2);
```

### Parameters

**Table 20–4 SET\_ACTION Procedure Parameters**

Parameter	Description
action_name	The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.

### Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

### Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN

-- balance transfer transaction

    DBMS_APPLICATION_INFO.SET_ACTION(
        action_name => 'transfer from chk to sav');
    UPDATE chk SET bal = bal + :amt
        WHERE acct# = :acct;
    UPDATE sav SET bal = bal - :amt
        WHERE acct# = :acct;
    COMMIT;
    DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
```

## SET\_CLIENT\_INFO Procedure

This procedure supplies additional information about the client application.

### Syntax

```
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (  
    client_info IN VARCHAR2);
```

### Parameters

**Table 20–5** SET\_CLIENT\_INFO Procedure Parameters

Parameter	Description
client_info	Supplies any additional information about the client application. This information is stored in the V\$SESSION view. Information exceeding 64 bytes is truncated.

---

---

**Note:** CLIENT\_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.

---

---

## SET\_MODULE Procedure

This procedure sets the name of the current application or module.

### Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
  module_name IN VARCHAR2,
  action_name IN VARCHAR2);
```

### Parameters

**Table 20–6 SET\_MODULE Procedure Parameters**

Parameter	Description
module_name	Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.
action_name	Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.

### Usage Notes

### Example

```
CREATE or replace PROCEDURE add_employee(
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE(
    module_name => 'add_employee',
    action_name => 'insert into emp');
  INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
  VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
    commission, department);
  DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

## SET\_SESSION\_LONGOPS Procedure

This procedure sets a row in the `V$SESSION_LONGOPS` view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the `SET_SESSION_LONGOPS` procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the `V$SESSION_LONGOPS` view.

### Syntax

```
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
  rindex      IN OUT BINARY_INTEGER,
  slno        IN OUT BINARY_INTEGER,
  op_name     IN      VARCHAR2         DEFAULT NULL,
  target      IN      BINARY_INTEGER  DEFAULT 0,
  context     IN      BINARY_INTEGER  DEFAULT 0,
  sofar       IN      NUMBER           DEFAULT 0,
  totalwork   IN      NUMBER           DEFAULT 0,
  target_desc IN      VARCHAR2        DEFAULT 'unknown target',
  units       IN      VARCHAR2        DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

### Parameters

**Table 20–7 SET\_SESSION\_LONGOPS Procedure Parameters**

Parameter	Description
<code>rindex</code>	A token which represents the <code>v\$session_longops</code> row to update. Set this to <code>set_session_longops_nohint</code> to start a new row. Use the returned value from the prior call to reuse a row.
<code>slno</code>	Saves information across calls to <code>set_session_longops</code> : It is for internal use and should not be modified by the caller.
<code>op_name</code>	Specifies the name of the long running task. It appears as the <code>OPNAME</code> column of <code>v\$session_longops</code> . The maximum length is 64 bytes.
<code>target</code>	Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the <code>TARGET</code> column of <code>v\$session_longops</code> .
<code>context</code>	Any number the client wants to store. It appears in the <code>CONTEXT</code> column of <code>v\$session_longops</code> .
<code>sofar</code>	Any number the client wants to store. It appears in the <code>SOFAR</code> column of <code>v\$session_longops</code> . This is typically the amount of work which has been done so far.
<code>totalwork</code>	Any number the client wants to store. It appears in the <code>TOTALWORK</code> column of <code>v\$session_longops</code> . This is typically an estimate of the total amount of work needed to be done in this long running operation.

**Table 20–7 (Cont.) SET\_SESSION\_LONGOPS Procedure Parameters**

Parameter	Description
target_desc	Specifies the description of the object being manipulated in this long operation. This provides a caption for the <code>target</code> parameter. This value appears in the <code>TARGET_DESC</code> field of <code>v\$session_longops</code> . The maximum length is 32 bytes.
units	Specifies the units in which <code>sofar</code> and <code>totalwork</code> are being represented. It appears as the <code>UNITS</code> field of <code>v\$session_longops</code> . The maximum length is 32 bytes.

## Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates `V$SESSION_LONGOPS` on the procedure's progress.

```

DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;

BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
        -- perform task on object target

        sofar := sofar + 1;
        dbms_application_info.set_session_longops(rindex, slno,
            "Operation X", obj, 0, sofar, totalwork, "table", "tables");
    END LOOP;
END;
```

---

## DBMS\_APPLY\_ADM

The DBMS\_APPLY\_ADM package provides subprograms to configure and manage Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers.

This chapter contains the following topics:

- [Using DBMS\\_APPLY\\_ADM](#)
  - Overview
  - Security Model
  - Operational Notes
- [Summary of DBMS\\_APPLY\\_ADM Subprograms](#)

**See Also:**

- *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and apply processes
- *Oracle Database XStream Guide* for more information about XStream outbound servers and inbound servers

## Using DBMS\_APPLY\_ADM

This section contains topics which relate to using the DBMS\_APPLY\_ADM package.

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

## Overview

This package provides interfaces to start, stop, and configure Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers. This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

---

---

**Note:**

- For simplicity, this chapter refers to apply processes, XStream outbound servers, and XStream inbound servers as **apply components**. This chapter identifies a specific type of apply component when necessary.
  - Using XStream requires purchasing a license for the Oracle GoldenGate product.
- 
- 

**See Also:**

- *Oracle Streams Concepts and Administration*
- *Oracle Streams Replication Administrator's Guide*
- *Oracle Database XStream Guide*

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

When the DBMS\_APPLY\_ADM package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the DBMS\_APPLY\_ADM package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

---

---

**Note:** The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting an apply user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

---

---

**See Also:**

- *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator
- *Oracle Database XStream Guide* for information about configuring an XStream administrator

## Operational Notes

The following sections contain operational notes for this package:

- [Deprecated Apply Component Parameter Value](#)

### Deprecated Apply Component Parameter Value

---

---

**Note:** Oracle recommends that you do not use deprecated apply component parameter values. Support for deprecated features is for backward compatibility only.

---

---

The NONE value for the `commit_serialization` apply component parameter is deprecated. It is replaced by the `DEPENDENT_TRANSACTIONS` value.

**See Also:** [SET\\_PARAMETER Procedure](#) on page 21-56

## Summary of DBMS\_APPLY\_ADM Subprograms

**Table 21-1 DBMS\_APPLY\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ADD_STMT_HANDLER Procedure</a> on page 21-8	Adds a statement DML handler for a specified operation on a specified database object to a single apply component or to all apply components in the database
<a href="#">ALTER_APPLY Procedure</a> on page 21-10	Alters an apply component
<a href="#">COMPARE_OLD_VALUES Procedure</a> on page 21-16	Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply
<a href="#">CREATE_APPLY Procedure</a> on page 21-18	Creates an apply component
<a href="#">CREATE_OBJECT_DEPENDENCY Procedure</a> on page 21-24	Creates an object dependency
<a href="#">DELETE_ALL_ERRORS Procedure</a> on page 21-25	Deletes all the error transactions for the specified apply component
<a href="#">DELETE_ERROR Procedure</a> on page 21-26	Deletes the specified error transaction
<a href="#">DROP_APPLY Procedure</a> on page 21-27	Drops an apply component
<a href="#">DROP_OBJECT_DEPENDENCY Procedure</a> on page 21-29	Drops an object dependency
<a href="#">EXECUTE_ALL_ERRORS Procedure</a> on page 21-30	Reexecutes the error transactions for the specified apply component
<a href="#">EXECUTE_ERROR Procedure</a> on page 21-31	Reexecutes the specified error transaction
<a href="#">GET_ERROR_MESSAGE Function</a> on page 21-34	Returns the message payload from the error queue for the specified message number and transaction identifier
<a href="#">REMOVE_STMT_HANDLER</a> on page 21-36	Removes a statement DML handler for a specified operation on a specified database object from a single apply component or from all apply components in the database
<a href="#">SET_CHANGE_HANDLER Procedure</a> on page 21-38	Sets or unsets a statement DML handler that tracks changes for a specified operation on a specified database object for a single apply component
<a href="#">SET_DML_HANDLER Procedure</a> on page 21-41	Sets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database
<a href="#">SET_ENQUEUE_DESTINATION Procedure</a> on page 21-46	Sets the queue where the apply component automatically enqueues a message that satisfies the specified rule
<a href="#">SET_EXECUTE Procedure</a> on page 21-48	Specifies whether a message that satisfies the specified rule is executed by an apply component

**Table 21-1 (Cont.) DBMS\_APPLY\_ADM Package Subprograms**

Subprogram	Description
<a href="#">SET_GLOBAL_INSTANTIATION_SCN Procedure</a> on page 21-50	Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas
<a href="#">SET_KEY_COLUMNS Procedures</a> on page 21-53	Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist
<a href="#">SET_PARAMETER Procedure</a> on page 21-56	Sets an apply parameter to the specified value
<a href="#">SET_SCHEMA_INSTANTIATION_SCN Procedure</a> on page 21-66	Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database
<a href="#">SET_TABLE_INSTANTIATION_SCN Procedure</a> on page 21-69	Records the specified instantiation SCN for the specified table in the specified source database
<a href="#">SET_UPDATE_CONFLICT_HANDLER Procedure</a> on page 21-71	Adds, updates, or drops an update conflict handler for the specified object
<a href="#">SET_VALUE_DEPENDENCY Procedure</a> on page 21-75	Sets or removes a value dependency
<a href="#">START_APPLY Procedure</a> on page 21-77	Directs the apply component to start applying messages
<a href="#">STOP_APPLY Procedure</a> on page 21-78	Stops the apply component from applying any messages and rolls back any unfinished transactions being applied

---

**Note:** All procedures commit unless specified otherwise. However, the `GET_ERROR_MESSAGE` function does not commit.

---

## ADD\_STMT\_HANDLER Procedure

This procedure adds a statement DML handler for a specified operation on a specified database object. The procedure adds the statement DML handler to a single apply component or to all apply components in the database.

This procedure is overloaded. One version of this procedure contains the `statement` and `comment` parameters, and the other does not. The `statement` parameter enables you to create the statement DML handler and add it to one or more processes in one step. Otherwise, create the statement DML handler using the `DBMS_STREAMS_HANDLER_ADM` package before adding it to one or more processes.

### See Also:

- [Chapter 147, "DBMS\\_STREAMS\\_HANDLER\\_ADM"](#)
- *Oracle Streams Concepts and Administration*

### Syntax

```
DBMS_APPLY_ADM.ADD_STMT_HANDLER(
  object_name      IN  VARCHAR2,
  operation_name   IN  VARCHAR2,
  handler_name     IN  VARCHAR2,
  statement        IN  CLOB,
  apply_name       IN  VARCHAR2  DEFAULT NULL,
  comment          IN  VARCHAR2  DEFAULT NULL);
```

```
DBMS_APPLY_ADM.ADD_STMT_HANDLER(
  object_name      IN  VARCHAR2,
  operation_name   IN  VARCHAR2,
  handler_name     IN  VARCHAR2,
  apply_name       IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 21–2 ADD\_STMT\_HANDLER Procedure Parameters**

Parameter	Description
<code>object_name</code>	The name of the source object specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.  If <code>NULL</code> , then the procedure raises an error.
<code>operation_name</code>	The name of the operation, which can be specified as: <ul style="list-style-type: none"> <li>■ <code>INSERT</code></li> <li>■ <code>UPDATE</code></li> <li>■ <code>DELETE</code></li> </ul> If <code>NULL</code> , then the procedure raises an error.  <b>Note:</b> Statement DML handlers cannot be specified for LOB operations.

**Table 21-2 (Cont.) ADD\_STMT\_HANDLER Procedure Parameters**

Parameter	Description
handler_name	<p>The name of the statement DML handler.</p> <p>If the specified statement DML handler exists, then the statement in the <code>statement</code> parameter is added to the existing handler. Ensure that the existing statement DML handler is for the same operation on the same database object as the settings for the <code>operation_name</code> and <code>object_name</code> parameters, respectively. If the existing handler is for a different operation or database object, then an apply error results when the handler is invoked.</p> <p>If the specified statement DML handler does not exist and a non-NULL statement parameter is specified, then this procedure creates the statement DML handler.</p> <p>If the specified statement DML handler does not exist and the <code>statement</code> parameter is not specified or is NULL, then this procedure raises an error.</p> <p>If NULL, then the procedure raises an error.</p>
statement	<p>The text of the SQL statement to add to the statement DML handler.</p> <p>If NULL, then the procedure raises an error.</p>
apply_name	<p>The name of the apply component that uses the statement DML handler.</p> <p>If NULL, then the procedure adds the statement DML handler as a general handler to all apply components in the database.</p>
comment	<p>A comment for the statement DML handler.</p> <p>If NULL, then no comment is recorded for the statement DML handler.</p>

## Usage Notes

The following usage notes apply to this procedure:

- [The ADD\\_STMT\\_HANDLER Procedure and XStream Outbound Servers](#)
- [The ADD\\_STMT\\_HANDLER Procedure and XStream Inbound Servers](#)

### The ADD\_STMT\_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers. Outbound servers ignore all apply handlers.

### The ADD\_STMT\_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## ALTER\_APPLY Procedure

This procedure alters an apply component.

### Syntax

```
DBMS_APPLY_ADM.ALTER_APPLY(
    apply_name          IN  VARCHAR2,
    rule_set_name       IN  VARCHAR2  DEFAULT NULL,
    remove_rule_set     IN  BOOLEAN   DEFAULT FALSE,
    message_handler     IN  VARCHAR2  DEFAULT NULL,
    remove_message_handler IN  BOOLEAN  DEFAULT FALSE,
    ddl_handler         IN  VARCHAR2  DEFAULT NULL,
    remove_ddl_handler  IN  BOOLEAN   DEFAULT FALSE,
    apply_user          IN  VARCHAR2  DEFAULT NULL,
    apply_tag           IN  RAW        DEFAULT NULL,
    remove_apply_tag    IN  BOOLEAN   DEFAULT FALSE,
    precommit_handler   IN  VARCHAR2  DEFAULT NULL,
    remove_precommit_handler IN  BOOLEAN  DEFAULT FALSE,
    negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
    remove_negative_rule_set IN  BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 21–3 ALTER\_APPLY Procedure Parameters**

Parameter	Description
apply_name	The name of the apply component being altered. You must specify the name of an existing apply component. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages.</p> <p>If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter <code>hr.job_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</p> <p>If you specify NULL and the <code>remove_rule_set</code> parameter is set to FALSE, then this procedure retains any existing positive rule set for the specified apply component. If you specify NULL and the <code>remove_rule_set</code> parameter is set to TRUE, then this procedure removes any existing positive rule set from the specified apply component.</p>

**Table 21-3 (Cont.) ALTER\_APPLY Procedure Parameters**

Parameter	Description
remove_rule_set	<p>If TRUE, then the procedure removes the positive rule set for the specified apply component. If you remove the positive rule set for an apply component, and the apply component does not have a negative rule set, then the apply component dequeues all messages in its queue.</p> <p>If you remove the positive rule set for an apply component, and a negative rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the negative rule set.</p> <p>If FALSE, then the procedure retains the positive rule set for the specified apply component.</p> <p>If the <code>rule_set_name</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>
message_handler	<p>A user-defined procedure that processes non-LCR messages in the queue for the apply component.</p> <p>See "Usage Notes" on page 21-22 in the <a href="#">CREATE_APPLY Procedure</a> for more information about a message handler procedure.</p>
remove_message_handler	<p>If TRUE, then the procedure removes the message handler for the specified apply component.</p> <p>If FALSE, then the procedure retains any message handler for the specified apply component.</p> <p>If the <code>message_handler</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>
ddl_handler	<p>A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply component.</p> <p>All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically.</p> <p>See "Usage Notes" on page 21-22 in the <a href="#">CREATE_APPLY Procedure</a> for more information about a DDL handler procedure.</p>
remove_ddl_handler	<p>If TRUE, then the procedure removes the DDL handler for the specified apply component.</p> <p>If FALSE, then the procedure retains any DDL handler for the specified apply component.</p> <p>If the <code>ddl_handler</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>

**Table 21–3 (Cont.) ALTER\_APPLY Procedure Parameters**

Parameter	Description
apply_user	<p>The user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations, and runs apply handlers. If NULL, then the apply user is not changed.</p> <p>If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS.</p> <p>If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply component. It also configures the user as a secure queue user of the queue.</p> <p>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> <li>■ The necessary privileges to perform DML and DDL changes on the apply objects</li> <li>■ EXECUTE privilege on the rule sets used by the apply component</li> <li>■ EXECUTE privilege on all rule-based transformation functions used in the rule set</li> <li>■ EXECUTE privilege on all apply handler procedures</li> </ul> <p>These privileges can be granted directly to the apply user, or they can be granted through roles.</p> <p>In addition, the apply user must be granted the EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p>By default, this parameter is set to the user who created the apply component by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package.</p> <p><b>Note:</b> If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically.</p>
apply_tag	<p>A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs.</p> <p>The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter.</p> <p>If NULL, the default, then the apply tag for the apply component is not changed.</p> <p>The following is an example of a tag with a hexadecimal value of 17:</p> <pre>HEXTORAW ( ' 17 ' )</pre> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

**Table 21-3 (Cont.) ALTER\_APPLY Procedure Parameters**

Parameter	Description
remove_apply_tag	<p>If TRUE, then the procedure sets the apply tag for the specified apply component to NULL, and the apply component generates redo entries with NULL tags.</p> <p>If FALSE, then the procedure retains any apply tag for the specified apply component.</p> <p>If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.</p>
precommit_handler	<p>A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.</p> <p>An internal commit directive is enqueued in the following ways:</p> <ul style="list-style-type: none"> <li>■ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.</li> <li>■ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically.</li> </ul> <p>For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply component.</p> <p>The precommit handler procedure must conform to the following restrictions:</p> <ul style="list-style-type: none"> <li>■ Any work that commits must be an autonomous transaction.</li> <li>■ Any rollback must be to a named savepoint created in the procedure.</li> </ul> <p>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</p> <p>See "Usage Notes" on page 21-22 in the <a href="#">CREATE_APPLY Procedure</a> for more information about a precommit handler procedure.</p>
remove_precommit_handler	<p>If TRUE, then the procedure removes the precommit handler for the specified apply component.</p> <p>If FALSE, then the procedure retains any precommit handler for the specified apply component.</p> <p>If the precommit_handler parameter is non-NULL, then this parameter should be set to FALSE.</p>

**Table 21–3 (Cont.) ALTER\_APPLY Procedure Parameters**

Parameter	Description
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages.</p> <p>If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_apply_rules</code>, enter <code>hr.neg_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.</p>
<code>remove_negative_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified apply component. If you remove the negative rule set for an apply component, and the apply component does not have a positive rule set, then the apply component dequeues all messages in its queue.</p> <p>If you remove the negative rule set for an apply component, and a positive rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified apply component.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

## Usage Notes

The following usage notes apply to this procedure:

- [Automatic Restart of Apply Components](#)
- [The ALTER\\_APPLY Procedure and XStream Outbound Servers](#)
- [The ALTER\\_APPLY Procedure and XStream Inbound Servers](#)

### Automatic Restart of Apply Components

An apply component is stopped and restarted automatically when you change the value of one or more of the following `ALTER_APPLY` procedure parameters:

- `message_handler`
- `ddl_handler`
- `apply_user`
- `apply_tag`
- `precommit_handler`

**The ALTER\_APPLY Procedure and XStream Outbound Servers**

The following usage notes apply to this procedure and XStream outbound servers:

- The `apply_user` parameter can change the connect user for an outbound server.
- You cannot specify an apply handler for an outbound server. An outbound server ignores the settings for the following parameters: `message_handler`, `ddl_handler`, and `precommit_handler`.

The client application can perform custom processing of the LCRs instead if necessary. However, if apply processes are configured in the same database as the outbound server, then you can specify apply handlers for these apply processes. In addition, you can configure general apply handlers for the database. An outbound server ignores general apply handlers.

- An outbound server cannot set an apply tag for the changes it processes. An outbound server ignores the setting for the `apply_tag` parameter.

**The ALTER\_APPLY Procedure and XStream Inbound Servers**

Inbound servers can use apply handlers. However, inbound servers only process LCRs. Therefore, inbound servers ignore message handlers specified in the `message_handler` parameter.

## COMPARE\_OLD\_VALUES Procedure

This procedure specifies whether to compare the old values of one or more columns in a row logical change record (row LCR) with the current values of the corresponding columns at the destination site during apply. This procedure is relevant only for UPDATE and DELETE operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about conflict detection and resolution in an Oracle Streams environment

### Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES (
  object_name      IN VARCHAR2,
  column_list      IN VARCHAR2,
  operation        IN VARCHAR2 DEFAULT 'UPDATE',
  compare          IN BOOLEAN  DEFAULT TRUE,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES (
  object_name      IN VARCHAR2,
  column_table     IN DBMS_UTILITY.LNAME_ARRAY,
  operation        IN VARCHAR2 DEFAULT 'UPDATE',
  compare          IN BOOLEAN  DEFAULT TRUE,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 21–4 COMPARE\_OLD\_VALUES Procedure Parameters**

Parameter	Description
<code>object_name</code>	The name of the source table specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>column_list</code>	A comma-delimited list of column names in the table. There must be no spaces between entries. Specify <code>*</code> to include all nonkey columns.
<code>column_table</code>	A PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code> that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.
<code>operation</code>	The name of the operation, which can be specified as: <ul style="list-style-type: none"> <li>■ UPDATE for UPDATE operations</li> <li>■ DELETE for DELETE operations</li> <li>■ * for both UPDATE and DELETE operations</li> </ul>
<code>compare</code>	If <code>compare</code> is <code>TRUE</code> , the old values of the specified columns are compared during apply. If <code>compare</code> is <code>FALSE</code> , the old values of the specified columns are not compared during apply.

**Table 21–4 (Cont.) COMPARE\_OLD\_VALUES Procedure Parameters**

Parameter	Description
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

## Usage Notes

The following usage notes apply to this procedure:

- [Conflict Detection](#)
- [The COMPARE\\_OLD\\_VALUES Procedure and XStream Outbound Servers](#)
- [The COMPARE\\_OLD\\_VALUES Procedure and XStream Inbound Servers](#)

### Conflict Detection

By default, an apply component uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you do not want to compare the old values for a set of columns during apply, then, using the COMPARE\_OLD\_VALUES procedure, specify the set of columns in the `column_list` or `column_table` parameter, and set the `compare` parameter to `FALSE`.

In addition, when the `compare_key_only` apply component parameter is set to `Y`, automatic conflict detection is disabled, and the apply component only uses primary key and unique key columns to identify the table row for a row LCR. When the `compare_key_only` apply component parameter is set to `N`, automatic conflict detection is enabled, and the apply component uses all of the old values in a row LCR to identify the table row for a row LCR.

---

---

#### Note:

- An apply component compares old values for non-key columns when they are present in a row LCR and when the apply component parameter `compare_key_only` is set to `N`.
  - This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.
- 
- 

**See Also:** [SET\\_PARAMETER Procedure](#) on page 21-56 for more information about the `compare_key_only` apply component parameter

### The COMPARE\_OLD\_VALUES Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

### The COMPARE\_OLD\_VALUES Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## CREATE\_APPLY Procedure

This procedure creates an apply component.

### Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY(
  queue_name          IN  VARCHAR2,
  apply_name          IN  VARCHAR2,
  rule_set_name       IN  VARCHAR2  DEFAULT NULL,
  message_handler     IN  VARCHAR2  DEFAULT NULL,
  ddl_handler         IN  VARCHAR2  DEFAULT NULL,
  apply_user          IN  VARCHAR2  DEFAULT NULL,
  apply_database_link IN  VARCHAR2  DEFAULT NULL,
  apply_tag           IN  RAW        DEFAULT '00',
  apply_captured      IN  BOOLEAN   DEFAULT FALSE,
  precommit_handler  IN  VARCHAR2  DEFAULT NULL,
  negative_rule_set_name IN VARCHAR2  DEFAULT NULL,
  source_database     IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 21–5 CREATE\_APPLY Procedure Parameters**

Parameter	Description
queue_name	<p>The name of the queue from which the apply component dequeues messages. You must specify an existing queue in the form <code>[ schema_name . ] queue_name</code>. For example, to specify a queue in the <code>hr</code> schema named <code>streams_queue</code>, enter <code>hr.streams_queue</code>. If the schema is not specified, then the current user is the default.</p> <p><b>Note:</b> The <code>queue_name</code> setting cannot be altered after the apply component is created.</p>
apply_name	<p>The name of the apply component being created. A <code>NULL</code> specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing apply component or messaging client.</p> <p><b>Note:</b> The <code>apply_name</code> setting cannot be altered after the apply component is created.</p>
rule_set_name	<p>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages.</p> <p>If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form <code>[ schema_name . ] rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>job_apply_rules</code>, enter <code>hr.job_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no negative rule set is specified, then the apply component applies either all captured messages or all messages in the persistent queue, depending on the setting of the <code>apply_captured</code> parameter.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p>

**Table 21-5 (Cont.) CREATE\_APPLY Procedure Parameters**

Parameter	Description
message_handler	<p>A user-defined procedure that processes non-LCR messages in the queue for the apply component.</p> <p>See "Usage Notes" on page 21-22 for more information about a message handler procedure.</p>
ddl_handler	<p>A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply component.</p> <p>All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically.</p> <p>See "Usage Notes" on page 21-22 for more information about a DDL handler procedure.</p>
apply_user	<p>The user who applies all DML and DDL changes that satisfy the apply component rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used.</p> <p>The apply user is the user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply component rules, and runs apply handlers configured for the apply component. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply component and configures the user as a secure queue user of the queue.</p> <p>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> <li>■ The necessary privileges to perform DML and DDL changes on the apply objects</li> <li>■ EXECUTE privilege on the rule sets used by the apply component</li> <li>■ EXECUTE privilege on all rule-based transformation functions used in the rule set</li> <li>■ EXECUTE privilege on all apply handler procedures</li> </ul> <p>These privileges can be granted directly to the apply user, or they can be granted through roles.</p> <p>In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p><b>Note:</b> If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically.</p> <p>See "Usage Notes" on page 21-22 for more information about this parameter.</p>

**Table 21–5 (Cont.) CREATE\_APPLY Procedure Parameters**

Parameter	Description
apply_database_link	<p>The database at which the apply component applies messages. This parameter is used by an apply component when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply component applies messages at the local database.</p> <p><b>Note:</b> The <code>apply_database_link</code> setting cannot be altered after the apply component is created.</p>
apply_tag	<p>A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs.</p> <p>The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter.</p> <p>By default, the tag for an apply component is the hexadecimal equivalent of '00' (double zero).</p> <p>The following is an example of a tag with a hexadecimal value of 17:</p> <pre>HEXTORAW('17')</pre> <p>If NULL, then the apply component generates redo entries with NULL tags.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
apply_captured	<p>Either TRUE or FALSE.</p> <p>If TRUE, then the apply component applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Streams capture process.</p> <p>If FALSE, then the apply component applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Streams capture process, such as persistent LCRs or user messages.</p> <p>To apply both captured LCRs and messages in a persistent queue, you must create at least two apply components.</p> <p><b>Note:</b> The <code>apply_captured</code> setting cannot be altered after the apply component is created.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about processing messages with an apply component</p>

**Table 21–5 (Cont.) CREATE\_APPLY Procedure Parameters**

Parameter	Description
precommit_handler	<p>A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.</p> <p>An internal commit directive is enqueued in the following ways:</p> <ul style="list-style-type: none"> <li>■ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.</li> <li>■ When a synchronous capture captures row LCRs, the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction.</li> <li>■ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically.</li> </ul> <p>For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For a message enqueued by a user or application, the commit SCN is generated by the apply component.</p> <p>The precommit handler procedure must conform to the following restrictions:</p> <ul style="list-style-type: none"> <li>■ Any work that commits must be an autonomous transaction.</li> <li>■ Any rollback must be to a named savepoint created in the procedure.</li> </ul> <p>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</p> <p>See "Usage Notes" on page 21-22 for more information about a precommit handler procedure.</p>
negative_rule_set_name	<p>The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages.</p> <p>If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter <code>hr.neg_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify NULL, and no positive rule set is specified, then the apply component applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the apply_captured parameter.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</p> <p>If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.</p>

**Table 21–5 (Cont.) CREATE\_APPLY Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database for the changes that will be applied by the apply component. The source database is the database where the changes originated. If an apply component applies captured messages, then the apply component can apply messages from only one capture process at one source database.</p> <p>If NULL, then the source database name of the first LCR received by the apply component is used for the source database.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1 . NET automatically.</p> <p>The rules in the apply component rule sets determine which messages are dequeued by the apply component. If the apply component dequeues an LCR with a source database that is different than the source database for the apply component, then an error is raised. You can determine the source database for an apply component by querying the DBA_APPLY_PROGRESS data dictionary view.</p>

## Usage Notes

The following sections describe usage notes for this procedure:

- [DBA Role Requirement](#)
- [Handler Procedure Names](#)
- [Message Handler and DDL Handler Procedure](#)
- [Precommit Handler Procedure](#)
- [The CREATE\\_APPLY Procedure and XStream Outbound Servers](#)
- [The CREATE\\_APPLY Procedure and XStream Inbound Servers](#)

### DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the `apply_user` parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the `apply_user` parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the `apply_user` to SYS.

### Handler Procedure Names

For the `message_handler`, `ddl_handler`, and `precommit_handler` parameters, specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_ddls`, enter `hr.apply_pkg.process_ddls`. An error is returned if the specified procedure does not exist.

The user who invokes the `CREATE_APPLY` procedure must have `EXECUTE` privilege on a specified handler procedure. Also, if the `schema_name` is not specified, then the user who invokes the `CREATE_APPLY` procedure is the default.

### Message Handler and DDL Handler Procedure

The procedure specified in both the `message_handler` parameter and the `ddl_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (
    parameter_name IN ANYDATA);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a `ANYDATA` encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a `ANYDATA` encapsulation of a DDL LCR.

**See Also:** [Chapter 248, "Logical Change Record TYPES"](#) for information about DDL LCRs

### Precommit Handler Procedure

The procedure specified in the `precommit_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (
    parameter_name IN NUMBER);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

### The CREATE\_APPLY Procedure and XStream Outbound Servers

This procedure cannot create an XStream outbound servers. To create an XStream outbound server, use the `DBMS_XSTREAM_ADM` package.

### The CREATE\_APPLY Procedure and XStream Inbound Servers

The following usage notes apply to this procedure and XStream inbound servers:

- The `CREATE_APPLY` procedure always creates an apply process. The apply process remains an apply process if it receives messages from a source other than an XStream client application, such as a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives messages from any other source. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.
- When creating an inbound server using the `CREATE_APPLY` procedure, set the `apply_captured` parameter to `TRUE`. Inbound servers only process LCRs captured by a capture process.
- Inbound servers can use apply handlers. However, inbound servers only process LCRs. Therefore, inbound servers ignore message handlers specified in the `message_handler` parameter.

## CREATE\_OBJECT\_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply component schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply component uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply component does not use column values in the LCRs to detect dependencies.

---

**Note:** An error is raised if NULL is specified for either of the procedure parameters.

---

### See Also:

- [DROP\\_OBJECT\\_DEPENDENCY Procedure](#) on page 21-29
- *Oracle Streams Concepts and Administration*

## Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY (
  object_name          IN  VARCHAR2,
  parent_object_name  IN  VARCHAR2);
```

## Parameters

**Table 21–6 CREATE\_OBJECT\_DEPENDENCY Procedure Parameters**

Parameter	Description
object_name	The name of the child database object, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
parent_object_name	The name of the parent database object, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.departments. If the schema is not specified, then the current user is the default.

## Usage Notes

The following usage notes apply to this procedure:

- [The CREATE\\_OBJECT\\_DEPENDENCY Procedure and XStream Outbound Servers](#)
- [The CREATE\\_OBJECT\\_DEPENDENCY Procedure and XStream Inbound Servers](#)

### The CREATE\_OBJECT\_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

### The CREATE\_OBJECT\_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## DELETE\_ALL\_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply component.

### Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS (
  apply_name IN VARCHAR2 DEFAULT NULL);
```

### Parameter

**Table 21–7** *DELETE\_ALL\_ERRORS Procedure Parameter*

Parameter	Description
apply_name	The name of the apply component that raised the errors while processing the transactions. Do not specify an owner.  If NULL, then all error transactions for all apply components are deleted.

### Usage Notes

The following usage notes apply to this procedure:

- [The DELETE\\_ALL\\_ERRORS Procedure and XStream Outbound Servers](#)
- [The DELETE\\_ALL\\_ERRORS Procedure and XStream Inbound Servers](#)

#### **The DELETE\_ALL\_ERRORS Procedure and XStream Outbound Servers**

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

#### **The DELETE\_ALL\_ERRORS Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## DELETE\_ERROR Procedure

This procedure deletes the specified error transaction.

### Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR(  
    local_transaction_id IN VARCHAR2);
```

### Parameter

**Table 21–8** *DELETE\_ERROR Procedure Parameter*

Parameter	Description
local_transaction_id	The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.

### Usage Notes

The following usage notes apply to this procedure:

#### **The DELETE\_ERROR Procedure and XStream Outbound Servers**

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

#### **The DELETE\_ERROR Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## DROP\_APPLY Procedure

This procedure drops an apply component.

### Syntax

```
DBMS_APPLY_ADM.DROP_APPLY(
    apply_name          IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 21–9 DROP\_APPLY Procedure Parameters**

Parameter	Description
apply_name	The name of the apply component being dropped. You must specify an existing apply component name. Do not specify an owner.
drop_unused_rule_sets	<p>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply component if these rule sets are not used by any other Oracle Streams or XStream component. These components include capture processes, propagations, apply processes, inbound servers, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.</p> <p>If FALSE, then the procedure does not drop the rule sets used by the specified apply component, and the rule sets retain their rules.</p>

### Usage Notes

The following usage notes apply to this procedure:

- [The DROP\\_APPLY Procedure and Rules](#)
- [The DROP\\_APPLY Procedure and XStream Outbound Servers](#)
- [The DROP\\_APPLY Procedure and XStream Inbound Servers](#)

#### The DROP\_APPLY Procedure and Rules

When you use this procedure to drop an apply component, information about rules created for the apply component using the DBMS\_STREAMS\_ADM package is removed from the data dictionary views for rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply component. The following are the data dictionary views for rules:

- ALL\_STREAMS\_GLOBAL\_RULES
- DBA\_STREAMS\_GLOBAL\_RULES
- ALL\_STREAMS\_MESSAGE\_RULES
- DBA\_STREAMS\_MESSAGE\_RULES
- ALL\_STREAMS\_SCHEMA\_RULES
- DBA\_STREAMS\_SCHEMA\_RULES
- ALL\_STREAMS\_TABLE\_RULES

- DBA\_STREAMS\_TABLE\_RULES

**See Also:** *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

**The DROP\_APPLY Procedure and XStream Outbound Servers**

When the `DROP_APPLY` procedure is executed on an outbound server, it runs the `DROP_OUTBOUND` procedure in the `DBMS_XSTREAM_ADM` package. Therefore, it might also drop the outbound server's capture process and queue.

**The DROP\_APPLY Procedure and XStream Inbound Servers**

When the `DROP_APPLY` procedure is executed on an inbound server, it runs the `DROP_INBOUND` procedure in the `DBMS_XSTREAM_ADM` package. Therefore, it might also drop the inbound server's queue.

## DROP\_OBJECT\_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

---

---

### Note:

- An error is raised if an object dependency does not exist for the specified database objects.
  - An error is raised if NULL is specified for either of the procedure parameters.
- 
- 

### See Also:

- [CREATE\\_OBJECT\\_DEPENDENCY Procedure](#) on page 21-24
- *Oracle Streams Concepts and Administration*

## Syntax

```
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY (
  object_name          IN  VARCHAR2,
  parent_object_name  IN  VARCHAR2);
```

## Parameters

**Table 21–10 DROP\_OBJECT\_DEPENDENCY Procedure Parameters**

Parameter	Description
object_name	The name of the child database object, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
parent_object_name	The name of the parent database object, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.departments. If the schema is not specified, then the current user is the default.

## Usage Notes

The following usage notes apply to this procedure:

### The DROP\_OBJECT\_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

### The DROP\_OBJECT\_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## EXECUTE\_ALL\_ERRORS Procedure

This procedure reexecutes the error transactions in the error queue for the specified apply component.

The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

**See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

### Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS (
    apply_name      IN  VARCHAR2  DEFAULT NULL,
    execute_as_user IN  BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 21–11 EXECUTE\_ALL\_ERRORS Procedure Parameters**

Parameter	Description
apply_name	The name of the apply component that raised the errors while processing the transactions. Do not specify an owner.  If NULL, then all error transactions for all apply components are reexecuted.
execute_as_user	If TRUE, then the procedure reexecutes the transactions in the security context of the current user.  If FALSE, then the procedure reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction.  The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.

### Usage Notes

The following usage notes apply to this procedure:

- [The EXECUTE\\_ALL\\_ERRORS Procedure and XStream Outbound Servers](#)
- [The EXECUTE\\_ALL\\_ERRORS Procedure and XStream Inbound Servers](#)

#### **The EXECUTE\_ALL\_ERRORS Procedure and XStream Outbound Servers**

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

#### **The EXECUTE\_ALL\_ERRORS Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## EXECUTE\_ERROR Procedure

This procedure reexecutes the specified error transaction in the error queue.

**See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

### Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
  local_transaction_id IN VARCHAR2,
  execute_as_user      IN BOOLEAN   DEFAULT FALSE,
  user_procedure       IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 21–12 EXECUTE\_ERROR Procedure Parameters**

Parameter	Description
local_transaction_id	The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.
execute_as_user	If TRUE, then the procedure reexecutes the transaction in the security context of the current user.  If FALSE, then the procedure reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction.  The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.
user_procedure	A user-defined procedure that modifies the error transaction so that it can be successfully executed.  Specify NULL to execute the error transaction without running a user procedure.  <b>See Also:</b> " <a href="#">Usage Notes</a> " on page 21-31 for more information about the user procedure

### Usage Notes

The following usage notes apply to this procedure:

- [The User Procedure](#)
- [The EXECUTE\\_ERROR Procedure and XStream Outbound Servers](#)
- [The EXECUTE\\_ERROR Procedure and XStream Inbound Servers](#)

#### The User Procedure

You must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the *package\_name* must be specified. The user who invokes the EXECUTE\_ERROR procedure must have EXECUTE privilege on the specified procedure. Also, if the *schema\_name* is not specified, then the user who invokes the EXECUTE\_ERROR procedure is the default.

For example, suppose the *procedure\_name* has the following properties:

- *strmadmin* is the *schema\_name*.
- *fix\_errors* is the *package\_name*.
- *fix\_hr\_errors* is the *procedure\_name*.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
    in_anydata          IN      ANYDATA,
    error_record        IN      DBA_APPLY_ERROR%ROWTYPE,
    error_message_number IN      NUMBER,
    messaging_default_processing IN OUT BOOLEAN,
    out_anydata         OUT     ANYDATA);
```

The user procedure has the following parameters:

- *in\_anydata*: The ANYDATA encapsulation of a message that the apply component passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- *error\_record*: The row in the DBA\_APPLY\_ERROR data dictionary view that identifies the transaction
- *error\_message\_number*: The message number of the ANYDATA object in the *in\_anydata* parameter, starting at 1
- *messaging\_default\_processing*: If TRUE, then the apply component continues processing the message in the *in\_anydata* parameter, which can include executing DML or DDL statements and invoking apply handlers.

If FALSE, then the apply component skips processing the message in the *in\_anydata* parameter and moves on to the next message in the *in\_anydata* parameter.

- *out\_anydata*: The ANYDATA object processed by the user procedure and used by the apply component if *messaging\_default\_processing* is TRUE.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the *messaging\_default\_processing* parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the in\_anydata parameter is a row LCR, then the out\_anydata parameter must be row LCR if the messaging\_default\_processing parameter is set to TRUE.
- If the ANYDATA object in the in\_anydata parameter is a DDL LCR, then the out\_anydata parameter must be DDL LCR if the messaging\_default\_processing parameter is set to TRUE.
- The user who runs the user procedure must have SELECT privilege on the DBA\_APPLY\_ERROR data dictionary view.

---

**Note:** LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

---

#### **The EXECUTE\_ERROR Procedure and XStream Outbound Servers**

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

#### **The EXECUTE\_ERROR Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## GET\_ERROR\_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two `OUT` parameters. These `OUT` parameters contain the destination queue into which the message should be enqueued, if one exists, and whether the message should be executed. The destination queue is specified using the `SET_ENQUEUE_DESTINATION` procedure, and the execution directive is specified using the `SET_EXECUTE` procedure.

### See Also:

- [SET\\_ENQUEUE\\_DESTINATION Procedure](#) on page 21-46
- [SET\\_EXECUTE Procedure](#) on page 21-48

## Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE (
    message_number          IN    NUMBER,
    local_transaction_id    IN    VARCHAR2,
    destination_queue_name  OUT   VARCHAR2,
    execute                 OUT   BOOLEAN)
RETURN ANYDATA;
```

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE (
    message_number          IN    NUMBER,
    local_transaction_id    IN    VARCHAR2)
RETURN ANYDATA;
```

## Parameters

**Table 21–13** GET\_ERROR\_MESSAGE Function Parameters

Parameter	Description
message_number	The identification number of the message. This number identifies the position of the message in the transaction. Query the <code>DBA_APPLY_ERROR</code> data dictionary view to view the message number of each apply error.
local_transaction_id	Identifier of the error transaction for which to return a message
destination_queue_name	Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains <code>NULL</code> .
execute	Contains <code>TRUE</code> if the message should be executed Contains <code>FALSE</code> if the message should not be executed

## Usage Notes

The following usage notes apply to this procedure:

- [The GET\\_ERROR\\_MESSAGE Procedure and XStream Outbound Servers](#)
- [The GET\\_ERROR\\_MESSAGE Procedure and XStream Inbound Servers](#)

**The GET\_ERROR\_MESSAGE Procedure and XStream Outbound Servers**

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

**The GET\_ERROR\_MESSAGE Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## REMOVE\_STMT\_HANDLER

This procedure removes a statement DML handler for a specified operation on a specified database object from a single apply component or from all apply components in the database.

**See Also:**

- [Chapter 147, "DBMS\\_STREAMS\\_HANDLER\\_ADM"](#)
- *Oracle Streams Concepts and Administration*

### Syntax

```
DBMS_APPLY_ADM.REMOVE_STMT_HANDLER(
  object_name      IN  VARCHAR2,
  operation_name   IN  VARCHAR2,
  handler_name     IN  VARCHAR2,
  apply_name       IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 21–14 REMOVE\_STMT\_HANDLER Procedure Parameters**

Parameter	Description
object_name	The name of the source object specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.  If NULL, then the procedure raises an error.
operation_name	The name of the operation, which can be specified as: <ul style="list-style-type: none"> <li>▪ INSERT</li> <li>▪ UPDATE</li> <li>▪ DELETE</li> </ul> If NULL, then the procedure raises an error.
handler_name	The name of the statement DML handler.  If NULL, then the procedure raises an error.
apply_name	The name of the apply component that uses the statement DML handler.  If NULL, then the procedure removes the statement DML handler from all apply components in the database.

### Usage Notes

The following usage notes apply to this procedure:

- [The REMOVE\\_STMT\\_HANDLER Procedure and XStream Outbound Servers](#)
- [The REMOVE\\_STMT\\_HANDLER Procedure and XStream Inbound Servers](#)

**The REMOVE\_STMT\_HANDLER Procedure and XStream Outbound Servers**

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

**The REMOVE\_STMT\_HANDLER Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## SET\_CHANGE\_HANDLER Procedure

This procedure sets or unsets a change handler that tracks changes for a specified operation on a specified database object for a single apply component.

A change handler is a special type of statement DML handler that tracks table changes and was created by either the `DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE` procedure or this `SET_CHANGE_HANDLER` procedure. Information about change handlers is stored in the `ALL_APPLY_CHANGE_HANDLERS` and `DBA_APPLY_CHANGE_HANDLERS` views.

This procedure automatically generates the statement that is added to the change handler based on values specified in the procedure parameters. You should only run this procedure when a configuration that tracks database changes exists.

---

---

**Note:** Use the [MAINTAIN\\_CHANGE\\_TABLE Procedure](#) to configure an environment that tracks table changes

---

---

### Syntax

```
DBMS_APPLY_ADM.SET_CHANGE_HANDLER (
  change_table_name  IN  VARCHAR2,
  source_table_name  IN  VARCHAR2,
  capture_values     IN  VARCHAR2,
  apply_name         IN  VARCHAR2,
  operation_name     IN  VARCHAR2,
  change_handler_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 21–15** SET\_CHANGE\_HANDLER Procedure Parameters

Parameter	Description
<code>change_table_name</code>	The table that records changes to the source table. Specify the table as <code>[schema_name.] table_name</code> . For example, <code>hr.jobs_change_table</code> . If the schema is not specified, then the current user is the default. If <code>NULL</code> , then the procedure raises an error.
<code>source_table_name</code>	The table at the source database for which changes are recorded. Specify the table as <code>[schema_name.] table_name</code> . For example, <code>hr.jobs</code> . If the schema is not specified, then the current user is the default. If <code>NULL</code> , then the procedure raises an error.

**Table 21–15 (Cont.) SET\_CHANGE\_HANDLER Procedure Parameters**

Parameter	Description
capture_values	<p>Specify which values to record in the change table when update operations are performed on the source table:</p> <ul style="list-style-type: none"> <li>■ old - To record the original values for an updated column in the source table</li> <li>■ new - To record the new values for an updated column in the source table</li> <li>■ * - To record both the original and the new values for an updated column in the source table</li> </ul> <p>If NULL, then the procedure raises an error.</p> <p><b>Note:</b> For insert operations, only new column values are captured. For delete operations, only old column values are captured.</p>
apply_name	<p>The name of the apply component that applies changes to the change table. Do not specify an owner.</p> <p>If NULL, then the procedure raises an error.</p>
operation_name	<p>The name of the operation, which can be specified as:</p> <ul style="list-style-type: none"> <li>■ INSERT</li> <li>■ UPDATE</li> <li>■ DELETE</li> </ul> <p>If NULL, then the procedure raises an error.</p> <p><b>Note:</b> Change handlers cannot be specified for LOB operations.</p>
change_handler_name	<p>The name of the change handler.</p> <p>If the specified change handler exists, then a statement is added to the existing handler. Ensure that the existing change handler is for the same operation on the same table as the settings for the <code>operation_name</code> and <code>source_table_name</code> parameters, respectively. If the existing handler is for a different operation or table, then an apply error results when the handler is invoked.</p> <p>If non-NULL and the specified change handler does not exist, then this procedure creates the change handler.</p> <p>If NULL and a change handler exists for the same operation on the same table as the settings for the <code>operation_name</code> and <code>source_table_name</code> parameters, respectively, then the existing change handler is removed.</p> <p>If NULL and the specified change handler does not exist, then the procedure raises an error.</p> <p><b>See Also:</b> "Usage Notes" on page 21-39 for more information about this parameter.</p>

## Usage Notes

The following usage notes apply to this procedure:

- [Checking for an Existing Change Handler](#)
- [The SET\\_CHANGE\\_HANDLER Procedure and XStream Outbound Servers](#)
- [The SET\\_CHANGE\\_HANDLER Procedure and XStream Inbound Servers](#)

**Checking for an Existing Change Handler**

To check for an existing change handler for a specific operation on a specific source table, run the following query:

```
SELECT HANDLER_NAME, APPLY_NAME FROM DBA_APPLY_CHANGE_HANDLERS
WHERE operation_name      = 'operation'
   AND source_table_owner = 'source_table_owner'
   AND source_table_name  = 'source_table_name'
   AND change_table_owner = 'change_table_owner'
   AND change_table_name  = 'change_table_name';
```

where:

- *operation* is operation specified for the new handler, either INSERT, UPDATE, or DELETE
- *source\_table\_owner* is the owner of the source table
- *source\_table\_name* is the name of the source table
- *change\_table\_owner* is the owner of the change table
- *change\_table\_name* is the name of the change table

**The SET\_CHANGE\_HANDLER Procedure and XStream Outbound Servers**

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

**The SET\_CHANGE\_HANDLER Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## SET\_DML\_HANDLER Procedure

This procedure sets or unsets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database. The user procedure alters the apply behavior for the specified operation on the specified object.

### Syntax

```
DBMS_APPLY_ADM.SET_DML_HANDLER (
  object_name      IN  VARCHAR2,
  object_type      IN  VARCHAR2,
  operation_name   IN  VARCHAR2,
  error_handler    IN  BOOLEAN   DEFAULT FALSE,
  user_procedure   IN  VARCHAR2,
  apply_database_link IN  VARCHAR2 DEFAULT NULL,
  apply_name       IN  VARCHAR2 DEFAULT NULL,
  assemble_lob    IN  BOOLEAN   DEFAULT TRUE);
```

### Parameters

**Table 21–16 SET\_DML\_HANDLER Procedure Parameters**

Parameter	Description
object_name	The name of the source object specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.
object_type	The type of the source object. Currently, <i>TABLE</i> is the only possible source object type.
operation_name	The name of the operation, which can be specified as: <ul style="list-style-type: none"> <li>▪ <i>INSERT</i></li> <li>▪ <i>UPDATE</i></li> <li>▪ <i>DELETE</i></li> <li>▪ <i>LOB_UPDATE</i></li> <li>▪ <i>DEFAULT</i></li> </ul> <p>For example, suppose you run this procedure twice for the <i>hr.employees</i> table. In one call, you set <i>operation_name</i> to <i>UPDATE</i> and <i>user_procedure</i> to <i>employees_update</i>. In another call, you set <i>operation_name</i> to <i>INSERT</i> and <i>user_procedure</i> to <i>employees_insert</i>. Both times, you set <i>error_handler</i> to <i>FALSE</i>. In this case, the <i>employees_update</i> procedure is run for <i>UPDATE</i> operations on the <i>hr.employees</i> table, and the <i>employees_insert</i> procedure is run for <i>INSERT</i> operations on the <i>hr.employees</i> table.</p> <p>Specify <i>DEFAULT</i> to set the procedure as the default procedure DML handler for the database object. In this case, the procedure DML handler is used for any <i>INSERT</i>, <i>UPDATE</i>, <i>DELETE</i>, and <i>LOB_WRITE</i> on the database object, if another procedure DML handler is not specifically set for the operation on the database object.</p>

**Table 21–16 (Cont.) SET\_DML\_HANDLER Procedure Parameters**

Parameter	Description
error_handler	<p>If TRUE, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions.</p> <p>If FALSE, then the handler being set is run for all row LCRs involving the specified operation on the specified object.</p>
user_procedure	<p>A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a procedure DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when an apply error is encountered.</p> <p>Specify NULL to unset a procedure DML handler that is set for the specified operation on the specified object.</p>
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.
apply_name	<p>The name of the apply component that uses the procedure DML handler or error handler.</p> <p>If NULL, then the procedure sets the procedure DML handler or error handler as a general handler for all apply components in the database.</p> <p>If the user_procedure parameter is set to NULL to unset a handler, and the handler being unset is set for a specific apply component, then use the apply_name parameter to specify the apply component to unset the handler.</p>
assemble_lob	<p>If TRUE, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly.</p> <p>If FALSE, then LOB assembly is not used for LOB columns in LCRs processed by the handler.</p>

## Usage Notes

The following usage notes apply to this procedure:

- [Run the SET\\_DML\\_HANDLER Procedure at the Destination Database](#)
- [Procedure DML Handlers and Error Handlers](#)
- [The apply\\_name Parameter](#)
- [Signature of a DML Handler Procedure or Error Handler Procedure](#)
- [LOB Assembly](#)
- [The SET\\_DML\\_HANDLER Procedure and XStream Outbound Servers](#)
- [The SET\\_DML\\_HANDLER Procedure and XStream Inbound Servers](#)

### Run the SET\_DML\_HANDLER Procedure at the Destination Database

Run this procedure at the destination database. The SET\_DML\_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

### Procedure DML Handlers and Error Handlers

If the `error_handler` parameter is set to `TRUE`, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the `error_handler` parameter is set to `FALSE`, then the user procedure is a procedure DML handler, not an error handler, and a procedure DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a procedure DML handler or an error handler for a particular operation on an object. It cannot set both a procedure DML handler and an error handler for the same object and operation.

---

**Note:** Currently, setting an error handler for an apply component that is applying changes to a non-Oracle database is not supported.

---

### The apply\_name Parameter

If the `apply_name` parameter is non-NULL, then the procedure DML handler or error handler is set for the specified apply component. In this case, this handler is not invoked for other apply components at the local destination database. If the `apply_name` parameter is NULL, the default, then the handler is set as a general handler for all apply components at the destination database. When a handler is set for a specific apply component, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A procedure DML handler named `handler_hr` is specified for an apply component named `apply_hr` for UPDATE operations on the `hr.employees` table.
- A general procedure DML handler named `handler_gen` also exists for UPDATE operations on the `hr.employees` table.

In this case, the `apply_hr` apply component uses the `handler_hr` procedure DML handler for UPDATE operations on the `hr.employees` table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

### Signature of a DML Handler Procedure or Error Handler Procedure

You can use the SET\_DML\_HANDLER procedure to set either a procedure DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the *package\_name* must be specified. The user who invokes the SET\_DML\_HANDLER procedure must have EXECUTE privilege on the specified procedure. Also, if the *schema\_name* is not specified, then the user who invokes the SET\_DML\_HANDLER procedure is the default.

For example, suppose the *procedure\_name* has the following properties:

- *hr* is the *schema\_name*.
- *apply\_pkg* is the *package\_name*.
- *employees\_default* is the *procedure\_name*.

In this case, specify the following:

```
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.
- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET\_KEY\_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET\_KEY\_COLUMNS procedure. If there is no specified key, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFs, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about and restrictions regarding procedure DML handlers and LOB, LONG, and LONG RAW data types

The procedure specified in the *user\_procedure* parameter must have the following signature:

```
PROCEDURE user_procedure (  
    parameter_name IN ANYDATA);
```

Here, *user\_procedure* stands for the name of the procedure and *parameter\_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

**See Also:** [Chapter 248, "Logical Change Record TYPES"](#) for more information about LCRs

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (  
    message          IN  ANYDATA,  
    error_stack_depth IN  NUMBER,  
    error_numbers    IN  DBMS_UTILITY.NUMBER_ARRAY,  
    error_messages   IN  emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the EXECUTE member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use `error_numbers(1)` and `error_messages(1)`.

---

---

**Note:**

- Each parameter is required and must have the specified data type. However, you can change the names of the parameters.
  - The `emsg_array` value must be a user-defined array that is a table of type `VARCHAR2` with at least 76 characters.
- 
- 

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply component.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

**LOB Assembly**

Do not modify `LONG`, `LONG RAW`, or nonassembled LOB column data in an LCR with procedure DML handlers, error handlers, or custom rule-based transformation functions. Procedure DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

**The SET\_DML\_HANDLER Procedure and XStream Outbound Servers**

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

**The SET\_DML\_HANDLER Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## SET\_ENQUEUE\_DESTINATION Procedure

This procedure sets the queue where the apply component automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_ENQUEUE`.
- The value is an ANYDATA instance containing the queue name specified as a VARCHAR2.

### Syntax

```
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
    rule_name           IN VARCHAR2,
    destination_queue_name IN VARCHAR2);
```

### Parameters

**Table 21–17 SET\_ENQUEUE\_DESTINATION Procedure Parameters**

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.]rule_name</code> . For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>destination_queue_name</code>	<p>The name of the queue into which the apply component enqueues the message. Specify the queue in the form <code>[schema_name.]queue_name</code>. Only local queues can be specified.</p> <p>For example, to specify a queue in the <code>hr</code> schema named <code>streams_queue</code>, enter <code>hr.streams_queue</code>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then an existing name-value pair with the name <code>APPLY\$_ENQUEUE</code> is removed. If no name-value pair exists with the name <code>APPLY\$_ENQUEUE</code> for the rule, then no action is taken.</p> <p>If non-NULL and a name-value pair exists for the rule with the name <code>APPLY\$_ENQUEUE</code>, then it is removed, and a new name-value pair with the value specified by this parameter is added.</p>

### Usage Notes

The following usage notes apply to this procedure:

- [The SET\\_ENQUEUE\\_DESTINATION Procedure and Apply Handlers](#)
- [Considerations for the SET\\_ENQUEUE\\_DESTINATION Procedure](#)
- [The SET\\_ENQUEUE\\_DESTINATION Procedure and XStream Outbound Servers](#)

- [The SET\\_ENQUEUE\\_DESTINATION Procedure and XStream Inbound Servers](#)

### **The SET\_ENQUEUE\_DESTINATION Procedure and Apply Handlers**

If an apply handler, such as a procedure DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

### **Considerations for the SET\_ENQUEUE\_DESTINATION Procedure**

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply component tries to enqueue a message into it.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply component using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply component. If the rule is in the negative rule set for an apply component, then the apply component does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply component rule sets.

### **The SET\_ENQUEUE\_DESTINATION Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

### **The SET\_ENQUEUE\_DESTINATION Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## SET\_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply component.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to `TRUE` for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_EXECUTE`.
- The value is an `ANYDATA` instance that contains `NO` as a `VARCHAR2`. When the value is `NO`, an apply component does not execute the message and does not send the message to any apply handler.

### Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE(
  rule_name IN VARCHAR2,
  execute   IN BOOLEAN);
```

### Parameters

**Table 21–18 SET\_EXECUTE Procedure Parameters**

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as [ <i>schema_name.</i> ] <i>rule_name</i> . For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>execute</code>	<p>If <code>TRUE</code>, then the procedure removes the name-value pair with the name <code>APPLY\$_EXECUTE</code> for the specified rule. Removing the name-value pair means that the apply component executes messages that satisfy the rule. If no name-value pair with name <code>APPLY\$_EXECUTE</code> exists for the rule, then no action is taken.</p> <p>If <code>FALSE</code>, then the procedure adds a name-value pair to the rule's action context. The name is <code>APPLY\$_EXECUTE</code> and the value is <code>NO</code>. An apply component does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair exists for the rule with the name <code>APPLY\$_EXECUTE</code>, then it is removed, and a new one with the value <code>NO</code> is added.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>

### Usage Notes

The following usage notes apply to this procedure:

- [Considerations for the SET\\_EXECUTE Procedure](#)
- [The SET\\_EXECUTE Procedure and XStream Outbound Servers](#)
- [The SET\\_EXECUTE Procedure and XStream Inbound Servers](#)

**Considerations for the SET\_EXECUTE Procedure**

The following are considerations for using this procedure:

- If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply component for the apply component to follow the execution directive. If the rule is in the negative rule set for an apply component, then the apply component ignores the execution directive for the rule.

**The SET\_EXECUTE Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

**The SET\_EXECUTE Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## SET\_GLOBAL\_INSTANTIATION\_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply component.

### Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 21–19 SET\_GLOBAL\_INSTANTIATION\_SCN Procedure Parameters**

Parameter	Description
source_database_name	The global name of the source database. For example, DBS1.NET.  If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user.  If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables.  <b>Note:</b> If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

## Usage Notes

The following usage notes apply to this procedure:

- [Instantiation SCNs and DDL LCRs](#)
- [The recursive Parameter](#)
- [Considerations for the SET\\_GLOBAL\\_INSTANTIATION\\_SCN Procedure](#)
- [The SET\\_GLOBAL\\_INSTANTIATION\\_SCN Procedure and XStream Outbound Servers](#)
- [The SET\\_GLOBAL\\_INSTANTIATION\\_SCN Procedure and XStream Inbound Servers](#)

### See Also:

- [SET\\_SCHEMA\\_INSTANTIATION\\_SCN Procedure](#) on page 21-66
- [SET\\_TABLE\\_INSTANTIATION\\_SCN Procedure](#) on page 21-69
- [LCR\\$\\_DDL\\_RECORD Type](#) on page 248-6 for more information about DDL LCRs
- *Oracle Streams Replication Administrator's Guide*

### Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, and `base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of CREATE USER.

### The recursive Parameter

If the `recursive` parameter is set to TRUE, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to FALSE, then this procedure does not set the instantiation SCN for any schemas or tables.

### Considerations for the SET\_GLOBAL\_INSTANTIATION\_SCN Procedure

The following are considerations for using this procedure:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the SYS or SYSTEM schemas.

**The SET\_GLOBAL\_INSTANTIATION\_SCN Procedure and XStream Outbound Servers**

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

**See Also:** *Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

**The SET\_GLOBAL\_INSTANTIATION\_SCN Procedure and XStream Inbound Servers**

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

## SET\_KEY\_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

### Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS (
  object_name          IN  VARCHAR2,
  column_list         IN  VARCHAR2,
  apply_database_link IN  VARCHAR2 DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS (
  object_name          IN  VARCHAR2,
  column_table        IN  DBMS_UTILITY.NAME_ARRAY,
  apply_database_link IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 21–20 SET\_KEY\_COLUMNS Procedure Parameters**

Parameter	Description
<code>object_name</code>	The name of the table specified as <code>[schema_name.] object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. If the apply component is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.
<code>column_list</code>	A comma-delimited list of the columns in the table to use as the substitute primary key, with no spaces between the column names.  If the <code>column_list</code> parameter is empty or NULL, then the current set of key columns is removed.
<code>column_table</code>	A PL/SQL associative array of type <code>DBMS_UTILITY.NAME_ARRAY</code> of the columns in the table to use as the substitute primary key. The index for <code>column_table</code> must be 1-based, increasing, dense, and terminated by a NULL.  If the <code>column_table</code> parameter is empty or NULL, then the current set of key columns is removed.
<code>apply_database_link</code>	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

### Usage Notes

The following usage notes apply to this procedure:

- [Considerations for the SET\\_KEY\\_COLUMNS Procedure](#)
- [Duplicate Rows and Substitute Primary Key Columns](#)
- [The SET\\_KEY\\_COLUMNS Procedure and XStream Outbound Servers](#)
- [The SET\\_KEY\\_COLUMNS Procedure and XStream Inbound Servers](#)

### Considerations for the SET\_KEY\_COLUMNS Procedure

The following are considerations for using this procedure:

- When not empty, the specified set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object has primary key columns and you want to use those primary key columns as the key.
- Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.
- Unlike true primary keys, columns specified as substitute key column columns can contain NULLs. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- Do not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

### Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when all of the column values are identical for two or more rows in the table, excluding LOB, LONG, and LONG RAW columns. You can specify substitute primary key columns for a table at a destination database using by the SET\_KEY\_COLUMNS procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to Y, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that supplemental logging is specified at source database for the columns specified as substitute key columns at the destination database. The substitute key columns must be in an unconditional log group at the source database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

When there is no key for a table and the `allow_duplicate_rows` apply component parameter is set to Y, a single row LCR with an UPDATE or DELETE command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the

source database, then both rows are deleted at the destination database when the row LCRs resulting from the source change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply component ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply component determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, LONG, and LONG RAW columns). Therefore, an apply component always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply component does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply component raises an error regardless of the setting for the `allow_duplicate_rows` apply component parameter.

**See Also:** [SET\\_PARAMETER Procedure](#) on page 21-56 for more information about the `allow_duplicate_rows` apply component parameter

### **The SET\_KEY\_COLUMNS Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

### **The SET\_KEY\_COLUMNS Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## SET\_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

### Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (
    apply_name IN VARCHAR2,
    parameter  IN VARCHAR2,
    value      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 21–21 SET\_PARAMETER Procedure Parameters**

Parameter	Description
apply_name	The apply component name. Do not specify an owner.
parameter	The name of the parameter you are setting. See " <a href="#">Apply Component Parameters</a> " on page 21-56 for a list of these parameters.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.

### Apply Component Parameters

The following table lists the parameters for an apply component.

---

---

**Note:** Starting with Oracle Database 11g Release 2 (11.2.0.2), this subprogram includes the following new parameters: apply\_sequence\_nextval, compare\_key\_only, grouptransops, ignore\_transaction, and max\_sga\_size.

---

---

**Table 21–22 Apply Component Parameters**

Parameter Name	Possible Values	Default	Description
allow_duplicate_rows	Y or N	N	<p>If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply component only updates or deletes one of the rows.</p> <p>If N, then the apply component raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table.</p> <p><b>Note:</b> Regardless of the setting for this parameter, apply components do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64 and "Duplicate Rows and Substitute Primary Key Columns" on page 21-54</p>
apply_sequence_nextval	Y or N	N for apply processes Y for XStream outbound servers and XStream inbound servers	<p>Controls whether the apply component checks and adjusts sequence values.</p> <p>If Y, then the apply component checks and adjusts sequence values.</p> <p>For ascending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or greater than the source sequence values.</p> <p>For descending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or less than the source sequence values.</p> <p>If N, then the apply component does not check or adjust sequence values.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream capabilities are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See <i>Oracle Database XStream Guide</i> for information about enabling XStream capabilities.</p> <p><b>See Also:</b> <a href="#">SET_PARAMETER Procedure</a> on page 32-39 for information about the capture_sequence_nextval capture process parameter</p>

**Table 21–22 (Cont.) Apply Component Parameters**

Parameter Name	Possible Values	Default	Description
commit_serialization	DEPENDENT_TRANSACTION or FULL	DEPENDENT_TRANSACTION	<p>The order in which applied transactions are committed.</p> <p>Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database.</p> <p>You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the <code>commit_serialization</code> apply parameter. This parameter has the following settings:</p> <ul style="list-style-type: none"> <li>▪ <code>DEPENDENT_TRANSACTION</code> - The apply component can commit nondependent transactions in any order. Performance is best if you specify <code>DEPENDENT_TRANSACTION</code>.</li> <li>▪ <code>FULL</code> - The apply component commits applied transactions in the order in which they were committed at the source database.</li> </ul> <p>Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies.</p> <p>If you specify <code>DEPENDENT_TRANSACTION</code>, then a destination database might commit changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order:</p> <ol style="list-style-type: none"> <li>1. Transaction A</li> <li>2. Transaction B</li> </ol> <p>At the destination database, these transactions might be committed in the opposite order:</p> <ol style="list-style-type: none"> <li>1. Transaction B</li> <li>2. Transaction A</li> </ol> <p>If you specify <code>DEPENDENT_TRANSACTION</code> and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add <code>RELY</code> constraints to account for the application constraints. See <i>Oracle Streams Concepts and Administration</i> for information about virtual dependency definitions and <i>Oracle Database Data Warehousing Guide</i> for information about <code>RELY</code> constraints.</p> <p><b>Note:</b> The <code>NONE</code> value is deprecated for this parameter. It is replaced by the <code>DEPENDENT_TRANSACTION</code> value.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>

**Table 21–22 (Cont.) Apply Component Parameters**

Parameter Name	Possible Values	Default	Description
compare_key_only	Y or N	N for apply processes Y for XStream inbound servers	<p>If Y, then disables automatic conflict detection and only uses primary and unique key columns to identify the table row for a row LCR.</p> <p>If N, then enables automatic conflict detection and uses all of the old values in a row LCR to identify the table row for a row LCR.</p> <p><b>Note:</b> The COMPARE_OLD_VALUES procedure in this package can disable comparison of old values for specified columns during apply. See <a href="#">COMPARE_OLD_VALUES Procedure</a> on page 21-16.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64 and <i>Oracle Streams Replication Administrator's Guide</i> for information about automatic conflict detection</p>
disable_on_error	Y or N	Y	<p>If Y, then the apply component is disabled on the first unresolved error, even if the error is not irrecoverable.</p> <p>If N, then the apply component continues regardless of unresolved errors.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>
disable_on_limit	Y or N	N	<p>If Y, then the apply component is disabled if the apply component terminates because it reached a value specified by the time_limit parameter or transaction_limit parameter.</p> <p>If N, then the apply component is restarted immediately after stopping because it reached a limit.</p> <p>When an apply component is restarted, it gets a new session identifier, and the processes associated with the apply component also get new session identifiers. However, the coordinator process number (APnn) remains the same.</p>
grouptransops	A positive integer from 1 to 10000	250 for apply processes and XStream inbound servers 10000 for XStream outbound servers	<p>The minimum number of LCRs that can be grouped into a single transaction. The commit LCR for a transaction is not included in the LCR count for the transaction.</p> <p>This parameter enables an apply component to group LCRs from multiple transactions into a single transaction. The apply component groups only LCRs that are part of committed transactions.</p> <p>If a transaction has more LCRs than the setting for this parameter, then the transaction is applied as a single transaction. The apply component does not split a transaction into separate transactions.</p> <p>This parameter only takes effect if the parallelism parameter setting is 1. The grouptransops parameter is ignored if the parallelism parameter setting is greater than 1.</p> <p><b>Note:</b> This parameter is intended for XStream outbound servers and inbound servers. An Oracle Streams apply process ignores this parameter unless XStream capabilities are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See <i>Oracle Database XStream Guide</i> for information about enabling XStream capabilities.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>

**Table 21–22 (Cont.) Apply Component Parameters**

Parameter Name	Possible Values	Default	Description
ignore_transaction	A valid source transaction ID or NULL	NULL	<p>Instructs the apply component to ignore the specified transaction from the source database, effective immediately.</p> <p>Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database.</p> <p>To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_APPLY_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter.</p> <p>If NULL, then the apply component ignores this parameter.</p> <p><b>Note:</b> An apply component ignores this parameter for transactions that were not captured by an Oracle Streams capture process.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>
max_sga_size	A positive integer	INFINITE	<p>Controls the amount of system global area (SGA) memory allocated specifically to the apply component, in megabytes.</p> <p>The memory is allocated for the duration of the apply component's session and is released when the apply component becomes disabled.</p> <p><b>Note:</b> The sum of SGA memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter.</p> <p>If NULL, then the apply component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See <i>Oracle Database XStream Guide</i> for information about enabling XStream capabilities.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>
maximum_scn	A valid SCN or INFINITE	INFINITE	<p>The apply component is disabled before applying a transaction with a commit SCN greater than or equal to the value specified.</p> <p>If INFINITE, then the apply component runs regardless of the SCN value.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>

**Table 21–22 (Cont.) Apply Component Parameters**

Parameter Name	Possible Values	Default	Description
parallelism	A positive integer	4	<p>The number of apply servers that can concurrently apply transactions.</p> <p>The reader server and the apply server process names are <i>ASnn</i>, where <i>nn</i> can include letters and numbers. The total number of <i>ASnn</i> processes is the value of the <code>parallelism</code> parameter plus one.</p> <p>For example, if <code>parallelism</code> is set to 4, then an apply component uses a total of five <i>ASnn</i> processes. In this case, there is one reader server and four apply servers.</p> <p>Setting the <code>parallelism</code> parameter to a number higher than the number of available operating system user processes can disable the apply component. Make sure the <code>PROCESSES</code> initialization parameter is set appropriately when you set the <code>parallelism</code> parameter.</p> <p><b>Note:</b> When the value of this parameter is changed from 1 to a higher value for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. When the value of this parameter is greater than 1, and the parameter value is decreased or increased, the apply component does not restart.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>
preserve_encryption	Y or N	Y	<p>Whether to preserve encryption for columns encrypted using transparent data encryption.</p> <p>If <code>Y</code>, then columns in tables at the destination database must be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then an error is raised when the apply component tries to apply the row LCRs.</p> <p>If <code>N</code>, then columns in tables at the destination database do not need to be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then the apply component applies the changes in the row LCRs.</p> <p><b>Note:</b> When the value of this parameter is changed for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>

**Table 21–22 (Cont.) Apply Component Parameters**

Parameter Name	Possible Values	Default	Description
rtrim_on_implicit_conversion	Y or N	Y	<p>Whether to remove blank padding from the right end of a column when automatic data type conversion is performed during apply.</p> <p>If Y, then blank padding is removed when a CHAR or NCHAR source column in a row LCR is converted to a VARCHAR2, NVARCHAR2, or CLOB column in a table.</p> <p>If N, then blank padding is preserved in the column.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64 and <i>Oracle Streams Concepts and Administration</i> for information about automatic data type conversion during apply</p>
startup_seconds	0, a positive integer, or INFINITE	0	<p>The maximum number of seconds to wait for another instantiation of the same apply component to finish. If the other instantiation of the same apply component does not finish within this time, then the apply component does not start.</p> <p>If INFINITE, then an apply component does not start until another instantiation of the same apply component finishes.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>
time_limit	A positive integer or INFINITE	INFINITE	<p>The apply component stops as soon as possible after the specified number of seconds since it started.</p> <p>If INFINITE, then the apply component continues to run until it is stopped explicitly.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>
trace_level	0 or a positive integer	0	<p>Set this parameter only under the guidance of Oracle Support Services.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>
transaction_limit	A positive integer or INFINITE	INFINITE	<p>The apply component stops after applying the specified number of transactions.</p> <p>If INFINITE, then the apply component continues to run regardless of the number of transactions applied.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>

**Table 21-22 (Cont.) Apply Component Parameters**

Parameter Name	Possible Values	Default	Description
txn_age_spill_threshold	A positive integer or INFINITE	900	<p>The apply component begins to spill messages from memory to hard disk for a particular transaction when the amount of time that any message in the transaction has been in memory exceeds the specified number. The parameter specifies the age in seconds.</p> <p>When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.</p> <p>Message spilling occurs at the transaction level. For example, if this parameter is set to 900, and the reader server of an apply component detects that one message in a transaction has been in memory longer than 900 seconds, then all of the messages in the transaction spill from memory to hard disk.</p> <p>If INFINITE, then the apply component does not spill messages to the hard disk based on the age of the messages.</p> <p>Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>

**Table 21–22 (Cont.) Apply Component Parameters**

Parameter Name	Possible Values	Default	Description
txn_lcr_spill_threshold	A positive integer or INFINITE	10000	<p>The apply component begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less.</p> <p>If the reader server of an apply component has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way:</p> <ol style="list-style-type: none"> <li>1. Reads the first 10,000 messages in the transaction into memory</li> <li>2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000</li> <li>3. Reads the next 100 messages in the transaction into memory</li> <li>4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100</li> <li>5. Reads the next 100 messages in the transaction into memory</li> </ol> <p>The apply component applies the first 10,100 messages from the hard disk and the last 100 messages from memory.</p> <p>When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.</p> <p>Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply component is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages.</p> <p>If INFINITE, then the apply component does not spill messages to the hard disk based on the number of messages in a transaction.</p> <p>Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component.</p> <p><b>See Also:</b> "Usage Notes" on page 21-64</p>
write_alert_log	Y or N	Y	<p>If Y, then the apply component writes a message to the alert log on exit.</p> <p>If N, then the apply component does not write a message to the alert log on exit.</p> <p>The message specifies the reason why the apply component stopped.</p>

## Usage Notes

The following usage notes apply to this procedure:

- [Delays Are Possible Before New Parameter Settings Take Effect](#)

- [Parameters Interpreted as Positive Integers](#)
- [Parameters with a System Change Number \(SCN\) Setting](#)
- [The SET\\_PARAMETER Procedure and XStream Outbound Servers](#)
- [The SET\\_PARAMETER Procedure and XStream Inbound Servers](#)

### **Delays Are Possible Before New Parameter Settings Take Effect**

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

### **Parameters Interpreted as Positive Integers**

For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify `INFINITE` for larger values.

### **Parameters with a System Change Number (SCN) Setting**

For parameters that require an SCN setting, any valid SCN value can be specified.

### **The SET\_PARAMETER Procedure and XStream Outbound Servers**

Outbound servers ignore the settings for the following apply parameters:

- `allow_duplicate_rows`
- `commit_serialization`
- `compare_key_only`
- `disable_on_error`
- `parallelism`
- `preserve_encryption`
- `rtrim_on_implicit_conversion`

The `commit_serialization` parameter is always set to `FULL` for an outbound server, and the `parallelism` parameter is always set to 1 for an outbound server.

You can use the other apply parameters with outbound servers.

---

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

---

### **The SET\_PARAMETER Procedure and XStream Inbound Servers**

Inbound servers ignore the settings for the `ignore_transaction` and `maximum_scn` apply component parameters. You can use all of the other apply component parameters with inbound servers.

The default setting for the `compare_key_only` parameter for an inbound server is `Y`.

The default setting for the `parallelism` parameter for an inbound server is 4.

---

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

---

## SET\_SCHEMA\_INSTANTIATION\_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply component.

### Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
  source_schema_name  IN  VARCHAR2,
  source_database_name IN  VARCHAR2,
  instantiation_scn   IN  NUMBER,
  apply_database_link IN  VARCHAR2  DEFAULT NULL,
  recursive           IN  BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 21–23 SET\_SCHEMA\_INSTANTIATION\_SCN Procedure Parameters**

Parameter	Description
source_schema_name	The name of the source schema. For example, hr.  When setting an instantiation SCN for schema, always specify the name of the schema at the source database, even if a rule-based transformation or apply handler is configured to change the schema name.
source_database_name	The global name of the source database. For example, DBS1.NET.  If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.

**Table 21-23 (Cont.) SET\_SCHEMA\_INSTANTIATION\_SCN Procedure Parameters**

Parameter	Description
<code>recursive</code>	<p>If <code>TRUE</code>, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the <code>ALL_TABLES</code> data dictionary view at the source database under the security context of the current user.</p> <p>If <code>FALSE</code>, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables</p> <p><b>Note:</b> If <code>recursive</code> is set to <code>TRUE</code>, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the <code>ALL_TABLES</code> or <code>DBA_TABLES</code> data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.</p>

## Usage Notes

The following usage notes apply to this procedure:

- [The SET\\_SCHEMA\\_INSTANTIATION\\_SCN Procedure and LCRs](#)
- [Instantiation SCNs and DDL LCRs](#)
- [The recursive Parameter](#)
- [The SET\\_SCHEMA\\_INSTANTIATION\\_SCN Procedure and XStream Outbound Servers](#)
- [The SET\\_SCHEMA\\_INSTANTIATION\\_SCN Procedure and XStream Inbound Servers](#)

### See Also:

- [SET\\_GLOBAL\\_INSTANTIATION\\_SCN Procedure](#) on page 21-50
- [SET\\_TABLE\\_INSTANTIATION\\_SCN Procedure](#) on page 21-69
- [LCR\\$\\_DDL\\_RECORD Type](#) on page 248-6 for more information about DDL LCRs
- *Oracle Streams Replication Administrator's Guide*

### The SET\_SCHEMA\_INSTANTIATION\_SCN Procedure and LCRs

Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

### Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-NULL `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

### The recursive Parameter

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

### The SET\_SCHEMA\_INSTANTIATION\_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

**See Also:** *Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

### The SET\_SCHEMA\_INSTANTIATION\_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

## SET\_TABLE\_INSTANTIATION\_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply component.

### Syntax

```
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
    source_object_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 21–24 SET\_TABLE\_INSTANTIATION\_SCN Procedure Parameters**

Parameter	Description
source_object_name	The name of the source object specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.  When setting an instantiation SCN for a database object, always specify the name of the schema and database object at the source database, even if a rule-based transformation or apply handler is configured to change the schema name or database object name.
source_database_name	The global name of the source database. For example, DBS1.NET.  If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.

### Usage Notes

The following usage notes apply to this procedure:

- [Instantiation SCNs and LCRs](#)
- [The SET\\_TABLE\\_INSTANTIATION\\_SCN Procedure and XStream Outbound Servers](#)
- [The SET\\_TABLE\\_INSTANTIATION\\_SCN Procedure and XStream Inbound Servers](#)

**Instantiation SCNs and LCRs**

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply component at the destination database disregards the LCR. Otherwise, the apply component applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL `base_table_owner` and `base_table_name` specified, except for DDL LCRs with a `command_type` of `CREATE TABLE`

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `ALTER TABLE` or `CREATE TRIGGER`.

---

---

**Note:** The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

---

---

**See Also:**

- [SET\\_GLOBAL\\_INSTANTIATION\\_SCN Procedure](#) on page 21-50
- [SET\\_SCHEMA\\_INSTANTIATION\\_SCN Procedure](#) on page 21-66
- [LCR\\$\\_ROW\\_RECORD Type](#) on page 248-15 for more information about row LCRs
- [LCR\\$\\_DDL\\_RECORD Type](#) on page 248-6 for more information about DDL LCRs
- *Oracle Streams Replication Administrator's Guide*

**The SET\_TABLE\_INSTANTIATION\_SCN Procedure and XStream Outbound Servers**

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

**See Also:** *Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

**The SET\_TABLE\_INSTANTIATION\_SCN Procedure and XStream Inbound Servers**

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

## SET\_UPDATE\_CONFLICT\_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

### Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER (
  object_name      IN  VARCHAR2,
  method_name      IN  VARCHAR2,
  resolution_column IN  VARCHAR2,
  column_list      IN  DBMS_UTILITY.NAME_ARRAY,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 21–25 SET\_UPDATE\_CONFLICT\_HANDLER Procedure Parameters**

Parameter	Description
object_name	<p>The schema and name of the table, specified as [<i>schema_name</i>.] <i>object_name</i>, for which an update conflict handler is being added, modified, or removed.</p> <p>For example, if an update conflict handler is being added for table <code>employees</code> owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>
method_name	<p>Type of update conflict handler to create.</p> <p>You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:</p> <ul style="list-style-type: none"> <li>■ <b>MAXIMUM:</b> Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database.</li> <li>■ <b>MINIMUM:</b> Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database.</li> <li>■ <b>OVERWRITE:</b> Applies the column list from the source database, overwriting the column values at the destination database.</li> <li>■ <b>DISCARD:</b> Retains the column list from the destination database, discarding the column list from the source database.</li> </ul> <p>If <code>NULL</code>, then the procedure removes any existing update conflict handler with the same <code>object_name</code>, <code>resolution_column</code>, and <code>column_list</code>. If non-<code>NULL</code>, then the procedure replaces any existing update conflict handler with the same <code>object_name</code> and <code>resolution_column</code>.</p>

**Table 21–25 (Cont.) SET\_UPDATE\_CONFLICT\_HANDLER Procedure Parameters**

Parameter	Description
resolution_column	<p>Name of the column used to uniquely identify an update conflict handler. For the <code>MAXIMUM</code> and <code>MINIMUM</code> prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the <code>column_list</code> parameter.</p> <p><code>NULL</code> is not allowed for this parameter. For the <code>OVERWRITE</code> and <code>DISCARD</code> prebuilt methods, you can specify any column in the column list.</p>
column_list	<p>List of columns for which the conflict handler is called.</p> <p>The same column cannot be in more than one column list.</p> <p>If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list.</p> <p><b>Note:</b> Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, user-defined type, and Oracle-supplied type columns. Therefore, you should not include these types of columns in the <code>column_list</code> parameter.</p>
apply_database_link	<p>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</p> <p><b>Note:</b> Currently, conflict handlers are not supported when applying changes to a non-Oracle database.</p>

## Usage Notes

The following usage notes apply to this procedure:

- [Modifying an Existing Update Conflict Handler](#)
- [Removing an Existing Update Conflict Handler](#)
- [Series of Actions for Conflicts](#)
- [Procedure DML Handlers for Conflicts](#)
- [A Column Can Be in Only One Column List](#)
- [Update Conflict Handlers and Non-Oracle Databases](#)
- [The SET\\_UPDATE\\_CONFLICT\\_HANDLER Procedure and XStream Outbound Servers](#)
- [The SET\\_UPDATE\\_CONFLICT\\_HANDLER Procedure and XStream Inbound Servers](#)

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about prebuilt and custom update conflict handlers

### Modifying an Existing Update Conflict Handler

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

**Removing an Existing Update Conflict Handler**

If you want to remove an existing update conflict handler, then specify `NULL` for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

**Series of Actions for Conflicts**

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

**See Also:** ["Signature of a DML Handler Procedure or Error Handler Procedure"](#) on page 21-43 for information about setting an error handler

**Procedure DML Handlers for Conflicts**

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

**See Also:** [SET\\_DML\\_HANDLER Procedure](#) on page 21-41

**A Column Can Be in Only One Column List**

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

```
ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED
```

**Update Conflict Handlers and Non-Oracle Databases**

Setting an update conflict handler for an apply component that is applying to a non-Oracle database is not supported.

**The SET\_UPDATE\_CONFLICT\_HANDLER Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

**The SET\_UPDATE\_CONFLICT\_HANDLER Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

**Examples**

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols DBMS_UTILITY.NAME_ARRAY;
```

```
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name      => 'hr.employees',
    method_name      => 'MAXIMUM',
    resolution_column => 'salary',
    column_list      => cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

## SET\_VALUE\_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply component uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.

**See Also:** *Oracle Streams Concepts and Administration*

### Syntax

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY (
  dependency_name IN VARCHAR2,
  object_name     IN VARCHAR2,
  attribute_list  IN VARCHAR2);
```

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY (
  dependency_name IN VARCHAR2,
  object_name     IN VARCHAR2,
  attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

### Parameters

**Table 21–26 SET\_VALUE\_DEPENDENCY Procedure Parameters**

Parameter	Description
<code>dependency_name</code>	The name of the value dependency.  If a dependency with the specified name does not exist, then it is created.  If a dependency with the specified name exists, then the specified object and attributes are added to the dependency.  If NULL, an error is raised.
<code>object_name</code>	The name of the table, specified as [ <i>schema_name</i> .] <i>table_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.  If NULL and the specified dependency exists, then the dependency is removed. If NULL and the specified dependency does not exist, then an error is raised.  If NULL, then <code>attribute_list</code> and <code>attribute_table</code> also must be NULL.
<code>attribute_list</code>	A comma-delimited list of column names in the table. There must be no spaces between entries.
<code>attribute_table</code>	A PL/SQL associative array of type <code>DBMS_UTILITY.NAME_ARRAY</code> that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.

## Usage Notes

The following usage notes apply to this procedure:

- [The SET\\_VALUE\\_DEPENDENCY Procedure and XStream Outbound Servers](#)
- [The SET\\_VALUE\\_DEPENDENCY Procedure and XStream Inbound Servers](#)

### **The SET\_VALUE\_DEPENDENCY Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

### **The SET\_VALUE\_DEPENDENCY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## START\_APPLY Procedure

This procedure directs the apply component to start applying messages.

### Syntax

```
DBMS_APPLY_ADM.START_APPLY(
    apply_name IN VARCHAR2);
```

### Parameter

**Table 21–27 START\_APPLY Procedure Parameter**

Parameter	Description
apply_name	The apply component name. A NULL setting is not allowed. Do not specify an owner.

### Usage Notes

The following usage notes apply to this procedure:

- [Apply Component Status](#)
- [The START\\_APPLY Procedure and XStream Outbound Servers](#)
- [The START\\_APPLY Procedure and XStream Inbound Servers](#)

#### Apply Component Status

The apply component status is persistently recorded. Hence, if the status is `ENABLED`, then the apply component is started upon database instance startup. An apply component (`anmn`) is an Oracle background process. The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of an apply component.

#### The START\_APPLY Procedure and XStream Outbound Servers

This procedure functions the same way for apply processes and outbound servers.

#### The START\_APPLY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## STOP\_APPLY Procedure

This procedure stops the apply component from applying messages and rolls back any unfinished transactions being applied.

### Syntax

```
DBMS_APPLY_ADM.STOP_APPLY (
  apply_name IN VARCHAR2,
  force      IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 21–28 STOP\_APPLY Procedure Parameters**

Parameter	Description
apply_name	The apply component name. A NULL setting is not allowed. Do not specify an owner.
force	<p>If TRUE, then the procedure stops the apply component as soon as possible.</p> <p>If FALSE, then the procedure stops the apply component after ensuring that there are no gaps in the set of applied transactions.</p> <p>The behavior of the apply component depends on the setting specified for the <code>force</code> parameter and the setting specified for the <code>commit_serialization</code> apply component parameter. See "Usage Notes" for more information.</p>

### Usage Notes

The following usage notes apply to this procedure:

- [Apply Component Status](#)
- [Queue Subprograms Have No Effect on Apply Component Status](#)
- [The STOP\\_APPLY force Parameter and the commit\\_serialization Apply Parameter](#)
- [The STOP\\_APPLY Procedure and XStream Outbound Servers](#)
- [The STOP\\_APPLY Procedure and XStream Inbound Servers](#)

#### Apply Component Status

The apply component status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the apply component is not started upon database instance startup.

#### Queue Subprograms Have No Effect on Apply Component Status

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the `STOP` status of an apply component.

#### The STOP\_APPLY force Parameter and the commit\_serialization Apply Parameter

The following table describes apply component behavior for each setting of the `force` parameter in the `STOP_APPLY` procedure and the `commit_serialization` apply component parameter. In all cases, the apply component rolls back any unfinished transactions when it stops.

<b>force</b>	<b>commit_serialization</b>	<b>Apply Component Behavior</b>
TRUE	FULL	The apply component stops immediately and does not apply any unfinished transactions.
TRUE	DEPENDENT_TRANSACTION	When the apply component stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.
FALSE	FULL	The apply component stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.
FALSE	DEPENDENT_TRANSACTION	Before stopping, the apply component applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.

For example, assume that the `commit_serialization` apply component parameter is set to `DEPENDENT_TRANSACTION` and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply component has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transaction 2 is not applied, and the apply component stops (transaction 2 is rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction 2 is applied before the apply component stops.

A different scenario would result if the `commit_serialization` apply component parameter is set to `FULL`. For example, assume that the `commit_serialization` apply component parameter is set to `FULL` and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply component has applied transaction A and is in the process of applying transactions B and C when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transactions B and C are not applied, and the apply component stops (transactions B and C are rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction B is applied before the apply component stops, and transaction C is rolled back.

**See Also:** [SET\\_PARAMETER Procedure](#) on page 21-56 for more information about the `commit_serialization` apply component parameter

### **The STOP\_APPLY Procedure and XStream Outbound Servers**

This procedure functions the same way for apply processes and outbound servers.

### **The STOP\_APPLY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

The `DBMS_AQ` package provides an interface to Oracle Streams Advanced Queuing (AQ).

**See Also:**

- *Oracle Streams Advanced Queuing User's Guide*
- [Oracle Streams AQ TYPES](#) for information about TYPES to use with `DBMS_AQ`.

This chapter contains the following topics:

- [Using DBMS\\_AQ](#)
  - Constants
  - Data Structures
  - Operational Notes
- [Summary of DBMS\\_AQ Subprograms](#)

## Using DBMS\_AQ

- [Constants](#)
- [Data Structures](#)
- [Operational Notes](#)

## Constants

The DBMS\_AQ package uses the constants shown in [Table 22–1](#).

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS\_AQ. For example: DBMS\_AQ.BROWSE.

---

**Note:** The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of DBMS\_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

---

**Table 22–1 Enumerated Constants**

Parameter	Options	Type	Description
VISIBILITY	IMMEDIATE		
.	ON_COMMIT		
DEQUEUE_MODE	BROWSE		
.	LOCKED		
.	REMOVE		
.	REMOVE_NODATA		
NAVIGATION	FIRST_MESSAGE		
.	NEXT_MESSAGE		
STATE	WAITING		
.	READY		
.	PROCESSED		
.	EXPIRED		
SEQUENCE_DEVIATION	BEFORE		
.	TOP		
WAIT	FOREVER	BINARY_INTEGER	
.	NO_WAIT	BINARY_INTEGER	
DELAY	NO_DELAY		
EXPIRATION	NEVER		
NAMESPACE	NAMESPACE_AQ		
.	NAMESPACE_ANONYMOUS		
NTFN_GROUPING_CLASS	NTFN_GROUPING_CLASS_TIME	NUMBER	
NTFN_GROUPING_TYPE	NTFN_GROUPING_TYPE_SUMMARY	NUMBER	

**Table 22–1 (Cont.) Enumerated Constants**

<b>Parameter</b>	<b>Options</b>	<b>Type</b>	<b>Description</b>
.	NTFN_GROUPING_TYPE_ LAST	NUMBER	
NTFN_GROUPING_ REPEAT_COUNT	NTFN_GROUPING_ FOREVER	NUMBER	

## Data Structures

**Table 22–2 DBMS\_AQ Data Structures**

Data Structures	Description
<a href="#">Object Name</a> on page 22-5	Names database objects
<a href="#">Type Name</a> on page 22-5	Defines queue types
<a href="#">Oracle Streams AQ PL/SQL Callback</a> on page 22-6	Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification

### Object Name

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

#### Syntax

```
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

#### Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

### Type Name

The `type_name` data structure defines queue types.

#### Syntax

```
type_name := VARCHAR2;
type_name := object_type | "RAW";
```

#### Attributes

**Table 22–3 Type Name Attributes**

Attribute	Description
<code>object_type</code>	Maximum number of attributes in the object type is limited to 900.

**Table 22–3 (Cont.) Type Name Attributes**

Attribute	Description
"RAW"	<p>To store payload of type RAW, Oracle Streams AQ creates a queue table with a LOB column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a LOB column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Streams AQ. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept RAW buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your RAW data will be limited to the maximum amount of contiguous memory (as an OCIRaw is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases.</p> <p>Because LOB columns are used for storing RAW payload, the Oracle Streams AQ administrator can choose the LOB tablespace and configure the LOB storage by constructing a LOB storage string in the <code>storage_clause</code> parameter during queue table creation time.</p>

## Oracle Streams AQ PL/SQL Callback

The `plsqllcallback` data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

### Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```
procedure plsqllcallback(
  context IN RAW,
  reginfo IN SYS.AQ$_REG_INFO,
  descr   IN SYS.AQ$_DESCRIPTOR,
  payload IN RAW,
  payloadl IN NUMBER);
```

### Attributes

**Table 22–4 Oracle Streams AQ PL/SQL Callback Attributes**

Attribute	Description
<code>context</code>	Specifies the context for the callback function that was passed by <code>dbms_aq.register</code> . See <a href="#">AQ\$_REG_INFO Type</a> on page 243-12.
<code>reginfo</code>	See <a href="#">AQ\$_REG_INFO Type</a> on page 243-12.
<code>descr</code>	See <a href="#">AQ\$_DESCRIPTOR Type</a> on page 243-5
<code>payload</code>	If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.
<code>payloadl</code>	Specifies the length of <code>payload</code> . If <code>payload</code> is null, <code>payloadl = 0</code> .

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```
procedure plsqllcallback(
  context IN RAW,
  reginfo IN SYS.AQ$_REG_INFO,
  descr   IN SYS.AQ$_DESCRIPTOR,
```

```
payload IN VARCHAR2,  
payload1 IN NUMBER);
```

## Operational Notes

- [DBMS\\_AQ and DBMS\\_AQADM Java Classes](#)

### **DBMS\_AQ and DBMS\_AQADM Java Classes**

Java interfaces are available for DBMS\_AQ and DBMS\_AQADM. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have EXECUTE privileges on the DBMS\_AQIN package to use these interfaces.

---

## Summary of DBMS\_AQ Subprograms

**Table 22-5 DBMS\_AQ Package Subprograms**

Subprograms	Description
<a href="#">BIND_AGENT Procedure</a> on page 22-10	Creates an entry for an Oracle Streams AQ agent in the LDAP directory
<a href="#">DEQUEUE Procedure</a> on page 22-11	Dequeues a message from the specified queue
<a href="#">DEQUEUE_ARRAY Function</a> on page 22-14	Dequeues an array of messages from the specified queue
<a href="#">ENQUEUE Procedure</a> on page 22-16	Adds a message to the specified queue
<a href="#">ENQUEUE_ARRAY Function</a> on page 22-18	Adds an array of messages to the specified queue
<a href="#">LISTEN Procedures</a> on page 22-19	Listen to one or more queues on behalf of a list of agents
<a href="#">POST Procedure</a> on page 22-21	Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications
<a href="#">REGISTER Procedure</a> on page 22-22	Registers for message notifications
<a href="#">UNBIND_AGENT Procedure</a> on page 22-23	Removes an entry for an Oracle Streams AQ agent from the LDAP directory
<a href="#">UNREGISTER Procedure</a> on page 22-24	Unregisters a subscription which turns off notification

---

**Note:** DBMS\_AQ does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have RNDS, WNDS, RNPS or WNPS constraints defined.

---

## BIND\_AGENT Procedure

This procedure creates an entry for an Oracle Streams AQ agent in the LDAP server.

### Syntax

```
DBMS_AQ.BIND_AGENT(  
  agent      IN SYS.AQ$_AGENT,  
  certificate IN VARCHAR2 default NULL);
```

### Parameters

**Table 22–6** *BIND\_AGENT Procedure Parameters*

Parameter	Description
agent	Agent that is to be registered in LDAP server.
certificate	Location (LDAP distinguished name) of the "organizationalperson" entry in LDAP whose digital certificate (attribute <code>usercertificate</code> ) is to be used for this agent. Example: "cn=OE, cn=ACME, cn=com" is a distinguished name for a <code>OrganizationalPerson</code> OE whose certificate will be used with the specified agent.

### Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the `OrganizationalPerson` entity. The distinguished name for this `OrganizationalPerson` must be specified when binding the agent.

## DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

### Syntax

```
DBMS_AQ.DEQUEUE (
  queue_name          IN      VARCHAR2,
  dequeue_options    IN      dequeue_options_t,
  message_properties OUT    message_properties_t,
  payload            OUT    "<ADT_1>"
  msgid             OUT    RAW);
```

### Parameters

**Table 22-7 DEQUEUE Procedure Parameters**

Parameter	Description
queue_name	Specifies the name of the queue.
dequeue_options	See <a href="#">DEQUEUE_OPTIONS_T Type</a> on page 243-17.
message_properties	See <a href="#">MESSAGE_PROPERTIES_T Type</a> on page 243-24.
payload	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. For the definition of <i>type_name</i> refer to <a href="#">Type Name</a> on page 22-5.
msgid	System generated identification of the message.

### Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in `dequeue_options`:

- `consumer_name`
- `msgid`

`Msgid` uniquely identifies the message to be dequeued. Only messages in the `READY` state are dequeued unless `msgid` is specified.

- `correlation`

Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Streams AQ.

- `deq_condition`

Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A `deq_condition` is specified as a Boolean expression using syntax similar to the `WHERE` clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the `where` clause of a SQL query). Message properties include `priority`, `corrid` and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with `tab.user_data` as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

---

---

**Note:** It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Streams AQ continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Streams AQ uses a new snapshot for every dequeue command.

---

---

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

### Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See [DEQUEUE\\_OPTIONS\\_T Type](#) on page 243-17 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See [CREATE\\_AQ\\_AGENT Procedure](#) on page 23-22.
- You must map the Oracle Streams AQ agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See [ENABLE\\_DB\\_ACCESS Procedure](#) on page 23-35.

**See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

## DEQUEUE\_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

### Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
    queue_name           IN   VARCHAR2,
    dequeue_options     IN   dequeue_options_t,
    array_size          IN   pls_integer,
    message_properties_array OUT message_properties_array_t,
    payload_array       OUT   "<COLLECTION_1>",
    msgid_array         OUT   msgid_array_t,
    error_array         OUT   error_array_t)
RETURN pls_integer;
```

### Parameters

**Table 22–8 DEQUEUE\_ARRAY Function Parameters**

Parameter	Description
queue_name	The queue name from which messages are dequeued (same as single-row dequeue).
dequeue_options	The set of options which will be applied to all messages in the array (same as single-row dequeue).
array_size	The number of elements to dequeue.
message_properties_array	A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See <a href="#">MESSAGE_PROPERTIES_ARRAY_T Type</a> on page 243-28.
payload_array	An array of dequeued payload data. "<COLLECTION_1>" can be an associative array, varray or nested table in its PL/SQL representation.
msgid_array	An array of message IDs of the dequeued messages. See <a href="#">MSGID_ARRAY_T Type</a> on page 243-29.
error_array	Currently not implemented

### Usage Notes

A nonzero wait time, as specified in `dequeue_options`, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the `DEQUEUE_ARRAY` function will dequeue up to `array_size` messages and return immediately.

Dequeue by `message_id` is not supported. See [DEQUEUE Procedure](#) on page 22-11 for more information on the `navigation` parameter. Existing `NAVIGATION` modes are supported. In addition, two new `NAVIGATION` modes are supported for queues enabled for message grouping:

- `FIRST_MESSAGE_MULTI_GROUP`
- `NEXT_MESSAGE_MULTI_GROUP`

**See Also:** [ENQUEUE\\_OPTIONS\\_T Type](#) on page 243-20

For transaction grouped queues and `ONE_GROUP` navigation, messages are dequeued from a single transaction group only, subject to the `array_size` limit. In `MULTI_GROUP` navigation, messages are dequeued across multiple transaction groups, still subject to the `array_size` limit. `ORA-25235` is returned to indicate the end of a transaction group.

`DEQUEUE_ARRAY` is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.

## ENQUEUE Procedure

This procedure adds a message to the specified queue.

### Syntax

```
DBMS_AQ.ENQUEUE (
  queue_name          IN      VARCHAR2,
  enqueue_options    IN      enqueue_options_t,
  message_properties IN      message_properties_t,
  payload            IN      "<ADT_1>",
  msgid              OUT     RAW);
```

### Parameters

**Table 22–9 ENQUEUE Procedure Parameters**

Parameter	Description
queue_name	Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.
enqueue_options	See <a href="#">ENQUEUE_OPTIONS_T Type</a> on page 243-20.
message_properties	See <a href="#">MESSAGE_PROPERTIES_T Type</a> on page 243-24.
payload	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of <i>type_name</i> refer to <a href="#">Type Name</a> on page 22-5.
msgid	System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.

### Usage Notes

The `sequence_deviation` parameter in `enqueue_options` can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the `enqueue_options` parameter `relative_msgid`. The relationship is identified by the `sequence_deviation` parameter.

Specifying `sequence_deviation` for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

---

**Note:** The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of `DBMS_AQADM` subprograms is set to `TRANSACTIONAL`. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

---

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error `ORA_24033` is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

### Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See [MESSAGE\\_PROPERTIES\\_T Type](#) on page 243-24 for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See [CREATE\\_AQ\\_AGENT Procedure](#) on page 23-22.
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See [ENABLE\\_DB\\_ACCESS Procedure](#) on page 23-35.

**See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

## ENQUEUE\_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

### Syntax

```
DBMS_AQ.ENQUEUE_ARRAY (
  queue_name          IN   VARCHAR2,
  enqueue_options    IN   enqueue_options_t,
  array_size         IN   pls_integer,
  message_properties_array IN message_properties_array_t,
  payload_array      IN   "<COLLECTION_1>",
  msgid_array        OUT  msgid_array_t,
  error_array        OUT  error_array_t)
RETURN pls_integer;
```

### Parameters

**Table 22-10 ENQUEUE\_ARRAY Function Parameters**

Parameter	Description
queue_name	The queue name in which messages are enqueued (same as single-row enqueue).
enqueue_options	See <a href="#">ENQUEUE_OPTIONS_T Type</a> on page 243-20.
array_size	The number of elements to enqueue.
message_properties_array	A record containing an array corresponding to each message property. For each property, the user must allocate <code>array_size</code> elements. See <a href="#">MESSAGE_PROPERTIES_ARRAY_T Type</a> on page 243-28.
payload_array	An array of payload data. "<COLLECTION_1>" can be an associative array, <code>VARRAY</code> , or nested table in its PL/SQL representation.
msgid_array	An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See <a href="#">MSGID_ARRAY_T Type</a> on page 243-29.
error_array	Currently not implemented

### Usage Notes

`ENQUEUE_ARRAY` is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.

## LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

### Syntax

```
DBMS_AQ.LISTEN (
  agent_list      IN    AQ$_AGENT_LIST_T,
  wait            IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
  agent           OUT   SYS.AQ$_AGENT);
```

```
DBMS_AQ.LISTEN (
  agent_list      IN    AQ$_AGENT_LIST_T,
  wait            IN    BINARY_INTEGER DEFAULT FOREVER,
  listen_delivery_mode IN PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
  agent           OUT   SYS.AQ$_AGENT,
  message_delivery_mode OUT PLS_INTEGER);
```

```
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
```

### Parameters

**Table 22–11 LISTEN Procedure Parameters**

Parameter	Description
agent_list	List of agents to listen for
wait	Time out for the listen call in seconds. By default, the call will block forever.
listen_delivery_mode	The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED
agent	Agent with a message available for consumption
message_delivery_mode	Returns the message type along with the queue and consumer for which there is a message

### Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the `LISTEN` call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

---

---

**Note:** You cannot call `LISTEN` on nonpersistent queues.

---

---

## POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

### Syntax

```
DBMS_AQ.POST (
  post_list      IN SYS.AQ$_POST_INFO_LIST,
  post_count     IN NUMBER);
```

### Parameters

**Table 22–12** *POST Procedure Parameters*

Parameter	Description
post_list	Specifies the list of anonymous subscriptions to which you want to post. It is a list of <a href="#">AQ\$_POST_INFO_LIST</a> Type.
post_count	Specifies the number of entries in the post_list.

### Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

## REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

### Syntax

```
DBMS_AQ.REGISTER (
  reg_list      IN  SYS.AQ$_REG_INFO_LIST,
  count         IN  NUMBER);
```

### Parameters

**Table 22–13 REGISTER Procedure Parameters**

Parameter	Description
reg_list	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of <a href="#">AQ\$_REG_INFO Type</a> .
count	Specifies the number of entries in the reg_list.

### Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only `TIME` criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion `TIME`)
  - Type – summary or last, also contains count of notifications received in group (for `AQ` namespace only, not for `DBCHANGE` namespace)
  - Repeat count – how many times to perform grouping (Default is `FOREVER`)
  - Start time – when to start grouping (Default is current time)
- If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.
- If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

**See Also:** [Chapter 24, "DBMS\\_AQELM"](#) for more information on e-mail and HTTP notifications

## UNBIND\_AGENT Procedure

This procedure removes the entry for an Oracle Streams AQ agent from the LDAP server.

### Syntax

```
DBMS_AQ.UNBIND_AGENT (  
    agent      IN SYS.AQ$_AGENT);
```

### Parameters

**Table 22–14** *BIND\_AGENT Procedure Parameters*

Parameter	Description
agent	Agent that is to be removed from the LDAP server

## UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

### Syntax

```
DBMS_AQ.UNREGISTER (  
    reg_list      IN  SYS.AQ$_REG_INFO_LIST,  
    reg_count     IN  NUMBER);
```

### Parameters

**Table 22–15 UNREGISTER Procedure Parameters**

Parameter	Description
reg_list	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of <a href="#">AQ\$_REG_INFO Type</a> .
reg_count	Specifies the number of entries in the reg_list.

### Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.

The DBMS\_AQADM package provides procedures to manage Oracle Streams Advanced Queuing (AQ) configuration and administration information.

**See Also:**

- *Oracle Streams Advanced Queuing User's Guide*
- [Chapter 243, "Oracle Streams AQ TYPES"](#) for information about the TYPES to use with DBMS\_AQADM

This chapter contains the following topics:

- [Using DBMS\\_AQADM](#)
  - Constants
- [Subprogram Groups](#)
  - Queue Table Subprograms
  - Privilege Subprograms
  - Queue Subprograms
  - Subscriber Subprograms
  - Notification Subprograms
  - Propagation Subprograms
  - Oracle Streams AQ Agent Subprograms
  - Alias Subprograms
- [Summary of DBMS\\_AQADM Subprograms](#)

---

## Using DBMS\_AQADM

This section contains the following topics.

- [Constants](#)

## Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL\_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS\_AQADM. For example: DBMS\_AQADM.NORMAL\_QUEUE.

**Table 23–1** *Enumerated Types in the Administrative Interface*

Parameter	Options
retention	0, 1, 2...INFINITE
message_grouping	TRANSACTIONAL, NONE
queue_type	NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE

**See Also:** For more information on the Java classes and data structures used in both DBMS\_AQ and DBMS\_AQADM, see the [DBMS\\_AQ](#) package.

## Subprogram Groups

This DBMS\_AQADM package is made up of the following subprogram groups:

- [Queue Table Subprograms](#) on page 23-5
- [Privilege Subprograms](#) on page 23-6
- [Queue Subprograms](#) on page 23-7
- [Subscriber Subprograms](#) on page 23-8
- [Notification Subprograms](#) on page 23-9
- [Propagation Subprograms](#) on page 23-10
- [Oracle Streams AQ Agent Subprograms](#) on page 23-11
- [Alias Subprograms](#) on page 23-12

## Queue Table Subprograms

**Table 23–2** *Queue Table Subprograms*

<b>Subprograms</b>	<b>Description</b>
<a href="#">ALTER_QUEUE_TABLE Procedure</a> on page 23-20	Alters the existing properties of a queue table
<a href="#">CREATE_QUEUE_TABLE Procedure</a> on page 23-26	Creates a queue table for messages of a predefined type
<a href="#">DROP_QUEUE_TABLE Procedure</a> on page 23-34	Drops an existing queue table
<a href="#">ENABLE_JMS_TYPES Procedure</a> on page 23-36	A precondition for the enqueue of JMS types and XML types
<a href="#">MIGRATE_QUEUE_TABLE Procedure</a> on page 23-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
<a href="#">PURGE_QUEUE_TABLE Procedure</a> on page 23-42	Purges messages from queue tables

## Privilege Subprograms

**Table 23–3** *Privilege Subprograms*

<b>Subprograms</b>	<b>Description</b>
<a href="#">GRANT_QUEUE_PRIVILEGE Procedure</a> on page 23-39	Grants privileges on a queue to users and roles
<a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a> on page 23-40	Grants Oracle Streams AQ system privileges to users and roles
<a href="#">REVOKE_QUEUE_PRIVILEGE Procedure</a> on page 23-46	Revokes privileges on a queue from users and roles
<a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a> on page 23-47	Revokes Oracle Streams AQ system privileges from users and roles

## Queue Subprograms

**Table 23–4 Queue Subprograms**

<b>Subprograms</b>	<b>Description</b>
<a href="#">ALTER_QUEUE Procedure</a> on page 23-19	Alters existing properties of a queue
<a href="#">CREATE_NP_QUEUE Procedure</a> on page 23-23	Creates a nonpersistent RAW queue
<a href="#">CREATE_QUEUE Procedure</a> on page 23-24	Creates a queue in the specified queue table
<a href="#">DROP_QUEUE Procedure</a> on page 23-33	Drops an existing queue
<a href="#">QUEUE_SUBSCRIBERS Function</a> on page 23-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type <code>DBMS_AQADM.AQ\$_subscriber_list_t</code>
<a href="#">START_QUEUE Procedure</a> on page 23-51	Enables the specified queue for enqueueing or dequeuing
<a href="#">STOP_QUEUE Procedure</a> on page 23-52	Disables enqueueing or dequeuing on the specified queue

## Subscriber Subprograms

**Table 23–5** *Subscriber Subprograms*

<b>Subprograms</b>	<b>Description</b>
<a href="#">ADD_SUBSCRIBER Procedure</a> on page 23-16	Adds a default subscriber to a queue
<a href="#">ALTER_SUBSCRIBER Procedure</a> on page 23-21	Alters existing properties of a subscriber to a specified queue
<a href="#">REMOVE_SUBSCRIBER Procedure</a> on page 23-45	Removes a default subscriber from a queue

## Notification Subprograms

**Table 23–6 Notification Subprograms**

<b>Subprograms</b>	<b>Description</b>
<a href="#">GET_WATERMARK Procedure</a> on page 23-38	Retrieves the value of watermark set by the SET_WATERMARK Procedure
<a href="#">SET_WATERMARK Procedure</a> on page 23-50	Used for Oracle Streams AQ notification to specify and limit memory use

## Propagation Subprograms

**Table 23–7 Propagation Subprograms**

<b>Subprograms</b>	<b>Description</b>
<a href="#">ALTER_PROPAGATION_SCHEDULE Procedure</a> on page 23-18	Alters parameters for a propagation schedule
<a href="#">DISABLE_PROPAGATION_SCHEDULE Procedure</a> on page 23-31	Disables a propagation schedule
<a href="#">ENABLE_PROPAGATION_SCHEDULE Procedure</a> on page 23-37	Enables a previously disabled propagation schedule
<a href="#">SCHEDULE_PROPAGATION Procedure</a> on page 23-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
<a href="#">UNSCHEDULE_PROPAGATION Procedure</a> on page 23-53	Unscheduled previously scheduled propagation of messages from a queue to a destination identified by a specific database link
<a href="#">VERIFY_QUEUE_TYPES Procedure</a> on page 23-54	Verifies that the source and destination queues have identical types

## Oracle Streams AQ Agent Subprograms

**Table 23–8 Oracle Streams AQ Agent Subprograms**

<b>Subprograms</b>	<b>Description</b>
<a href="#">ALTER_AQ_AGENT Procedure</a> on page 23-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
<a href="#">CREATE_AQ_AGENT Procedure</a> on page 23-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
<a href="#">DISABLE_DB_ACCESS Procedure</a> on page 23-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
<a href="#">DROP_AQ_AGENT Procedure</a> on page 23-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
<a href="#">ENABLE_DB_ACCESS Procedure</a> on page 23-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user

## Alias Subprograms

**Table 23–9** *Alias Subprograms*

<b>Subprograms</b>	<b>Description</b>
<a href="#">ADD_ALIAS_TO_LDAP Procedure</a> on page 23-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
<a href="#">DEL_ALIAS_FROM_LDAP Procedure</a> on page 23-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP

## Summary of DBMS\_AQADM Subprograms

**Table 23–10 DBMS\_AQADM Package Subprograms**

Subprograms	Description
<a href="#">ADD_ALIAS_TO_LDAP Procedure</a> on page 23-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
<a href="#">ADD_SUBSCRIBER Procedure</a> on page 23-16	Adds a default subscriber to a queue
<a href="#">ALTER_AQ_AGENT Procedure</a> on page 23-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
<a href="#">ALTER_PROPAGATION_SCHEDULE Procedure</a> on page 23-18	Alters parameters for a propagation schedule
<a href="#">ALTER_QUEUE Procedure</a> on page 23-19	Alters existing properties of a queue
<a href="#">ALTER_QUEUE_TABLE Procedure</a> on page 23-20	Alters the existing properties of a queue table
<a href="#">ALTER_SUBSCRIBER Procedure</a> on page 23-21	Alters existing properties of a subscriber to a specified queue
<a href="#">CREATE_AQ_AGENT Procedure</a> on page 23-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
<a href="#">CREATE_NP_QUEUE Procedure</a> on page 23-23	Creates a nonpersistent RAW queue
<a href="#">CREATE_QUEUE Procedure</a> on page 23-24	Creates a queue in the specified queue table
<a href="#">CREATE_QUEUE_TABLE Procedure</a> on page 23-26	Creates a queue table for messages of a predefined type
<a href="#">DEL_ALIAS_FROM_LDAP Procedure</a> on page 23-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP
<a href="#">DISABLE_DB_ACCESS Procedure</a> on page 23-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
<a href="#">DISABLE_PROPAGATION_SCHEDULE Procedure</a> on page 23-31	Disables a propagation schedule
<a href="#">DROP_AQ_AGENT Procedure</a> on page 23-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
<a href="#">DROP_QUEUE Procedure</a> on page 23-33	Drops an existing queue
<a href="#">DROP_QUEUE_TABLE Procedure</a> on page 23-34	Drops an existing queue table
<a href="#">ENABLE_DB_ACCESS Procedure</a> on page 23-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user
<a href="#">ENABLE_JMS_TYPES Procedure</a> on page 23-36	A precondition for the enqueue of JMS types and XML types

**Table 23–10 (Cont.) DBMS\_AQADM Package Subprograms**

<b>Subprograms</b>	<b>Description</b>
<a href="#">ENABLE_PROPAGATION_SCHEDULE Procedure</a> on page 23-37	Enables a previously disabled propagation schedule
<a href="#">GET_WATERMARK Procedure</a> on page 23-38	Retrieves the value of watermark set by the <a href="#">SET_WATERMARK Procedure</a>
<a href="#">GRANT_QUEUE_PRIVILEGE Procedure</a> on page 23-39	Grants privileges on a queue to users and roles
<a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a> on page 23-40	Grants Oracle Streams AQ system privileges to users and roles
<a href="#">MIGRATE_QUEUE_TABLE Procedure</a> on page 23-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
<a href="#">PURGE_QUEUE_TABLE Procedure</a> on page 23-42	Purges messages from queue tables
<a href="#">QUEUE_SUBSCRIBERS Function</a> on page 23-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type <code>DBMS_AQADM.AQ\$_subscriber_list_t</code>
<a href="#">REMOVE_SUBSCRIBER Procedure</a> on page 23-45	Removes a default subscriber from a queue
<a href="#">REVOKE_QUEUE_PRIVILEGE Procedure</a> on page 23-46	Revokes privileges on a queue from users and roles
<a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a> on page 23-47	Revokes Oracle Streams AQ system privileges from users and roles
<a href="#">SCHEDULE_PROPAGATION Procedure</a> on page 23-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
<a href="#">SET_WATERMARK Procedure</a> on page 23-50	Used for Oracle Streams AQ notification to specify and limit memory use
<a href="#">START_QUEUE Procedure</a> on page 23-51	Enables the specified queue for enqueueing or dequeuing
<a href="#">STOP_QUEUE Procedure</a> on page 23-52	Disables enqueueing or dequeuing on the specified queue
<a href="#">UNSCHEDULE_PROPAGATION Procedure</a> on page 23-53	Unscheduled previously scheduled propagation of messages from a queue to a destination identified by a specific database link
<a href="#">VERIFY_QUEUE_TYPES Procedure</a> on page 23-54	Verifies that the source and destination queues have identical types

## ADD\_ALIAS\_TO\_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

### Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP (
  alias          IN VARCHAR2,
  obj_location  IN VARCHAR2);
```

### Parameters

**Table 23–11 ADD\_ALIAS\_TO\_LDAP Procedure Parameters**

Parameter	Description
alias	Name of the alias. Example: west_shipping.
obj_location	The distinguished name of the object (queue, agent or connection factory) to which alias refers.

### Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Streams AQ Internet access.

## ADD\_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

### Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (
  queue_name      IN      VARCHAR2,
  subscriber      IN      sys.aq$_agent,
  rule            IN      VARCHAR2 DEFAULT NULL,
  transformation  IN      VARCHAR2 DEFAULT NULL,
  queue_to_queue  IN      BOOLEAN DEFAULT FALSE,
  delivery_mode   IN      PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

### Parameters

**Table 23–12 ADD\_SUBSCRIBER Procedure Parameters**

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being defined.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are <code>priority</code> and <code>corrid</code> .  To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.
queue_to_queue	If TRUE, propagation is from queue-to-queue.
delivery_mode	The administrator may specify one of <code>DBMS_AQADM.PERSISTENT</code> , <code>DBMS_AQADM.BUFFERED</code> , or <code>DBMS_AQADM.PERSISTENT_OR_BUFFERED</code> for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by <code>ALTER_SUBSCRIBER</code> .

### Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule => 'PRIORITY <= 3 AND CORRID = ''FROM JAPAN'''
```

Note that these are all single quotation marks.

## ALTER\_AQ\_AGENT Procedure

This procedure alters an agent registered for Oracle Streams AQ Internet access. It is also used to alter an Oracle Streams AQ agent that accesses secure queues.

**See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

### Syntax

```
DBMS_AQADM.ALTER_AQ_AGENT (
  agent_name           IN VARCHAR2,
  certificate_location IN VARCHAR2 DEFAULT NULL,
  enable_http         IN BOOLEAN DEFAULT FALSE,
  enable_smtp         IN BOOLEAN DEFAULT FALSE,
  enable_anyp         IN BOOLEAN DEFAULT FALSE )
```

### Parameters

**Table 23–13 ALTER\_AQ\_AGENT Procedure Parameters**

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

## ALTER\_PROPAGATION\_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

### Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
  queue_name          IN    VARCHAR2,
  destination         IN    VARCHAR2 DEFAULT NULL,
  duration            IN    NUMBER  DEFAULT NULL,
  next_time           IN    VARCHAR2 DEFAULT NULL,
  latency             IN    NUMBER  DEFAULT 60,
  destination_queue   IN    VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 23–14 ALTER\_PROPAGATION\_SCHEDULE Procedure Parameters**

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as <code>SYSDATE + 1 - duration/86400</code> .
latency	<p>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value.</p> <p>For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.</p>
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

## ALTER\_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters `max_retries`, `retention_time`, and `retry_delay` are not supported for nonpersistent queues.

### Syntax

```
DBMS_AQADM.ALTER_QUEUE (
    queue_name      IN      VARCHAR2,
    max_retries     IN      NUMBER   DEFAULT NULL,
    retry_delay     IN      NUMBER   DEFAULT NULL,
    retention_time  IN      NUMBER   DEFAULT NULL,
    auto_commit     IN      BOOLEAN  DEFAULT TRUE,
    comment         IN      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 23–15 ALTER\_QUEUE Procedure Parameters**

Parameter	Description
<code>queue_name</code>	Name of the queue that is to be altered
<code>max_retries</code>	Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of <code>max_retries</code> is $2^{31}-1$ .  A message is moved to an exception queue if <code>RETRY_COUNT</code> is greater than <code>MAX_RETRIES</code> . <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then <code>RETRY_COUNT</code> is not incremented.  Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
<code>retry_delay</code>	Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means that the value will not be altered.  Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
<code>retention_time</code>	Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the value will not be altered.
<code>auto_commit</code>	TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation become persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.  Caution: This parameter has been deprecated.
<code>comment</code>	User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.

## ALTER\_QUEUE\_TABLE Procedure

This procedure alters the existing properties of a queue table.

### Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (
  queue_table      IN  VARCHAR2,
  comment          IN  VARCHAR2      DEFAULT NULL,
  primary_instance IN  BINARY_INTEGER DEFAULT NULL,
  secondary_instance IN BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 23–16 ALTER\_QUEUE\_TABLE Procedure Parameters**

Parameter	Description
queue_table	Name of a queue table to be created.
comment	Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.
primary_instance	This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.

## ALTER\_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

### Syntax

```
DBMS_AQADM.ALTER_SUBSCRIBER (
  queue_name      IN      VARCHAR2,
  subscriber      IN      sys.aq$_agent,
  rule            IN      VARCHAR2
  transformation  IN      VARCHAR2);
```

### Parameters

**Table 23–17 ALTER\_SUBSCRIBER Procedure Parameters**

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being altered. See " <a href="#">AQ\$_AGENT Type</a> " on page 243-3.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.

### Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the *schema.AQ\$queue\_table\_R* and *schema.AQ\$queue\_table\_S* views.

## CREATE\_AQ\_AGENT Procedure

This procedure registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Streams AQ agent to access secure queues.

**See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

### Syntax

```
DBMS_AQADM.CREATE_AQ_AGENT (
  agent_name          IN VARCHAR2,
  certificate_location IN VARCHAR2 DEFAULT NULL,
  enable_http        IN BOOLEAN DEFAULT FALSE,
  enable_smtp        IN BOOLEAN DEFAULT FALSE,
  enable_anyp        IN BOOLEAN DEFAULT FALSE )
```

### Parameters

**Table 23–18** CREATE\_AQ\_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

### Usage Notes

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Streams AQ Internet agents.

## CREATE\_NP\_QUEUE Procedure

---

**Note:** nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

---

This procedure creates a nonpersistent RAW queue.

### Syntax

```
DBMS_AQADM.CREATE_NP_QUEUE (
  queue_name          IN          VARCHAR2,
  multiple_consumers IN          BOOLEAN DEFAULT FALSE,
  comment             IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 23–19 CREATE\_NP\_QUEUE Procedure Parameters**

Parameter	Description
queue_name	Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in <i>Oracle Database SQL Language Reference</i> .
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.  Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.
comment	User-specified description of the queue. This user comment is added to the queue catalog.

### Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ\$\_MEM\_SC or AQ\$\_MEM\_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with `CREATE_NP_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the `LISTEN` call on a nonpersistent queue.

## CREATE\_QUEUE Procedure

This procedure creates a queue in the specified queue table.

### Syntax

```
DBMS_AQADM.CREATE_QUEUE (
  queue_name      IN      VARCHAR2,
  queue_table     IN      VARCHAR2,
  queue_type      IN      BINARY_INTEGER DEFAULT NORMAL_QUEUE,
  max_retries     IN      NUMBER          DEFAULT NULL,
  retry_delay     IN      NUMBER          DEFAULT 0,
  retention_time  IN      NUMBER          DEFAULT 0,
  dependency_tracking IN    BOOLEAN        DEFAULT FALSE,
  comment         IN      VARCHAR2        DEFAULT NULL,
  auto_commit     IN      BOOLEAN        DEFAULT TRUE);
```

### Parameters

**Table 23–20 CREATE\_QUEUE Procedure Parameters**

Parameter	Description
queue_name	Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in <i>Oracle Database SQL Language Reference</i> with regard to reserved characters.
queue_table	Name of the queue table that will contain the queue.
queue_type	Specifies whether the queue being created is an exception queue or a normal queue. <code>NORMAL_QUEUE</code> means the queue is a normal queue. This is the default. <code>EXCEPTION_QUEUE</code> means it is an exception queue. Only the dequeue operation is allowed on the exception queue.
max_retries	Limits the number of times a dequeue with the <code>REMOVE</code> mode can be attempted on a message. The maximum value of <code>max_retries</code> is $2^{31} - 1$ .  A message is moved to an exception queue if <code>RETRY_COUNT</code> is greater than <code>MAX_RETRIES</code> . <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code> ) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.  Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time, in seconds, before this message is scheduled for processing again after an application rollback.  The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if <code>max_retries</code> is set to 0. Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Number of seconds for which a message is retained in the queue table after being dequeued from the queue. <code>INFINITE</code> means the message is retained forever. <code>NUMBER</code> is the number of seconds for which to retain the messages. The default is 0, no retention.

**Table 23–20 (Cont.) CREATE\_QUEUE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
dependency_tracking	Reserved for future use. FALSE is the default. TRUE is not permitted in this release.
comment	User-specified description of the queue. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.  Caution: This parameter has been deprecated.

**Usage Notes**

All queue names must be unique within a schema. After a queue is created with CREATE\_QUEUE, it can be enabled by calling START\_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

## CREATE\_QUEUE\_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

### Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (
  queue_table          IN      VARCHAR2,
  queue_payload_type  IN      VARCHAR2,
  storage_clause       IN      VARCHAR2          DEFAULT NULL,
  sort_list           IN      VARCHAR2          DEFAULT NULL,
  multiple_consumers  IN      BOOLEAN           DEFAULT FALSE,
  message_grouping    IN      BINARY_INTEGER   DEFAULT NONE,
  comment             IN      VARCHAR2          DEFAULT NULL,
  auto_commit         IN      BOOLEAN           DEFAULT TRUE,
  primary_instance    IN      BINARY_INTEGER   DEFAULT 0,
  secondary_instance  IN      BINARY_INTEGER   DEFAULT 0,
  compatible          IN      VARCHAR2          DEFAULT NULL,
  secure              IN      BOOLEAN           DEFAULT FALSE);
```

### Parameters

**Table 23–21 CREATE\_QUEUE\_TABLE Procedure Parameters**

Parameter	Description
queue_table	Name of a queue table to be created
queue_payload_type	Type of the user data stored. See <a href="#">Type Name</a> on page 22-5 for valid values for this parameter.
storage_clause	Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause.  If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See <i>Oracle Database SQL Language Reference</i> for the usage of these parameters.

**Table 23–21 (Cont.) CREATE\_QUEUE\_TABLE Procedure Parameters**

Parameter	Description
sort_list	<p>The columns to be used as the sort key in ascending order. This parameter has the following format:</p> <p><i>'sort_column_1, sort_column_2'</i></p> <p>The allowed column names are <code>priority</code> and <code>enq_time</code>. If both columns are specified, then <code>sort_column_1</code> defines the most significant order.</p> <p>After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created.</p> <p>If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order.</p> <p>Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its <code>msgid</code> or <code>correlation.msgid</code>, <code>correlation</code>, and <code>sequence_deviation</code> take precedence over the default dequeuing order, if they are specified.</p>
multiple_consumers	<p><code>FALSE</code> means queues created in the table can only have one consumer for each message. This is the default. <code>TRUE</code> means queues created in the table can have multiple consumers for each message.</p>
message_grouping	<p>Message grouping behavior for queues created in the table. <code>NONE</code> means each message is treated individually. <code>TRANSACTIONAL</code> means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.</p>
comment	<p>User-specified description of the queue table. This user comment is added to the queue catalog.</p>
auto_commit	<p><code>TRUE</code> causes the current transaction, if any, to commit before the <code>CREATE_QUEUE_TABLE</code> operation is carried out. The <code>CREATE_QUEUE_TABLE</code> operation becomes persistent when the call returns. This is the default. <code>FALSE</code> means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.</p> <p>Note: This parameter has been deprecated.</p>
primary_instance	<p>The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance.</p> <p>The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.</p>
secondary_instance	<p>The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.</p>
compatible	<p>The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.</p>

**Table 23–21 (Cont.) CREATE\_QUEUE\_TABLE Procedure Parameters**

Parameter	Description
<code>secure</code>	This parameter must be set to <code>TRUE</code> if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.

## Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- `aq$_queue_table_name_e`, a default exception queue associated with the queue table
- `aq$queue_table_name`, a read-only view, which is used by Oracle Streams AQ applications for querying queue data
- `aq$_queue_table_name_t`, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- `aq$_queue_table_name_i`, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- `aq$_queue_table_name_s`, a table for storing information about the subscribers
- `aq$_queue_table_name_r`, a table for storing information about rules on subscriptions

`aq$_queue_table_name_h`, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Streams AQ object type payloads. However, only CLOB and BLOB can be propagated using Oracle Streams AQ propagation in Oracle8i release 8.1.5 or later. See the *Oracle Streams Advanced Queuing User's Guide* for more information.

The default value of the `compatible` parameter depends on the database compatibility mode in the `init.ora`. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the `primary_instance` and `secondary_instance` only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

## DEL\_ALIAS\_FROM\_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

### Syntax

```
DBMS_AQ.DEL_ALIAS_FROM_LDAP(  
    alias IN VARCHAR2);
```

### Parameters

**Table 23–22** *DEL\_ALIAS\_FROM\_LDAP Procedure Parameters*

Parameter	Description
alias	The alias to be removed.

## DISABLE\_DB\_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent.

### Syntax

```
DBMS_AQADM.DISABLE_DB_ACCESS (  
  agent_name          IN VARCHAR2,  
  db_username         IN VARCHAR2)
```

### Parameters

**Table 23–23** *DISABLE\_DB\_ACCESS Procedure Parameters*

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specifies the database user whose privileges are to be revoked from the Oracle Streams AQ Internet agent.

### Usage Notes

The Oracle Streams AQ Internet agent should have been previously granted those privileges using the [ENABLE\\_DB\\_ACCESS Procedure](#).

## DISABLE\_PROPAGATION\_SCHEDULE Procedure

This procedure disables a propagation schedule.

### Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
  queue_name          IN  VARCHAR2,
  destination         IN  VARCHAR2 DEFAULT NULL,
  destination_queue   IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 23–24** *DISABLE\_PROPAGATION\_SCHEDULE Procedure Parameters*

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a <code>dblink</code> .

## DROP\_AQ\_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Streams AQ Internet access.

### Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (  
    agent_name          IN VARCHAR2)
```

### Parameters

**Table 23–25** *DROP\_AQ\_AGENT Procedure Parameters*

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent

## DROP\_QUEUE Procedure

This procedure drops an existing queue.

### Syntax

```
DBMS_AQADM.DROP_QUEUE (
  queue_name      IN    VARCHAR2,
  auto_commit     IN    BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 23–26 DROP\_QUEUE Procedure Parameters**

Parameter	Description
queue_name	Name of the queue that is to be dropped.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.  Caution: This parameter has been deprecated.

### Usage Notes

DROP\_QUEUE is not allowed unless STOP\_QUEUE has been called to disable the queue for both enqueueing and dequeuing. All the queue data is deleted as part of the drop operation.

## DROP\_QUEUE\_TABLE Procedure

This procedure drops an existing queue table.

### Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (  
    queue_table      IN    VARCHAR2,  
    force            IN    BOOLEAN DEFAULT FALSE,  
    auto_commit      IN    BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 23–27** DROP\_QUEUE\_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be dropped.
force	FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.  Caution: This parameter has been deprecated.

### Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the `force` option is used, in which case this is done automatically.

## ENABLE\_DB\_ACCESS Procedure

This procedure grants an Oracle Streams AQ Internet agent the privileges of a specific database user.

### Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (
  agent_name          IN VARCHAR2,
  db_username        IN VARCHAR2)
```

### Parameters

**Table 23–28** *ENABLE\_DB\_ACCESS Procedure Parameters*

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specified the database user whose privileges are to be granted to the Oracle Streams AQ Internet agent.

### Usage Notes

The Oracle Streams AQ Internet agent should have been previously created using the [CREATE\\_AQ\\_AGENT Procedure](#).

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

**See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Streams AQ Internet agents and the names of the database users whose privileges are granted to them.

## ENABLE\_JMS\_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams Sys.Anydata queues unless you call this procedure after DBMS\_STREAMS\_ADM.SET\_UP\_QUEUE. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

### Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (  
    queue_table IN VARCHAR2);
```

### Parameters

**Table 23–29** *ENABLE\_JMS\_TYPES Procedure Parameters*

Parameter	Description
queue_table	Specifies name of the queue table to be enabled for JMS and XML types.

## ENABLE\_PROPAGATION\_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

### Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
    queue_name          IN   VARCHAR2,
    destination         IN   VARCHAR2 DEFAULT NULL,
    destination_queue   IN   VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 23–30** *ENABLE\_PROPAGATION\_SCHEDULE Procedure Parameters*

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

## GET\_WATERMARK Procedure

This procedure retrieves the value of watermark set by SET\_WATERMARK.

### Syntax

```
DBMS_AQADM.GET_WATERMARK (  
    wmvalue      OUT      NUMBER);
```

### Parameters

**Table 23–31** GET\_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

## GRANT\_QUEUE\_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

### Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
  privilege      IN   VARCHAR2,
  queue_name     IN   VARCHAR2,
  grantee        IN   VARCHAR2,
  grant_option   IN   BOOLEAN := FALSE);
```

### Parameters

**Table 23–32 GRANT\_QUEUE\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
grant_option	Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.

## GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure grants Oracle Streams AQ system privileges to users and roles. The privileges are `ENQUEUE_ANY`, `DEQUEUE_ANY`, and `MANAGE_ANY`. Initially, only `SYS` and `SYSTEM` can use this procedure successfully.

### Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (
  privilege      IN   VARCHAR2,
  grantee        IN   VARCHAR2,
  admin_option   IN   BOOLEAN := FALSE);
```

### Parameters

**Table 23–33 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
<code>privilege</code>	The Oracle Streams AQ system privilege to grant. The options are <code>ENQUEUE_ANY</code> , <code>DEQUEUE_ANY</code> , and <code>MANAGE_ANY</code> . <code>ENQUEUE_ANY</code> means users granted this privilege are allowed to enqueue messages to any queues in the database. <code>DEQUEUE_ANY</code> means users granted this privilege are allowed to dequeue messages from any queues in the database. <code>MANAGE_ANY</code> means users granted this privilege are allowed to run <code>DBMS_AQADM</code> calls on any schemas in the database.
<code>grantee</code>	Grantee(s). The grantee(s) can be a user, a role, or the <code>PUBLIC</code> role.
<code>admin_option</code>	Specifies if the system privilege is granted with the <code>ADMIN</code> option or not. If the privilege is granted with the <code>ADMIN</code> option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is <code>FALSE</code> .

## MIGRATE\_QUEUE\_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

### Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (  
    queue_table IN VARCHAR2,  
    compatible  IN VARCHAR2);
```

### Parameters

**Table 23–34** *MIGRATE\_QUEUE\_TABLE Procedure Parameters*

Parameter	Description
queue_table	Specifies name of the queue table to be migrated.
compatible	Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table.

## PURGE\_QUEUE\_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

### Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE (
  queue_table      IN  VARCHAR2,
  purge_condition  IN  VARCHAR2,
  purge_options    IN  aq$_purge_options_t);
```

where type `aq$_purge_options_t` is described in [Chapter 243, "Oracle Streams AQ TYPES"](#).

### Parameters

**Table 23–35** *PURGE\_QUEUE\_TABLE Procedure Parameters*

Parameter	Description
<code>queue_table</code>	Specifies the name of the queue table to be purged.
<code>purge_condition</code>	<p>Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL <code>WHERE</code> clause, and it is case-sensitive. The condition is based on the columns of <code>aq\$queue_table_name</code> view.</p> <p>When specifying the <code>purge_condition</code>, qualify the column names in <code>aq\$queue_table_name</code> view with <code>qtview</code>.</p> <p>To purge all queues in a queue table, set <code>purge_condition</code> to either <code>NULL</code> (a bare null word, no quotes) or <code>' '</code> (two single quotes).</p>
<code>purge_options</code>	<p>Type <code>aq\$_purge_options_t</code> contains a <code>block</code> parameter and a <code>delivery_mode</code> parameter.</p> <ul style="list-style-type: none"> <li>■ If <code>block</code> is <code>TRUE</code>, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if <code>block</code> is <code>TRUE</code>. The default for <code>block</code> is <code>FALSE</code>. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</li> <li>■ <code>delivery_mode</code> is used to specify whether <code>DBMS_AQADM.PERSISTENT</code>, <code>DBMS_AQADM.BUFFERED</code> or <code>DBMS_AQADM.PERSISTENT_OR_BUFFERED</code> types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.</li> </ul>

### Usage Notes

- You can purge selected messages from the queue table by specifying a `purge_condition`. [Table 23–35](#) describes these parameters. Messages can be enqueued and dequeued from the queue table while the queue table is being purged.

- A trace file is generated in the `udump` destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one `purge_queue_table` call depending on the number of messages in the queue table.

## QUEUE\_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`. Each element of the collection is of type `sys.aq$_agent`. This functionality is provided for 8.1-compatible queues by the `AQ$queue_table_name_S` view.

### Syntax

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (
    queue_name          IN          VARCHAR2);
RETURN aq$_subscriber_list_t IS
```

### Parameters

**Table 23–36** *QUEUE\_SUBSCRIBERS Function Parameters*

Parameter	Description
queue_name	Specifies the queue whose subscribers are to be printed.

## REMOVE\_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

### Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (  
    queue_name      IN      VARCHAR2,  
    subscriber      IN      sys.aq$_agent);
```

### Parameters

**Table 23–37 REMOVE\_SUBSCRIBER Procedure Parameters**

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent who is being removed. See <a href="#">AQ\$_AGENT Type</a> on page 243-3.

## REVOKE\_QUEUE\_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

### Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (  
  privilege      IN      VARCHAR2,  
  queue_name     IN      VARCHAR2,  
  grantee        IN      VARCHAR2);
```

### Parameters

**Table 23–38** *REVOKE\_QUEUE\_PRIVILEGE Procedure Parameters*

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.

### Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor's privileges are revoked.

## REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure revokes Oracle Streams AQ system privileges from users and roles. The privileges are ENQUEUE\_ANY, DEQUEUE\_ANY and MANAGE\_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

### Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
  privilege      IN  VARCHAR2,
  grantee        IN  VARCHAR2);
```

### Parameters

**Table 23–39 REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The Oracle Streams AQ system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.

## SCHEDULE\_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

### Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (
  queue_name          IN   VARCHAR2,
  destination         IN   VARCHAR2 DEFAULT NULL,
  start_time         IN   DATE      DEFAULT SYSDATE,
  duration            IN   NUMBER   DEFAULT NULL,
  next_time          IN   VARCHAR2 DEFAULT NULL,
  latency            IN   NUMBER   DEFAULT 60,
  destination_queue  IN   VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 23–40 SCHEDULE\_PROPAGATION Procedure Parameters**

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
start_time	Initial start time for the propagation window for messages from the source queue to the destination.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued.  For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds.  It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

### Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in

either the same or different queues, the message is propagated to all of them at the same time.

## SET\_WATERMARK Procedure

This procedure is used for Oracle Streams AQ notification to specify and limit memory use.

### Syntax

```
DBMS_AQADM.SET_WATERMARK (  
    wmvalue      IN      NUMBER);
```

### Parameters

**Table 23–41** SET\_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

## START\_QUEUE Procedure

This procedure enables the specified queue for enqueueing or dequeuing.

### Syntax

```
DBMS_AQADM.START_QUEUE (
    queue_name      IN      VARCHAR2,
    enqueue         IN      BOOLEAN DEFAULT TRUE,
    dequeue         IN      BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 23–42** *START\_QUEUE Procedure Parameters*

Parameter	Description
queue_name	Name of the queue to be enabled
enqueue	Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.

### Usage Notes

After creating a queue, the administrator must use `START_QUEUE` to enable the queue. The default is to enable it for both `ENQUEUE` and `DEQUEUE`. Only `dequeue` operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

## STOP\_QUEUE Procedure

This procedure disables enqueueing or dequeuing on the specified queue.

### Syntax

```
DBMS_AQADM.STOP_QUEUE (
  queue_name      IN  VARCHAR2,
  enqueue         IN  BOOLEAN DEFAULT TRUE,
  dequeue         IN  BOOLEAN DEFAULT TRUE,
  wait            IN  BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 23–43 STOP\_QUEUE Procedure Parameters**

Parameter	Description
queue_name	Name of the queue to be disabled
enqueue	Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.
wait	Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.

### Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

## UNSCHEDULE\_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

### Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
  queue_name      IN  VARCHAR2,
  destination     IN  VARCHAR2 DEFAULT NULL
  destination_queue IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 23–44 UNSCHEDULE\_PROPAGATION Procedure Parameters**

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a <code>dblink</code> .

## VERIFY\_QUEUE\_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

### Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
    src_queue_name    IN    VARCHAR2,
    dest_queue_name   IN    VARCHAR2,
    destination       IN    VARCHAR2 DEFAULT NULL,
    rc                OUT   BINARY_INTEGER);
```

### Parameters

**Table 23–45** VERIFY\_QUEUE\_TYPES Procedure Parameters

Parameter	Description
<code>src_queue_name</code>	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
<code>dest_queue_name</code>	Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
<code>destination</code>	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
<code>rc</code>	Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in <code>rc</code> .

The DBMS\_AQELM package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

**See Also:** *Oracle Streams Advanced Queuing User's Guide* for detailed information about DBMS\_AQELM

This chapter contains the following topic:

- [Summary of DBMS\\_AQELM Subprograms](#)

## Summary of DBMS\_AQELM Subprograms

**Table 24–1** *DBMS\_ALERT Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">SET_MAILHOST Procedure</a> on page 24-3	Sets the host name for the SMTP server that the database will use to send out e-mail notifications
<a href="#">SET_MAILPORT Procedure</a> on page 24-4	Sets the port number for the SMTP server
<a href="#">SET_SENDFROM Procedure</a> on page 24-5	Sets the sent-from e-mail address

## SET\_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

### Syntax

```
DBMS_AQELM.SET_MAILHOST (  
    mailhost IN VARCHAR2);
```

### Parameters

**Table 24–2** *SET\_MAILHOST Procedure Parameters*

Parameter	Description
mailhost	SMTP server host name.

### Usage Notes

As part of the configuration for e-mail notifications, a user with AQ\_ADMINISTRATOR\_ROLE or with EXECUTE permissions on the DBMS\_AQELM package needs to set the host name before registering for e-mail notifications.

## SET\_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

### Syntax

```
DBMS_AQELM.SET_MAILPORT (  
    mailport IN NUMBER);
```

### Parameters

**Table 24–3** SET\_MAILPORT Procedure Parameters

Parameter	Description
mailport	SMTP server port number.

### Usage Notes

As part of the configuration for e-mail notifications, a user with AQ\_ADMINISTRATOR\_ROLE or with EXECUTE permissions on DBMS\_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

## SET\_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

### Syntax

```
DBMS_AQELM.SET_SENDFROM (  
    sendfrom IN VARCHAR2);
```

### Parameters

**Table 24–4 SET\_SENDFROM Procedure Parameters**

Parameter	Description
sendfrom	The sent-from e-mail address.

### Usage Notes

As part of the configuration for e-mail notifications, a user with AQ\_ADMINISTRATOR\_ROLE or with EXECUTE permissions on the DBMS\_AQELM package should set the sent-from address before registering for e-mail notifications

The DBMS\_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

**See Also:** *Oracle Streams Advanced Queuing User's Guide* for detailed information about DBMS\_AQIN

This chapter contains the following topic:

- [Using DBMS\\_AQIN](#)
  - Over view

---

## Using DBMS\_AQIN

This section contains topics which relate to using the DBMS\_AQIN package.

- [Overview](#)

## Overview

While you should not call any subprograms in the DBMS\_AQIN package directly, you must have the EXECUTE privilege on the DBMS\_AQIN and DBMS\_AQJMS packages to use the Oracle JMS interfaces. Use the following syntax to accomplish this with regard to the DBMS\_AQIN package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

Note that you can also acquire these rights through the AQ\_USER\_ROLE or the AQ\_ADMINISTRATOR\_ROLE.

The DBMS\_ASSERT package provides an interface to validate properties of the input value.

**See Also:** *Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- [Using DBMS\\_ASSERT](#)
  - Operational Notes
- [Summary of DBMS\\_ASSERT Subprograms](#)

---

## Using DBMS\_ASSERT

- [Operational Notes](#)

## Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned through the return value. Most functions return the value unchanged, however, several functions modify the value.

## Summary of DBMS\_ASSERT Subprograms

**Table 26–1** *DBMS\_APPLICATION\_INFO Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">ENQUOTE_LITERAL Function</a> on page 26-5	Enquotes a string literal
<a href="#">ENQUOTE_NAME Function</a> on page 26-6	Encloses a name in double quotes
<a href="#">NOOP Functions</a> on page 26-7	Returns the value without any checking
<a href="#">QUALIFIED_SQL_NAME Function</a> on page 26-8	Verifies that the input string is a qualified SQL name
<a href="#">SCHEMA_NAME Function</a> on page 26-9	Verifies that the input string is an existing schema name
<a href="#">SIMPLE_SQL_NAME Function</a> on page 26-10	Verifies that the input string is a simple SQL name
<a href="#">SQL_OBJECT_NAME Function</a> on page 26-11	Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object

## ENQUOTE\_LITERAL Function

This function enquotes a string literal.

### Syntax

```
DBMS_ASSERT.ENQUOTE_LITERAL (  
    str          VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 26–2 ENQUOTE\_LITERAL Function Parameters**

Parameter	Description
str	String to enquote

### Usage Notes

- Add leading and trailing single quotes to a string literal.
- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.

## ENQUOTE\_NAME Function

This function encloses a name in double quotes.

### Syntax

```
DBMS_ASSERT.ENQUOTE_NAME (  
    str          VARCHAR2,  
    capitalize   BOOLEAN DEFAULT TRUE)  
RETURN VARCHAR2;
```

### Parameters

**Table 26-3 ENQUOTE\_NAME Function Parameters**

Parameter	Description
<code>str</code>	String to enquote
<code>capitalize</code>	If TRUE or defaulted, alphabetic characters of <code>str</code> which was not in quotes are translated to upper case

## NOOP Functions

This function returns the value without any checking.

### Syntax

```
DBMS_ASSERT.NOOP (  
    str      VARCHAR2 CHARACTER SET ANY_CS)  
RETURN      VARCHAR2 CHARACTER SET str%CHARSET;
```

```
DBMS_ASSERT.NOOP (  
    str      CLOB CHARACTER SET ANY_CS)  
RETURN      CLOB CHARACTER SET str%CHARSET;
```

### Parameters

**Table 26–4** NOOP Function Parameters

Parameter	Description
str	Input value

## QUALIFIED\_SQL\_NAME Function

This function verifies that the input string is a qualified SQL name.

### Syntax

```
DBMS_ASSERT.QUALIFIED_SQL_NAME (  
    str      VARCHAR2 CHARACTER SET ANY_CS)  
RETURN      VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 26–5** *QUALIFIED\_SQL\_NAME Function Parameters*

Parameter	Description
str	Input value

### Exceptions

ORA44004: string is not a qualified SQL name

### Usage Notes

A qualified SQL name <qualified name> can be expressed by the following grammar:

```
<local qualified name> ::= <simple name> { '.' <simple name> }  
<database link name> ::= <local qualified name> [ '@' <connection string> ]  
<connection string> ::= <simple name>  
<qualified name> ::= <local qualified name> [ '@' <database link name> ]
```

## SCHEMA\_NAME Function

This function verifies that the input string is an existing schema name.

### Syntax

```
DBMS_ASSERT.SCHEMA_NAME (  
    str          VARCHAR2 CHARACTER SET ANY_CS)  
RETURN          VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 26–6** SCHEMA\_NAME Function Parameters

Parameter	Description
str	Input value

### Exceptions

ORA44001: Invalid schema name

### Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.

## SIMPLE\_SQL\_NAME Function

This function verifies that the input string is a simple SQL name.

### Syntax

```
DBMS_ASSERT.SIMPLE_SQL_NAME (  
    str      VARCHAR2 CHARACTER SET ANY_CS)  
RETURN      VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 26–7** SIMPLE\_SQL\_NAME Function Parameters

Parameter	Description
str	Input value

### Exceptions

ORA44003: string is not a simple SQL name

### Usage Notes

- The input value must meet the following conditions:
  - The name must begin with an alphabetic character. It may contain alphanumeric characters as well as the characters `_`, `$`, and `#` in the second and subsequent character positions.
  - Quoted SQL names are also allowed.
  - Quoted names must be enclosed in double quotes.
  - Quoted names allow any characters between the quotes.
  - Quotes inside the name are represented by two quote characters in a row, for example, "a name with "" inside" is a valid quoted name.
  - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.

## SQL\_OBJECT\_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

### Syntax

```
DBMS_ASSERT.SQL_OBJECT_NAME (  
    str          VARCHAR2 CHARACTER SET ANY_CS)  
RETURN          VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 26–8** *SQL\_OBJECT\_NAME Function Parameters*

Parameter	Description
str	Input value

### Exceptions

ORA44002: Invalid object name

### Usage Notes

The use of synonyms requires that the base object exists.

---

## DBMS\_AUDIT\_MGMT

The DBMS\_AUDIT\_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the various audit trail types like database audit trails, operating system (OS) audit trails, and XML audit trails.

**See Also:** "Verifying Security Access with Auditing" in the *Oracle Database Security Guide* for more information on using the DBMS\_AUDIT\_MGMT package to manage audit trails

This chapter contains the following topics:

- [Using DBMS\\_AUDIT\\_MGMT](#)
  - Overview
  - Security Model
  - Constants
  - Views
- [Subprogram Groups](#)
  - Audit Trail Management Subprograms
  - Audit Trail Cleanup Subprograms
- [Summary of DBMS\\_AUDIT\\_MGMT Subprograms](#)

## Using DBMS\_AUDIT\_MGMT

This section contains topics which relate to using the DBMS\_AUDIT\_MGMT package. The following topics are included:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)

## Overview

Database auditing helps meet your database security and compliance requirements. Audit records are written to database tables, operating system (OS) files, or XML files depending on the `AUDIT_TRAIL` initialization parameter setting.

When `AUDIT_TRAIL` is set to `DB`, database records are written to the `AUD$` table.

When `AUDIT_TRAIL` is set to `OS`, audit records are written to operating system files.

When `AUDIT_TRAIL` is set to `XML`, audit records are written to operating system files in XML format.

**See Also:** "Verifying Security Access with Auditing" in the *Oracle Database Security Guide* for more background information on database auditing

It is important to manage your audit records properly in order to ensure efficient performance and disk space management. The `DBMS_AUDIT_MGMT` subprograms enable you to efficiently manage your audit trail records.

The `DBMS_AUDIT_MGMT` package provides a subprogram that allows you to move the database audit trail tables out of the `SYSTEM` tablespace. This improves overall database performance by reducing the load on the `SYSTEM` tablespace. It also enables you to dedicate an optimized tablespace for audit records.

The `DBMS_AUDIT_MGMT` subprograms also enable you to manage your operating system and XML audit files. You can define properties like the maximum size and age of an audit file. This enables you to keep the file sizes of OS and XML audit files in check.

The `DBMS_AUDIT_MGMT` subprograms enable you to perform cleanup operations on all audit trail types. Audit trails can be cleaned based on the Last Archive Timestamp value. The Last Archive Timestamp represents the timestamp of the most recent audit record that was securely archived.

The `DBMS_AUDIT_MGMT` package provides a subprogram that enables audit administrators to set the last archive timestamp for archived audit records. This subprogram can also be used by external archival systems to set the last archive timestamp.

The `DBMS_AUDIT_MGMT` subprograms also enable you to configure jobs that periodically delete audit trail records. The frequency with which these jobs should run can be controlled by the audit administrator.

## Security Model

All `DBMS_AUDIT_MGMT` subprograms require the user to have `EXECUTE` privilege over the `DBMS_AUDIT_MGMT` package. The `SYSDBA` role has `EXECUTE` privileges on the package by default.

Oracle strongly recommends that only audit administrators should have `EXECUTE` privileges over the `DBMS_AUDIT_MGMT` package.

## Constants

The DBMS\_AUDIT\_MGMT package defines several enumerated constants that can be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS\_AUDIT\_MGMT.AUDIT\_TRAIL\_AUD\_STD.

The DBMS\_AUDIT\_MGMT package includes the constants shown in the following tables:

- [DBMS\\_AUDIT\\_MGMT Constants - Audit Trail Types](#)
- [DBMS\\_AUDIT\\_MGMT Constants - Audit Trail Properties](#)
- [DBMS\\_AUDIT\\_MGMT Constants - Purge Job Status](#)

Audit trails can be classified based on whether audit records are written to database tables, operating system files, or XML files. [Table 27-1](#) lists the audit trail type constants.

**Table 27-1 DBMS\_AUDIT\_MGMT Constants - Audit Trail Types**

Constant	Type	Description
AUDIT_TRAIL_ALL	PLS_INTEGER	All audit trail types. This includes the standard database audit trail (SYS.AUD\$ and SYS.FGA_LOG\$ tables), operating system (OS) audit trail, and XML audit trail.
AUDIT_TRAIL_AUD_STD	PLS_INTEGER	Standard database audit records in the SYS.AUD\$ table
AUDIT_TRAIL_DB_STD	PLS_INTEGER	Both standard audit (SYS.AUD\$) and FGA audit(SYS.FGA_LOG\$) records
AUDIT_TRAIL_FGA_STD	PLS_INTEGER	Standard database fine-grained auditing (FGA) records in the SYS.FGA_LOG\$ table
AUDIT_TRAIL_FILES	PLS_INTEGER	Both operating system (OS) and XML audit trails
AUDIT_TRAIL_OS	PLS_INTEGER	Operating system audit trail. This refers to the audit records stored in operating system files.
AUDIT_TRAIL_XML	PLS_INTEGER	XML audit trail. This refers to the audit records stored in XML files.

Audit trail properties determine the audit configuration settings. [Table 27-2](#) lists the constants related to audit trail properties.

**Table 27-2 DBMS\_AUDIT\_MGMT Constants - Audit Trail Properties**

Constant	Type	Description
CLEAN_UP_INTERVAL	PLS_INTEGER	Interval, in hours, after which the cleanup procedure is called to clear audit records in the specified audit trail
DB_DELETE_BATCH_SIZE	PLS_INTEGER	Specifies the batch size to be used for deleting audit records in database audit tables. The audit records are deleted in batches of size equal to DB_DELETE_BATCH_SIZE.
FILE_DELETE_BATCH_SIZE	PLS_INTEGER	Specifies the batch size to be used for deleting audit files in the audit directory. The audit files are deleted in batches of size equal to FILE_DELETE_BATCH_SIZE.

**Table 27–2 (Cont.) DBMS\_AUDIT\_MGMT Constants - Audit Trail Properties**

Constant	Type	Description
OS_FILE_MAX_AGE	PLS_INTEGER	Specifies the maximum number of days for which an operating system (OS) or XML audit file can be kept open before a new audit file gets created
OS_FILE_MAX_SIZE	PLS_INTEGER	Specifies the maximum size, in kilobytes (KB), to which an operating system (OS) or XML audit file can grow before a new file is opened

The audit trail purge job cleans the audit trail. [Table 27–3](#) lists the constants related to purge job status values.

**Table 27–3 DBMS\_AUDIT\_MGMT Constants - Purge Job Status**

Constant	Type	Description
PURGE_JOB_DISABLE	PLS_INTEGER	Disables a purge job
PURGE_JOB_ENABLE	PLS_INTEGER	Enables a purge job

## Views

The views listed in [Table 27-4](#) are used to display DBMS\_AUDIT\_MGMT configuration and cleanup events.

**Table 27-4 Views used by DBMS\_AUDIT\_MGMT**

<b>View</b>	<b>Description</b>
DBA_AUDIT_MGMT_CLEAN_EVENTS	Displays the cleanup event history
DBA_AUDIT_MGMT_CLEANUP_JOBS	Displays the currently configured audit trail purge jobs
DBA_AUDIT_MGMT_CONFIG_PARAMS	Displays the currently configured audit trail properties
DBA_AUDIT_MGMT_LAST_ARCH_TS	Displays the last archive timestamps set for the audit trails

**See Also:** *Oracle Database Reference* for more information on these views

---

## Subprogram Groups

The DBMS\_AUDIT\_MGMT package subprograms can be grouped into the following categories:

- [Audit Trail Management Subprograms](#)
- [Audit Trail Cleanup Subprograms](#)

## Audit Trail Management Subprograms

Audit trail management subprograms enable you to manage audit trail properties.

**Table 27-5** *Audit Trail Management Subprograms*

Subprogram	Description
<a href="#">CLEAR_AUDIT_TRAIL_PROPERTY Procedure</a> on page 27-14	Clears the value for the audit trail property that you specify
<a href="#">SET_AUDIT_TRAIL_LOCATION Procedure</a> on page 27-25	Moves the audit trail tables from their current tablespace to a user-specified tablespace
<a href="#">SET_AUDIT_TRAIL_PROPERTY Procedure</a> on page 27-27	Sets an audit trail property for the audit trail type that you specify

The [Summary of DBMS\\_AUDIT\\_MGMT Subprograms](#) contains a complete listing of all subprograms in the package.

## Audit Trail Cleanup Subprograms

Audit trail cleanup subprograms help you perform cleanup related operations on the audit trail records.

**Table 27–6 Audit Trail Cleanup Subprograms**

Subprogram	Description
<a href="#">CLEAN_AUDIT_TRAIL Procedure</a> on page 27-12	Deletes audit trail records/files that have been archived
<a href="#">CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure</a> on page 27-16	Clears the timestamp set by the <a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a>
<a href="#">CREATE_PURGE_JOB Procedure</a> on page 27-17	Creates a purge job for periodically deleting the audit trail records/files
<a href="#">DEINIT_CLEANUP Procedure</a> on page 27-19	Undoes the setup and initialization performed by the <a href="#">INIT_CLEANUP Procedure</a>
<a href="#">DROP_PURGE_JOB Procedure</a> on page 27-20	Drops the purge job created using the <a href="#">CREATE_PURGE_JOB Procedure</a>
<a href="#">INIT_CLEANUP Procedure</a> on page 27-22	Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records/files
<a href="#">IS_CLEANUP_INITIALIZED Function</a> on page 27-24	Checks to see if the <a href="#">INIT_CLEANUP Procedure</a> has been run for an audit trail type
<a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a> on page 27-30	Sets a timestamp indicating when the audit records/files were last archived
<a href="#">SET_PURGE_JOB_INTERVAL Procedure</a> on page 27-32	Sets the interval at which the <a href="#">CLEAN_AUDIT_TRAIL Procedure</a> is called for the purge job that you specify
<a href="#">SET_PURGE_JOB_STATUS Procedure</a> on page 27-33	Enables or disables the purge job that you specify

The [Summary of DBMS\\_AUDIT\\_MGMT Subprograms](#) contains a complete listing of all subprograms in the package.

---

## Summary of DBMS\_AUDIT\_MGMT Subprograms

**Table 27–7 DBMS\_AUDIT\_MGMT Package Subprograms**

Subprogram	Description
<a href="#">CLEAN_AUDIT_TRAIL Procedure</a> on page 27-12	Deletes audit trail records that have been archived
<a href="#">CLEAR_AUDIT_TRAIL_PROPERTY Procedure</a> on page 27-14	Clears the value for the audit trail property that you specify
<a href="#">CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure</a> on page 27-16	Clears the timestamp set by the <a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a>
<a href="#">CREATE_PURGE_JOB Procedure</a> on page 27-17	Creates a purge job for periodically deleting the audit trail records
<a href="#">DEINIT_CLEANUP Procedure</a> on page 27-19	Undoes the setup and initialization performed by the <a href="#">INIT_CLEANUP Procedure</a>
<a href="#">DROP_PURGE_JOB Procedure</a> on page 27-20	Drops the purge job created using the <a href="#">CREATE_PURGE_JOB Procedure</a>
<a href="#">GET_AUDIT_COMMIT_DELAY Function</a> on page 27-21	Returns the Audit Commit Delay as the number of seconds. This is the maximum time that it takes to COMMIT an audit record to the database audit trail.
<a href="#">INIT_CLEANUP Procedure</a> on page 27-22	Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records
<a href="#">IS_CLEANUP_INITIALIZED Function</a> on page 27-24	Checks to see if the <a href="#">INIT_CLEANUP Procedure</a> has been run for an audit trail type
<a href="#">SET_AUDIT_TRAIL_LOCATION Procedure</a> on page 27-25	Moves the audit trail tables from their current tablespace to a user-specified tablespace
<a href="#">SET_AUDIT_TRAIL_PROPERTY Procedure</a> on page 27-27	Sets the audit trail properties for the audit trail type that you specify
<a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a> on page 27-30	Sets a timestamp indicating when the audit records were last archived
<a href="#">SET_PURGE_JOB_INTERVAL Procedure</a> on page 27-32	Sets the interval at which the <a href="#">CLEAN_AUDIT_TRAIL Procedure</a> is called for the purge job that you specify
<a href="#">SET_PURGE_JOB_STATUS Procedure</a> on page 27-33	Enables or disables the purge job that you specify

## CLEAN\_AUDIT\_TRAIL Procedure

This procedure deletes audit trail records. The `CLEAN_AUDIT_TRAIL` procedure is usually called after the [SET\\_LAST\\_ARCHIVE\\_TIMESTAMP Procedure](#) has been used to set the last archived timestamp for the audit records.

### Syntax

```
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL (
  audit_trail_type          IN PLS_INTEGER,
  use_last_arch_timestamp   IN BOOLEAN DEFAULT TRUE) ;
```

### Parameters

**Table 27–8** *CLEAN\_AUDIT\_TRAIL Procedure Parameters*

Parameter	Description
<code>audit_trail_type</code>	The audit trail type for which the cleanup operation needs to be performed. Audit trail types are listed in <a href="#">Table 27–1</a> , "DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 27-5.
<code>use_last_arch_timestamp</code>	Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted.  A value of <code>TRUE</code> indicates that only audit records created before the last archive timestamp should be deleted.  A value of <code>FALSE</code> indicates that all audit records should be deleted.  The default value is <code>TRUE</code> . Oracle recommends using this value, as this helps guard against inadvertent deletion of records.

### Usage Notes

The following usage notes apply:

- When cleaning up operating system (OS) or XML audit files, only files in the current audit directory, specified by the `AUDIT_FILE_DEST` parameter, are cleaned up.
- For Windows platforms, no cleanup is performed when the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`. This is because operating system (OS) audit records on Windows are written to the Windows Event Viewer.
- For Unix platforms, no cleanup is performed for cases where the operating system (OS) audit records are written to the syslog. When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`, it removes only the `*.aud` files under the directory specified by the `AUDIT_FILE_DEST` initialization parameter.

**See Also:** "AUDIT\_SYSLOG\_LEVEL" in the *Oracle Database Reference*

- When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_XML`, this procedure only removes XML audit files (`*.xml`) from the current audit directory.

Oracle database maintains a book-keeping file (`adx_${ORACLE_SID}.txt`) for the XML audit files. This file is not removed by the cleanup procedure.

## Examples

The following example calls the `CLEAN_AUDIT_TRAIL` procedure to clean up the operating system (OS) audit trail records that were updated before the last archive timestamp.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
  audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
  use_last_arch_timestamp => TRUE);
END;
/
```

## CLEAR\_AUDIT\_TRAIL\_PROPERTY Procedure

This procedure clears the value for the audit trail property that is specified. Audit trail properties are set using the [SET\\_AUDIT\\_TRAIL\\_PROPERTY Procedure](#).

The CLEAR\_AUDIT\_TRAIL\_PROPERTY procedure can optionally reset the property value to its default value through the `use_default_values` parameter.

### Syntax

```
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY (
  audit_trail_type      IN PLS_INTEGER,
  audit_trail_property  IN PLS_INTEGER,
  use_default_values    IN BOOLEAN DEFAULT FALSE) ;
```

### Parameters

**Table 27-9 CLEAR\_AUDIT\_TRAIL\_PROPERTY Procedure Parameters**

Parameter	Description
<code>audit_trail_type</code>	The audit trail type for which the property needs to be cleared. Audit trail types are listed in <a href="#">Table 27-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types"</a> on page 27-5
<code>audit_trail_property</code>	The audit trail property whose value needs to be cleared. You cannot clear the value for the <code>CLEANUP_INTERVAL</code> property.  Audit trail properties are listed in <a href="#">Table 27-2, "DBMS_AUDIT_MGMT Constants - Audit Trail Properties"</a>
<code>use_default_values</code>	Specifies whether the default value of the <code>audit_trail_property</code> should be used in place of the cleared value. A value of <code>TRUE</code> causes the default value of the parameter to be used. A value of <code>FALSE</code> causes the <code>audit_trail_property</code> to have no value.  The default value for this parameter is <code>FALSE</code> .

### Usage Notes

The following usage notes apply:

- You can use this procedure to clear the value for an audit trail property that you do not wish to use. For example, if you do not want a restriction on the operating system audit file size, then you can use this procedure to reset the `OS_FILE_MAX_SIZE` property.

You can also use this procedure to reset an audit trail property to its default value. You need to set `use_default_values` to `TRUE` when invoking the procedure.

- The `DB_DELETE_BATCH_SIZE` property needs to be individually cleared for the `AUDIT_TRAIL_AUD_STD` and `AUDIT_TRAIL_FGA_STD` audit trail types. You cannot clear this property collectively using the `AUDIT_TRAIL_DB_STD` and `AUDIT_TRAIL_ALL` audit trail types.
- If you clear the value of the `DB_DELETE_BATCH_SIZE` property with `use_default_value` set to `FALSE`, the default value of `DB_DELETE_BATCH_SIZE` is still assumed. This is because audit records are always deleted in batches.

- The `FILE_DELETE_BATCH_SIZE` property needs to be individually cleared for the `AUDIT_TRAIL_OS` and `AUDIT_TRAIL_XML` audit trail types. You cannot clear this property collectively using the `AUDIT_TRAIL_FILES` and `AUDIT_TRAIL_ALL` audit trail types.
- If you clear the value of the `FILE_DELETE_BATCH_SIZE` property with `use_default_value` set to `FALSE`, the default value of `FILE_DELETE_BATCH_SIZE` is still assumed. This is because audit files are always deleted in batches.
- You cannot clear the value for the `CLEANUP_INTERVAL` property.

## Examples

The following example calls the `CLEAR_AUDIT_TRAIL_PROPERTY` procedure to clear the value for the audit trail property, `OS_FILE_MAX_SIZE`. The procedure uses a value of `FALSE` for the `USE_DEFAULT_VALUES` parameter. This means that there will be no maximum size threshold for operating system (OS) audit files.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY (
  AUDIT_TRAIL_TYPE      =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
  AUDIT_TRAIL_PROPERTY  =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
  USE_DEFAULT_VALUES    =>  FALSE );
END;
/
```

## CLEAR\_LAST\_ARCHIVE\_TIMESTAMP Procedure

This procedure clears the timestamp set by the [SET\\_LAST\\_ARCHIVE\\_TIMESTAMP Procedure](#).

### Syntax

```
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP (
  audit_trail_type      IN PLS_INTEGER,
  rac_instance_number  IN PLS_INTEGER DEFAULT NULL) ;
```

### Parameters

**Table 27-10 CLEAR\_LAST\_ARCHIVE\_TIMESTAMP Procedure Parameters**

Parameter	Description
audit_trail_type	The audit trail type for which the timestamp needs to be cleared. Audit trail types are listed in <a href="#">Table 27-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types"</a> on page 27-5.
rac_instance_number	The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for single instance databases.

### Usage Notes

The following usage notes apply:

- The timestamp for only one audit\_trail\_type can be cleared at a time.
- The following are invalid audit\_trail\_type values for this procedure and cannot be used:
  - AUDIT\_TRAIL\_ALL
  - AUDIT\_TRAIL\_DB\_STD
  - AUDIT\_TRAIL\_FILES

### Examples

The following example calls the CLEAR\_LAST\_ARCHIVE\_TIMESTAMP procedure to clear the timestamp value for the operating system (OS) audit trail type.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP (
  audit_trail_type      => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
  rac_instance_number  => 1);
END;
/
```

## CREATE\_PURGE\_JOB Procedure

This procedure creates a purge job for periodically deleting the audit trail records.

This procedure carries out the cleanup operation at intervals specified by the user. It calls the [CLEAN\\_AUDIT\\_TRAIL Procedure](#) to perform the cleanup operation.

The [SET\\_PURGE\\_JOB\\_INTERVAL Procedure](#) is used to modify the frequency of the purge job.

The [SET\\_PURGE\\_JOB\\_STATUS Procedure](#) is used to enable or disable the purge job.

The [DROP\\_PURGE\\_JOB Procedure](#) is used to drop a purge job created with the CREATE\_PURGE\_JOB procedure.

### Syntax

```
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB (
  audit_trail_type          IN PLS_INTEGER,
  audit_trail_purge_interval IN PLS_INTEGER,
  audit_trail_purge_name    IN VARCHAR2,
  use_last_arch_timestamp  IN BOOLEAN DEFAULT TRUE) ;
```

### Parameters

**Table 27-11 CREATE\_PURGE\_JOB Procedure Parameters**

Parameter	Description
audit_trail_type	The audit trail type for which the purge job needs to be created. Audit trail types are listed in <a href="#">Table 27-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types"</a> on page 27-5.
audit_trail_purge_interval	The interval, in hours, at which the clean up procedure is called. A lower value means that the cleanup is performed more often.
audit_trail_purge_name	A name to identify the purge job.
use_last_arch_timestamp	Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted.  A value of <code>TRUE</code> indicates that only audit records created before the last archive timestamp should be deleted.  A value of <code>FALSE</code> indicates that all audit records should be deleted.  The default value is <code>TRUE</code> .

### Usage Notes

Use this procedure to schedule the [CLEAN\\_AUDIT\\_TRAIL Procedure](#) for your audit trail records.

### Examples

The following example calls the CREATE\_PURGE\_JOB procedure to create a cleanup job called CLEANUP, for all audit trail types. It sets the audit\_trail\_purge\_interval parameter to 100. This means that the cleanup job is invoked every 100 hours. It also sets the use\_last\_arch\_timestamp parameter

value to TRUE. This means that all audit records older than the last archive timestamp are deleted.

```
BEGIN
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB (
  audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
  audit_trail_purge_interval => 100 /* hours */,
  audit_trail_purge_name => 'CLEANUP',
  use_last_arch_timestamp => TRUE);
END;
/
```

## DEINIT\_CLEANUP Procedure

This procedure undoes the setup and initialization performed by the [INIT\\_CLEANUP Procedure](#). The DEINIT\_CLEANUP procedure clears the value of the `default_cleanup_interval` parameter. However, when used for audit tables, it does not move the audit trail tables back to their original tablespace.

### Syntax

```
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
    audit_trail_type IN PLS_INTEGER) ;
```

### Parameters

**Table 27–12 DEINIT\_CLEANUP Procedure Parameters**

Parameter	Description
<code>audit_trail_type</code>	The audit trail type for which the procedure needs to be called.  Audit trail types are listed in <a href="#">Table 27–1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types"</a> on page 27-5

### Examples

The following example clears the `default_cleanup_interval` parameter setting for the standard database audit trail:

```
BEGIN
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
    AUDIT_TRAIL_TYPE => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD);
END;
/
```

## DROP\_PURGE\_JOB Procedure

This procedure drops the purge job created using the [CREATE\\_PURGE\\_JOB Procedure](#). The name of the purge job is passed as an argument.

### Syntax

```
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(  
    audit_trail_purge_name    IN VARCHAR2) ;
```

### Parameters

**Table 27–13** *DROP\_PURGE\_JOB Procedure Parameters*

Parameter	Description
audit_trail_purge_name	The name of the purge job which is being deleted. This is the purge job name that you specified with the <a href="#">CREATE_PURGE_JOB Procedure</a> .

### Examples

The following example calls the DROP\_PURGE\_JOB procedure to drop the purge job called CLEANUP.

```
BEGIN  
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(  
    AUDIT_TRAIL_PURGE_NAME => 'CLEANUP');  
END;  
/
```

## GET\_AUDIT\_COMMIT\_DELAY Function

This function returns the Audit Commit Delay as the number of seconds. Audit Commit Delay is the maximum time that it takes to COMMIT an audit record to the database audit trail. If it takes more time to COMMIT an audit record than defined by the Audit Commit Delay, then a copy of the audit record is written to the operating system (OS) audit trail.

The Audit Commit Delay value is useful when determining the last archive timestamp for database audit records.

### Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_COMMIT_DELAY  
RETURN NUMBER;
```

## INIT\_CLEANUP Procedure

This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records. If the audit trail tables are in the `SYSTEM` tablespace, then the procedure moves them to the `SYSAUX` tablespace.

Moving the audit trail tables out of the `SYSTEM` tablespace enhances overall database performance. The `INIT_CLEANUP` procedure moves the audit trail tables to the `SYSAUX` tablespace. If the [SET\\_AUDIT\\_TRAIL\\_LOCATION Procedure](#) has already moved the audit tables elsewhere, then no tables are moved.

The [SET\\_AUDIT\\_TRAIL\\_LOCATION Procedure](#) enables you to specify an alternate target tablespace for the database audit tables.

The `INIT_CLEANUP` procedure is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. No preliminary set up is required for these audit trail types.

**See Also:** [Table 27-1, "DBMS\\_AUDIT\\_MGMT Constants - Audit Trail Types"](#) on page 27-5 for a list of all audit trail types

This procedure also sets a default cleanup interval for the audit trail records.

### Syntax

```
DBMS_AUDIT_MGMT.INIT_CLEANUP (
  audit_trail_type          IN PLS_INTEGER,
  default_cleanup_interval IN PLS_INTEGER);
```

### Parameters

**Table 27-14** *INIT\_CLEANUP Procedure Parameters*

Parameter	Description
<code>audit_trail_type</code>	The audit trail type for which the clean up operation needs to be initialized.  Audit trail types are listed in <a href="#">Table 27-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types"</a> on page 27-5
<code>default_cleanup_interval</code>	The default time interval, in hours, after which the cleanup procedure should be called. The minimum value is 1 and the maximum is 999.

### Usage Notes

The following usage notes apply:

- This procedure may involve data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the `SYSAUX` tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the `SYSAUX` tablespace for frequent write operations.
- You can change the `default_cleanup_interval` later using the [SET\\_AUDIT\\_TRAIL\\_PROPERTY Procedure](#).

- If you do not wish to move the audit trail tables to the SYSAUX tablespace, then you should use the `DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION` procedure to move the audit trail tables to another tablespace before calling the `INIT_CLEANUP` procedure.

**See Also:** ["SET\\_AUDIT\\_TRAIL\\_LOCATION Procedure"](#) on page 27-25

## Examples

The following example calls the `INIT_CLEANUP` procedure to set a `default_cleanup_interval` of 12 hours for all audit trail types:

```
BEGIN
DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    default_cleanup_interval => 12 /* hours */);
END;
/
```

**See Also:** [Table 27-1, "DBMS\\_AUDIT\\_MGMT Constants - Audit Trail Types"](#) on page 27-5 for a list of all audit trail types

## IS\_CLEANUP\_INITIALIZED Function

This function checks to see if the [INIT\\_CLEANUP Procedure](#) has been run for an audit trail type. The `IS_CLEANUP_INITIALIZED` function returns `TRUE` if the procedure has already been run for the audit trail type. It returns `FALSE` if the procedure has not been run for the audit trail type.

This function is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. The function always returns `TRUE` for these audit trail types. No preliminary set up is required for these audit trail types.

**See Also:** [Table 27-1, "DBMS\\_AUDIT\\_MGMT Constants - Audit Trail Types"](#) on page 27-5 for a list of all audit trail types

### Syntax

```
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
    audit_trail_type IN PLS_INTEGER)
RETURN BOOLEAN;
```

### Parameters

**Table 27-15 IS\_CLEANUP\_INITIALIZED Function Parameters**

Parameter	Description
<code>audit_trail_type</code>	The audit trail type for which the function needs to be called.  Audit trail types are listed in <a href="#">Table 27-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types"</a> on page 27-5

### Examples

The following example checks to see if the standard database audit trail type has been initialized for cleanup operation. If the audit trail type has not been initialized, then it calls the [INIT\\_CLEANUP Procedure](#) to initialize the audit trail type.

```
BEGIN
  IF
    NOT DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD)
  THEN
    DBMS_AUDIT_MGMT.INIT_CLEANUP(
      audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
      default_cleanup_interval => 12 /* hours */);
  END IF;
END;
```

## SET\_AUDIT\_TRAIL\_LOCATION Procedure

This procedure moves the audit trail tables from their current tablespace to a user-specified tablespace.

The SET\_AUDIT\_TRAIL\_LOCATION procedure is currently not relevant for the AUDIT\_TRAIL\_OS, AUDIT\_TRAIL\_XML, and AUDIT\_TRAIL\_FILES audit trail types. The AUDIT\_FILE\_DEST initialization parameter is the only way you can specify the destination directory for these audit trail types.

### See Also:

- [Table 27-1, "DBMS\\_AUDIT\\_MGMT Constants - Audit Trail Types"](#) on page 27-5 for a list of all audit trail types
- "AUDIT\_FILE\_DEST" in the *Oracle Database Reference*

### Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
  audit_trail_type          IN PLS_INTEGER,
  audit_trail_location_value IN VARCHAR2) ;
```

### Parameters

**Table 27-16 SET\_AUDIT\_TRAIL\_LOCATION Procedure Parameters**

Parameter	Description
audit_trail_type	The audit trail type for which the audit trail location needs to be set.  Audit trail types are listed in <a href="#">Table 27-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types"</a> on page 27-5
audit_trail_location_value	The target location/tablespace for the audit trail records

### Usage Notes

The following usage notes apply:

- This procedure involves data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the target tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the target tablespace for frequent write operations.
- This procedure is valid for the following audit\_trail\_type values only:
  - AUDIT\_TRAIL\_AUD\_STD
  - AUDIT\_TRAIL\_FGA\_STD
  - AUDIT\_TRAIL\_DB\_STD

### Examples

The following example moves the database audit trail tables, AUD\$ and FGA\_LOG\$, from the current tablespace to a user-created tablespace called RECORDS:

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_DB_STD,
    audit_trail_location_value => 'RECORDS');
END;
/
```

## SET\_AUDIT\_TRAIL\_PROPERTY Procedure

This procedure sets an audit trail property for the audit trail type that is specified.

The procedure sets properties like `OS_FILE_MAX_SIZE`, `OS_FILE_MAX_AGE`, and `FILE_DELETE_BATCH_SIZE` for operating system (OS) and XML audit trail types. The `OS_FILE_MAX_SIZE` and `OS_FILE_MAX_AGE` properties determine the maximum size and age of an audit trail file before a new audit trail file gets created. The `FILE_DELETE_BATCH_SIZE` property specifies the number of audit trail files that are deleted in one batch.

The procedure sets properties like `DB_DELETE_BATCH_SIZE` and `CLEANUP_INTERVAL` for the database audit trail type. `DB_DELETE_BATCH_SIZE` specifies the batch size in which records get deleted from audit trail tables. This ensures that if a cleanup operation gets interrupted midway, the process does not need to start afresh the next time it is invoked. This is because all batches before the last processed batch are already committed.

The `CLEANUP_INTERVAL` specifies the frequency, in hours, with which the cleanup procedure is called.

### Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY (
  audit_trail_type          IN PLS_INTEGER,
  audit_trail_property      IN PLS_INTEGER,
  audit_trail_property_value IN PLS_INTEGER) ;
```

### Parameters

**Table 27-17 SET\_AUDIT\_TRAIL\_PROPERTY Procedure Parameters**

Parameter	Description
<code>audit_trail_type</code>	The audit trail type for which the property needs to be set. Audit trail types are listed in <a href="#">Table 27-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types"</a> on page 27-5
<code>audit_trail_property</code>	The audit trail property that is being set. Audit trail properties are listed in <a href="#">Table 27-2, "DBMS_AUDIT_MGMT Constants - Audit Trail Properties"</a>

**Table 27–17 (Cont.) SET\_AUDIT\_TRAIL\_PROPERTY Procedure Parameters**

Parameter	Description
audit_trail_property_value	<p>The value of the property specified using <code>audit_trail_property</code>. The following are valid values for audit trail properties:</p> <ul style="list-style-type: none"> <li>■ <code>OS_FILE_MAX_SIZE</code> can have a minimum value of 1 and maximum value of 2000000. The default value is 10000. <code>OS_FILE_MAX_SIZE</code> is measured in kilobytes (KB).</li> <li>■ <code>OS_FILE_MAX_AGE</code> can have a minimum value of 1 and a maximum value of 497. The default value is 5. <code>OS_FILE_MAX_AGE</code> is measured in days.</li> <li>■ <code>DB_DELETE_BATCH_SIZE</code> can have a minimum value of 100 and a maximum value of 1000000. The default value is 10000. <code>DB_DELETE_BATCH_SIZE</code> is measured as the number of audit records that are deleted in one batch.</li> <li>■ <code>FILE_DELETE_BATCH_SIZE</code> can have a minimum value of 100 and a maximum value of 1000000. The default value is 1000. <code>FILE_DELETE_BATCH_SIZE</code> is measured as the number of audit files that are deleted in one batch.</li> <li>■ <code>CLEANUP_INTERVAL</code> can have a minimum value of 1 and a maximum value of 999. The default value is set using the <a href="#">INIT_CLEANUP Procedure</a>. <code>CLEANUP_INTERVAL</code> is measured in hours.</li> </ul>

## Usage Notes

The following usage notes apply:

- The audit trail properties for which you do not explicitly set values use their default values.
- If you have set both the `OS_FILE_MAX_SIZE` and `OS_FILE_MAX_AGE` properties for an operating system (OS) or XML audit trail type, then a new audit trail file gets created depending on which of these two limits is reached first.
 

For example, let us take a scenario where `OS_FILE_MAX_SIZE` is 10000 and `OS_FILE_MAX_AGE` is 5. If the operating system audit file is already more than 5 days old and has a size of 9000 KB, then a new audit file is opened. This is because one of the limits has been reached.
- The `DB_DELETE_BATCH_SIZE` property needs to be individually set for the `AUDIT_TRAIL_AUD_STD` and `AUDIT_TRAIL_FGA_STD` audit trail types. You cannot set this property collectively using the `AUDIT_TRAIL_DB_STD` and `AUDIT_TRAIL_ALL` audit trail types.
- The `DB_DELETE_BATCH_SIZE` property enables you to control the number of audit records that are deleted in one batch. Setting a large value for this parameter requires increased allocation for the undo log space.
- The `FILE_DELETE_BATCH_SIZE` property needs to be individually set for the `AUDIT_TRAIL_OS` and `AUDIT_TRAIL_XML` audit trail types. You cannot set this property collectively using the `AUDIT_TRAIL_FILES` and `AUDIT_TRAIL_ALL` audit trail types.

- The `FILE_DELETE_BATCH_SIZE` property enables you to control the number of audit files that are deleted in one batch. Setting a very large value may engage the `GEN0` background process for a long time.

## Examples

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_SIZE` property for the operating system (OS) audit trail. It sets this property value to 102400. This means that a new audit file gets created every time the current audit file size reaches 100 MB.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
    audit_trail_property_value => 102400 /* 100MB*/ );
END;
/
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_AGE` property for the operating system (OS) audit trail. It sets this property value to 5. This means that a new audit file gets created every sixth day.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE,
    audit_trail_property_value => 5 /* days */);
END;
/
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `DB_DELETE_BATCH_SIZE` property for the `AUDIT_TRAIL_AUD_STD` audit trail. It sets this property value to 100000. This means that during a cleanup operation, audit records are deleted from the `SYS.AUD$` table in batches of size 100000.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
    audit_trail_property => DBMS_AUDIT_MGMT.DB_DELETE_BATCH_SIZE,
    audit_trail_property_value => 100000 /* delete batch size */);
END;
/
```

## SET\_LAST\_ARCHIVE\_TIMESTAMP Procedure

This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records. The [CLEAN\\_AUDIT\\_TRAIL Procedure](#) uses this timestamp to decide on the audit records to be deleted.

### Syntax

```
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP (
  audit_trail_type      IN PLS_INTEGER,
  last_archive_time     IN TIMESTAMP,
  rac_instance_number   IN PLS_INTEGER DEFAULT NULL) ;
```

### Parameters

**Table 27-18 SET\_LAST\_ARCHIVE\_TIMESTAMP Procedure Parameters**

Parameter	Description
audit_trail_type	The audit trail type for which the timestamp needs to be set. Audit trail types are listed in <a href="#">Table 27-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types"</a> on page 27-5.
last_archive_time	The <code>TIMESTAMP</code> value based on which the audit records or files should be deleted. This indicates the last time when the audit records/files were archived.
rac_instance_number	The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is <code>NULL</code> .  The <code>rac_instance_number</code> is not relevant for the database audit trail type, as the database audit trail tables are shared by all Oracle RAC instances. The <code>rac_instance_number</code> is also not relevant for a single-instance database.

### Usage Notes

The following usage notes apply:

- The `last_archive_time` must be specified in Coordinated Universal Time (UTC) when the audit trail types are `AUDIT_TRAIL_AUD_STD` or `AUDIT_TRAIL_FGA_STD`. This is because the database audit trails store the timestamps in UTC. UTC is also known as Greenwich Mean Time (GMT).
- The `last_archive_time` must be specified as the local time zone time when the audit trail types are `AUDIT_TRAIL_OS` or `AUDIT_TRAIL_XML`. The time zone must be the time zone of the machine where the OS or XML audit files were created. This is because the operating system audit files are cleaned based on the audit file's Last Modification Timestamp property. The Last Modification Timestamp property value is stored in the local time zone of the machine.
- The following `audit_trail_type` values are valid for this procedure:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_OS`
  - `AUDIT_TRAIL_XML`

- When using an Oracle Real Application Clusters (Oracle RAC) database, Oracle recommends that you use the Network Time Protocol (NTP) to synchronize individual Oracle RAC nodes.

## Examples

The following example calls the `SET_LAST_ARCHIVE_TIMESTAMP` procedure to set the last archive timestamp for the operating system (OS) audit trail type on Oracle RAC instance 1. It uses the `TO_TIMESTAMP` function to convert a character string into a timestamp value.

A subsequent call to the [CLEAN\\_AUDIT\\_TRAIL Procedure](#), with `use_last_arch_timestamp` set to `TRUE`, will delete all those OS audit files from the current `AUDIT_FILE_DEST` directory that were modified before 10-Sep-2007 14:10:10.0.

```
BEGIN
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP (
  audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
  last_archive_time =>
TO_TIMESTAMP('10-SEP-0714:10:10.0', 'DD-MON-RRHH24:MI:SS.FF'),
  rac_instance_number => 1);
END;
/
```

## SET\_PURGE\_JOB\_INTERVAL Procedure

This procedure sets the interval at which the [CLEAN\\_AUDIT\\_TRAIL Procedure](#) is called for the purge job specified. The purge job must have already been created using the [CREATE\\_PURGE\\_JOB Procedure](#).

### Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
  audit_trail_purge_name      IN VARCHAR2,
  audit_trail_interval_value  IN PLS_INTEGER) ;
```

### Parameters

**Table 27–19 SET\_PURGE\_JOB\_INTERVAL Procedure Parameters**

Parameter	Description
audit_trail_purge_name	The name of the purge job for which the interval is being set. This is the purge job name that you specified with the <a href="#">CREATE_PURGE_JOB Procedure</a> .
audit_trail_interval_value	The interval, in hours, at which the clean up procedure should be called. This value modifies the audit_trail_purge_interval parameter set using the <a href="#">CREATE_PURGE_JOB Procedure</a>

### Usage Notes

Use this procedure to modify the audit\_trail\_purge\_interval parameter set using the [CREATE\\_PURGE\\_JOB Procedure](#).

### Examples

The following example calls the SET\_PURGE\_JOB\_INTERVAL procedure to change the frequency at which the purge job called CLEANUP is invoked. The new interval is set to 24 hours.

```
BEGIN
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL (
  AUDIT_TRAIL_PURGE_NAME      => 'CLEANUP',
  AUDIT_TRAIL_INTERVAL_VALUE  => 24 );
END;
/
```

## SET\_PURGE\_JOB\_STATUS Procedure

This procedure enables or disables the specified purge job. The purge job must have already been created using the [CREATE\\_PURGE\\_JOB Procedure](#).

### Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS (
  audit_trail_purge_name    IN VARCHAR2,
  audit_trail_status_value  IN PLS_INTEGER) ;
```

### Parameters

**Table 27–20 SET\_PURGE\_JOB\_STATUS Procedure Parameters**

Parameter	Description
audit_trail_purge_name	The name of the purge job for which the status is being set. This is the purge job name that you specified with the <a href="#">CREATE_PURGE_JOB Procedure</a> .
audit_trail_status_value	One of the values specified in <a href="#">DBMS_AUDIT_MGMT Constants - Purge Job Status</a> . The value PURGE_JOB_ENABLE enables the specified purge job. The value PURGE_JOB_DISABLE disables the specified purge job.

### Examples

The following example calls the SET\_PURGE\_JOB\_STATUS procedure to enable the CLEANUP purge job.

```
BEGIN
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS (
  audit_trail_purge_name    => 'CLEANUP',
  audit_trail_status_value  => DBMS_AUDIT_MGMT.PURGE_JOB_ENABLE);
END;
/
```

---

## DBMS\_AUTO\_SQLTUNE

The DBMS\_AUTO\_SQLTUNE package is the interface for managing the Automatic SQL Tuning task. Unlike DBMS\_SQLTUNE, the DBMS\_AUTO\_SQLTUNE package requires the DBA role.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

The chapter contains the following topics:

- [Using DBMS\\_AUTO\\_SQLTUNE](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_AUTO\\_SQLTUNE Subprograms](#)

---

## Using DBMS\_AUTO\_SQLTUNE

- [Overview](#)
- [Security Model](#)

## Overview

The DBMS\_AUTO\_SQLTUNE package is the interface to SQL Tuning Advisor (DBMS\_SQLTUNE) when run within the Autotask framework. The database creates the automated system task SYS\_AUTO\_SQL\_TUNING\_TASK as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

The automated task tests any SQL profiles it finds by executing both the old and new query plans. Automatic SQL Tuning differs from manual SQL tuning in one important way. If automatic implementation of SQL profiles is enabled (the default is disabled), then the database implements any SQL profiles that promise a great performance benefit. The implementation occurs at tuning time so that the database can immediately benefit from the new plan. You can enable or disable automatic implementation by using the SET\_AUTO\_TUNING\_TASK\_PARAMETER API to set the ACCEPT\_SQL\_PROFILES parameter.

In each maintenance window, the automated tuning task stores its results as a new execution. Each execution result has the same task name but a different execution name. Query the DBA\_ADVISOR\_EXECUTIONS view for information about task executions. Use the [REPORT\\_AUTO\\_TUNING\\_TASK Function](#) to view reports that span multiple executions.

## Security Model

This package is available to users with the DBA role. For other users, you must grant the EXECUTE privilege on the package explicitly. Note that the EXECUTE\_AUTO\_TUNING\_TASK procedure is an exception: only SYS can invoke it.

Users can call APIs in this package to control how the automatic tuning task behaves when it runs, such as enabling automatic SQL profile creation and configuring the total and per-SQL time limits under which the task runs. Because these settings affect the overall performance of the database, it may not be appropriate for all users with the ADVISOR privilege to have access to this package.

---

## Summary of DBMS\_AUTO\_SQLTUNE Subprograms

**Table 28–1 DBMS\_AUTO\_SQLTUNE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">EXECUTE_AUTO_TUNING_TASK Function &amp; Procedure</a> on page 28-6	Executes the Automatic SQL Tuning task immediately (SYS only)
<a href="#">REPORT_AUTO_TUNING_TASK Function</a> on page 28-7	Displays a text report of the automatic tuning task's history
<a href="#">SET_AUTO_TUNING_TASK_PARAMETER Procedures</a> on page 28-9	Changes a task parameter value for the daily automatic runs

## EXECUTE\_AUTO\_TUNING\_TASK Function & Procedure

This function and procedure executes the Automatic SQL Tuning task (`SYS_AUTO_SQL_TUNING_TASK`). Both the function and the procedure run in the context of a new task execution. The difference is that the function returns that new execution name. Note that only `SYS` can invoke this subprogram.

### Syntax

```
DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
  execution_name  IN VARCHAR2           := NULL,
  execution_params IN dbms_advisor.argList := NULL,
  execution_desc  IN VARCHAR2           := NULL)
RETURN VARCHAR2;
```

```
DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
  execution_name  IN VARCHAR2           := NULL,
  execution_params IN dbms_advisor.argList := NULL,
  execution_desc  IN VARCHAR2           := NULL);
```

### Parameters

**Table 28-2 EXECUTE\_TUNING\_TASK Function & Procedure Parameters**

Parameter	Description
<code>execution_name</code>	A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.
<code>execution_params</code>	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the <a href="#">SET_AUTO_TUNING_TASK_PARAMETER Procedures</a> ).
<code>execution_desc</code>	A 256-length string describing the execution

### Usage Notes

A tuning task can be executed multiple times without having to reset it.

### Examples

```
EXEC DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(:exec_name);
```

## REPORT\_AUTO\_TUNING\_TASK Function

This procedure displays the results of an Automatic SQL Tuning task.

### Syntax

```
DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK (
  begin_exec      IN  VARCHAR2  := NULL,
  end_exec        IN  VARCHAR2  := NULL,
  type            IN  VARCHAR2  := 'TEXT',
  level           IN  VARCHAR2  := 'TYPICAL',
  section         IN  VARCHAR2  := ALL,
  object_id       IN  NUMBER     := NULL,
  result_limit    IN  NUMBER     := NULL)
RETURN CLOB;
```

### Parameters

**Table 28-3** REPORT\_TUNING\_TASK Function Parameters

Parameter	Description
begin_exec	Name of the beginning task execution to use. If NULL, the report is generated for the most recent task execution.
end_exec	Name of the ending task execution to use. If NULL, the report is generated for the most recent task execution.
type	Type of the report to produce. Possible values are TEXT which produces a text report.
level	Level of detail in the report: <ul style="list-style-type: none"> <li>▪ BASIC: simple version of the report. Just show info about the actions taken by the advisor.</li> <li>▪ TYPICAL: show information about every statement analyzed, including requests not implemented.</li> <li>▪ ALL: highly detailed report level, also provides annotations about statements skipped over.</li> </ul>
section	Section of the report to include: <ul style="list-style-type: none"> <li>▪ SUMMARY: summary information</li> <li>▪ FINDINGS: tuning findings</li> <li>▪ PLAN: explain plans</li> <li>▪ INFORMATION: general information</li> <li>▪ ERROR: statements with errors</li> <li>▪ ALL: all sections</li> </ul>
object_id	Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report

### Return Values

A CLOB containing the desired report.

### Examples

```
-- Get the whole report for the most recent execution
```

```
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK
FROM   DUAL;

-- Show the summary for a range of executions
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:begin_exec, :end_exec, 'TEXT',
        'TYPICAL', 'SUMMARY')
FROM   DUAL;

-- Show the findings for the statement of interest
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:exec, :exec, 'TEXT',
        'TYPICAL', 'FINDINGS', 5)
FROM   DUAL;
```

## SET\_AUTO\_TUNING\_TASK\_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER as used for the reserved auto tuning task, SYS\_AUTO\_SQL\_TUNING\_TASK.

### Syntax

```
DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER (  
  parameter      IN  VARCHAR2,  
  value          IN  VARCHAR2);
```

```
DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER (  
  parameter      IN  VARCHAR2,  
  value          IN  NUMBER);
```

## Parameters

**Table 28–4 SET\_AUTO\_TUNING\_TASK\_PARAMETER Procedure Parameters**

Parameter	Description
parameter	<p>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</p> <ul style="list-style-type: none"> <li>■ MODE: tuning scope (comprehensive, limited)</li> <li>■ USERNAME: username under which the statement is parsed</li> <li>■ DAYS_TO_EXPIRE: number of days until the task is deleted</li> <li>■ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task)</li> <li>■ DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the <a href="#">EXECUTE_AUTO_TUNING_TASK Function &amp; Procedure</a>.</li> <li>■ TIME_LIMIT: global time out (seconds)</li> <li>■ LOCAL_TIME_LIMIT: per-statement time out (seconds)</li> <li>■ TEST_EXECUTE: FULL/AUTO/OFF. <ul style="list-style-type: none"> <li>* FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</li> <li>* AUTO - test-execute for an automatically-chosen time proportional to the tuning time</li> <li>* OFF - do not test-execute</li> </ul> </li> <li>■ BASIC_FILTER: basic filter for SQL tuning set</li> <li>■ OBJECT_FILTER: object filter for SQL tuning set</li> <li>■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</li> <li>■ RANK_MEASURE1: first ranking measure for SQL tuning set</li> <li>■ RANK_MEASURE2: second possible ranking measure for SQL tuning set</li> <li>■ RANK_MEASURE3: third possible ranking measure for SQL tuning set</li> <li>■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</li> <li>■ SQL_LIMIT: maximum number of SQL statements to tune</li> <li>■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements</li> </ul> <p>The following parameters are supported for the automatic tuning task only:</p> <ul style="list-style-type: none"> <li>■ ACCEPT_SQL_PROFILES: TRUE/FALSE: whether the task should accept SQL profiles automatically</li> <li>■ MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum</li> <li>■ MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.</li> </ul>
value	New value of the specified parameter

---

---

## DBMS\_AUTO\_TASK\_ADMIN

The DBMS\_AUTO\_TASK\_ADMIN package provides an interface to AUTOTASK functionality. It is used by the DBA as well as Enterprise Manager to access the AUTOTASK controls. Enterprise Manager also uses the AUTOTASK Advisor.

**See Also:** *Oracle Database Administrator's Guide* for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

- [Using DBMS\\_AUTO\\_TASK\\_ADMIN](#)
  - Constants
- [Summary of DBMS\\_AUTO\\_TASK\\_ADMIN Subprograms](#)

---

## Using DBMS\_AUTO\_TASK\_ADMIN

- [Constants](#)

## Constants

The DBMS\_AUTO\_TASK\_ADMIN package uses the constants shown in [Table 29-1](#):

**Table 29-1 DBMS\_AUTO\_TASK\_ADMIN Constants**

<b>Name</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
PRIORITY_MEDIUM	VARCHAR2	'MEDIUM'	Task with this priority should be executed as time permits
PRIORITY_HIGH	VARCHAR2	'HIGH'	Task with this priority should be executed within the current Maintenance Window
PRIORITY_URGENT	VARCHAR2	'URGENT'	Task with this priority is to be executed at the earliest opportunity

## Summary of DBMS\_AUTO\_TASK\_ADMIN Subprograms

**Table 29–2 DBMS\_XMLSTORE Package Subprograms**

Method	Description
<a href="#">DISABLE Procedures</a> on page 29-5	Prevents AUTOTASK from executing any requests from a specified client or operation.
<a href="#">ENABLE Procedures</a> on page 29-6	Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control
<a href="#">GET_CLIENT_ATTRIBUTES Procedure</a> on page 29-7	Returns values of select client attributes
<a href="#">GET_P1_RESOURCES Procedure</a> on page 29-8	Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups
<a href="#">OVERRIDE_PRIORITY Procedures</a> on page 29-9	Manually overrides task priority.
<a href="#">SET_CLIENT_SERVICE Procedure</a> on page 29-10	Associates an AUTOTASK Client with a specified Service
<a href="#">SET_P1_RESOURCES Procedure</a> on page 29-11	Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients

## DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

### Syntax

Disables all AUTOTASK functionality.

```
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```
DBMS_AUTO_TASK_ADMIN.DISABLE (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  window_name     IN   VARCHAR2);
```

### Parameters

**Table 29–3** *DISABLE Procedure Parameters*

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be disabled

### Usage Notes

- If operation and window\_name are both NULL, the client is disabled.
- If operation is not NULL, window\_name is ignored and the operation is disabled
- If operation is NULL and window\_name is not NULL, the client is disabled in the specified window.

## ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control. Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

### Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  window_name     IN   VARCHAR2);
```

### Parameters

**Table 29–4** *ENABLE Procedure Parameters*

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be enabled

### Usage Notes

- If operation and window\_name are both NULL, the client is enabled.
- If operation is not NULL, window\_name is ignored and the specified operation is enabled
- If operation is NULL and window\_name is not NULL, the client is enabled in the specified window.

## GET\_CLIENT\_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

### Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES (  
  client_name      IN   VARCHAR2,  
  service_name     OUT  VARCHAR2,  
  window_group     OUT  VARCHAR2);
```

### Parameters

**Table 29-5** GET\_CLIENT\_ATTRIBUTES Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL
window_group	Name of the window group in which the client is active

## GET\_P1\_RESOURCES Procedure

This procedure returns percent of resources allocated to each AUTOTASK High Priority Consumer Group.

### Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES (  
  stats_group_pct      OUT  NUMBER,  
  seg_group_pct        OUT  NUMBER,  
  tune_group_pct       OUT  NUMBER,  
  health_group_pct     OUT  NUMBER);
```

### Parameters

**Table 29–6** GET\_P1\_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seg_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

### Usage Notes

Values will add up to 100%.

## OVERRIDE\_PRIORITY Procedures

This procedure is used to manually override task priority. This can be done at the client, operation or individual task level. This priority assignment is honored during the next maintenance window in which the named client is active. Specifically, setting the priority to `URGENT` causes a high priority job to be generated at the start of the maintenance window. Setting `priority` to `CLEAR` removes the override.

### Syntax

Override Priority for a Client.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
  client_name      IN   VARCHAR2,
  priority         IN   VARCHAR2);
```

Override Priority for an Operation.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  priority         IN   VARCHAR2);
```

Override Priority for a Task.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  task_target_type IN   VARCHAR2,
  task_target_name IN   VARCHAR2,
  priority         IN   VARCHAR2);
```

### Parameters

**Table 29–7** *OVERRIDE\_PRIORITY Procedure Parameters*

Parameter	Description
<code>client_name</code>	Name of the client, as found in <code>DBA_AUTOTASK_CLIENT</code> View
<code>priority</code>	<code>URGENT</code> , <code>HIGH</code> , <code>MEDIUM</code> or <code>LOW</code>
<code>operation</code>	Name of the operation as specified in <code>DBA_AUTOTASK_OPERATION</code> View
<code>task_target_type</code>	Type of target to be affected, as found in <code>V\$AUTOTASK_TARGET_TYPE</code> View
<code>task_target_name</code>	Name of the specific target to be affected

## SET\_CLIENT\_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

### Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(  
    client_name      IN    VARCHAR2,  
    service_name    IN    VARCHAR2);
```

### Parameters

**Table 29–8 SET\_CLIENT\_SERVICE Procedure Parameters**

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL

### Usage Notes

All work performed on behalf of the Client takes place only on instances where the service is enabled.

## SET\_P1\_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

### Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES (
  stats_group_pct    OUT  NUMBER,
  seq_group_pct      OUT  NUMBER,
  tune_group_pct     OUT  NUMBER,
  health_group_pct   OUT  NUMBER);
```

### Parameters

**Table 29–9 SET\_P1\_RESOURCES Procedure Parameters**

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seq_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

### Usage Notes

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.

---

---

## DBMS\_AUTO\_TASK\_IMMEDIATE

The DBMS\_AUTO\_TASK\_IMMEDIATE package consists of one subprogram whose function is to initiate gathering of optimizer statistics without delay.

This chapter contains the following topics:

- [Summary of DBMS\\_AUTO\\_TASK\\_IMMEDIATE Subprograms](#)

---

## Summary of DBMS\_AUTO\_TASK\_IMMEDIATE Subprograms

**Table 30–1** *DBMS\_AUTO\_TASK\_IMMEDIATE Subprograms*

Subprogram	Description
<a href="#">GATHER_OPTIMIZER_STATS Procedure</a> on page 30-3	Initiates gathering of optimizer statistics without waiting for the start of a maintenance window

## **GATHER\_OPTIMIZER\_STATS Procedure**

This procedure initiates gathering of optimizer statistics without waiting for the start of a maintenance window.

### **Syntax**

```
DBMS_AUTO_TASK_IMMEDIATE.GATHER_OPTIMIZER_STATS;
```

---

---

## DBMS\_AW\_STATS

DBMS\_AW\_STATS contains subprograms for managing optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

**See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topic:

- [Using DBMS\\_AW\\_STATS](#)
- [Summary of DBMS\\_AW\\_STATS Subprograms](#)

---

## Using DBMS\_AW\_STATS

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.

## Summary of DBMS\_AW\_STATS Subprograms

**Table 31-1** *DBMS\_AW\_STATS Package Subprograms*

Subprogram	Description
<a href="#">ANALYZE Procedure</a> on page 31-4	Generates optimizer statistics on cubes and cube dimensions.
<a href="#">CLEAR Procedure</a> on page 31-7	Clears optimizer statistics from cubes and cube dimensions.

## ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a cube dimension. These statistics are used to generate some execution plans, as described in ["Using DBMS\\_AW\\_STATS"](#) on page 31-2.

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

### Syntax

```
DBMS_AW_STATS.ANALYZE
    (inname          IN VARCHAR2);
```

### Parameters

**Table 31–2 ANALYZE Procedure Parameters**

Parameter	Description
inname	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is <i>owner.cube_name</i> . For a dimension, the format is <i>owner.dimension_name</i> .

### Usage Notes

Always analyze the dimensions first, then the cube.

After analyzing a dimension, analyze all cubes that use that dimension.

### Example

This sample script generates optimizer statistics on UNITS\_CUBE and its dimensions.

```
BEGIN
    DBMS_AW_STATS.ANALYZE('time');
    DBMS_AW_STATS.ANALYZE('customer');
    DBMS_AW_STATS.ANALYZE('product');
    DBMS_AW_STATS.ANALYZE('channel');
    DBMS_AW_STATS.ANALYZE('units_cube');
END;
/
```

The following statements create and display an execution plan for a SELECT statement that joins columns from UNITS\_CUBE\_VIEW, CUSTOMER\_PRIMARY\_VIEW, and the ACCOUNTS table:

```

EXPLAIN PLAN FOR SELECT
  cu.long_description customer,
  a.city city,
  a.zip_pc zip,
  cu.level_name "LEVEL",
  round(f.sales) sales
/* From dimension views and cube view */
FROM time_calendar_view t,
  product_primary_view p,
  customer_view cu,
  channel_view ch,
  units_cube_view f,
  account a
/* Create level filters instead of GROUP BY */
WHERE t.long_description = '2004'
  AND p.level_name = 'TOTAL'
  AND cu.customer_account_id like 'COMP%'
  AND ch.level_name = 'TOTAL'
/* Join dimension views to cube view */
  AND t.dim_key = f.TIME
  AND p.dim_key = f.product
  AND cu.dim_key = f.customer
  AND ch.dim_key = f.channel
  AND a.account_id = cu.customer_account_id
ORDER BY zip;

```

```
SQL> SELECT plan_table_output FROM TABLE(dbms_xplan.display());
```

```
PLAN_TABLE_OUTPUT
```

```
-----
Plan hash value: 3890178023
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT		1	89	6 (34)	00:00:01
1	SORT ORDER BY		1	89	6 (34)	00:00:01
* 2	HASH JOIN		1	89	5 (20)	00:00:01
3	JOINED CUBE SCAN PARTIAL OUTER					
4	CUBE ACCESS	UNITS_CUBE				
5	CUBE ACCESS	CHANNEL				
6	CUBE ACCESS	CUSTOMER				
7	CUBE ACCESS	PRODUCT				
* 8	CUBE ACCESS	TIME	1	55	2 (0)	00:00:01
* 9	TABLE ACCESS FULL	ACCOUNT	3	102	2 (0)	00:00:01

```
Predicate Information (identified by operation id):
```

```

-----
2 - access("A"."ACCOUNT_ID"=SYS_OP_ATG(VALUE(KOKBF$),39,40,2))
8 - filter(SYS_OP_ATG(VALUE(KOKBF$),16,17,2)='2004' AND
  SYS_OP_ATG(VALUE(KOKBF$),39,40,2) LIKE 'COMP%' AND
  SYS_OP_ATG(VALUE(KOKBF$),47,48,2)='TOTAL' AND
  SYS_OP_ATG(VALUE(KOKBF$),25,26,2)='TOTAL')
```

```
9 - filter("A"."ACCOUNT_ID" LIKE 'COMP%')
```

Note

-----

- dynamic sampling used for this statement

30 rows selected.

## CLEAR Procedure

Clears the statistics generated by the [ANALYZE Procedure](#).

### Syntax

```
DBMS_AW_STATS.CLEAR (
    inname          IN VARCHAR2;
```

### Parameters

**Table 31–3 CLEAR Procedure Parameters**

Parameter	Description
inname	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is <i>owner.cube_name</i> . For a dimension, the format is <i>owner.dimension_name</i> .

### Examples

The following scripts clears the statistics from UNITS\_CUBE and its dimensions.

```
BEGIN
    DBMS_AW_STATS.clear('units_cube');
    DBMS_AW_STATS.clear('time');
    DBMS_AW_STATS.clear('customer');
    DBMS_AW_STATS.clear('product');
    DBMS_AW_STATS.clear('channel');
END;
/
```

---

---

## DBMS\_CAPTURE\_ADM

The DBMS\_CAPTURE\_ADM package, one of a set of Oracle Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

**See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and capture processes

This chapter contains the following topics:

- [Using DBMS\\_CAPTURE\\_ADM](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_CAPTURE\\_ADM Subprograms](#)

---

## Using DBMS\_CAPTURE\_ADM

This section contains topics which relate to using the DBMS\_CAPTURE\_ADM package.

- [Overview](#)
- [Security Model](#)

## Overview

This package provides interfaces to start, stop, and configure a capture process or a synchronous capture. This package includes subprograms for preparing database objects for instantiation.

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

When the DBMS\_CAPTURE\_ADM package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the DBMS\_CAPTURE\_ADM package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

---

---

**Note:**

- The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting a capture user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.
  - Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.
- 
- 

**See Also:**

- *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator
- *Oracle Database XStream Guide* for information about configuring an XStream administrator

---

## Summary of DBMS\_CAPTURE\_ADM Subprograms

**Table 32–1 DBMS\_CAPTURE\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ABORT_GLOBAL_INSTANTIATION Procedure</a> on page 32-7	Reverses the effects of running the <code>PREPARE_GLOBAL_INSTANTIATION</code> , <code>PREPARE_SCHEMA_INSTANTIATION</code> , and <code>PREPARE_TABLE_INSTANTIATION</code> procedures
<a href="#">ABORT_SCHEMA_INSTANTIATION Procedure</a> on page 32-8	Reverses the effects of running the <code>PREPARE_SCHEMA_INSTANTIATION</code> and <code>PREPARE_TABLE_INSTANTIATION</code> procedures
<a href="#">ABORT_SYNC_INSTANTIATION Procedure</a> on page 32-9	Reverses the effects of running the <code>PREPARE_SYNC_INSTANTIATION</code> procedure
<a href="#">ABORT_TABLE_INSTANTIATION Procedure</a> on page 32-10	Reverses the effects of running the <code>PREPARE_TABLE_INSTANTIATION</code> procedure
<a href="#">ALTER_CAPTURE Procedure</a> on page 32-11	Alters a capture process
<a href="#">ALTER_SYNC_CAPTURE Procedure</a> on page 32-16	Alters a synchronous capture
<a href="#">BUILD Procedure</a> on page 32-18	Extracts the data dictionary of the current database to the redo logs and automatically specifies database supplemental logging for all primary key and unique key columns
<a href="#">CREATE_CAPTURE Procedure</a> on page 32-19	Creates a capture process
<a href="#">CREATE_SYNC_CAPTURE Procedure</a> on page 32-29	Creates a synchronous capture
<a href="#">DROP_CAPTURE Procedure</a> on page 32-31	Drops a capture process
<a href="#">INCLUDE_EXTRA_ATTRIBUTE Procedure</a> on page 32-33	Includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture
<a href="#">PREPARE_GLOBAL_INSTANTIATION Procedure</a> on page 32-35	Performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables
<a href="#">PREPARE_SCHEMA_INSTANTIATION Procedure</a> on page 32-36	Performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables
<a href="#">PREPARE_SYNC_INSTANTIATION Function</a> on page 32-37	Performs the synchronization necessary for instantiating one or more tables at another database and returns the prepare SCN
<a href="#">PREPARE_TABLE_INSTANTIATION Procedure</a> on page 32-38	Performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table
<a href="#">SET_PARAMETER Procedure</a> on page 32-39	Sets a capture process parameter to the specified value

**Table 32–1 (Cont.) DBMS\_CAPTURE\_ADM Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">START_CAPTURE Procedure</a> on page 32-49	Starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue
<a href="#">STOP_CAPTURE Procedure</a> on page 32-50	Stops the capture process from mining redo logs

---

---

**Note:** All subprograms commit unless specified otherwise.

---

---

## ABORT\_GLOBAL\_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures

### Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION;
```

## ABORT\_SCHEMA\_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_SCHEMA_INSTANTIATION` procedure. It also reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the `PREPARE_SCHEMA_INSTANTIATION` procedure
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure for tables in the specified schema

### Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(  
    schema_name IN VARCHAR2);
```

### Parameter

**Table 32–2** *ABORT\_SCHEMA\_INSTANTIATION Procedure Parameter*

Parameter	Description
<code>schema_name</code>	The name of the schema for which to abort the effects of preparing instantiation

## ABORT\_SYNC\_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_SYNC_INSTANTIATION` procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The `table_names` parameter is `VARCHAR2` data type in one version and `DBMS_UTILITY.UNCL_ARRAY` data type in the other version.

### Syntax

```
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN VARCHAR2);
```

```
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN DBMS_UTILITY.UNCL_ARRAY);
```

### Parameters

**Table 32–3** *ABORT\_SYNC\_INSTANTIATION Procedure Parameter*

Parameter	Description
<code>table_names</code>	<p>When the <code>table_names</code> parameter is <code>VARCHAR2</code> data type, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries.</p> <p>When the <code>table_names</code> parameter is <code>DBMS_UTILITY.UNCL_ARRAY</code> data type, specify a PL/SQL associative array of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be <code>NULL</code> terminated.</p> <p>In either version of the procedure, specify the name of each table in the form <code>[schema_name.] table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>

## ABORT\_TABLE\_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure

### Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(  
    table_name IN VARCHAR2);
```

### Parameter

**Table 32–4** *ABORT\_TABLE\_INSTANTIATION Procedure Parameter*

Parameter	Description
<code>table_name</code>	The name of the table for which to abort the effects of preparing instantiation, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.

## ALTER\_CAPTURE Procedure

This procedure alters a capture process.

---

**Note:** Starting with Oracle Database 11g Release 2 (11.2.0.2), the `start_time` parameter is included in this procedure.

---

**See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

### Syntax

```
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
  capture_name          IN  VARCHAR2,
  rule_set_name        IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set      IN  BOOLEAN   DEFAULT FALSE,
  start_scn            IN  NUMBER     DEFAULT NULL,
  use_database_link    IN  BOOLEAN   DEFAULT NULL,
  first_scn            IN  NUMBER     DEFAULT NULL,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN  BOOLEAN  DEFAULT FALSE,
  capture_user         IN  VARCHAR2  DEFAULT NULL,
  checkpoint_retention_time IN  NUMBER  DEFAULT NULL,
  start_time           IN  TIMESTAMP  DEFAULT NULL);
```

### Parameters

**Table 32–5 ALTER\_CAPTURE Procedure Parameters**

Parameter	Description
<code>capture_name</code>	The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.
<code>rule_set_name</code>	<p>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</p> <p>To change the positive rule set for the capture process, specify an existing rule set in the form [<i>schema_name.</i>] <i>rule_set_name</i>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>job_capture_rules</code>, enter <code>hr.job_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a capture process</p>

**Table 32–5 (Cont.) ALTER\_CAPTURE Procedure Parameters**

Parameter	Description
<code>remove_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified capture process.</p> <p>If the <code>rule_set_name</code> parameter is non-<code>NULL</code>, then ensure that this parameter is set to <code>FALSE</code>.</p>
<code>start_scn</code>	<p>A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN.</p> <p>An error is returned if an invalid SCN is specified or if the capture process is enabled.</p>
<code>use_database_link</code>	<p>If <code>TRUE</code>, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify <code>TRUE</code>. In this case, a database link with the same name as the global name of the source database must exist at the downstream database.</p> <p>If <code>FALSE</code>, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify <code>FALSE</code>. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects.</p> <p>If <code>NULL</code>, then the current value of this parameter for the capture process is not changed.</p>

**Table 32-5 (Cont.) ALTER\_CAPTURE Procedure Parameters**

Parameter	Description
first_scn	<p>The lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:</p> <ul style="list-style-type: none"> <li>■ It must be greater than the current first SCN for the capture process.</li> <li>■ It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero.</li> <li>■ It must be less than or equal to the required checkpoint SCN for the capture process.</li> </ul> <p>An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" on page 32-15 for information about determining an SCN value that meets all of these conditions.</p> <p>When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See <a href="#">BUILD Procedure</a> on page 32-18 for more information about a LogMiner data dictionary.</p> <p>If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.</p>
negative_rule_set_name	<p>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</p> <p>To change the negative rule set for the capture process, specify an existing rule set in the form <code>[ schema_name. ] rule_set_name</code>. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter <code>hr.neg_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</p> <p>If you specify NULL and the <code>remove_negative_rule_set</code> parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the <code>remove_negative_rule_set</code> parameter is set to TRUE, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</p>

**Table 32–5 (Cont.) ALTER\_CAPTURE Procedure Parameters**

Parameter	Description
<code>remove_negative_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified capture process.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-NULL, then ensure that this parameter is set to <code>FALSE</code>.</p>
<code>capture_user</code>	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the capture user is not changed.</p> <p>To change the capture user, the user who invokes the <code>ALTER_CAPTURE</code> procedure must be granted the <code>DBA</code> role. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>If you change the capture user, then this procedure grants the new capture user <code>enqueue</code> privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges:</p> <ul style="list-style-type: none"> <li>▪ <code>EXECUTE</code> privilege on the rule sets used by the capture process</li> <li>▪ <code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> </ul> <p>These privileges can be granted directly to the capture user, or they can be granted through roles.</p> <p>In addition, the capture user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>The capture process is stopped and restarted automatically when you change the value of this parameter.</p> <p><b>Note:</b> If the capture user for a capture process is dropped using <code>DROP USER . . . CASCADE</code>, then the capture process is also dropped automatically.</p>

**Table 32–5 (Cont.) ALTER\_CAPTURE Procedure Parameters**

Parameter	Description
checkpoint_retention_time	<p>Either the number of days that a capture process retains checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If NULL, then the checkpoint retention time is not changed.</p> <p>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours.</p> <p>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about checkpoint retention time</p>
start_time	<p>A valid time from which the capture process starts capturing changes. The capture process must be stopped before resetting its start time.</p> <p>An error is returned if an invalid time is specified or if the capture process is enabled.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p>

## Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the first\_scn parameter.

## Examples

The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
       FROM DBA_CAPTURE;
```

## ALTER\_SYNC\_CAPTURE Procedure

This procedure alters a synchronous capture.

**See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

### Syntax

```
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE (
    capture_name IN VARCHAR2,
    rule_set_name IN VARCHAR2 DEFAULT NULL,
    capture_user IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 32–6 ALTER\_SYNC\_CAPTURE Procedure Parameters**

Parameter	Description
capture_name	The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes.</p> <p>To change the rule set for the synchronous capture, specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the <code>strmadmin</code> schema named <code>sync_cap_rules</code>, enter <code>strmadmin.sync_cap_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You must specify a rule set that was created using the <code>DBMS_STREAMS_ADM</code> package.</p> <p>If <code>NULL</code>, then the rule set is not changed.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a synchronous capture</p>
capture_user	<p>The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If <code>NULL</code>, then the capture user is not changed.</p> <p>To change the capture user, the user who invokes the <code>ALTER_SYNC_CAPTURE</code> procedure must be granted the <code>DBA</code> role. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>If you change the capture user, then this procedure grants the new capture user <code>enqueue</code> privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges:</p> <ul style="list-style-type: none"> <li>▪ <code>EXECUTE</code> privilege on the rule sets used by the synchronous capture</li> <li>▪ <code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> </ul> <p>These privileges can be granted directly to the capture user, or they can be granted through roles.</p> <p>In addition, the capture user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles.</p>

## Usage Notes

If the capture user for a synchronous capture is dropped using `DROP USER . . . CASCADE`, then the synchronous capture is also dropped automatically.

## BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the OUT parameter `first_scn`, and the other does not.

### Syntax

```
DBMS_CAPTURE_ADM.BUILD(  
    first_scn OUT NUMBER);
```

```
DBMS_CAPTURE_ADM.BUILD;
```

### Parameters

**Table 32–7** BUILD Procedure Parameter

Parameter	Description
<code>first_scn</code>	Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process

### Usage Notes

The following usage notes apply to this procedure:

- You can run this procedure multiple times at a source database.
- If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.
- A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.
- After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes. You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

## CREATE\_CAPTURE Procedure

This procedure creates a capture process.

---

**Note:** Starting with Oracle Database 11g Release 2 (11.2.0.2), the `start_time` parameter is included in this procedure.

---

### See Also:

- *Oracle Streams Replication Administrator's Guide* for more information about creating a capture process
- [Chapter 127, "DBMS\\_RULE\\_ADM"](#) for more information about rules and rule sets

## Syntax

```
DBMS_CAPTURE_ADM.CREATE_CAPTURE (
  queue_name           IN  VARCHAR2,
  capture_name        IN  VARCHAR2,
  rule_set_name       IN  VARCHAR2  DEFAULT NULL,
  start_scn           IN  NUMBER    DEFAULT NULL,
  source_database     IN  VARCHAR2  DEFAULT NULL,
  use_database_link   IN  BOOLEAN   DEFAULT FALSE,
  first_scn           IN  NUMBER    DEFAULT NULL,
  logfile_assignment  IN  VARCHAR2  DEFAULT 'implicit',
  negative_rule_set_name IN VARCHAR2  DEFAULT NULL,
  capture_user        IN  VARCHAR2  DEFAULT NULL,
  checkpoint_retention_time IN NUMBER  DEFAULT 60,
  start_time          IN  TIMESTAMP  DEFAULT NULL);
```

## Parameters

**Table 32–8 CREATE\_CAPTURE Procedure Parameters**

Parameter	Description
<code>queue_name</code>	The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [ <i>schema_name</i> .] <i>queue_name</i> . For example, to specify a queue in the <code>hr</code> schema named <code>streams_queue</code> , enter <code>hr.streams_queue</code> . If the schema is not specified, then the current user is the default.  <b>Note:</b> The <code>queue_name</code> setting cannot be altered after the capture process is created.
<code>capture_name</code>	The name of the capture process being created. A <code>NULL</code> specification is not allowed. Do not specify an owner.  <b>Note:</b> The <code>capture_name</code> setting cannot be altered after the capture process is created.

**Table 32–8 (Cont.) CREATE\_CAPTURE Procedure Parameters**

Parameter	Description
rule_set_name	<p>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</p> <p>If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [<i>schema_name.</i>] <i>rule_set_name</i>. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</p> <p>If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.</p> <p>If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a capture process</p>
start_scn	<p>A valid SCN for the database from which the capture process starts capturing changes.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> <p><b>See Also:</b> "Usage Notes" on page 32-23 for more information setting the start_scn parameter</p>
source_database	<p>The global name of the source database. The source database is where the changes to be captured originated.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p>If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for use_database_link and first_scn can be specified.</p>

**Table 32–8 (Cont.) CREATE\_CAPTURE Procedure Parameters**

Parameter	Description
use_database_link	<p>If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. A database link with the same name as the global name of the source database must exist at the downstream database.</p> <p>The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary.</p> <p>During the creation of a downstream capture process, if the first_scn parameter is set to NULL, then the use_database_link parameter must be set to TRUE. Otherwise, an error is returned.</p> <p>If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually:</p> <ul style="list-style-type: none"> <li>■ Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created.</li> <li>■ Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process.</li> <li>■ Prepare source database objects for instantiation.</li> </ul>
first_scn	<p>The lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database.</p> <p>You can query the FIRST_CHANGE# column of the V\$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available.</p> <p><b>See Also:</b> "Usage Notes" on page 32-23 for more information setting the first_scn parameter</p>

**Table 32–8 (Cont.) CREATE\_CAPTURE Procedure Parameters**

Parameter	Description
logfile_assignment	<p>If <code>implicit</code>, which is the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database.</p> <p>If <code>explicit</code>, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the <code>FOR logminer_session_name</code> clause. If <code>explicit</code>, then the redo log file must be added manually to the downstream database, and redo transport services cannot be used to add redo log files to the capture process being created.</p> <p>If you specify <code>explicit</code> for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log.</p> <p><b>See Also:</b> "Usage Notes" on page 32-23 for information about adding redo log files manually</p>
negative_rule_set_name	<p>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</p> <p>If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form <code>[ schema_name. ] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_capture_rules</code>, enter <code>hr.neg_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</p>
capture_user	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the user who runs the <code>CREATE_CAPTURE</code> procedure is used.</p> <p><b>Note:</b> If the capture user for a capture process is dropped using <code>DROP USER . . . CASCADE</code>, then the capture process is also dropped automatically.</p> <p><b>See Also:</b> "Usage Notes" on page 32-23 for more information about this parameter.</p>

**Table 32–8 (Cont.) CREATE\_CAPTURE Procedure Parameters**

Parameter	Description
checkpoint_retention_time	<p>Either specify the number of days that a capture process retains checkpoints before purging them automatically, or specify DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically.</p> <p>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours.</p> <p>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about checkpoint retention time</p>
start_time	<p>A valid time from which the capture process starts capturing changes.</p> <p>An error is returned if an invalid time is specified.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" on page 32-23 for more information setting the start_time parameter</p>

## Usage Notes

Consider the following usage notes when you run this procedure:

- [DBA Role Requirement](#)
- [Capture User Requirements](#)
- [First SCN and Start SCN Settings](#)
- [Explicit Log File Assignment](#)

### DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the capture\_user parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the capture\_user parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the capture\_user to SYS.

### Capture User Requirements

The capture\_user parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- EXECUTE privilege on the rule sets used by the capture process

- EXECUTE privilege on all rule-based transformation functions used in the positive rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

---

---

**Note:**

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
  - Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.
- 
- 

**First SCN and Start SCN Settings**

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

---

---

**Note:** When you specify the `start_time` parameter instead of the `start_scn` parameter, the `start_time` corresponds with a specific SCN. In this case, the information in this section also applies to the SCN that corresponds with the specified `start_time`.

---

---

In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:

<b>first_scn Setting</b>	<b>start_scn Setting</b>	<b>Capture Process Type</b>	<b>Description</b>
Non-NULL	NULL	Local or Downstream	<p>The new capture process is created at the local database with a new LogMiner session starting from the value specified for the <code>first_scn</code> parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN.</p> <p>The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised when the capture process is started.</p> <p>Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</p>
Non-NULL	Non-NULL	Local or Downstream	<p>If the specified value for the <code>start_scn</code> parameter is greater than or equal to the specified value for the <code>first_scn</code> parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the <code>start_scn</code> parameter is less than the specified value for the <code>first_scn</code> parameter, then an error is raised.</p> <p>The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been called at least once before on the source database, and the specified <code>first_scn</code> must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised.</p> <p>Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</p>

<b>first_scn Setting</b>	<b>start_scn Setting</b>	<b>Capture Process Type</b>	<b>Description</b>
NULL	Non-NULL	Local	<p>The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:</p> <ul style="list-style-type: none"> <li>■ There is no existing capture process for the local source database, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database.</li> <li>■ There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database.</li> </ul> <p>In either of these cases, the <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the <code>BUILD</code> procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build.</p> <p>However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.</p> <p>If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.</p>

first_scn Setting	start_scn Setting	Capture Process Type	Description
NULL	Non-NULL	Downstream	<p>When the CREATE_CAPTURE procedure creates a downstream capture process, the use_database_link parameter must be set to TRUE when the first_scn parameter is set to NULL. Otherwise, an error is raised. The database link is used to obtain the current SCN of the source database.</p> <p>The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:</p> <ul style="list-style-type: none"> <li>There is no existing capture process that captures changes to the source database at the downstream database, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database.</li> <li>There are existing capture processes that capture changes to the source database at the downstream database, but none of the capture processes have taken a checkpoint yet, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database.</li> </ul> <p>In either of these cases, the BUILD procedure in the DBMS_CAPTURE_ADM package is run during capture process creation. The first time you start the new capture process, it uses the resulting build of the source data dictionary in the redo log files copied to the downstream database to create a LogMiner data dictionary. Here, the first SCN for the new capture process corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the BUILD procedure waits until these transactions commit before completing.</p> <p>However, if at least one existing capture process has taken a checkpoint and captures changes to the source database at the downstream database, then the new capture process shares an existing LogMiner data dictionary with one or more of these existing capture processes. In this case, one of these existing capture processes with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.</p> <p>If there is no existing capture process that captures changes to the source database at the downstream database (or no existing capture process has taken a checkpoint), and the specified start_scn parameter value is less than the current SCN for the source database, then an error is raised.</p>
NULL	NULL	Local or Downstream	<p>The behavior is the same as setting the first_scn parameter to NULL and setting the start_scn parameter to the current SCN of the source database.</p>

---

**Note:** When you create a capture process using the DBMS\_STREAMS\_ADM package, both the first SCN and the start SCN are set to NULL during capture process creation.

---

**See Also:** [BUILD Procedure](#) on page 32-18 for more information about the BUILD procedure and the LogMiner data dictionary

### Explicit Log File Assignment

If you specify explicit for the logfile\_assignment parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE  
    file_name FOR capture_process;
```

Here, *file\_name* is the name of the redo log file being added and *capture\_process* is the name of the capture process that will use the redo log file at the downstream database. The *capture\_process* is equivalent to the *logminer\_session\_name* and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the DBMS\_FILE\_TRANSFER package, FTP, or some other transfer method.

**See Also:** *Oracle Database SQL Language Reference* for more information about the ALTER DATABASE statement and *Oracle Data Guard Concepts and Administration* for more information registering redo log files

## CREATE\_SYNC\_CAPTURE Procedure

This procedure creates a synchronous capture.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about creating a synchronous capture

### Syntax

```
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE (
  queue_name      IN  VARCHAR2,
  capture_name    IN  VARCHAR2,
  rule_set_name   IN  VARCHAR2,
  capture_user    IN  VARCHAR2  DEFAULT NUL);
```

### Parameters

**Table 32–9** CREATE\_SYNC\_CAPTURE Procedure Parameters

Parameter	Description
queue_name	<p>The name of the queue into which the synchronous capture enqueues changes. You must specify an existing queue in the form [<i>schema_name</i>.] <i>queue_name</i>. For example, to specify a queue in the <i>strmadmin</i> schema named <i>streams_queue</i>, enter <i>strmadmin.streams_queue</i>. If the schema is not specified, then the current user is the default.</p> <p><b>Note:</b> The <i>queue_name</i> setting cannot be altered after the synchronous capture is created.</p>
capture_name	<p>The name of the synchronous capture being created. A NULL specification is not allowed. Do not specify an owner.</p> <p><b>Note:</b> The <i>capture_name</i> setting cannot be altered after the synchronous capture is created.</p>
rule_set_name	<p>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes.</p> <p>Specify an existing rule set in the form [<i>schema_name</i>.] <i>rule_set_name</i>. For example, to specify a positive rule set in the <i>strmadmin</i> schema named <i>sync_cap_rules</i>, enter <i>strmadmin.sync_cap_rules</i>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You must specify a rule set that was created using the <i>DBMS_STREAMS_ADM</i> package.</p> <p>If NULL, then an error is returned.</p> <p><b>Note:</b> Synchronous capture rules must be added to the synchronous capture rule set using the <i>ADD_TABLE_RULES</i> or <i>ADD_SUBSET_RULES</i> procedure in the <i>DBMS_STREAMS_ADM</i> package. A synchronous capture ignores rules added to the rule set with other procedures.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a synchronous capture</p>

**Table 32–9 (Cont.) CREATE\_SYNC\_CAPTURE Procedure Parameters**

Parameter	Description
capture_user	<p>The user in whose security domain the synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the user who runs the CREATE_SYNC_CAPTURE procedure is used.</p> <p>Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS.</p> <p><b>Note:</b> If the capture user for a synchronous capture is dropped using DROP USER . . . CASCADE, then the synchronous capture is also dropped automatically.</p> <p><b>See Also:</b> "Usage Notes" on page 32-30 for more information about this parameter.</p>

## Usage Notes

When the CREATE\_SYNC\_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The capture\_user parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- ENQUEUE privilege on the queue specified in the queue\_name parameter
- EXECUTE privilege on the rule set used by the synchronous capture
- EXECUTE privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. These privileges cannot be granted through roles.

---

---

**Note:** A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

---

---

## DROP\_CAPTURE Procedure

This procedure drops a capture process.

### Syntax

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
  capture_name          IN VARCHAR2,
  drop_unused_rule_sets IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 32–10 DROP\_CAPTURE Procedure Parameters**

Parameter	Description
capture_name	The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.  If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.

### Usage Notes

The following usage notes apply to this procedure:

- [The Capture Process Must Be Stopped Before It Is Dropped](#)
- [The DROP\\_CAPTURE Procedure and Rules-related Information](#)

#### **The Capture Process Must Be Stopped Before It Is Dropped**

A capture process must be stopped before it can be dropped.

**See Also:** [STOP\\_CAPTURE Procedure](#) on page 32-50

#### **The DROP\_CAPTURE Procedure and Rules-related Information**

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS\_STREAMS\_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Streams rules:

- ALL\_STREAMS\_GLOBAL\_RULES
- DBA\_STREAMS\_GLOBAL\_RULES
- ALL\_STREAMS\_MESSAGE\_RULES
- DBA\_STREAMS\_MESSAGE\_RULES
- ALL\_STREAMS\_SCHEMA\_RULES
- DBA\_STREAMS\_SCHEMA\_RULES

- ALL\_STREAMS\_TABLE\_RULES
- DBA\_STREAMS\_TABLE\_RULES
- ALL\_STREAMS\_RULES
- DBA\_STREAMS\_RULES

**See Also:** *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

## INCLUDE\_EXTRA\_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

### Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE (
  capture_name   IN  VARCHAR2,
  attribute_name IN  VARCHAR2,
  include        IN  BOOLEAN   DEFAULT TRUE);
```

### Parameters

**Table 32–11 INCLUDE\_EXTRA\_ATTRIBUTE Procedure Parameters**

Parameter	Description
capture_name	The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.
attribute_name	The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings: <ul style="list-style-type: none"> <li>▪ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2.</li> <li>▪ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>▪ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>▪ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</li> <li>▪ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2.</li> <li>▪ username The name of the user who performed the change captured in the LCR. The type is VARCHAR2.</li> </ul>
include	If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture.  If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.

### Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want

to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify `FALSE` for the `include` parameter.

## PREPARE\_GLOBAL\_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure prepares the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

### Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
    supplemental_logging IN VARCHAR2 DEFAULT 'KEYS');
```

### Parameter

**Table 32–12** *PREPARE\_GLOBAL\_INSTANTIATION Procedure Parameter*

Parameter	Description
supplemental_logging	<p>Either NONE, KEYS, or ALL.</p> <p>If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables.</p> <p>If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns.</p> <p>If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</p>

### Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

## PREPARE\_SCHEMA\_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure prepares the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

### Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
  schema_name          IN VARCHAR2,
  supplemental_logging IN VARCHAR2 DEFAULT 'KEYS');
```

### Parameters

**Table 32–13** *PREPARE\_SCHEMA\_INSTANTIATION Procedure Parameters*

Parameter	Description
schema_name	The name of the schema. For example, hr.
supplemental_logging	<p>Either NONE, KEYS, or ALL.</p> <p>If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.</p> <p>If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns.</p> <p>If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</p>

### Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

## PREPARE\_SYNC\_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function prepares one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs after the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The `table_names` parameter is `VARCHAR2` data type in one version and `DBMS_UTILITY.UNCL_ARRAY` data type in the other version.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation

### Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names IN DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;
```

### Parameters

**Table 32–14** *PREPARE\_SYNC\_INSTANTIATION Function Parameter*

Parameter	Description
<code>table_names</code>	<p>When the <code>table_names</code> parameter is <code>VARCHAR2</code> data type, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries.</p> <p>When the <code>table_names</code> parameter is <code>DBMS_UTILITY.UNCL_ARRAY</code> data type, specify a PL/SQL associative array of this type that contains the names of the tables to prepare for instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be <code>NULL</code> terminated.</p> <p>In either version of the function, specify the name of each table in the form <code>[schema_name.] table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>

## PREPARE\_TABLE\_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table. This procedure prepares the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

### Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
    table_name          IN  VARCHAR2,
    supplemental_logging IN  VARCHAR2 DEFAULT 'KEYS');
```

### Parameters

**Table 32–15** *PREPARE\_TABLE\_INSTANTIATION Procedure Parameters*

Parameter	Description
table_name	The name of the table specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default.
supplemental_logging	Either NONE, KEYS, or ALL.  If NONE is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.  If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying KEYS does not enable supplemental logging of bitmap join index columns.  If ALL is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.

### Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

## SET\_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

### Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER (
  capture_name IN VARCHAR2,
  parameter    IN VARCHAR2,
  value        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 32–16 SET\_PARAMETER Procedure Parameters**

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner.
parameter	The name of the parameter you are setting. See " <a href="#">Capture Process Parameters</a> " on page 32-39 for a list of these parameters.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.

### Capture Process Parameters

The following table lists the parameters for the capture process.

---

---

**Note:** Starting with Oracle Database 11g Release 2 (11.2.0.2), this subprogram includes the following new capture process parameters: `capture_idkey_objects`, `capture_sequence_nextval`, `excludeuserid`, `excludeuser`, `excludetrans`, `getapplops`, `getreplicates`, `ignore_transaction`, `ignore_unsupported_table`, and `max_sga_size`.

---

---

**Table 32–17 Capture Process Parameters**

Parameter Name	Possible Values	Default	Description
capture_idkey_objects	Y or N	N	<p>If Y, then the capture process captures ID key logical change records (LCRs).</p> <p>If N, then the capture process does not capture ID key LCRs.</p> <p>Capture processes do not fully support capturing changes to some data types from the redo log. ID key LCRs enable an XStream configuration to capture these changes and process them with an XStream client application.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</p> <p><b>See Also:</b> "Usage Notes" on page 32-47 for more information about this parameter and <i>Oracle Database XStream Guide</i> for more information about ID key LCRs</p>
capture_sequence_nextval	Y or N	N	<p>If Y, then the capture process captures sequence LCRs for all of the sequences in the database, except for sequences in Oracle-supplied, administrative schemas such as <code>SYS</code> and <code>SYSTEM</code>. The capture process's rule sets can filter sequence LCRs in the same way that they filter row LCRs and DDL LCRs.</p> <p>If N, then the capture process does not capture sequence LCRs.</p> <p>An apply process or XStream inbound server can use sequence LCRs to ensure that the sequence values at a destination database use the appropriate values. For increasing sequences, the sequence values at the destination are equal to or greater than the sequence values at the source database. For decreasing sequences, the sequence values at the destination are less than or equal to the sequence values at the source database.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</p> <p><b>See Also:</b> "Usage Notes" on page 32-47 for more information about this parameter and "SET_PARAMETER Procedure" on page 21-56 for information about the <code>apply_sequence_nextval</code> apply process parameter</p>
disable_on_limit	Y or N	N	<p>If Y, then the capture process is disabled because it reached a value specified by the <code>time_limit</code> parameter or <code>message_limit</code> parameter.</p> <p>If N, then the capture process is restarted immediately after stopping because it reached a limit.</p> <p>When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (<code>CPnn</code>) remains the same.</p>

**Table 32–17 (Cont.) Capture Process Parameters**

Parameter Name	Possible Values	Default	Description
downstream_real_time_mine	Y or N	Y for local capture processes N for downstream capture processes	<p>If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement ALTER SYSTEM ARCHIVE LOG CURRENT to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. See <i>Oracle Streams Replication Administrator's Guide</i> for information about creating a real-time downstream capture process.</p> <p>If N, then the capture process is an archived-log downstream capture process.</p> <p>An error is raised if an attempt is made to set this parameter for a local capture process.</p>
excludeuserid	Comma-delimited list of user ID values	NULL	<p>Controls whether the capture process captures data manipulation language (DML) changes made by the specified users.</p> <p>Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters.</p> <p>To view the user ID for a user, query the <code>USER_ID</code> column in the <code>ALL_USERS</code> data dictionary view.</p> <p>If NULL, then the capture process ignores this parameter.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</p> <p><b>See Also:</b> "Usage Notes" on page 32-47 for more information about this parameter</p>
excludeuser	Comma-delimited list of user names	NULL	<p>Controls whether the capture process captures DML changes made by the specified users.</p> <p>Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters.</p> <p>Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify <code>HR</code> for the <code>hr</code> user.</p> <p>If NULL, then the capture process ignores this parameter.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</p> <p><b>See Also:</b> "Usage Notes" on page 32-47 for more information about this parameter</p>

**Table 32–17 (Cont.) Capture Process Parameters**

Parameter Name	Possible Values	Default	Description
excludetrans	Comma-delimited list of transaction names	NULL	<p>Controls whether the capture process captures DML changes in the specified transactions.</p> <p>Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters.</p> <p>If NULL, then the capture process ignores this parameter.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</p> <p><b>See Also:</b> "Usage Notes" on page 32-47 for more information about this parameter</p>
getapplops	Y or N	Y	<p>If Y, then the capture process captures DML changes if the original user is not specified in the <code>excludeuserid</code> or <code>excludeuser</code> parameters and the transaction name is not specified in the <code>excludetrans</code> parameter.</p> <p>If N, then the capture process ignores DML changes if the original user is not specified in the <code>excludeuserid</code> or <code>excludeuser</code> parameters and the transaction name is not specified in the <code>excludetrans</code> parameter.</p> <p>In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</p> <p><b>See Also:</b> "Usage Notes" on page 32-47 for more information about this parameter</p>
getreplicates	Y or N	N	<p>If Y, then the capture process captures DML changes if the original user is specified in the <code>excludeuserid</code> or <code>excludeuser</code> parameters and the transaction name is specified in the <code>excludetrans</code> parameter.</p> <p>If N, then the capture process ignores DML changes if the original user is specified in the <code>excludeuserid</code> or <code>excludeuser</code> parameters and the transaction name is specified in the <code>excludetrans</code> parameter.</p> <p>In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</p> <p><b>See Also:</b> "Usage Notes" on page 32-47 for more information about this parameter</p>

**Table 32–17 (Cont.) Capture Process Parameters**

Parameter Name	Possible Values	Default	Description
ignore_transaction	A valid transaction ID or NULL	NULL	<p>Instructs the capture process to ignore the specified transaction from the source database, effective immediately.</p> <p>The capture process eliminates all subsequent LCRs for the transaction. If the specified transaction is committed successfully at the source database, the destination database will receive a ROLLBACK statement instead, and any LCRs from the transaction that were enqueued before the ignore transaction request are rolled back at the destination database.</p> <p>If NULL, then the capture process ignores this parameter.</p> <p>Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database.</p> <p>To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_CAPTURE_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter.</p>
ignore_unsupported_table	A fully qualified table name, *, or -	*	<p>Controls the behavior of the capture process when it tries to capture changes to a specified table or to an unsupported table.</p> <p>A capture process tries to capture changes to an unsupported table when its rule sets instruct it to do so. If you do not want the capture process to try to capture changes to unsupported tables, then ensure that the capture process's rule sets exclude unsupported tables.</p> <p>When a table name is specified, the capture process does not capture changes to the specified table. The table name must be entered in the form <i>table_owner. table_name</i>. For example, <i>hr.employees</i>. To specify multiple tables, specify each table in a separate call to the SET_PARAMETER procedure.</p> <p>When * is specified and the capture process tries to capture a change to an unsupported table, the capture process ignores the change and continues to run. The change to the unsupported table is not captured, and the capture process records the unsupported table in the alert log.</p> <p>When - is specified and the capture process tries to capture a change to an unsupported table, the capture process aborts.</p>

**Table 32–17 (Cont.) Capture Process Parameters**

Parameter Name	Possible Values	Default	Description
max_sga_size	A positive integer	INFINITE	<p>Controls the amount of system global area (SGA) memory allocated specifically to the capture process, in megabytes. The capture process attempts to allocate memory up to this limit. A capture process uses Oracle LogMiner to scan for changes in the redo log.</p> <p>The memory is allocated for the duration of the capture process session and is released when the capture process becomes disabled.</p> <p><b>Note:</b> The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the <code>STREAMS_POOL_SIZE</code> initialization parameter.</p> <p>If <code>NULL</code>, then the capture component uses the original default value. A <code>NULL</code> value has the same effect as resetting the parameter to its default value.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream capabilities are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure.</p> <p><b>See Also:</b> "Usage Notes" on page 32-47 for more information about this parameter</p>
maximum_scn	A valid SCN or INFINITE	INFINITE	<p>The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified.</p> <p>If <code>INFINITE</code>, then the capture process runs regardless of the SCN value.</p>
merge_threshold	A negative integer, 0, a positive integer, or INFINITE	60	<p>The amount of time, in seconds, between the message creation time of the original capture process and the message creation time of the cloned capture process.</p> <p>Specifically, if the difference, in seconds, between the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then automatic merge begins by running the <code>MERGE_STREAMS</code> procedure. If the difference is greater than the value specified by this parameter, then automatic merge does not begin, and the value is recorded in the <code>LAG</code> column of the <code>DBA_STREAMS_SPLIT_MERGE</code> view. The <code>CAPTURE_MESSAGE_CREATE_TIME</code> is recorded in the <code>V\$STREAMS_CAPTURE</code> view.</p> <p>This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes and the <code>split_threshold</code> parameter is set to a value other than <code>INFINITE</code>.</p> <p>If a negative value is specified, then automatic merge is disabled.</p> <p>If 0 (zero) is specified, then there must be no lag between the original capture process and the cloned capture process to begin the merge.</p> <p>If <code>INFINITE</code> is specified, then automatic merging starts immediately.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i></p>

**Table 32–17 (Cont.) Capture Process Parameters**

Parameter Name	Possible Values	Default	Description
message_limit	A positive integer or INFINITE	INFINITE	<p>The capture process stops after capturing the specified number of messages.</p> <p>If INFINITE, then the capture process continues to run regardless of the number of messages captured.</p>
message_tracking_frequency	0 or a positive integer	2000000	<p>The frequency at which messages captured by the capture process are tracked automatically.</p> <p>For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically.</p> <p>The tracking label used for automatic message tracking is <code>capture_process_name:AUTOTRACK</code>, where <code>capture_process_name</code> is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes.</p> <p>If 0 (zero), then no messages are tracked automatically.</p> <p>See <i>Oracle Streams Replication Administrator's Guide</i> for more information about message tracking.</p>
parallelism	A positive integer	1	<p>The number of preparer servers that can concurrently mine the redo log for the capture process.</p> <p>A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the <code>parallelism</code> capture process parameter. So, if <code>parallelism</code> is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server.</p> <p>Setting the <code>parallelism</code> parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the <code>PROCESSES</code> initialization parameter is set appropriately when you set the <code>parallelism</code> capture process parameter.</p> <p><b>Note:</b> When you change the value of this parameter, the capture process is stopped and restarted automatically.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about capture process components</p>
skip_autofiltered_table_ddl	Y or N	Y	<p>If Y, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process.</p> <p>If N, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets.</p> <p>The <code>AUTO_FILTERED</code> column in the <code>DBA_STREAMS_UNSUPPORTED</code> data dictionary view shows which tables are automatically filtered by capture processes.</p>

**Table 32–17 (Cont.) Capture Process Parameters**

Parameter Name	Possible Values	Default	Description
split_threshold	0, a positive integer, or INFINITE	1800	<p>The amount of time, in seconds, that a stream is broken before the stream is automatically split from other streams that flow from the capture process. When a stream is split, the capture process, queue, and propagation are cloned.</p> <p>In this case, a stream is a flow of logical change records (LCRs) that flows from a capture process to an apply. A stream is broken when LCRs captured by the capture process cannot reach the apply process. For example, a stream is broken when the relevant propagation or apply process is disabled.</p> <p>This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes.</p> <p>If 0 (zero), then automatic splitting starts immediately.</p> <p>If INFINITE, then automatic splitting is disabled. The stream is not split regardless of the amount of time that it is broken.</p> <p>This parameter is designed to be used with the merge_threshold parameter. You can monitor an automatic split and merge operation by querying the DBA_STREAMS_SPLIT_MERGE view.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i></p>
startup_seconds	0, a positive integer, or INFINITE	0	<p>The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually.</p> <p>If INFINITE, then the capture process does not start until another instantiation of the same capture process finishes.</p>
time_limit	A positive integer or INFINITE	INFINITE	<p>The capture process stops as soon as possible after the specified number of seconds since it started.</p> <p>If INFINITE, then the capture process continues to run until it is stopped explicitly.</p>

**Table 32–17 (Cont.) Capture Process Parameters**

Parameter Name	Possible Values	Default	Description
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.
write_alert_log	Y or N	Y	If Y, then the capture process writes a message to the alert log on exit. If N, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.
xout_client_exists	Y or N	Y if the capture process sends LCRs to XStream outbound servers N if the capture process sends LCRs to Oracle Streams apply processes	Y indicates that the capture process sends LCRs to one or more XStream outbound servers. N indicates that the capture process sends LCRs to one or more Oracle Streams apply processes. A single capture process cannot send LCRs to both outbound servers and apply processes. In an XStream configuration where an outbound server runs on a different database than its capture process, set this parameter to Y to enable the capture process to send LCRs to the outbound server. <b>Note:</b> Using XStream requires purchasing a license for the Oracle GoldenGate product. See <i>Oracle Database XStream Guide</i> .

## Usage Notes

The following usage notes apply to the SET\_PARAMETER procedure:

- [Delays Are Possible Before New Parameter Settings Take Effect](#)
- [Parameters Interpreted as Positive Integers](#)
- [Parameters with a System Change Number \(SCN\) Setting](#)
- [Parameters that Require XStream Capabilities](#)

### Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

### Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify INFINITE for larger values.

### Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

### Parameters that Require XStream Capabilities

A capture process uses the following parameters only when the capture process is sending logical change records (LCRs) to an XStream outbound server or when XStream capabilities are enabled for Oracle Streams components:

- capture\_idkey\_lcrs
- capture\_sequence\_nextval
- excludeuserid
- excludeuser

- `excludetrans`
- `getapplops`
- `getreplicates`
- `max_sga_size`

The `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure enables XStream capabilities for Oracle Streams. When XStream capabilities are not enabled by the `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure, a capture process raises an error if one of these parameters is set to any value other than its default value.

When XStream capabilities are enabled for Oracle Streams and the `capture_idkey_lcrs` parameter is set to `Y`, a capture process can capture ID key LCRs. ID key LCRs do not contain all of the columns for a row change. Instead, they contain the rowid of the changed row, a group of key columns to identify the row in the table, and the data for the scalar columns of the table that are supported by capture processes. An apply process can apply these changes using the information available the ID key LCRs.

To determine the database objects for which a capture process will capture ID key LCRs, run the following query on the source database:

```
SELECT OWNER, OBJECT_NAME
       FROM DBA_XSTREAM_OUT_SUPPORT_MODE
       WHERE SUPPORT_MODE='ID KEY';
```

---

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

---

## START\_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by `c`.

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of a capture process.

**See Also:** [Chapter 144, "DBMS\\_STREAMS\\_ADM"](#)

### Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE (
  capture_name IN VARCHAR2);
```

### Parameters

**Table 32–18** *START\_CAPTURE Procedure Parameter*

Parameter	Description
<code>capture_name</code>	The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A <code>NULL</code> setting is not allowed.

### Usage Notes

The capture process status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup. A capture process (`cnnn`) is an Oracle background process.

## STOP\_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

### Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(
  capture_name IN VARCHAR2,
  force        IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 32–19 STOP\_CAPTURE Procedure Parameters**

Parameter	Description
capture_name	The name of the capture process. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then it aborts.  If FALSE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then an ORA-26672 error is returned, and the capture process might continue to run.

### Usage Notes

The following usage notes apply to this procedure:

- The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup.
- A capture process is an Oracle background process with a name in the form CPnn, where nn can include letters and numbers.
- The enqueue and dequeue state of DBMS\_AQADM.START\_QUEUE and DBMS\_AQADM.STOP\_QUEUE have no effect on the stop status of a capture process.

---

---

## DBMS\_CDC\_PUBLISH

---

---

**Note:** Oracle Change Data Capture will be de-supported in a future release of Oracle Database and will be replaced with Oracle GoldenGate. Therefore, Oracle strongly recommends that you use Oracle GoldenGate for new applications.

For Oracle Database 11g Release 2 (11.2), Change Data Capture continues to function as in earlier releases. If you are currently using Change Data Capture, then you will be able to continue to do so for the foreseeable future. However, Change Data Capture will not be further enhanced, and will only be supported based on the current, documented functionality.

---

---

The `DBMS_CDC_PUBLISH` package, one of a set of Change Data Capture packages, is used by a publisher to set up an Oracle Change Data Capture system to capture and publish change data from one or more Oracle relational source tables.

Change Data Capture captures and publishes only committed data. Oracle Change Data Capture identifies new data that has been added to, updated in, or removed from relational tables, and publishes the change data in a form that is usable by subscribers.

Typically, a Change Data Capture system has one **publisher** who captures and publishes changes for any number of Oracle relational source tables. The publisher then provides subscribers (applications or individuals) with access to the published data. Subscribers access the published data using the `DBMS_CDC_SUBSCRIBE` package.

**See Also:** *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture

This chapter contains the following topics:

- [Using DBMS\\_CDC\\_PUBLISH](#)
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Views
- [Summary of DBMS\\_CDC\\_PUBLISH Subprograms](#)

---

## Using DBMS\_CDC\_PUBLISH

This section contains the following topics, which relate to using the DBMS\_CDC\_PUBLISH package:

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Views](#)

## Overview

Through the DBMS\_CDC\_PUBLISH package, the publisher creates and maintains change sources, change sets, and change tables, and eventually drops them when they are no longer useful.

The publisher, typically a database administrator, is concerned primarily with the source of the data and with creating the schema objects that describe the structure of the capture system: change sources, change sets, and change tables.

Most Change Data Capture systems have one publisher and many subscribers. The publisher accomplishes the following main objectives:

1. Determines which source table changes need to be published.
2. Decides whether to capture changes asynchronously or synchronously.
3. Uses the subprograms in the DBMS\_CDC\_PUBLISH package to capture change data from the source tables and make it available by creating and administering the change source, change set, and change table objects.
4. Allows controlled access to subscribers by using the SQL GRANT and REVOKE statements to grant and revoke the SELECT privilege on change tables for users and roles. (This is necessary to allow the subscribers to subscribe to the change data using the DBMS\_CDC\_SUBSCRIBE package.)

**See Also:** [Chapter 34, "DBMS\\_CDC\\_SUBSCRIBE"](#) for information on the package used to subscribe to published change data

## Deprecated Subprograms

---

---

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

---

The following subprograms are deprecated with Oracle Database 11g:

- `DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION` with a subscription handle  
When dropping a subscription, the publisher should now specify the name of the subscription to be dropped, not the subscription handle.
- `DBMS_CDC_PUBLISH.DROP_SUBSCRIBER_VIEW`  
Dropping a subscriber view is now performed automatically by Change Data Capture.

## Security Model

You must have the EXECUTE\_CATALOG\_ROLE role to use the DBMS\_CDC\_PUBLISH package. Additional privileges and roles are required depending on the publishing mode and whether the publisher is on the source or staging database. See the section on Granting Privileges and Roles to the Publisher in *Oracle Database Data Warehousing Guide* for details.

## Views

The `DBMS_CDC_PUBLISH` package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

## Summary of DBMS\_CDC\_PUBLISH Subprograms

Table 33–1 describes the subprograms in the DBMS\_CDC\_PUBLISH supplied package and the mode or modes with which each can be used. A value of All in the Mode column indicates that the subprogram can be used with synchronous and all modes of asynchronous Change Data Capture, a value of Asynchronous in the Mode column indicates that the subprogram can be used with all modes of asynchronous Change Data Capture (HotLog, Distributed HotLog, and AutoLog).

**Table 33–1 DBMS\_CDC\_PUBLISH Package Subprograms**

Subprogram	Mode	Description
<a href="#">ALTER_AUTOLOG_CHANGE_SOURCE Procedure</a> on page 33-8	Asynchronous AutoLog	Changes one or more properties of an existing AutoLog change source
<a href="#">ALTER_CHANGE_SET Procedure</a> on page 33-10	All	Changes one or more of the properties of an existing change set
<a href="#">ALTER_CHANGE_TABLE Procedure</a> on page 33-13	All	Adds or drops columns for an existing change table, or changes the properties of an existing change table
<a href="#">ALTER_HOTLOG_CHANGE_SOURCE Procedure</a> on page 33-16	Asynchronous Distributed HotLog	Changes one or more properties of an existing Distributed HotLog change source
<a href="#">CREATE_AUTOLOG_CHANGE_SOURCE Procedure</a> on page 33-18	Asynchronous AutoLog	Creates an AutoLog change source
<a href="#">CREATE_CHANGE_SET Procedure</a> on page 33-20	All	Creates a change set
<a href="#">CREATE_CHANGE_TABLE Procedure</a> on page 33-23	All	Creates a change table in a specified schema
<a href="#">CREATE_HOTLOG_CHANGE_SOURCE Procedure</a> on page 33-27	Asynchronous Distributed HotLog	Creates a Distributed HotLog change source
<a href="#">DROP_CHANGE_SET Procedure</a> on page 33-29	All	Drops an existing change set
<a href="#">DROP_CHANGE_SOURCE Procedure</a> on page 33-30	Asynchronous Autolog and Asynchronous Distributed Hotlog	Drops an existing AutoLog or Distributed HotLog change source
<a href="#">DROP_CHANGE_TABLE Procedure</a> on page 33-31	All	Drops an existing change table
<a href="#">DROP_SUBSCRIPTION Procedure</a> on page 33-32	All	Allows a publisher to drop a subscription that was created by a subscriber
<a href="#">GET_DDLOPER Function</a> on page 33-33	All	Converts a binary integer into a user friendly string that describes the DDL operation that actually took place
<a href="#">PURGE Procedure</a> on page 33-34	All	Removes unneeded rows from all change tables in the staging database
<a href="#">PURGE_CHANGE_SET Procedure</a> on page 33-35	All	Removes unneeded rows from all change tables in a specified change set
<a href="#">PURGE_CHANGE_TABLE Procedure</a> on page 33-36	All	Removes unneeded rows from a specified change table

## ALTER\_AUTOLOG\_CHANGE\_SOURCE Procedure

This procedure changes the properties of an existing AutoLog change source.

### Syntax

```
DBMS_CDC_PUBLISH.ALTER_AUTOLOG_CHANGE_SOURCE (
    change_source_name IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    remove_description IN CHAR DEFAULT 'N',
    first_scn          IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 33–2 ALTER\_AUTOLOG\_CHANGE\_SOURCE Procedure Parameters**

Parameter	Description
change_source_name	Name of an existing AutoLog change source. Change source names follow Oracle schema object naming rules.
description	New description of the change source. The description must be specified using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
first_scn	New first SCN.

### Exceptions

**Table 33–3 ALTER\_AUTOLOG\_CHANGE\_SOURCE Procedure Exceptions**

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31445	Invalid lock handle while acquiring lock on string
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31497	Invalid value specified for first_scn
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31501	Specified change source is not an AutoLog change source
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Specified parameter value longer than maximum length

### Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- This procedure can be used in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

**See Also:** The section on asynchronous Change Data Capture and redo log files in *Oracle Database Data Warehousing Guide* for information on how the publisher can use the `ALTER_AUTOLOG_CHANGE_SOURCE` procedure in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

## ALTER\_CHANGE\_SET Procedure

This procedure changes the properties of an existing change set that was created with the CREATE\_CHANGE\_SET procedure.

### Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_SET (
  change_set_name      IN VARCHAR2,
  description           IN VARCHAR2 DEFAULT NULL,
  remove_description   IN CHAR DEFAULT 'N',
  enable_capture       IN CHAR DEFAULT NULL,
  recover_after_error  IN CHAR DEFAULT NULL,
  remove_ddl           IN CHAR DEFAULT NULL,
  stop_on_ddl          IN CHAR DEFAULT NULL);
```

### Parameters

**Table 33–4 ALTER\_CHANGE\_SET Procedure Parameters**

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
description	New description of the change set. Specify using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_capture	A value of 'Y' or 'N'. If the value is 'Y', then change data capture is enabled for this change set. If the value is 'N', then change data capture is disabled for this change set. Synchronous change sets are created with change data capture enabled. Asynchronous change sets are created with change data capture disabled.
recover_after_error	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture will attempt to recover from earlier capture errors. If the value is 'N', then Change Data Capture will not attempt to recover from earlier capture errors.
remove_ddl	A value of 'Y' or 'N'. If the value is 'Y' and the value of the recover_after_error parameter is 'Y', then any DDL records that may have caused capture errors will be filtered out during recovery. If the value is 'N', then DDL records that may have caused capture errors will not be filtered out during recovery. This parameter has meaning only when the recover_after_error parameter is specified with a value of 'Y'.

**Table 33–4 (Cont.) ALTER\_CHANGE\_SET Procedure Parameters**

Parameter	Description
stop_on_ddl	<p>A value of 'Y' or 'N'.</p> <p>If the value is 'Y', then Change Data Capture stops when a DDL event is detected.</p> <p>If the value is 'N', then Change Data Capture continues when a DDL event is detected.</p> <p>See the Usage Notes for additional information about this parameter.</p>

## Exceptions

**Table 33–5 ALTER\_CHANGE\_SET Procedure Exceptions**

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31445	Invalid lock handle while acquiring lock on string
ORA-31468	Cannot process DDL change record
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31485	Invalid database link
ORA-31498	The <code>description</code> and <code>remove_description</code> parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31514	Change set disabled due to capture error

## Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the predefined synchronous change set, `SYNC_SET`, cannot be altered, and the following parameters cannot be altered for publisher-defined synchronous change sets: `enable_capture`, `recover_after_error`, `remove_ddl`, and `stop_on_ddl`.
- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can alter more than one parameter at a time.
- Enabling or disabling an asynchronous HotLog or AutoLog change set starts or stops the Oracle Streams capture process and apply process underlying the change set. Enabling or disabling an asynchronous Distributed HotLog change set starts or stops the Oracle Streams apply process underlying the change set.
- The effect of the `stop_on_ddl` parameter is as follows:
  - When the `stop_on_ddl` parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity

to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to 'Y' and any of the following statements is encountered:

- \* ANALYZE TABLE
- \* LOCK TABLE
- \* GRANT privileges to access a table
- \* REVOKE privileges to access a table
- \* COMMENT on a table
- \* COMMENT on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

- When the `stop_on_ddl` parameter is set to 'N', Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects change tables, that change can result in a capture error. There are also system conditions that can cause capture errors, such as being out of disk space.

**See Also:** *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been stopped and the DDL statement that caused it to be stopped. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

- The publisher can attempt to recover an asynchronous change set after a capture error by specifying 'Y' for the `recover_after_error` parameter. Capture errors can occur when any of the following is true:
  - The `stop_on_ddl` parameter is set to 'Y' and there is a DDL record in the change data. In this case, to recover from the error, the publisher must also specify 'Y' for the `remove_ddl` parameter.
  - The `stop_on_ddl` parameter is set to 'N' and there is a DDL record that affects capture. For example, if the publisher drops and re-creates a change table, it causes an error the next time that Change Data Capture attempts to add change data to the named change table.
  - A miscellaneous error occurs, such as running out of disk space, or a redo log file error (such as ORA-01688: unable to extend table *string.string* partition *string* by *string* in tablespace *string*).

**See Also:** *Oracle Database Data Warehousing Guide* for more information on how to recover from a capture error.

## ALTER\_CHANGE\_TABLE Procedure

This procedure adds columns to, or drops columns from, or changes the properties of, a change table that was created with the CREATE\_CHANGE\_TABLE procedure.

### Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_TABLE (
    owner                IN VARCHAR2,
    change_table_name    IN VARCHAR2,
    operation            IN VARCHAR2,
    column_list         IN VARCHAR2,
    rs_id               IN CHAR,
    row_id              IN CHAR,
    user_id             IN CHAR,
    timestamp           IN CHAR,
    object_id           IN CHAR,
    source_colmap       IN CHAR,
    target_colmap       IN CHAR,
    ddl_markers         IN CHAR DEFAULT NULL);
```

### Parameters

**Table 33–6 ALTER\_CHANGE\_TABLE Procedure Parameters**

Parameter	Description
owner	The schema that owns the change table.
change_table_name	The change table that is being altered. Change table names follow the Oracle schema object naming rules.
operation	Either the value ADD or DROP to indicate whether to add or drop the user columns specified with the column_list parameter and any control columns specified by other parameters.
column_list	User column names and datatypes for each column of the source table that should be added to, or dropped from, the change table. The list is comma-delimited.

**Table 33–6 (Cont.) ALTER\_CHANGE\_TABLE Procedure Parameters**

Parameter	Description
rs_id	Each listed parameter specifies a particular control column, as follows:
row_id	
user_id	<ul style="list-style-type: none"> <li>▪ The <code>rs_id</code> parameter specifies the <code>RSID\$</code> control column.</li> </ul>
timestamp	<ul style="list-style-type: none"> <li>▪ The <code>row_id</code> parameter specifies the <code>ROW_ID\$</code> control column.</li> </ul>
object_id	<ul style="list-style-type: none"> <li>▪ The <code>user_id</code> parameter specifies the <code>USERNAME\$</code> control column.</li> </ul>
source_colmap	<ul style="list-style-type: none"> <li>▪ The <code>timestamp</code> parameter specifies the <code>TIMESTAMP\$</code> control column.</li> </ul>
target_colmap	<ul style="list-style-type: none"> <li>▪ The <code>object_id</code> parameter specifies the <code>SYS_NC_OID\$</code> control column.</li> </ul>
ddl_markers	<ul style="list-style-type: none"> <li>▪ The <code>source_colmap</code> parameter specifies the <code>SOURCE_COLMAP\$</code> control column.</li> <li>▪ The <code>target_colmap</code> parameter specifies the <code>TARGET_COLMAP\$</code> control column.</li> <li>▪ The <code>ddl_markers</code> parameter tracks all DDL operations on the source table and stores information about those operations in the change table. These are the three additional control columns you get when <code>ddl_markers</code> is enabled. There are three values: <code>DDLOPER\$</code> is a bit vector that indicates what kind of DDL operation happened. (Use the procedure <code>DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper\$)</code> to get the name of the DDL operation.) <code>DDLDESC\$</code> is a CLOB containing the actual DDL statement executed. <code>DDLPOBJN\$</code> is not used in this release.</li> </ul> <p>Each parameter must have a value of either 'Y' or 'N', where:</p> <ul style="list-style-type: none"> <li>▪ 'Y': Adds the specified control column to, or drops it from the change table, as indicated by the <code>operation</code> parameter.</li> <li>▪ 'N': Neither adds the specified control column, nor drops it from the change table.</li> </ul>

**See Also:** *Oracle Database Data Warehousing Guide* for a complete description of control columns.

## Exceptions

**Table 33–7 ALTER\_CHANGE\_TABLE Procedure Exceptions**

Exception	Description
ORA-31403	Specified change table already contains the specified column
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid <code>SOURCE_COLMAP</code> value
ORA-31417	Column list contains control column <i>control-column-name</i>
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31423	Specified change table does not contain the specified column
ORA-31454	Invalid value specified for operation parameter, expecting ADD or DROP

**Table 33–7 (Cont.) ALTER\_CHANGE\_TABLE Procedure Exceptions**

Exception	Description
ORA-31455	Nothing to alter
ORA-31456	Error executing a procedure in the DBMS_CDC_UTILITY package
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31471	Invalid OBJECT_ID value

## Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher cannot add and drop user columns in the same call to the ALTER\_CHANGE\_TABLE procedure; these schema changes require separate calls.
- The publisher must not specify the name of the control columns in the column\_list parameter.
- When altering an asynchronous change table, the publisher must accept the default value or specify 'N' for the source\_colmap and object\_id parameters. In addition, for the asynchronous Distributed HotLog mode, the publisher also must accept the default value or specify 'N' for the row\_id and username parameters when the change source is 9.2 or 10.1.

**See Also:** *Oracle Database Data Warehousing Guide* for information about the impact on subscriptions when a publisher adds a column to a change table.

## ALTER\_HOTLOG\_CHANGE\_SOURCE Procedure

This procedure changes the properties of an existing Distributed HotLog change source.

### Syntax

```
DBMS_CDC_PUBLISH.ALTER_HOTLOG_CHANGE_SOURCE (
    change_source_name IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    remove_description IN CHAR DEFAULT 'N',
    enable_source      IN CHAR DEFAULT NULL);
```

### Parameters

**Table 33–8 ALTER\_HOTLOG\_CHANGE\_SOURCE Procedure Parameters**

Parameter	Description
change_source_name	Name of an existing Distributed HotLog change source. Change source names follow Oracle schema object naming rules.
description	New description of the change source. The description must be specified using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_source	A value of 'Y' or 'N'. If the value is 'Y', then the change source is enabled. If the value is 'N', then the change source is disabled.

### Exceptions

**Table 33–9 ALTER\_HOTLOG\_CHANGE\_SOURCE Procedure Exceptions**

Exception	Description
ORA-31401	Change source is not an existing change source
ORA-31455	Nothing to ALTER
ORA-31480	Staging database and source database cannot be the same
ORA-31481	Change source is not a HotLog change source
ORA-31482	Invalid option for non-distributed HotLog change source
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Parameter value longer than maximum length
ORA-31532	Cannot enable change source

**Table 33–9 (Cont.) ALTER\_HOTLOG\_CHANGE\_SOURCE Procedure Exceptions**

<b>Exception</b>	<b>Description</b>
ORA-31534	Change Data Capture publisher is missing DBA role

### Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- Enabling or disabling a Distributed HotLog change source starts or stops the Oracle Streams capture process that underlies the change source.
- This procedure cannot be used to alter the change source for the asynchronous HotLog mode of Change Database Capture. The change source for the asynchronous HotLog mode is the predefined change source, `HOTLOG_SOURCE`, which cannot be altered.

## CREATE\_AUTOLOG\_CHANGE\_SOURCE Procedure

This procedure creates an AutoLog change source. An AutoLog change source is based on a set of redo log files automatically copied by redo transport services to the system on which the staging database resides.

### Syntax

```
DBMS_CDC_PUBLISH.CREATE_AUTOLOG_CHANGE_SOURCE (
    change_source_name IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    source_database    IN VARCHAR2,
    first_scn          IN NUMBER,
    online_log         IN CHAR DEFAULT 'N');
```

### Parameters

**Table 33–10 CREATE\_AUTOLOG\_CHANGE\_SOURCE Procedure Parameters**

Parameter	Description
change_source_name	Name of the change source. Change source names follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	Global name of the change source's source database instance.
first_scn	The SCN of the start of a LogMiner dictionary that is in the change source's archived redo log files.
online_log	A value of 'Y' or 'N'. If the value is 'Y', then the change source uses the AutoLog online option to hot-mine the source database online redo log to gather change data. There can only be one change source with <code>online_log='Y'</code> on a given staging database.  If the value is 'N', then the change source uses the AutoLog archive option to get change data from archived redo log files. There can be one or more change sources with <code>online_log='N'</code> on a given staging database.

### Exceptions

**Table 33–11 CREATE\_AUTOLOG\_CHANGE\_SOURCE Procedure Exceptions**

Exception	Description
ORA-31436	Duplicate change source specified
ORA-31497	Invalid value specified for <code>first_scn</code>
ORA-31499	Null value specified for required parameter
ORA-31507	Specified parameter value is longer than the maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31535	Cannot support change source in this configuration

### Usage Notes

- The publisher can use this procedure for asynchronous Change Data Capture only.

- The publisher must take care when specifying a value for the `source_database` parameter. Change Data Capture does not validate this value when creating the change source. The publisher can query the `GLOBAL_NAME` column in the `GLOBAL_NAME` view at the source database for the `source_database` parameter value.
- The publisher must configure redo transport services to automatically copy the log files to the system on which the staging database resides.

**See Also:** The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on configuring redo transport services to automatically copy the log files to the system on which the staging database resides.

- An AutoLog change source must begin with an archived redo log file that contains a LogMiner dictionary. The `CREATE_AUTOLOG_CHANGE_SOURCE first_scn` parameter indicates the SCN for this dictionary extraction and is the point at which the change source can begin capturing changes. The publisher can determine the value for the `first_scn` parameter using either of the following methods:

- Direct `DBMS_CAPTURE_ADM.BUILD` to return the value when the dictionary is built:

```
SET SERVEROUTPUT ON
VARIABLE FSCN NUMBER;
BEGIN
  :FSCN := 0;
  DBMS_CAPTURE_ADM.BUILD(:FSCN);
  DBMS_OUTPUT.PUT_LINE('The first_scn value is ' || :FSCN);
END;
/
The first_scn value is 207722
```

- Make the following query on the source database. If this query returns multiple distinct values for `first_change#`, then the data dictionary has been extracted more than once and the publisher should choose the `first_change#` value that is the most appropriate to the change source.

```
SELECT DISTINCT FIRST_CHANGE#, NAME
FROM V$ARCHIVED_LOG
WHERE DICTIONARY_BEGIN = 'YES';
```

**See Also:** The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on archived redo log files and the LogMiner dictionary.

- For the asynchronous mode of Change Data Capture, the amount of change data captured is dependent on the level of supplemental logging enabled at the source database.

**See Also:** *Oracle Database Data Warehousing Guide* for information about supplemental logging.

## CREATE\_CHANGE\_SET Procedure

This procedure allows the publisher to create a change set. For asynchronous HotLog and AutoLog Change Data Capture, the publisher can optionally provide beginning and ending date values at which to begin and end change data capture.

### Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_SET(
    change_set_name      IN VARCHAR2,
    description          IN VARCHAR2 DEFAULT NULL,
    change_source_name  IN VARCHAR2,
    stop_on_ddl         IN CHAR DEFAULT 'N',
    begin_date          IN DATE DEFAULT NULL,
    end_date            IN DATE DEFAULT NULL);
```

### Parameters

**Table 33–12 CREATE\_CHANGE\_SET Procedure Parameters**

Parameter	Description
change_set_name	Name of the change set. Change set names follow the Oracle schema object naming rules.
description	Description of the change set. Specify using 255 or fewer characters.
change_source_name	Name of the existing change source to contain this change set.
stop_on_ddl	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture stops when a DDL event is detected. If the value is 'N', then Change Data Capture continues when a DDL event is detected. See the Usage Notes for additional information about this parameter.
begin_date	Date on which the publisher wants the change set to begin capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.
end_date	Date on which the publisher wants the change set to stop capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.

### Exceptions

**Table 33–13 CREATE\_CHANGE\_SET Procedure Exceptions**

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31407	The end_date must be greater than the begin_date
ORA-31408	Invalid value specified for begin_scn or end_scn
ORA-31437	Duplicate change set specified
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31483	Cannot have spaces in the parameter
ORA-31485	Invalid database link

**Table 33–13 (Cont.) CREATE\_CHANGE\_SET Procedure Exceptions**

Exception	Description
ORA-31487	Cannot support begin dates or end dates in this configuration
ORA-31488	Cannot support change set in this configuration
ORA-31499	Null value specified for required parameter
ORA-31503	Invalid date supplied for <code>begin_date</code> or <code>end_date</code>
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set

## Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the default values for the following parameters are the only supported values for synchronous change sets: `begin_date`, `end_date`, and `stop_on_ddl`. The default values for the following parameters are the only supported values for asynchronous Distributed HotLog change sets: `begin_date` and `end_date`.
- When the change source is Distributed HotLog on a release of Oracle Database earlier than 10.2, Change Data Capture inserts rows into the `CHANGE_PROPAGATION` and `CHANGE_PROPAGATION_SETS` views on the staging database.
- An AutoLog online change source (created with `online_log='Y'`) can only contain one change set.
- The `begin_date` and `end_date` parameters are optional. The publisher can specify neither of them, one of them, or both. The effect of these parameters is as follows:
  - When a `begin_date` is specified, changes from transactions that begin on or after that date are captured.
  - When a `begin_date` is not specified, capture starts with the earliest available change data.
  - When an `end_date` is specified, changes from transactions that are committed on or before that date are captured.
  - When an `end_date` is not specified, Change Data Capture continues indefinitely.
- The effect of the `stop_on_ddl` parameter is as follows:
  - When the `stop_on_ddl` parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.
 

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to 'Y' and any of the following statements is encountered:

    - \* `ANALYZE TABLE`
    - \* `LOCK TABLE`
    - \* `GRANT` privileges to access a table

- \* REVOKE privileges to access a table
- \* COMMENT on a table
- \* COMMENT on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

- When the `stop_on_ddl` parameter is set to 'N', Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects capture, that change can result in a capture error.

**See Also:** *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error.

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been terminated and the DDL statement that caused it to be terminated. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

## CREATE\_CHANGE\_TABLE Procedure

This procedure creates a change table in a specified schema.

---

---

**Note:** Oracle recommends that the publisher be certain that the source table that will be referenced in a `CREATE_CHANGE_TABLE` procedure has been created prior to calling this procedure, particularly if the change set that will be specified in the procedure has the `stop_on_ddl` parameter set to 'Y'.

---

---

### Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_TABLE(
  owner                IN VARCHAR2,
  change_table_name    IN VARCHAR2,
  change_set_name      IN VARCHAR2,
  source_schema        IN VARCHAR2,
  source_table         IN VARCHAR2,
  column_type_list     IN VARCHAR2,
  capture_values       IN VARCHAR2,
  rs_id                IN CHAR,
  row_id               IN CHAR,
  user_id              IN CHAR,
  timestamp            IN CHAR,
  object_id            IN CHAR,
  source_colmap        IN CHAR,
  target_colmap        IN CHAR,
  options_string       IN VARCHAR2,
  ddl_markers          IN CHAR DEFAULT 'Y');
```

### Parameters

**Table 33–14** CREATE\_CHANGE\_TABLE Procedure Parameters

Parameter	Description
<code>owner</code>	Name of the schema that owns the change table.
<code>change_table_name</code>	Name of the change table that is being created. Change table names follow the Oracle schema object naming rules.
<code>change_set_name</code>	Name of the change set in which this change table resides.
<code>source_schema</code>	The schema where the source table is located.
<code>source_table</code>	The source table from which the change records are captured.
<code>column_type_list</code>	The user columns and datatypes that are being tracked. Specify using a comma-delimited list.
<code>capture_values</code>	One of the following capture values for update operations: <ul style="list-style-type: none"> <li>■ OLD: Captures the original values from the source table.</li> <li>■ NEW: Captures the changed values from the source table.</li> <li>■ BOTH: Captures the original and changed values from the source table.</li> </ul>

**Table 33–14 (Cont.) CREATE\_CHANGE\_TABLE Procedure Parameters**

Parameter	Description	
rs_id	<p>Each listed parameter specifies a particular control column as follows:</p> <ul style="list-style-type: none"> <li>■ The rs_id parameter specifies the RSID\$ control column.</li> <li>■ The row_id parameter specifies the ROW_ID\$ control column.</li> <li>■ The user_id parameter specifies the USERNAME\$ control column.</li> <li>■ The timestamp parameter specifies the TIMESTAMP\$ control column.</li> <li>■ The object_id parameter specifies the SYS_NC_OID\$ control column.</li> <li>■ The source_colmap parameter specifies the SOURCE_COLMAP\$ control column.</li> <li>■ The target_colmap parameter specifies the TARGET_COLMAP\$ control column.</li> <li>■ The ddl_markers parameter tracks all DDL operations on the source table and stores information about those operations in the change table. There are three values: DDLOPER\$ is a bit vector that indicates what kind of DDL operation happened. (Use the procedure DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper\$) to get the name of the DDL operation.) DDLDESC\$ is a CLOB containing the actual DDL statement executed. DDLPDOBJN\$ is not used in this release.</li> </ul> <p>Each parameter can have a value of 'Y' or 'N', where:</p> <ul style="list-style-type: none"> <li>■ 'Y': Adds the specified control column to the change table.</li> <li>■ 'N': Does not add the specified control column to the change table.</li> </ul>	
row_id		
user_id		
timestamp		
object_id		
source_colmap		
target_colmap		
ddl_markers		
options_string		The syntactically correct options to be passed to a CREATE TABLE DDL statement. The options string is appended to the generated CREATE TABLE DDL statement after the closing parenthesis that defines the columns of the table. See the Usage Notes for more information.

**See Also:** *Oracle Database Data Warehousing Guide* for a complete description of control columns

## Exceptions

**Table 33–15 CREATE\_CHANGE\_TABLE Procedure Exceptions**

Exception	Description
ORA-31402	Unrecognized parameter specified
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column <i>control-column-name</i>
ORA-31418	Specified source schema does not exist
ORA-31419	Specified source table does not exist
ORA-31420	Unable to submit the purge job

**Table 33–15 (Cont.) CREATE\_CHANGE\_TABLE Procedure Exceptions**

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Owner schema does not exist
ORA-31438	Duplicate change table
ORA-31447	Cannot create change tables in the SYS schema
ORA-31450	Invalid value for <code>change_table_name</code>
ORA-31451	Invalid value for <code>capture_values</code> , expecting: OLD, NEW, or BOTH
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31467	No column found in the source table
ORA-31471	Invalid OBJECT_ID value

## Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- A change table is a database table that contains the change data resulting from DML statements (INSERT, UPDATE, and DELETE) made to a source table. A given change table can capture changes from only one source table.
- A change table is a database table that contains two types of columns:
  - User columns, which are copies of actual columns of source tables that reside in the change table.
  - Control columns, which maintain special metadata for each change row in the change table. Information such as the DML operation performed, the capture time (time stamp), and changed column vectors are examples of control columns. The publisher must not specify the name of the control columns in the user column list.
- If there are multiple publishers on the staging database for the Distributed HotLog mode of Change Data capture, and one publisher defines a change table in another publisher's Distributed HotLog change set, then Change Data Capture uses the database link established by the publisher who created the change set to access the source database. Therefore, the database link to the source database established by the publisher who created the change set must be intact for the change table to be successfully created. If the change set publisher's database link is not present when creating a change table, an error is returned indicating that the connection description for the remote database was not found.
- The publisher must not attempt to control a change table's partitioning properties. Change Data Capture automatically manages the change table partitioning as part of its change table management.
- When creating a change table for any mode of asynchronous Change Data Capture, the publisher must accept the default value or specify 'N' for the `source_colmap` and `object_id` parameters. In addition, for the asynchronous Distributed HotLog mode of Change Data Capture, the publisher also must accept the default value or specify 'N' for the `row_id` and `username` parameters when the change source is 9.2 or 10.1.

- When the publisher specifies the `rs_id` parameter, the `RSID$` column is added to the change table. The `RSID$` column value reflects an operation's capture order within a transaction, but not across transactions. The publisher cannot use the `RSID$` column value by itself to order committed operations across transactions; it must be used in conjunction with the `CSCN$` column value.
- The publisher can control a change table's physical properties, tablespace properties, and so on, by specifying the `options_string` parameter. With the `options_string` parameter, the publisher can set any option that is valid for the `CREATE TABLE DDL` statement (except for partitioning properties).

---

---

**Note:** How the publisher defines the `options_string` parameter can have an effect on the performance and operations in a Change Data Capture system. For example, if the publisher places several constraints in the options column, it can have a noticeable effect on performance. Also, if the publisher uses `NOT NULL` constraints and a particular column is not changed in an incoming change row, then the constraint can cause the `INSERT` operation to fail and the transaction that contains the `INSERT` operation to be rolled back.

---

---

- Oracle recommends that change tables not be created in system tablespaces. This can be accomplished if the publisher's default tablespace is not the system tablespace or if the publisher specifies a tablespace in the `options_string` parameter. If a tablespace is not specified by the publisher, and the publisher's default table space is the system tablespace, then Change Data Capture creates change tables in the system tablespace.

**See Also:** *Oracle Database Data Warehousing Guide* for more information on, and examples of, creating change tables in tablespaces managed by the publisher.

## CREATE\_HOTLOG\_CHANGE\_SOURCE Procedure

This procedure creates a Distributed HotLog change source on the source database when the publisher runs this procedure from the staging database. A Distributed HotLog change source is based on data in the online redo log files that is automatically transferred to the staging database by Oracle Streams propagation.

### Syntax

```
DBMS_CDC_PUBLISH.CREATE_HOTLOG_CHANGE_SOURCE (
    change_source_name    IN VARCHAR2,
    description           IN VARCHAR2 DEFAULT NULL,
    source_database       IN VARCHAR2);
```

### Parameters

**Table 33–16 CREATE\_HOTLOG\_CHANGE\_SOURCE Procedure Parameters**

Parameters	Description
change_source_name	Name of the Distributed HotLog change source to be created. Each change source name must be unique and must follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	The name of the database link defined from the staging database to the source database, where the source database is Oracle9i Database, Database 10g Release 1, Oracle Database 10g Release 2, or Oracle Database 11g Release 1. See <i>Oracle Database Data Warehousing Guide</i> for information on creating database links for the Distributed HotLog mode of Change Data Capture.

### Exceptions

**Table 33–17 CREATE\_HOTLOG\_CHANGE\_SOURCE Procedure Exceptions**

Exception	Description
ORA-31436	Duplicate change source
ORA-31480	Staging database and source database cannot be the same
ORA-31483	Cannot have spaces in the parameter
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31507	Parameter value longer than the maximum length
ORA-31534	Change Data Capture publisher is missing DBA role

### Usage Notes

- The publisher can use this procedure for the asynchronous Distributed HotLog mode of Change Data Capture only.

This procedure cannot be used to create a change source for the asynchronous HotLog mode of Change Database Capture. The publisher must use the

predefined change source, `HOTLOG_SOURCE`, for the asynchronous HotLog mode of Change Data Capture.

- A Distributed HotLog change source can contain one or more change sets, but they must all be on the same staging database.
- A staging database publisher cannot create multiple Distributed HotLog change sources with the same name, even when those change sources are on different source databases.
- When the publisher creates a change source on a release of Oracle Database earlier than 10.2, Change Data Capture:
  - Generates names for the Streams capture process, capture queue, and propagation based on the change source name. If a generated name is already in use, an error indicating that the capture process, queue, or propagation cannot be created is returned.
  - Inserts a row into the `CHANGE_SOURCES` view on the staging database where the `SOURCE_TYPE` column of the inserted row indicates that the source Oracle Database release is earlier than 10.2.
- Note that the database link indicated by the `source_database` parameter must exist when creating, altering, or dropping a Distributed HotLog change source and the change sets and change tables it contains. However, this database link is not required for change capture to occur. Once the required Distributed HotLog change sources, change sets and change tables are in place and enabled, this database link can be dropped without interrupting change capture. This database link would need to be recreated to create, alter, or drop Distributed HotLog change sources, change sets and change tables.

## DROP\_CHANGE\_SET Procedure

This procedure drops an existing change set that was created with the CREATE\_CHANGE\_SET procedure.

### Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SET (
    change_set_name    IN VARCHAR2);
```

### Parameters

**Table 33–18 DROP\_CHANGE\_SET Procedure Parameters**

Parameter	Description
change_set_name	Name of the change set to be dropped. Change set names follow the Oracle schema object naming rules.

### Exceptions

**Table 33–19 DROP\_CHANGE\_SET Procedure Exceptions**

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31411	Specified change set is referenced by a change table
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value is longer than maximum length

### Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The change set to be dropped cannot contain any change tables.
- The predefined synchronous change set, SYNC\_SET, cannot be dropped.

## DROP\_CHANGE\_SOURCE Procedure

This procedure drops an existing AutoLog change source that was created with the CREATE\_AUTOLOG\_CHANGE\_SOURCE procedure or an existing Distributed HotLog change source that was created with the CREATE\_HOTLOG\_CHANGE\_SOURCE procedure.

### Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SOURCE (  
    change_source_name    IN VARCHAR2);
```

### Parameters

**Table 33–20 DROP\_CHANGE\_SOURCE Procedure Parameters**

Parameter	Description
change_source_name	Name of the change source to be dropped. Change source names follow the Oracle schema object naming rules.

### Exceptions

**Table 33–21 DROP\_CHANGE\_SOURCE Procedure Exceptions**

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31406	Specified change source is referenced by a change set
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Specified parameter value longer than maximum length

### Usage Notes

- The change source to be dropped cannot contain any change sets.
- The predefined change sources, HOTLOG\_SOURCE and SYNC\_SOURCE, cannot be dropped.

## DROP\_CHANGE\_TABLE Procedure

This procedure drops an existing change table that was created with the CREATE\_CHANGE\_TABLE procedure.

### Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_TABLE (
    owner           IN VARCHAR2,
    change_table_name IN VARCHAR2,
    force_flag      IN CHAR);
```

### Parameters

**Table 33–22 DROP\_CHANGE\_TABLE Procedure Parameters**

Parameter	Description
owner	Name of the schema that owns the change table.
change_table_name	Name of the change table to be dropped. Change table names follow the Oracle schema object naming rules.
force_flag	Drops the change table, depending on whether or not there are subscriptions to it, as follows: <ul style="list-style-type: none"> <li>■ 'Y': Drops the change table even if there are subscriptions to it.</li> <li>■ 'N': Drops the change table only if there are no subscriptions to it.</li> </ul>

### Exceptions

**Table 33–23 DROP\_CHANGE\_TABLE Procedure Exceptions**

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31424	Change table has active subscriptions
ORA-31441	Table is not a change table

### Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- If the publisher wants to drop a change table while there are active subscriptions to that table, he or she must call the DROP\_CHANGE\_TABLE procedure using the force\_flag => 'Y' parameter. This tells Change Data Capture to override its normal safeguards and allow the change table to be dropped despite active subscriptions. The subscriptions that include the dropped table will no longer be valid, and subscribers will lose access to the change data.

## DROP\_SUBSCRIPTION Procedure

This procedure allows a publisher to drop a subscription that was created by a subscriber with a prior call to the `DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION` procedure.

### Syntax

```
DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION(
    subscription_name IN VARCHAR2);
```

### Parameters

**Table 33–24 DROP\_SUBSCRIPTION Procedure Parameters**

Parameter	Description
subscription_name	Name of the subscription that was specified by a previous call to the <code>DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION</code> procedure. Subscription names follow the Oracle schema object naming rules.

### Exceptions

**Table 33–25 DROP\_SUBSCRIPTION Procedure Exceptions**

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31432	Invalid source table

### Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- This procedure works the same way as the `DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION` procedure.
- This procedure provides the publisher with a way to drop subscriptions that have not been dropped by the subscriber. It is possible that a subscription that is no longer needed still exists and is holding change data in a change table indefinitely. The publisher can use this procedure to remove such a subscription so that a purge operation can clean up its change data. Oracle recommends that the publisher attempt to verify that the subscription is not needed prior to dropping it. If that is not possible, the publisher should inform the subscription owner that the subscription has been dropped. Ideally, subscribers drop subscriptions that are no longer needed using the `DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION` procedure and the publisher need not use the `DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION` procedure.

## GET\_DDLOPER Function

This function converts a binary integer into a user friendly string that describes the DDL operation that actually took place.

### Syntax

```
DBMS_CDC_PUBLISH.GET_DDLOPER (ddloper IN BINARY_INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 33–26 Function Parameters**

Parameter	Description
ddloper	An integer value representing what DDL operation actually occurred. This value is obtained from the ddloper\$ column in the subscriber's view.

### Example

The following illustrates how to use change markers. First, you execute a DDL statement and then verify that it has been captured.

```
ALTER TABLE cdc_psales DROP PARTITION Dec_06;
```

```
SELECT ddloper$, DECODE(ddloper$, NULL, 'NULL',
    DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$))
    AS DDL_OPER
FROM cdc_psales_act
WHERE DDLOPER$ IS NOT NULL
ORDER BY cscn$;
```

```
ddloper$          DDL_OPER
-----
512              Drop Partition
1 row selected.
```

```
SELECT ddldesc$
FROM cdc_psales_act
WHERE ddloper$
IS NOT NULL
ORDER BY cscn$;
```

```
DDLDESC$
-----
alter table cdc_psales drop partition Dec_06
1 row selected.
```

### Usage Notes

- If an invalid value for ddloper is given, then 'Invalid value for DDLOPR\$' will be returned by this function.
- This function only works for asynchronous Change Data Capture.

## PURGE Procedure

This procedure monitors change table usage by all subscriptions, determines which rows are no longer needed by any subscriptions, and removes the unneeded rows to prevent change tables from growing indefinitely. When called, this procedure purges all change tables on the staging database.

### Syntax

```
DBMS_CDC_PUBLISH.PURGE;
```

### Exceptions

Only standard Oracle exceptions (for example, a privilege violation) are returned during a purge operation.

### Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually or automatically:
  - The publisher can run this procedure manually from the command line to purge data from change tables.
  - The publisher can run this procedure in a script to routinely perform a purge operation and control the growth of change tables.
- Note that the `DBMS_CDC_PUBLISH.PURGE` procedure (used by the publisher and the Change Data Capture default purge job) is distinct from the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure (used by subscribers). A call to the `DBMS_CDC_PUBLISH.PURGE` procedure physically removes unneeded rows from change tables. A call to the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

## PURGE\_CHANGE\_SET Procedure

This procedure removes unneeded rows from all change tables in the named change set. This procedure allows a finer granularity purge operation than the basic PURGE procedure.

### Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_SET (
    change_set_name IN VARCHAR2,
    force           IN CHAR DEFAULT 'Y',
    purge_date     IN DATE DEFAULT NULL);
```

### Parameters

**Table 33–27** *PURGE\_CHANGE\_SET Procedure Parameters*

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
force	If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.
purge_date	All records that have a commit_timestamp of less than or equal to this date will be purged.

### Exceptions

**Table 33–28** *PURGE\_CHANGE\_SET Procedure Exceptions*

Exception	Description
ORA-31410	Change set is not an existing change set

### Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from change tables in a specific change set.
- Note that the DBMS\_CDC\_PUBLISH.PURGE\_CHANGE\_SET procedure (used by the publisher) is distinct from the DBMS\_CDC\_SUBSCRIBE.PURGE\_WINDOW procedure (used by subscribers). A call to the DBMS\_CDC\_PUBLISH.PURGE\_CHANGE\_SET procedure physically removes unneeded rows from change tables in the specified change set. A call to the DBMS\_CDC\_SUBSCRIBE.PURGE\_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

## PURGE\_CHANGE\_TABLE Procedure

This procedure removes unneeded rows from the named change table. This procedure allows a finer granularity purge operation than the basic PURGE procedure or the PURGE\_CHANGE\_SET procedure.

### Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE (
  owner          IN VARCHAR2,
  change_table_name IN VARCHAR2,
  force          IN CHAR DEFAULT 'Y',
  purge_date     IN DATE DEFAULT NULL);
```

### Parameters

**Table 33–29** PURGE\_CHANGE\_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the named change table.
change_table_name	Name of an existing change table. Change table names follow the Oracle schema object naming rules.
force	If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.
purge_date	All records that have a commit_timestamp of less than or equal to this date will be purged.

### Exceptions

**Table 33–30** PURGE\_CHANGE\_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist

### Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from a specified change table.
- Note that the DBMS\_CDC\_PUBLISH.PURGE\_CHANGE\_TABLE procedure (used by the publisher) is distinct from the DBMS\_CDC\_SUBSCRIBE.PURGE\_WINDOW procedure (used by subscribers). A call to the DBMS\_CDC\_PUBLISH.PURGE\_CHANGE\_TABLE procedure physically removes unneeded rows from the specified change table. A call to the DBMS\_CDC\_SUBSCRIBE.PURGE\_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

---

---

## DBMS\_CDC\_SUBSCRIBE

---

---

**Note:** Oracle Change Data Capture will be de-supported in a future release of Oracle Database and will be replaced with Oracle GoldenGate. Therefore, Oracle strongly recommends that you use Oracle GoldenGate for new applications.

For Oracle Database 11g Release 2 (11.2), Change Data Capture continues to function as in earlier releases. If you are currently using Change Data Capture, then you will be able to continue to do so for the foreseeable future. However, Change Data Capture will not be further enhanced, and will only be supported based on the current, documented functionality.

---

---

The `DBMS_CDC_SUBSCRIBE` package, one of a set of Change Data Capture packages, lets subscribers view and query change data that was captured and published with the `DBMS_CDC_PUBLISH` package.

A Change Data Capture system usually has one publisher and many subscribers. The **subscribers** (applications or individuals), use the Oracle supplied package, `DBMS_CDC_SUBSCRIBE`, to access published data.

**See Also:** *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture.

This chapter contains the following topics:

- [Using DBMS\\_CDC\\_SUBSCRIBE](#)
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Views
- [Summary of DBMS\\_CDC\\_SUBSCRIBE Subprograms](#)

## Using DBMS\_CDC\_SUBSCRIBE

This section contains the following topics, which relate to using the DBMS\_CDC\_SUBSCRIBE package:

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Views](#)

## Overview

The primary role of the subscriber is to use the change data. Through the DBMS\_CDC\_SUBSCRIBE package, each subscriber registers interest in source tables by subscribing to them.

Once the publisher sets up the system to capture data into change tables (which are viewed as publications by subscribers) and grants subscribers access to the change tables, subscribers can access and query the published change data for any of the source tables of interest. Using the subprograms in the DBMS\_CDC\_SUBSCRIBE package, the subscriber accomplishes the following main objectives:

1. Indicates the change data of interest by creating a subscription and associated subscriber views on published source tables and source columns
2. Activates the subscription to indicate that the subscriber is ready to receive change data
3. Extends the subscription window to receive a new set of change data
4. Uses SQL `SELECT` statements to retrieve change data from the subscriber views
5. Purges the subscription window when finished processing a block of changes
6. Drops the subscription when finished with the subscription

Figure 34–1 provides a graphical flowchart of the order in which subscribers most typically use the subprograms in the DBMS\_CDC\_SUBSCRIBE package (which are listed in Table 34–1). A subscriber would typically create a subscription, subscribe to one or more source tables and columns, activate the subscription, extend the subscription window, query the subscriber views, purge the subscription window, and then either extend the subscription window again or drop the subscription.

---

---

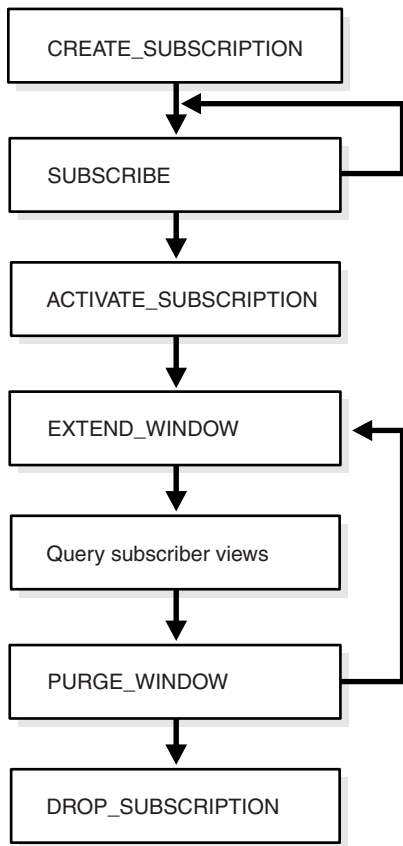

**Note:** If a subscriber uses the `PURGE_WINDOW` procedure immediately after using an `EXTEND_WINDOW` procedure, then change data may be lost without ever being processed.

---

---

**See Also:** [Chapter 34, "DBMS\\_CDC\\_SUBSCRIBE"](#) for information on the package for publishing change data.

**Figure 34-1 Subscription Flow**

This is a text description of arpls011.gif. This figure provides a graphical flowchart. The flowchart shows the following sequence:

1. CREATE\_SUBSCRIPTION
2. SUBSCRIBE
3. Either repeat step 2 or continue to step 4
4. ACTIVATE\_SUBSCRIPTION
5. EXTEND\_WINDOW
6. Query subscriber views
7. PURGE\_WINDOW
8. Either return to step 5 or continue to step 9
9. DROP\_SUBSCRIPTION

\*\*\*\*\*

## Deprecated Subprograms

The following subprograms are deprecated with Oracle Database 11g:

- `DROP_SUBSCRIBER_VIEW`

Subscribers no longer need to drop subscriber views. This work is now done automatically by Change Data Capture.

- `GET_SUBSCRIPTION_HANDLE`

Subscribers no longer explicitly specify subscription handles. Subscribers should use the `CREATE_SUBSCRIPTION` procedure instead to specify a subscription name.

- `PREPARE_SUBSCRIBER_VIEW`

Subscribers no longer need to prepare subscriber views. This work is now done automatically by Change Data Capture.

## Security Model

Change Data Capture grants EXECUTE privileges to PUBLIC on the DBMS\_CDC\_  
SUBSCRIBE package.

## Views

The DBMS\_CDC\_SUBSCRIBE package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

## Summary of DBMS\_CDC\_SUBSCRIBE Subprograms

**Table 34–1 DBMS\_CDC\_SUBSCRIBE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">ACTIVATE_SUBSCRIPTION Procedure</a> on page 34-9	Indicates that a subscription is ready to start accessing change data
<a href="#">CREATE_SUBSCRIPTION Procedure</a> on page 34-10	Creates a subscription and associates it with one change set
<a href="#">DROP_SUBSCRIPTION Procedure</a> on page 34-12	Drops a subscription that was created with a prior call to the <code>CREATE_SUBSCRIPTION</code> procedure
<a href="#">EXTEND_WINDOW Procedure</a> on page 34-13	Sets a subscription window high boundary so that new change data can be seen
<a href="#">PURGE_WINDOW Procedure</a> on page 34-15	Sets the low boundary for a subscription window to notify Change Data Capture that the subscriber is finished processing a set of change data
<a href="#">SUBSCRIBE Procedure</a> on page 34-16	Specifies a source table and the source columns for which the subscriber wants to access change data and specifies the subscriber view through which the subscriber sees change data for the source table

## ACTIVATE\_SUBSCRIPTION Procedure

This procedure indicates that a subscription is ready to start accessing change data.

### Syntax

```
DBMS_CDC_SUBSCRIBE.ACTIVATE_SUBSCRIPTION (
    subscription_name IN VARCHAR2);
```

### Parameters

**Table 34–2 ACTIVATE\_SUBSCRIPTION Procedure Parameters**

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

### Exceptions

**Table 34–3 ACTIVATE\_SUBSCRIPTION Procedure Exceptions**

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

### Usage Notes

- The ACTIVATE\_SUBSCRIPTION procedure indicates that the subscriber is finished subscribing to tables, and the subscription is ready to start accessing change data.
- Once the subscriber activates the subscription:
  - No additional source tables can be added to the subscription.
  - Change Data Capture holds the available data for the source tables and sets the subscription window to empty.
  - The subscriber must use the EXTEND\_WINDOW procedure to see the initial set of change data.
  - The subscription cannot be activated again.
- A subscription cannot be activated if the underlying change set has reached its end\_date parameter value.

## CREATE\_SUBSCRIPTION Procedure

This procedure creates a subscription that is associated with one change set. This procedure replaces the deprecated `GET_SUBSCRIPTION_HANDLE` procedure.

### Syntax

```
DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION (
    change_set_name      IN  VARCHAR2,
    description          IN  VARCHAR2,
    subscription_name    IN  VARCHAR2);
```

### Parameters

**Table 34-4 CREATE\_SUBSCRIPTION Procedure Parameters**

Parameter	Description
<code>change_set_name</code>	The name of an existing change set to which the subscriber subscribes
<code>description</code>	A description of the subscription (which might include, for example, the purpose for which it is used). The description must be specified using 255 or fewer characters.
<code>subscription_name</code>	A unique name for a subscription that must consist of 30 characters or fewer and cannot have a prefix of <code>CDC\$</code> . Subscription names follow the Oracle schema object naming rules.

### Exceptions

**Table 34-5 CREATE\_SUBSCRIPTION Procedure Exceptions**

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31449	Invalid value for <code>change_set_name</code>
ORA-31457	Maximum length of description field exceeded
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31506	Duplicate subscription name specified
ORA-31510	Name uses reserved prefix <code>CDC\$</code>
ORA-31511	Name exceeds maximum length of 30 characters

### Usage Notes

- The `CREATE_SUBSCRIPTION` procedure allows a subscriber to register interest in a change set associated with source tables of interest.
- A subscriber can query the `ALL_PUBLISHED_COLUMNS` view to see all the published source tables for which the subscriber has privileges and the change sets in which the source table columns are published.
- Subscriptions are not shared among subscribers; rather, each subscription name is validated against a given subscriber's login ID.

- Subscriptions cannot be created if the underlying change set has reached its end\_date parameter value.

## DROP\_SUBSCRIPTION Procedure

This procedure drops a subscription.

### Syntax

```
DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION (  
    subscription_name IN VARCHAR2);
```

### Parameters

**Table 34–6** *DROP\_SUBSCRIPTION Procedure Parameters*

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

### Exceptions

**Table 34–7** *DROP\_SUBSCRIPTION Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist

### Usage Notes

Subscribers should be diligent about dropping subscriptions that are no longer needed so that change data will not be held in the change tables unnecessarily.

## EXTEND\_WINDOW Procedure

This procedure sets the subscription window high boundary so that new change data can be seen.

### Syntax

```
DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW (
    subscription_name IN VARCHAR2,
    upper_bound       IN DATE DEFAULT NULL);
```

### Parameters

**Table 34–8** *EXTEND\_WINDOW Procedure Parameters*

Parameter	Description
subscription_name	The unique name of the subscription that was specified by a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
upper_bound	A date/timestamp to move the upper bound of the subscription window to.

### Exceptions

**Table 34–9** *EXTEND\_WINDOW Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31508	Invalid parameter value for synchronous change set
ORA-31509	Publication does not exist
ORA-31514	Change set disabled due to capture error

### Usage Notes

- Until the subscriber calls the EXTEND\_WINDOW procedure to begin receiving change data, the subscription window remains empty.
  - The first time that the subscriber calls the EXTEND\_WINDOW procedure, it establishes the initial boundaries for the subscription window.
  - Subsequent calls to the EXTEND\_WINDOW procedure extend the high boundary of the subscription window so that new change data can be seen.
- Oracle recommends that subscribers not view change tables directly. Instead, subscribers should use the DBMS\_CDC\_SUBSCRIBE package and access data through subscriber views only. Control column values are guaranteed to be consistent only when viewed through subscriber views that have been updated with a call to the EXTEND\_WINDOW procedure.

- When the underlying change set for a subscription has reached its `end_date` parameter value, subsequent calls to the `EXTEND_WINDOW` procedure will not raise the high boundary.
- Subscriptions employing synchronous Change Data Capture are not allowed to extend the window to a specified date. Hence, the `upper_bound` parameter should not be specified.

## PURGE\_WINDOW Procedure

This procedure sets the low boundary of the subscription window so that the subscription no longer sees any change data, effectively making the subscription window empty. The subscriber calls this procedure to notify Change Data Capture that the subscriber is finished processing a block of change data.

### Syntax

```
DBMS_CDC_SUBSCRIBE.PURGE_WINDOW (
    subscription_name  IN VARCHAR2,
    lower_bound        IN DATE DEFAULT NULL);
```

### Parameters

**Table 34–10** *PURGE\_WINDOW Procedure Parameters*

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
lower_bound	A date/timestamp to move the lower bound of the subscription window to.

### Exceptions

**Table 34–11** *PURGE\_WINDOW Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

### Usage Notes

- When finished with a set of changes, the subscriber purges the subscription window with the PURGE\_WINDOW procedure. By this action, the subscriber performs the following functions:
  - Informs Change Data Capture that the subscriber is finished with the current set of change data.
  - Enables Change Data Capture to remove change data that is no longer needed by any subscribers.

Change Data Capture manages the change data to ensure that it is available as long as there are subscribers who need it.

- When the underlying change set for a subscription has reached its end\_date parameter value, subsequent calls to the PURGE\_WINDOW procedure will not move the low boundary.

## SUBSCRIBE Procedure

This procedure specifies a source table and the source columns for which the subscriber wants to access change data. In addition, it specifies the subscriber view through which the subscriber sees change data for the source table.

### Syntax

There are two versions of syntax for the `SUBSCRIBE` procedure, as follow:

- Using source schema and source table

When this syntax is used, Change Data Capture will attempt to find a single publication ID that contains the specified `source_table` and `column_list`. If such a publication cannot be found, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
    subscription_name    IN VARCHAR2,
    source_schema       IN VARCHAR2,
    source_table        IN VARCHAR2,
    column_list         IN VARCHAR2,
    subscriber_view     IN VARCHAR2);
```

- Using publication IDs

When this syntax is used, Change Data Capture will use the publication ID to identify the change table. If the columns specified in the `column_list` parameter are not in the identified change table, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
    subscription_name    IN VARCHAR2,
    publication_id       IN NUMBER,
    column_list         IN VARCHAR2,
    subscriber_view     IN VARCHAR2);
```

### Parameters

**Table 34–12** *SUBSCRIBE Procedure Parameters*

Parameter	Description
<code>subscription_name</code>	The name of a subscription that was specified for, or returned by, a previous call to the <code>CREATE_SUBSCRIPTION</code> procedure. Subscription names follow the Oracle schema object naming rules.
<code>source_schema</code>	The name of the schema where the source table resides
<code>source_table</code>	The name of a published source table
<code>column_list</code>	A comma-delimited list of columns from the published source table or publication
<code>subscriber_view</code>	Unique name for the subscriber view for this source table or publication that must consist of 30 or fewer characters and must not have a prefix of <code>CDC\$</code> . Subscriber view names follow the Oracle schema object naming rules.
<code>publication_id</code>	A valid <code>publication_id</code> , which the subscriber can obtain from the <code>ALL_PUBLISHED_COLUMNS</code> view.

## Exceptions

**Table 34–13** *SUBSCRIBE Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31427	Publication string already subscribed
ORA-31428	No publication contains all the specified columns
ORA-31432	Invalid source table
ORA-31466	No publications found
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31510	Name uses reserved prefix CDC\$
ORA-31511	Name exceeds maximum length of 30 characters

## Usage Notes

- The `SUBSCRIBE` procedure allows a subscriber to subscribe to one or more published source tables and to specific columns in each source table. Each call to the `SUBSCRIBE` procedure can specify only a single source table or publication ID. The subscriber can make multiple calls to the `SUBSCRIBE` procedure to include multiple source tables or publications IDs in a subscription.
- If the columns of interest are all in a single publication, the subscriber can call the `SUBSCRIBE` procedure using the `source_schema` and `source_table` parameters or using the `publication_id` parameter. However, if there are multiple publications on a single source table and these publications share some columns, and if any of the shared columns will be used by a single subscription, then the subscriber should call the `SUBSCRIBE` procedure using the `publication_id` parameter.
- The subscriber can subscribe to any valid publication ID on which the subscriber has privileges to access. The subscriber can find valid publication IDs on which the subscriber has access by querying the `ALL_PUBLISHED_COLUMNS` view.
- A subscriber can query the `ALL_PUBLISHED_COLUMNS` view to see all the published source table columns accessible to the subscriber.
- Subscriptions must be created before a subscriber calls the `SUBSCRIBE` procedure. Change Data Capture does not guarantee that there will be any change data available at the moment the subscription is created.
- Subscribers can subscribe only to published columns from the source table. All of the columns specified in a single call to the `SUBSCRIBE` procedure must come from the same publication. Any control columns associated with the underlying change table are added to the subscription automatically.
- All specified source tables or publications must be in the change set that is associated with the named subscription.
- A single source table can have more than one publication defined on it. A subscriber can subscribe to one or more of these publications. However a subscriber can subscribe to a particular publication only once.

- Each publication in a subscription has its own subscriber view. Subscriber views are used to query the change data encompassed by the subscription's current window. Subscriber views are created in the schema of the subscriber.
- A subscriber cannot subscribe to a publication within a change set that has reached its `end_date` parameter value.

## DBMS\_COMPARISON

The DBMS\_COMPARISON package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

- [Using DBMS\\_COMPARISON](#)
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- [Data Structures](#)
- [Summary of DBMS\\_COMPARISON Subprograms](#)

**See Also:**

- *Oracle Streams Replication Administrator's Guide* for information about using the advanced features of this package

---

## Using DBMS\_COMPARISON

This section contains topics which relate to using the DBMS\_COMPARISON package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)

## Overview

The DBMS\_COMPARISON package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a **shared database object**. Several data dictionary views contain information about comparisons made with the DBMS\_COMPARISON package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the CREATE\_COMPARE procedure in this package to create a **comparison**. The comparison identifies the database objects to compare and specifies parameters for the comparison.
2. Run the COMPARE function in this package to compare the database object at the two databases and identify differences. This function returns TRUE when no differences are found and FALSE when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the COMPARE function.
3. If you want to examine the comparison results, query the following data dictionary views:
  - DBA\_COMPARISON\_SCAN
  - USER\_COMPARISON\_SCAN
  - DBA\_COMPARISON\_SCAN\_VALUES
  - USER\_COMPARISON\_SCAN\_VALUES
  - DBA\_COMPARISON\_ROW\_DIF
  - USER\_COMPARISON\_ROW\_DIF
4. If there are differences, and you want to synchronize the database objects at the two databases, then run the CONVERGE procedure in this package.

After you create a comparison with the CREATE\_COMPARISON procedure in the DBMS\_COMPARISON package, you can run the comparison at any time using the COMPARE function. Each time you run the COMPARE function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the RECHECK function.

The comparison results for a single execution of the COMPARE function can include one or more **scans**. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.

A **bucket** is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the `COMPARE` function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the **parent scan** of each scan that analyzes the smaller buckets into which the larger bucket was split. The **root scan** in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the `RECHECK` function, and you can converge a scan using the `CONVERGE` procedure. When you want to recheck or converge all of the rows in comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about comparisons, including detailed information about scans, buckets, parent scans, and root scans

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

Each subprogram in the DBMS\_COMPARISON package has a `comparison_name` parameter. The current user must be the owner of the specified comparison to run a subprogram in the DBMS\_COMPARISON package.

To run the COMPARE function, RECHECK function, or CONVERGE procedure, the following users must have SELECT privilege on each copy of the shared database object:

- The comparison owner at the local database
- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The CONVERGE procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have INSERT, UPDATE, and DELETE privileges on the shared database object at this database.

In addition, when the CONVERGE procedure is run with either the `local_converge_tag` or `remote_converge_tag` parameter set to a non-NULL value, then the following additional requirements must be met:

- If the local table "wins," then the user at the remote database to which the invoker of the CONVERGE procedure connects through a database link must be granted either EXECUTE\_CATALOG\_ROLE or EXECUTE privilege on the DBMS\_STREAMS\_ADM package.
- If the remote table "wins," then the invoker of the CONVERGE procedure at the local database must be granted either EXECUTE\_CATALOG\_ROLE or EXECUTE privilege on the DBMS\_STREAMS\_ADM package.

## Constants

The `DBMS_COMPARISON` package defines several enumerated constants to use specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_COMPARISON.CMP_SCAN_MODE_FULL`.

[Table 35-1](#) lists the parameters and enumerated constants.

**Table 35-1** *DBMS\_COMPARISON Parameters with Enumerated Constants*

Parameter	Option	Type	Description
<code>comparison_mode</code>	<ul style="list-style-type: none"> <li>■ <code>CMP_COMPARE_MODE_OBJECT</code></li> </ul>	<code>VARCHAR2 (30)</code>	<code>CMP_COMPARE_MODE_OBJECT</code> is a database object. This constant can be specified as <code>'OBJECT'</code> .
<code>scan_mode</code>	<ul style="list-style-type: none"> <li>■ <code>CMP_SCAN_MODE_FULL</code></li> <li>■ <code>CMP_SCAN_MODE_RANDOM</code></li> <li>■ <code>CMP_SCAN_MODE_CYCLIC</code></li> <li>■ <code>CMP_SCAN_MODE_CUSTOM</code></li> </ul>	<code>VARCHAR2 (30)</code>	<p><code>CMP_SCAN_MODE_FULL</code> indicates that the entire database object is compared. This constant can be specified as <code>'FULL'</code>.</p> <p><code>CMP_SCAN_MODE_RANDOM</code> indicates that a random portion of the database object is compared. This constant can be specified as <code>'RANDOM'</code>.</p> <p><code>CMP_SCAN_MODE_CYCLIC</code> indicates that a portion of the database object is compared when you perform a single comparison. When you compare the database object again, another portion of the database object is compared, starting where the last comparison ended. This constant can be specified as <code>'CYCLIC'</code>.</p> <p><code>CMP_SCAN_MODE_CUSTOM</code> indicates that the user who runs the subprogram specifies the range to compare in the database object. This constant can be specified as <code>'CUSTOM'</code>.</p>
<code>converge_options</code>	<ul style="list-style-type: none"> <li>■ <code>CMP_CONVERGE_LOCAL_WINS</code></li> <li>■ <code>CMP_CONVERGE_REMOTE_WINS</code></li> </ul>	<code>VARCHAR2 (30)</code>	<p><code>CMP_CONVERGE_LOCAL_WINS</code> indicates that the column values at the local database replace the column values at the remote database when these column values are different. This constant can be specified as <code>'LOCAL'</code>.</p> <p><code>CMP_CONVERGE_REMOTE_WINS</code> indicates that the column values at the remote database replace the column values at the local database when these column values are different. This constant can be specified as <code>'REMOTE'</code>.</p>

**Table 35–1 (Cont.) DBMS\_COMPARISON Parameters with Enumerated Constants**

Parameter	Option	Type	Description
null_value	<ul style="list-style-type: none"> <li>■ CMP_NULL_VALUE_DEF</li> </ul>	VARCHAR2(100)	CMP_NULL_VALUE_DEF indicates that ORA\$STREAMS\$NV is substituted for NULL values in database objects during comparison. This constant can be specified as 'ORA\$STREAMS\$NV'.
max_num_buckets	<ul style="list-style-type: none"> <li>■ CMP_MAX_NUM_BUCKETS</li> </ul>	INTEGER	CMP_MAX_NUM_BUCKETS indicates that the maximum number of buckets is 1,000. This constant can be specified as 1000.
min_rows_in_bucket	<ul style="list-style-type: none"> <li>■ CMP_MIN_ROWS_IN_BUCKET</li> </ul>	INTEGER	CMP_MIN_ROWS_IN_BUCKET indicates that the minimum number of rows in a bucket is 10,000. This constant can be specified as 10000.

## Views

The `DBMS_COMPARISON` package uses the following views:

- `DBA_COMPARISON`
- `USER_COMPARISON`
- `DBA_COMPARISON_COLUMNS`
- `USER_COMPARISON_COLUMNS`
- `DBA_COMPARISON_SCAN`
- `USER_COMPARISON_SCAN`
- `DBA_COMPARISON_SCAN_VALUES`
- `USER_COMPARISON_SCAN_VALUES`
- `DBA_COMPARISON_ROW_DIF`
- `USER_COMPARISON_ROW_DIF`

**See Also:** *Oracle Database Reference*

## Operational Notes

This section contains the following operational notes for the DBMS\_COMPARISON package:

- [Oracle Database Release Requirements for the DBMS\\_COMPARISON Package](#)
- [Database Character Set Requirements for the DBMS\\_COMPARISON Package](#)
- [Database Object Requirements for the DBMS\\_COMPARISON Package](#)
- [Index Column Requirements for the DBMS\\_COMPARISON Package](#)
- [Data Type Requirements for the DBMS\\_COMPARISON Package](#)
- [Only Converge Rows That Are Not Being Updated](#)

### Oracle Database Release Requirements for the DBMS\_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the DBMS\_COMPARISON package:

- The local database that runs the subprograms in the DBMS\_COMPARISON package must be an Oracle Database 11g Release 1 (11.1) database.
- The remote database must be an Oracle Database 10g Release 1 (10.1) or later database. Oracle databases before this release and non-Oracle databases are not supported.

### Database Character Set Requirements for the DBMS\_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

**See Also:** *Oracle Database Globalization Support Guide* for information about database character sets

### Database Object Requirements for the DBMS\_COMPARISON Package

The DBMS\_COMPARISON package can compare the following types of database objects:

- Tables
- Single-table views
- Materialized views
- Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the DBMS\_COMPARISON package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the data types of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the `column_list` parameter in the CREATE\_COMPARISON procedure to list only the columns that exist in both database objects.

**See Also:** [CREATE\\_COMPARISON Procedure](#) on page 35-20

## Index Column Requirements for the DBMS\_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following data types:

- Number columns are of the following data types: NUMBER, FLOAT, BINARY\_FLOAT, and BINARY\_DOUBLE.
- Timestamp columns are of the following data types: TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE
- Interval columns are of the following data types: INTERVAL YEAR TO MONTH and INTERVAL DAY TO SECOND.

For all scan modes to be supported by the DBMS\_COMPARISON package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or DATE data type column
- A composite index that only includes number, timestamp, interval, or DATE data type columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

For the scan modes CMP\_SCAN\_MODE\_FULL and CMP\_SCAN\_MODE\_CUSTOM to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, DATE, VARCHAR2, or CHAR data type column
- A composite index that only includes number, timestamp, interval, DATE, VARCHAR2, or CHAR columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the DBMS\_COMPARISON package does not support the database objects. For example, if the database objects only have a single index on an NVARCHAR2 column, then the DBMS\_COMPARISON package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a NUMBER column and an NCHAR column, then the DBMS\_COMPARISON package does not support them.

You can specify an index when you create a comparison using the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint
- A unique constraint on one or more non-NULL columns

If these constraints are not present on a table, then use the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure to specify an index whose columns satisfy this requirement.

When a single index value identifies both a local row and a remote row, the two rows must be copies of the same row in the replicated tables. In addition, each pair of copies of the same row must always have the same index value.

The DBMS\_COMPARISON package can use an index only if all of the columns in the index are included in the `column_list` parameter when the comparison is created with the `CREATE_COMPARISON` procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND
      INDEX_COLUMN      = 'Y';
```

If there are multiple index columns, then the index column with 1 for the `COLUMN_POSITION` is the lead index column in the composite index.

**See Also:**

- ["Constants"](#) on page 35-6 for information about scan modes
- [CREATE\\_COMPARISON Procedure](#) on page 35-20 for information about specifying an index for a comparison

### Data Type Requirements for the DBMS\_COMPARISON Package

The DBMS\_COMPARISON package can compare data in columns of the following data types:

- VARCHAR2
- NVARCHAR2
- NUMBER
- FLOAT
- DATE
- BINARY\_FLOAT
- BINARY\_DOUBLE
- TIMESTAMP
- TIMESTAMP WITH TIME ZONE
- TIMESTAMP WITH LOCAL TIME ZONE
- INTERVAL YEAR TO MONTH
- INTERVAL DAY TO SECOND
- RAW
- CHAR
- NCHAR

If a column with data type `TIMESTAMP WITH LOCAL TIME ZONE` is compared, then the two databases must use the same time zone. Also, if a column with data type `NVARCHAR2` or `NCHAR` is compared, then the two databases must use the same national character set.

The DBMS\_COMPARISON package cannot compare data in columns of the following data types:

- LONG
- LONG RAW

- ROWID
- UROWID
- CLOB
- NCLOB
- BLOB
- BFILE
- User-defined types (including object types, REFS, varrays, and nested tables)
- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the `column_list` parameter in the `CREATE_COMPARISON` procedure to list only the supported columns in a shared database object.

**See Also:**

- [CREATE\\_COMPARISON Procedure](#) on page 35-20
- *Oracle Database SQL Language Reference* for more information about data types
- *Oracle Database Globalization Support Guide* for information about national character sets

## Only Converge Rows That Are Not Being Updated

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

---

---

**Attention:** If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the `CONVERGE` procedure is run.

---

---

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about the `DBMS_COMPARISON` package in an Oracle Streams replication environment

## Data Structures

---

The DBMS\_COMPARISON package defines a RECORD type.

### RECORD Types

- [COMPARISON\\_TYPE Record Type](#)

## COMPARISON\_TYPE Record Type

Contains information returned by the COMPARE function or CONVERGE procedure in the DBMS\_COMPARISON package.

---

---

**Note:** The COMPARE function only returns a value for the scan\_id field.

---

---

### Syntax

```
TYPE COMPARISON_TYPE IS RECORD(  
    scan_id          NUMBER,  
    loc_rows_merged NUMBER,  
    rmt_rows_merged NUMBER,  
    loc_rows_deleted NUMBER,  
    rmt_rows_deleted NUMBER);
```

### Fields

**Table 35–2** *COMPARISON\_TYPE Attributes*

Field	Description
scan_id	The scan ID of the scan
loc_rows_merged	The number of rows in the local database object updated with information from the database object at the remote site
rmt_rows_merged	The number of rows in the database object updated at the remote site with information from the database object at the local site
loc_rows_deleted	The number of rows deleted from the local database object
rmt_rows_deleted	The number of rows deleted from the remote database object

---

## Summary of DBMS\_COMPARISON Subprograms

**Table 35–3** *DBMS\_COMPARISON Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">COMPARE Function</a> on page 35-16	Performs the specified comparison
<a href="#">CONVERGE Procedure</a> on page 35-18	Executes data manipulation language (DML) changes to synchronize the portion of the database object that was compared in the specified scan
<a href="#">CREATE_COMPARISON Procedure</a> on page 35-20	Creates a comparison
<a href="#">DROP_COMPARISON Procedure</a> on page 35-24	Drops a comparison
<a href="#">PURGE_COMPARISON Procedure</a> on page 35-25	Purges the comparison results, or a subset of the comparison results, for a comparison
<a href="#">RECHECK Function</a> on page 35-26	Rechecks the differences in a specified scan for a comparison

## COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the `CREATE_COMPARISON` procedure.

### See Also:

- ["Overview"](#) on page 35-3
- [CREATE\\_COMPARISON Procedure](#) on page 35-20

## Syntax

```
DBMS_COMPARISON.COMPARE(
    comparison_name IN  VARCHAR2,
    scan_info       OUT COMPARISON_TYPE,
    min_value       IN   VARCHAR2  DEFAULT NULL,
    max_value       IN   VARCHAR2  DEFAULT NULL,
    perform_row_dif IN   BOOLEAN    DEFAULT FALSE)
RETURN BOOLEAN;
```

## Parameters

**Table 35–4 COMPARE Function Parameters**

Parameter	Description
<code>comparison_name</code>	The name of the comparison.
<code>scan_info</code>	Information about the compare operation returned in the <code>COMPARISON_TYPE</code> data type. See <a href="#">COMPARISON_TYPE Record Type</a> on page 35-14.
<code>min_value</code>	When the scan mode for the comparison is set to <code>CMP_SCAN_MODE_CUSTOM</code> , specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the <code>DBA_COMPARISON_COLUMNS</code> data dictionary view. For a composite index, specify a value for the column with <code>column_position</code> equal to 1 in the <code>DBA_COMPARISON_COLUMNS</code> view. See <a href="#">"Index Column Requirements for the DBMS_COMPARISON Package"</a> on page 35-10.  If the scan mode is set to a value other than <code>CMP_SCAN_MODE_CUSTOM</code> , then this parameter must be set to <code>NULL</code> .  If <code>NULL</code> and the <code>scan_mode</code> parameter is set to <code>CMP_SCAN_MODE_CUSTOM</code> , then an error is raised.  To determine the scan mode for the comparison, query the <code>DBA_COMPARISON</code> data dictionary view.  See <a href="#">Constants</a> on page 35-6 for information about scan modes.

**Table 35–4 (Cont.) COMPARE Function Parameters**

Parameter	Description
max_value	<p>When the scan mode for the comparison is set to <code>CMP_SCAN_MODE_CUSTOM</code>, specify the maximum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the <code>DBA_COMPARISON_COLUMNS</code> data dictionary view. For a composite index, specify a value for the column with <code>column_position</code> equal to 1 in the <code>DBA_COMPARISON_COLUMNS</code> view. See <a href="#">"Index Column Requirements for the DBMS_COMPARISON Package"</a> on page 35-10.</p> <p>If the scan mode is set to a value other than <code>CMP_SCAN_MODE_CUSTOM</code>, then this parameter must be set to <code>NULL</code>.</p> <p>If <code>NULL</code> and the <code>scan_mode</code> parameter is set to <code>CMP_SCAN_MODE_CUSTOM</code>, then an error is raised.</p> <p>To determine the scan mode for the comparison, query the <code>DBA_COMPARISON</code> data dictionary view.</p> <p>See <a href="#">Constants</a> on page 35-6 for information about scan modes.</p>
perform_row_dif	<p>If <code>TRUE</code>, then compares each row individually in the database object being compared after reaching the smallest possible bucket for the comparison.</p> <p>If <code>FALSE</code>, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket.</p> <p>See <a href="#">"Overview"</a> on page 35-3 for information about buckets.</p>

## Return Values

This function returns `TRUE` when no differences are found in the database objects being compared. This function returns `FALSE` when differences are found in the database objects being compared.

## CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

### Syntax

```
DBMS_COMPARISON.CONVERGE (
  comparison_name    IN   VARCHAR2,
  scan_id            IN   NUMBER,
  scan_info          OUT  COMPARISON_TYPE,
  converge_options   IN   VARCHAR2  DEFAULT CMP_CONVERGE_LOCAL_WINS,
  perform_commit     IN   BOOLEAN    DEFAULT TRUE,
  local_converge_tag IN   RAW        DEFAULT NULL,
  remote_converge_tag IN  RAW        DEFAULT NULL);
```

### Parameters

**Table 35–5 CONVERGE Procedure Parameters**

Parameter	Description
comparison_name	The name of the comparison.
scan_id	The identifier for the scan that contains the differences between the database objects being converged.  See <a href="#">"Overview"</a> on page 35-3 for more information about specifying a scan ID in this parameter.
scan_info	Information about the converge operation returned in the COMPARISON_TYPE data type.  See <a href="#">COMPARISON_TYPE Record Type</a> on page 35-14.
converge_options	Either the CMP_CONVERGE_LOCAL_WINS constant or the CMP_CONVERGE_REMOTE_WINS constant.  See <a href="#">"Constants"</a> on page 35-6 for information about these constants.
perform_commit	If TRUE, then performs a COMMIT periodically while making the DML changes. The CONVERGE procedure might perform more than one COMMIT when this parameter is set to TRUE.  If FALSE, then does not perform a COMMIT after making DML changes.
local_converge_tag	The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being converged.  If non-NULL, then this parameter setting takes precedence over the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison.  If NULL, then this parameter is ignored, and the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used.  See <a href="#">"Security Model"</a> on page 35-5 for information about security requirement related to this parameter, and see the <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags.

**Table 35–5 (Cont.) CONVERGE Procedure Parameters**

Parameter	Description
remote_converge_tag	<p>The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being converged.</p> <p>If non-NULL, then this parameter setting takes precedence over the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison.</p> <p>If NULL, then this parameter is ignored, and the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used.</p> <p>See "<a href="#">Security Model</a>" on page 35-5 for information about security requirement related to this parameter, and see the <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags.</p>

### Usage Notes

If one of the database objects being converged is a read-only materialized view, then the converge\_options parameter must be set to ensure that the read-only materialized view "wins" in the converge operation. The CONVERGE procedure raises an error if it tries to make changes to a read-only materialized view.

## CREATE\_COMPARISON Procedure

This procedure creates a comparison.

### Syntax

```
DBMS_COMPARISON.CREATE_COMPARISON(
  comparison_name      IN  VARCHAR2,
  schema_name          IN  VARCHAR2,
  object_name          IN  VARCHAR2,
  dblink_name          IN  VARCHAR2,
  index_schema_name    IN  VARCHAR2  DEFAULT NULL,
  index_name           IN  VARCHAR2  DEFAULT NULL,
  remote_schema_name   IN  VARCHAR2  DEFAULT NULL,
  remote_object_name   IN  VARCHAR2  DEFAULT NULL,
  comparison_mode      IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
  column_list          IN  VARCHAR2  DEFAULT '*',
  scan_mode            IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
  scan_percent         IN  NUMBER     DEFAULT NULL,
  null_value           IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
  local_converge_tag   IN  RAW        DEFAULT NULL,
  remote_converge_tag  IN  RAW        DEFAULT NULL,
  max_num_buckets     IN  NUMBER     DEFAULT CMP_MAX_NUM_BUCKETS,
  min_rows_in_bucket  IN  NUMBER     DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

### Parameters

**Table 35–6 CREATE\_COMPARISON Procedure Parameters**

Parameter	Description
comparison_name	The name of the comparison.
schema_name	The name of the schema that contains the local database object to compare.
object_name	The name of the local database object to compare.
dblink_name	Database link to the remote database. The specified database object in the remote database is compared with the database object in the local database.  If NULL, then the comparison is configured to compare two database objects in the local database. In this case, parameters that specify the remote database object apply to the second database object in the comparison and to operations on the second database object. For example, specify the second database object in this procedure by using the remote_schema_name and remote_object_name parameters.
index_schema_name	The name of the schema that contains the index.  If NULL, then the schema specified in the schema_name parameter is used.
index_name	The name of the index.  If NULL, then the system determines the index columns for the comparison automatically.  If the index_schema_name parameter is non-NULL, then the index_name parameter must also be non-NULL. Otherwise, an error is raised.  <b>See Also:</b> " <a href="#">Usage Notes</a> " on page 35-22 for more information about specifying an index

**Table 35–6 (Cont.) CREATE\_COMPARISON Procedure Parameters**

Parameter	Description
remote_schema_name	<p>The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases.</p> <p>If NULL, then the schema specified in the schema_name parameter is used.</p>
remote_object_name	<p>The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases.</p> <p>If NULL, then the database object specified in the object_name parameter is used.</p>
comparison_mode	<p>Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.</p>
column_list	<p>Specify '*' to include all of the columns in the database objects being compared.</p> <p>To compare a subset of columns in the database objects, specify a comma-delimited list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence.</p> <p>See <a href="#">"Usage Notes"</a> on page 35-22 for information about columns that are required in the column_list parameter.</p>
scan_mode	<p>Either CMP_SCAN_MODE_FULL, CMP_SCAN_MODE_RANDOM, CMP_SCAN_MODE_CYCLIC, or CMP_SCAN_MODE_CUSTOM.</p> <p>If you specify CMP_SCAN_MODE_CUSTOM, then make sure you specify an index using the index_schema_name and index_name parameters. Specifying an index ensures that you can specify the correct min_value and max_value for the lead index column when you run the COMPARE or RECHECK function.</p> <p>See <a href="#">"Constants"</a> on page 35-6 for information about these constants.</p>
scan_percent	<p>The percentage of the database object to scan for comparison when the scan_mode parameter is set to either CMP_SCAN_MODE_RANDOM or CMP_SCAN_MODE_CYCLIC. For these scan_mode settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required.</p> <p>If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_FULL, then the entire database object is scanned for comparison.</p> <p>If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then the portion of the database object scanned for comparison is specified when the COMPARE function is run.</p> <p>If non-NULL and the scan_mode parameter is set to either CMP_SCAN_MODE_FULL or CMP_SCAN_MODE_CUSTOM, then the scan_percent parameter is ignored.</p> <p><b>Note:</b> When the scan_percent parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified scan_percent value. See <a href="#">"Index Column Requirements for the DBMS_COMPARISON Package"</a> on page 35-10 for more information about the lead index column.</p>

**Table 35–6 (Cont.) CREATE\_COMPARISON Procedure Parameters**

Parameter	Description
<code>null_value</code>	<p>The value to substitute for each NULL in the database objects being compared. Specify a value or use the <code>CMP_NULL_VALUE_DEF</code> constant.</p> <p>If a column being compared can contain NULLs, then the value specified for this parameter must be different than any non-NULL value in the column. Otherwise, if the value specified for this parameter can appear in the column, some row differences might not be found.</p> <p>See "Constants" on page 35-6 for information about this constant.</p>
<code>local_converge_tag</code>	<p>The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being compared.</p> <p>If the <code>local_converge_tag</code> parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See <a href="#">CONVERGE Procedure</a> on page 35-18 for more information.</p> <p>See the <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags.</p>
<code>remote_converge_tag</code>	<p>The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being compared.</p> <p>If the <code>remote_converge_tag</code> parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See <a href="#">CONVERGE Procedure</a> on page 35-18 for more information.</p> <p>See the <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags.</p>
<code>max_num_buckets</code>	<p>Specify the maximum number of buckets to use. Specify a value or use the <code>CMP_MAX_NUM_BUCKETS</code> constant. See "Constants" on page 35-6 for information about this constant.</p> <p>See "Overview" on page 35-3 for information about buckets.</p> <p><b>Note:</b> If an index column for a comparison is a VARCHAR2 or CHAR column, then the number of buckets might exceed the value specified for the <code>max_num_buckets</code> parameter.</p>
<code>min_rows_in_bucket</code>	<p>Specify the minimum number of rows in each bucket. Specify a value or use the <code>CMP_MIN_ROWS_IN_BUCKET</code> constant. See "Constants" on page 35-6 for information about this constant.</p> <p>See "Overview" on page 35-3 for information about buckets.</p>

## Usage Notes

This section contains usage notes for the CREATE\_COMPARISON procedure.

### Usage Notes for the `index_schema_name` and `index_name` Parameters

When you specify an index for a comparison with the `index_schema_name` and `index_name` parameters, the specified index determines the comparison's index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.

The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in `column_list` parameter might or might not be used.

The columns in the specified index must meet the requirements described in "[Index Column Requirements for the DBMS\\_COMPARISON Package](#)" on page 35-10. If the index columns do not meet these requirements, then an error is raised.

---

---

**Note:** If you do not specify an index when you create a comparison, then the `CREATE_COMPARISON` procedure selects either the primary key, if it exists, or an existing unique index. The procedure never selects a non-unique index. However, if you specify an index, then the `CREATE_COMPARISON` procedure does not check its uniqueness. Therefore, if you specify a non-unique index, and duplicate index keys exist, then the results might be incorrect when the `CONVERGE` procedure synchronizes data.

---

---

### Usage Notes for the `column_list` Parameter

When the `column_list` parameter is set to a value other than `'*'`, the following columns are required in the `column_list` parameter:

- Any columns that are required to meet the index column requirements for the `DBMS_COMPARISON` package. If the `index_name` parameter is non-NULL, then the columns in the specified index must be in the column list. If the `index_name` parameter is NULL, then see "[Index Column Requirements for the DBMS\\_COMPARISON Package](#)" on page 35-10.
- If you plan to use the `CONVERGE` procedure to make changes to a database object based on the comparison, then any columns in this database object that have a NOT NULL constraint but no default value must be included in the column list. If these columns are not included, then the `CONVERGE` procedure returns an error. See [CONVERGE Procedure](#) on page 35-18.

## DROP\_COMPARISON Procedure

This procedure drops a comparison.

### Syntax

```
DBMS_COMPARISON.DROP_COMPARISON(  
    comparison_name IN VARCHAR2);
```

### Parameters

**Table 35–7** *DROP\_COMPARISON Procedure Parameters*

Parameter	Description
comparison_name	The name of the comparison.

## PURGE\_COMPARISON Procedure

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

---

---

**Note:** At least one of the following parameters must be set to NULL: `scan_id` or `purge_time`. If both the `scan_id` and `purge_time` parameters are NULL, then this procedure purges all comparison results for the comparison.

---

---

### Syntax

```
DBMS_COMPARISON.PURGE_COMPARISON(
  comparison_name IN VARCHAR2,
  scan_id         IN NUMBER     DEFAULT NULL,
  purge_time      IN TIMESTAMP  DEFAULT NULL);
```

### Parameters

**Table 35–8** *PURGE\_COMPARISON Procedure Parameters*

Parameter	Description
<code>comparison_name</code>	The name of the comparison.
<code>scan_id</code>	The scan ID of the scan for which results are purged. The scan ID must identify a root scan. If the scan ID does not identify a root scan, then an error is raised. When a root scan ID is specified, it is purged, and all direct and indirect child scans of the specified root scan are purged.  If NULL, then no scan ID is considered when purging comparison results for the comparison.  See <a href="#">"Overview"</a> on page 35-3 for information about scans.
<code>purge_time</code>	The date before which results are purged.  If NULL, then no date is considered when purging comparison results for the comparison.

## RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function continues to check the database object from the point where the previous scan ended.

---

**Note:** This function does not compare the shared database object for differences that were not recorded in the specified comparison scan. To check for those differences, run the `COMPARE` function.

---

### See Also:

- *Oracle Streams Replication Administrator's Guide*
- [COMPARE Function](#) on page 35-16

## Syntax

```
DBMS_COMPARISON.RECHECK(
  comparison_name IN VARCHAR2,
  scan_id         IN NUMBER,
  perform_row_dif IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;
```

## Parameters

**Table 35–9 RECHECK Function Parameters**

Parameter	Description
<code>comparison_name</code>	The name of the comparison.
<code>scan_id</code>	The scan ID of the scan to recheck. See " <a href="#">Overview</a> " on page 35-3 for more information about specifying a scan ID in this parameter.
<code>perform_row_dif</code>	If <code>TRUE</code> , then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison.  If <code>FALSE</code> , then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket.  See " <a href="#">Overview</a> " on page 35-3 for information about buckets.

## Return Values

This function returns `TRUE` when no differences are found in the database objects being compared. This function returns `FALSE` when differences are found in the database objects being compared.

---

---

## DBMS\_COMPRESSION

The DBMS\_COMPRESSION package provides an interface to facilitate choosing the correct compression level for an application.

This chapter contains the following topics:

- [Using DBMS\\_COMPRESSION](#)
  - Overview
  - Security Model
  - Constants
  - Views
- [Summary of DBMS\\_COMPRESSION Subprograms](#)

## Using DBMS\_COMPRESSION

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)

## Overview

The DBMS\_COMPRESSION package gathers compression-related information within a database environment. This includes tools for estimating compressibility of a table for both partitioned and non-partitioned tables, and gathering row-level compression information on previously compressed tables. This gives the user with adequate information to make compression-related decision.

## Security Model

The `DBMS_COMPRESSSION` package is owned by user `SYS`, and must be created by `SYS`. The execution privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## Constants

The DBMS\_COMPRESSION package uses the constants shown in [Table 36-1, "DBMS\\_COMPRESSION Constants - Compression Types"](#):

**Table 36-1 DBMS\_COMPRESSION Constants - Compression Types**

Constant	Type	Value	Description
COMP_NOCOMPRESS	NUMBER	1	No compression
COMP_FOR_OLTP	NUMBER	2	OLTP compression
COMP_FOR_QUERY_HIGH	NUMBER	4	High compression level for query operations
COMP_FOR_QUERY_LOW	NUMBER	8	Low compression level for query operations
COMP_FOR_ARCHIVE_HIGH	NUMBER	16	High compression level for archive operations
COMP_FOR_ARCHIVE_LOW	NUMBER	32	Low compression level for archive operations

---

---

**Note:** Hybrid columnar compression is a feature of certain Oracle storage systems. See *Oracle Database Concepts* for more information.

---

---

## Views

The DBMS\_DST package uses views described in the *Oracle Database Reference*. The twenty catalog views that contain a COMPRESS\_FOR or DEF\_COMPRESS\_FOR will have a list of valid displayed values to be one of the following:

- BASIC
- OLTP
- QUERY LOW
- QUERY HIGH
- ARCHIVE LOW
- ARCHIVE LOW

The affected views are:

- ALL\_ALL\_TABLES
- ALL\_OBJECT\_TABLES
- ALL\_PART\_TABLES
- ALL\_TABLES
- ALL\_TAB\_PARTITIONS
- ALL\_TAB\_SUBPARTITIONS
- DBA\_ALL\_TABLES
- DBA\_OBJECT\_TABLES
- DBA\_PART\_TABLES
- DBA\_TABLES
- DBA\_TAB\_PARTITIONS
- DBA\_TAB\_SUBPARTITIONS
- DBA\_TABLESPACES
- USER\_OBJECT\_TABLES
- USER\_PART\_TABLES
- USER\_TABLES
- USER\_TAB\_PARTITIONS
- USER\_TABLESPACES

## Summary of DBMS\_COMPRESSION Subprograms

**Table 36–2** *DBMS\_COMPRESSION Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">GET_COMPRESSION_RATIO Procedure</a> on page 36-8	Analyzes the compression ratio of a table, and gives information about compressibility of a table
<a href="#">GET_COMPRESSION_TYPE Function</a> on page 36-10	Returns the compression type for a specified row

## GET\_COMPRESSION\_RATIO Procedure

This procedure analyzes the compression ratio of a table, and gives information about compressibility of a table. Various parameters can be provided by the user to selectively analyze different compression types.

The overload takes an index name and an optional partition name as IN arguments, and for every possible type of compression algorithm (currently Auto-Prefix or OLTP), it return the compression ratio as an OUT argument. In addition, it returns a count of the compressed blocks and uncompressed blocks which can be used to determine absolute space consumption of the index (partition) with or without compression.

### Syntax

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
    scratchtbsname      IN    VARCHAR2,
    tabowner            IN    VARCHAR2,
    ownname             IN    VARCHAR2,
    partname            IN    VARCHAR2,
    comptype            IN    NUMBER,
    blkcnt_cmp          OUT   PLS_INTEGER,
    blkcnt_uncmp        OUT   PLS_INTEGER,
    row_cmp             OUT   PLS_INTEGER,
    row_uncmp           OUT   PLS_INTEGER,
    cmp_ratio           OUT   NUMBER,
    comptype_str        OUT   VARCHAR2,
    subset_numrows      IN    NUMBER DEFAULT COMP_RATIO_MINROWS);
```

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
    scratchtbsname      IN    VARCHAR2,
    indexname           IN    VARCHAR2,
    tabowner            IN    VARCHAR2,
    tabname             IN    VARCHAR2,
    lobname             IN    VARCHAR2,
    partname            IN    VARCHAR2,
    comptype            IN    NUMBER,
    blkcnt_cmp          OUT   PLS_INTEGER,
    blkcnt_uncmp        OUT   PLS_INTEGER,
    row_cmp             OUT   PLS_INTEGER,
    row_uncmp           OUT   PLS_INTEGER,
    cmp_ratio           OUT   NUMBER,
    comptype_str        OUT   VARCHAR2,
    subset_numrows      IN    NUMBER DEFAULT COMP_RATIO_LOB_MAXROWS);
```

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
    scratchtbsname      IN    VARCHAR2,
    indexname           IN    VARCHAR2,
    tabowner            IN    VARCHAR2,
    tabname             IN    VARCHAR2,
    partname            IN    VARCHAR2,
    comptype            IN    NUMBER,
    blkcnt_cmp          OUT   PLS_INTEGER,
    blkcnt_uncmp        OUT   PLS_INTEGER,
    row_cmp             OUT   PLS_INTEGER,
    row_uncmp           OUT   PLS_INTEGER,
    cmp_ratio           OUT   NUMBER,
    comptype_str        OUT   VARCHAR2,
    subset_numrows      IN    NUMBER DEFAULT COMP_RATIO_MINROWS);
```

## Parameters

**Table 36–3** *GET\_COMPRESSION\_RATIO Procedure Parameters*

Parameter	Description
scratchtbsname	Temporary scratch tablespace that can be used for analysis
ownname / tabowner	Schema of the table to analyze
tabname	Name of the table to analyze
partname	In case of partitioned tables, the related partition name
comptype	Compression types for which analysis should be performed
blkcnt_cmp	Number of blocks used by compressed sample of the table
blkcnt_uncmp	Number of blocks used by uncompressed sample of the table
row_cmp	Number of rows in a block in compressed sample of the table
row_uncmp	Number of rows in a block in uncompressed sample of the table
cmp_ratio	Compression ratio, blkcnt_uncmp divided by blkcnt_cmp
comptype_str	String describing the compression type
indexname	Name of index
tabowner	Owner of table to analyze
row_cmp	Number of rows in compressed sample of the table
row_uncmp	Number of rows in uncompressed sample of the table
lobname	
subset_numrows	

## Usage Notes

The procedure creates different tables in the scratch tablespace and runs analysis on these objects. It does not modify anything in the user-specified tables.

## GET\_COMPRESSION\_TYPE Function

This function returns the compression type for a specified row. If the row is chained, the function returns the compression type of the head piece only, and does not examine the intermediate or the tail piece since head pieces can be differently compressed.

### Syntax

```
DBMS_COMPRESSION.GET_COMPRESSION_TYPE (  
    ownname    IN    VARCHAR2,  
    tabname    IN    VARCHAR2,  
    row_id     IN    ROWID)  
RETURN NUMBER;
```

### Parameters

**Table 36–4** GET\_COMPRESSION\_TYPE Function Parameters

Parameter	Description
ownname	Schema name of the table
tabname	Name of table
rowid	Rowid of the row

### Return Values

Flag to indicate the compression type (see [DBMS\\_COMPRESSION Constants - Compression Types](#)).

---

---

## DBMS\_CONNECTION\_POOL

The DBMS\_CONNECTION\_POOL package provides an interface to manage Database Resident Connection Pool.

**See Also:** *Oracle Database Concepts* for more information on "Database Resident Connection Pooling"

This chapter contains the following topic:

- [Summary of DBMS\\_CONNECTION\\_POOL Subprograms](#)

## Summary of DBMS\_CONNECTION\_POOL Subprograms

**Table 37-1 DBMS\_CONNECTION\_POOL Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">ALTER_PARAM Procedure</a> on page 37-3	Alters a specific configuration parameter as a standalone unit and does not affect other parameters
<a href="#">CONFIGURE_POOL Procedure</a> on page 37-4	Configures the pool with advanced options
<a href="#">START_POOL Procedure</a> on page 37-6	Starts the pool for operations. It is only after this call that the pool could be used by connection clients for creating sessions
<a href="#">STOP_POOL Procedure</a> on page 37-7	Stops the pool and makes it unavailable for the registered connection clients
<a href="#">RESTORE_DEFAULTS Procedure</a> on page 37-8	Restores the pool to default settings

## ALTER\_PARAM Procedure

This procedure alters a specific configuration parameter as a standalone unit and does not affect other parameters.

### Syntax

```
DBMS_CONNECTION_POOL.ALTER_PARAM (
  pool_name      IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
  param_name     IN  VARCHAR2,
  param_value    IN  VARCHAR2);
```

### Parameters

**Table 37-2 ALTER\_PARAM Procedure Parameters**

Parameter	Description
pool_name	Pool to be configured. Currently only the default pool name is supported.
param_name	Any parameter name from CONFIGURE_POOL
param_value	Parameter value for param_name.

### Exceptions

**Table 37-3 ALTER\_PARAM Procedure Exceptions**

Exception	Description
ORA-56500	Connection pool not found
ORA-56504	Invalid connection pool configuration parameter name
ORA-56505	Invalid connection pool configuration parameter value
ORA-56507	Connection pool alter configuration failed

### Examples

```
DBMS_CONNECTION_POOL.ALTER_PARAM(
  'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');
```

## CONFIGURE\_POOL Procedure

This procedure configures the pool with advanced options.

### Syntax

```
DBMS_CONNECTION_POOL.CONFIGURE_POOL (
  pool_name          IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
  minsize            IN NUMBER   DEFAULT 4,
  maxsize            IN NUMBER   DEFAULT 40,
  incrsz            IN NUMBER   DEFAULT 2,
  session_cached_cursors IN NUMBER DEFAULT 20,
  inactivity_timeout IN NUMBER   DEFAULT 300,
  max_think_time     IN NUMBER   DEFAULT 120,
  max_use_session    IN NUMBER   DEFAULT 500000,
  max_lifetime_session IN NUMBER   DEFAULT 86400);
```

### Parameters

**Table 37-4 CONFIGURE\_POOL Procedure Parameters**

Parameter	Description
pool_name	Pool to be configured. Currently only the default pool name is supported.
minsize	Minimum number of pooled servers in the pool
maxsize	Maximum allowed pooled servers in the pool
incrsz	Pool would increment by this number of pooled server when pooled server are unavailable at application request time
session_cached_cursors	Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter
inactivity_timeout	TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.
max_think_time	Maximum time of inactivity by the client after getting a session from the pool. If the client does not issue a database call after grabbing a server from the pool, the client will be forced to relinquish control of the pooled server and will get an ORA-xxxxxx error. The freed up server may or may not be returned to the pool.
max_use_session	Maximum number of times a connection can be taken and released to the pool
max_lifetime_session	TTL (Time to live) for a pooled session

### Exceptions

**Table 37-5 CONFIGURE\_POOL Procedure Exceptions**

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

## Usage Notes

- All expressions of time are in seconds
- All of the parameters should be set based on statistical request patterns.
- `minsize` should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.
- `maxsize` should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.
- `session_cached_cursors` is typically set to the number of most frequently used statements. It occupies cursor resource on the server
- In doubt, do not set the `increment` and `inactivity_timeout`. The pool will have reasonable defaults.
- `max_use_session` and `max_lifetime_session` allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.
- The connection pool reserves 5% of the pooled servers for authentication, and at least one pooled server is always reserved for authentication. When setting the `maxsize` parameter, ensure that there are enough pooled servers for both authentication and connections.

## START\_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

### Syntax

```
DBMS_CONNECTION_POOL.START_POOL (  
    pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

### Parameters

**Table 37-6** *START\_POOL Procedure Parameters*

Parameter	Description
pool_name	Pool to be started. Currently only the default pool name is supported.

### Exceptions

**Table 37-7** *START\_POOL Procedure Exceptions*

Exception	Description
ORA-56500	Connection pool not found
ORA-56501	Connection pool startup failed

### Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

## STOP\_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

### Syntax

```
DBMS_CONNECTION_POOL.STOP_POOL (
    pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

### Parameters

**Table 37–8 STOP\_POOL Procedure Parameters**

Parameter	Description
pool_name	Pool to be stopped. Currently only the default pool name is supported.

### Exceptions

**Table 37–9 STOP\_POOL Procedure Exceptions**

Exception	Description
ORA-56500	Connection pool not found
ORA-56506	Connection pool shutdown failed

### Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.

## RESTORE\_DEFAULTS Procedure

This procedure restores the pool to default settings.

### Syntax

```
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (  
    pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

### Parameters

**Table 37–10** *RESTORE\_DEFAULTS Procedure Parameters*

Parameter	Description
pool_name	Pool to be restored. Currently only the default pool name is supported.

### Exceptions

**Table 37–11** *RESTORE\_DEFAULTS Procedure Exceptions*

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

### Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

---

---

## DBMS\_CQ\_NOTIFICATION

The `DBMS_CQ_NOTIFICATION` package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

**See Also:** *Oracle Database Advanced Application Developer's Guide* regarding implementing database change notification.

This chapter contains the following topics:

- [Using DBMS\\_CQ\\_NOTIFICATION](#)
  - Overview
  - Security Model
  - Constants
  - Operational Notes
  - Examples
- [Data Structures](#)
  - OBJECT Types
- [Summary of DBMS\\_CQ\\_NOTIFICATION Subprograms](#)

## Using DBMS\_CQ\_NOTIFICATION

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Examples](#)

## Overview

The `DBMS_CQ_NOTIFICATION` package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and `|COMMIT|s`, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a `BEGIN-END` block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the `BEGIN` phase. Any queries executed subsequently (inside the registration block) are considered "interesting queries" and objects referenced by those queries during query execution are registered. The registration is completed by `ENDING` the registration block.

The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

### Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

## Security Model

The `DBMS_CQ_NOTIFICATION` package requires that the user have the `CHANGE NOTIFICATION` system privilege in order to receive notifications, and be granted `EXECUTE` privilege on the `DBMS_CQ_NOTIFICATION` package.

In addition the user is required to have `SELECT` privileges on all objects to be registered. Note that if the `SELECT` privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

## Constants

The DBMS\_CQ\_NOTIFICATION package uses the constants shown in [Table 38–1](#). The constants are used as flag parameters either during registration or when received during the notification.

The DBMS\_CQ\_NOTIFICATION package has sets of constants:

- EVENT\_STARTUP, EVENT\_SHUTDOWN, EVENT\_SHUTDOWN\_ANY, EVENT\_DEREG describe the type of the notification published by the database.
- INSERTOP, DELETEOP, UPDATEOP, ALTEROP, DROPOP and UNKNOWNOP describe the type of operation on a table (during a notification published by the database).
- QOS\_RELIABLE, QOS\_DEREG\_NFY, QOS\_ROWIDS describe registration Quality of Service properties that the client requires. These are specified during registration.

**Table 38–1 DBMS\_CQ\_NOTIFICATION Constants**

Name	Type	Value	Description
ALL_OPERATIONS	BINARY_INTEGER	0	Interested in being notified on all operations, specified as a parameter during registration
ALL_ROWS	BINARY_INTEGER	1	All rows within the table may have been potentially modified
EVENT_STARTUP	BINARY_INTEGER	1	Instance startup notification
EVENT_SHUTDOWN	BINARY_INTEGER	2	Instance shutdown notification
EVENT_SHUTDOWN_ANY	BINARY_INTEGER	3	Any instance shutdown when running Oracle Real Application Clusters (Oracle RAC)
EVENT_DEREG	BINARY_INTEGER	5	Registration has been removed
EVENT_OBJCHANGE	BINARY_INTEGER	6	Notification for object change
EVENT_QUERYCHANGE	BINARY_INTEGER	7	Notification for query result set change
INSERTOP	BINARY_INTEGER	2	Insert operation
UPDATEOP	BINARY_INTEGER	4	Update operation
DELETEOP	BINARY_INTEGER	8	Delete operation
ALTEROP	BINARY_INTEGER	16	Table altered
DROPOP	BINARY_INTEGER	32	Table dropped
UNKNOWNOP	BINARY_INTEGER	64	Unknown operation
QOS_RELIABLE	BINARY_INTEGER	1	Reliable or persistent notification. Also implies that the notifications will be inserted into the persistent storage atomically with the committing transaction that results in an object change.
QOS_DEREG_NFY	BINARY_INTEGER	2	Purge registration on first notification
QOS_ROWIDS	BINARY_INTEGER	4	Require rowids of modified rows
QOS_QUERY	BINARY_INTEGER	8	Register at query granularity
QOS_BEST_EFFORT	BINARY_INTEGER	16	Best effort evaluation

**Table 38–1 (Cont.) DBMS\_CQ\_NOTIFICATION Constants**

<b>Name</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
NTFN_GROUPING_ CLASS_TIME	BINARY_INTEGER	1	Group notifications by time
NTFN_GROUPING_ TYPE_SUMMARY	BINARY_INTEGER	1	Summary grouping of notifications
NTFN_GROUPING_ TYPE_LAST	BINARY_INTEGER	2	Last notification in the group
NTFN_GROUPING_ FOREVER	BINARY_INTEGER	-1	Repeat notifications forever

## Operational Notes

With regard to object level registration:

- The notifications are published by the database when a transaction changes the registered objects and `COMMITs`.
- All objects referenced in the queries executed inside the registration block starting from the previous `NEW_REG_START` or `ENABLE_REG` to `REG_END` are considered interesting objects and added to the registration.

With regard to query result change registration:

- The notifications are published by the database when a transaction changes the result set of the registered query and `COMMITs`.

### Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the `job_queue_processes` parameter set to a nonzero value? This parameter needs to be configured to a nonzero value in order to receive PL/SQL notifications through the handler.
- Are the registrations being created as a non-SYS user?
- If you are attempting DML changes on the registered object, are you `COMMITting` the transaction? Please note that the notifications are transactional and will be generated when the transaction `COMMITs`.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the `JOBQ` process that attempts to execute the procedure. The trace file would be usually named `<ORACLE_SID>_j*_<PID>.trc.`

For example, if the `ORACLE_SID` is 'dbs1' and the process is 12483, the trace file might be named 'dbs1\_j000\_12483.trc.

Suppose a registration is created with `chnf_callback` as the notification handler and with `registration_id` 100. Let us suppose the user forgets to define the `chnf_callback` procedure. Then the `JOBQ` trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
Error in PLSQL notification of msgid:
Queue :
Consumer Name :
PLSQL function :chnf_callback
Exception Occured, Error msg:
ORA-00604: error occurred at recursive SQL level 2
ORA-06550: line 1, column 7:
PLS-00201: identifier 'CHNF_CALLBACK' must be declared
ORA-06550: line 1, column 7:
PL/SQL: Statement ignored
```

**See Also:** For more information about troubleshooting Database Change Notification, see *Oracle Database Advanced Application Developer's Guide*.

## Examples

### Object Change Registration Example

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

The DBMS\_CQ\_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.
2. Create a server side stored procedure to process notifications

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
                             table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
                           row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
  regid          NUMBER;
  tbname         VARCHAR2(60);
  event_type     NUMBER;
  numtables      NUMBER;
  operation_type NUMBER;
  numrows        NUMBER;
  row_id         VARCHAR2(20);
BEGIN
  regid          := ntfnds.registration_id;
  numtables      := ntfnds.numtables;
  event_type     := ntfnds.event_type;

  INSERT INTO nfevents VALUES(regid, event_type);
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
    FOR i IN 1..numtables LOOP
      tbname       := ntfnds.table_desc_array(i).table_name;
      operation_type := ntfnds.table_desc_array(i).Opflags;
      INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
```

```

        /* Send the table name and operation_type to client side listener using
UTL_HTTP */
        /* If interested in the rowids, obtain them as follows */
        IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
            numrows := ntfnds.table_desc_array(i).numrows;
        ELSE
            numrows :=0; /* ROWID INFO NOT AVAILABLE */
        END IF;

        /* The body of the loop is not executed when numrows is ZERO */
        FOR j IN 1..numrows LOOP
            Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
            INSERT INTO nfrowchanges VALUES(regid, tname, Row_id);
            /* optionally Send out row_ids to client side listener using UTL_HTTP;
*/
        END LOOP;

    END LOOP;
END IF;
COMMIT;
END;
/

```

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

#### Notes

- a. In the above example, a registration was created on the EMPLOYEES table with 'chnf\_callback' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (QOS\_RELIABLE) and rowid notifications (QOS\_ROWIDS)
- b. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of EVENT\_OBJCHANGE. In all other cases (e.g EVENT\_DEREG, EVENT\_SHUTDOWN), the table descriptor array should not be accessed.
- c. The handler accesses the row descriptor array from the table notification descriptor only if the ALL\_ROWS bit is not set in the table operation flag. If the ALL\_ROWS bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like TRUNCATE that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation.

This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1% of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier HTTP listener of its cache management system (as in the example) using UTL\_HTTP. The listener could then refresh its cache by querying from the back-end database.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (chnf\_callback) as the name of the server side PL/SQL procedure to be executed when a notification is generated.

```

Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
  REGDS      SYS.CHNF$_REG_INFO;
  regid      NUMBER;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  qosflags   NUMBER;
BEGIN
  qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE +
             DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
  REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
  regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
  SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
  DBMS_CQ_NOTIFICATION.REG_END;
END;
/

```

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any COMMITted changes to the HR.EMPLOYEES table. As an example, let us assume that the following update is performed on the employees table.

```

UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;
COMMIT;

```

Once the notification is processed, you will find rows which might look like the following in the nfevents, nftablechanges and nfrowchanges tables.

```
SQL> SELECT * FROM nfevents;
```

REGID	EVENT_TYPE
20045	6

```
SQL> SELECT * FROM nftablechanges;
```

REGID	TABLE_NAME	TABLE_OPERATION
20045	HR.EMPLOYEES	4

```
SQL> select * from nfrowchanges;
```

REGID	TABLE_NAME	ROW_ID
20045	HR.EMPLOYEES	AAAKB/AABAAAJ8zAAF

## Query Result Change Registration Example

### 1. Creating a Callback

```

CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid NUMBER, event_type NUMBER);

```

```

Rem Create a table to record notification queries
CREATE TABLE nfqueries (qid NUMBER, qop NUMBER);

Rem Create a table to record changes to registered tables
CREATE TABLE nftablechanges(
    qid                NUMBER,
    table_name         VARCHAR2(100),
    table_operation    NUMBER);

Rem Create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(
    qid                NUMBER,
    table_name         VARCHAR2(100),
    row_id             VARCHAR2(2000));

CREATE OR REPLACE PROCEDURE chnf_callback
    (ntfnds IN CQ_NOTIFICATION$_DESCRIPTOR)
IS
    regid            NUMBER;
    tbname           VARCHAR2(60);
    event_type       NUMBER;
    numtables        NUMBER;
    operation_type   NUMBER;
    numrows          NUMBER;
    row_id           VARCHAR2(2000);
    numqueries       NUMBER;
    qid NUMBER;
    qop NUMBER;

BEGIN
    regid := ntfnds.registration_id;
    event_type := ntfnds.event_type;
    INSERT INTO nfevents VALUES(regid, event_type);
    numqueries :=0;
    IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_QUERYCHANGE) THEN
        numqueries := ntfnds.query_desc_array.count;
        FOR i in 1..numqueries LOOP
            qid := ntfnds.QUERY_DESC_ARRAY(i).queryid;
            qop := ntfnds.QUERY_DESC_ARRAY(i).queryop;
            INSERT INTO nfqueries VALUES(qid, qop);
            numtables := 0;
            numtables := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array.count;
            FOR j IN 1..numtables LOOP
                tbname := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).table_name;
                operation_type := ntfnds.QUERY_DESC_ARRAY(i).table_desc_
array(j).Opflags;
                INSERT INTO nftablechanges VALUES(qid, tbname, operation_type);
                IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0)
                THEN
                    numrows := ntfnds.query_desc_array(i).table_desc_array(j).numrows;
                ELSE
                    numrows :=0; /* ROWID INFO NOT AVAILABLE */
                END IF;

                /* The body of the loop is not executed when numrows is ZERO */
                FOR k IN 1..numrows LOOP
                    Row_id := ntfnds.query_desc_array(i).table_desc_array(j).row_
desc_array(k).row_id;
                    INSERT INTO nfrowchanges VALUES(qid, tbname, Row_id);

```

```

        END LOOP; /* loop over rows */
    END LOOP; /* loop over tables */
END LOOP; /* loop over queries */
END IF;
COMMIT;
END;
/

```

## 2. Creates a query registration

```

DECLARE
    reginfo    cq_notification$_reg_info;
    mgr_id     NUMBER;
    dept_id    NUMBER;
    v_cursor   SYS_REFCURSOR;
    regid      NUMBER;
    qosflags   NUMBER;

BEGIN
    /* Register two queries for result-set-change notifications: */

    /* 1. Construct registration information.
       'chnf_callback' is name of notification handler.
       QOS_QUERY specifies result-set-change notifications. */

    qosflags := DBMS_CQ_NOTIFICATION.QOS_QUERY +
                DBMS_CQ_NOTIFICATION.QOS_ROWIDS;

    reginfo := cq_notification$_reg_info('chnf_callback', qosflags,0, 0, 0);

    /* 2. Create registration */

    regid := DBMS_CQ_NOTIFICATION.NEW_REG_START(reginfo);

    OPEN v_cursor FOR
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, manager_id
        FROM HR.employees
        WHERE employee_id = 7902;
    CLOSE v_cursor;

    OPEN v_cursor for
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, department_id
        FROM HR.departments
        WHERE department_name = 'IT';
    CLOSE v_cursor;

    DBMS_CQ_NOTIFICATION.REG_END;
END;
/

```

## 3. After creating the query registrations, the output from USER\_CQ\_NOTIFICATION\_QUERIES would appear as follows.

```

SQL> SELECT queryid, regid, to_char(querytext)
       FROM user_cq_notification_queries;

```

```

      QUERYID      REGID
-----
TO_CHAR (QUERYTEXT)

```

```
-----
-
          22          41
SELECT HR.DEPARTMENTS.DEPARTMENT_ID FROM HR.DEPARTMENTS WHERE
HR.DEPARTMENTS.
DEPARTMENT_NAME = 'IT'
```

```
          21          41
SELECT HR.EMPLOYEES.MANAGER_ID FROM HR.EMPLOYEES WHERE
HR.EMPLOYEES.EMPLOYEE_
ID = 7902
```

Now, let us perform an UPDATE that changes the result of the query with queryid 22 by renaming the department with name 'IT' to FINANCE.

```
SQL> update departments set department_name = 'FINANCE' where department_name
= 'IT';
```

1 row updated.

```
SQL> commit;
```

Commit complete.

Now we can query the notifications that we recorded in the callback.

```
SQL> select * from nfevents;
```

```
          REGID EVENT_TYPE
-----
          61          7
```

Event type 7 corresponds to EVENT\_QUERYCHANGE

```
SQL> select * from nfqueries;
```

```
          QID          QOP
-----
          42          7
```

Event type 7 corresponds to EVENT\_QUERYCHANGE

```
SQL> select * from nftablechanges;
```

```
SQL> select * from nftablechanges;
```

```
          REGID
-----
TABLE_NAME
-----
-
TABLE_OPERATION
-----
          42
HR.DEPARTMENTS
          4
```

TABLE\_OPERATION 4 corresponds to UPDATEOP

```
SQL> select * from nfrowchanges;
```

```
      REGID
-----
TABLE_NAME
-----
-
ROW_ID
-----
-
          61
HR.DEPARTMENTS
AAANKdAABAAALinAAF
```

## Data Structures

The DBMS\_CQ\_NOTIFICATION package defines the following OBJECT types.

### OBJECT Types

- CQ\_NOTIFICATION\$\_DESCRIPTOR Object Type
- CQ\_NOTIFICATION\$\_QUERY Object Type
- CQ\_NOTIFICATION\$\_QUERY\_ARRAY Object (Array) Type
- CQ\_NOTIFICATION\$\_TABLE Object Type
- CQ\_NOTIFICATION\$\_TABLE\_ARRAY Object (Array) Type
- CQ\_NOTIFICATION\$\_ROW Object Type
- CQ\_NOTIFICATION\$\_ROW\_ARRAY Object (Array) Type
- CQ\_NOTIFICATION\$\_REG\_INFO Object Type

## CQ\_NOTIFICATION\$\_DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the SYS.CHNF\$\_DESC type.

### Syntax

```
TYPE SYS.CHNF$_DESC IS OBJECT(
  registration_id    NUMBER,
  transaction_id    RAW(8),
  dbname            VARCHAR2(30),
  event_type        NUMBER,
  numtables         NUMBER,
  table_desc_array  CQ_NOTIFICATION$_TABLE_ARRAY,
  query_desc_array  CQ_NOTIFICATION$_QUERY_ARRAY);
```

### Attributes

**Table 38–2 CQ\_NOTIFICATION\$\_DESCRIPTOR Object Type**

Attribute	Description
registration_id	Registration ID returned during registration
transaction_id	Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE or EVENT_QUERYCHANGE.
dbname	Name of database
event_type	Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, or EVENT_QUERYCHANGE, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)
numtables	Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.
table_desc_array	Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.
query_desc_array	Array of queries changed. This will be NULL unless event_type is EVENT_QUERYCHANGE

## CQ\_NOTIFICATION\$\_QUERY Object Type

The object type describes the changes to a query result caused by an event such as a transaction commit. An array of CQ\_NOTIFICATION\$\_QUERY descriptors is embedded inside the top level notification descriptor (CQ\_NOTIFICATION\$\_DESCRIPTOR) for events of type EVENT\_QUERYCHANGE. The array corresponds to the SET of queryids which were invalidated as a result of the event.

This is a synonym for the base type SYS.CHNF\$\_QDESC.

### Syntax

```
TYPE SYS.CHNF$_QDESC IS OBJECT (
  queryid          NUMBER,
  queryop         NUMBER,
  table_desc_array CQ_NOTIFICATION$_TABLE_ARRAY);
```

### Attributes

**Table 38-3** TYPE SYS.CQ\_NOTIFICATION\$\_QUERY Object Type

Attribute	Description
queryid	QueryId of the changed query
queryop	Operation describing change to the query
table_desc_array	Array of table changes which contributed to the query Result Set change

## CQ\_NOTIFICATION\$\_QUERY\_ARRAY Object (Array) Type

This type corresponds to an array of CQ\_NOTIFICATION\$\_QUERY objects. It is a synonym for the SYS.CHNF\$\_QUERY\_ARRAY type.

### Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```

## CQ\_NOTIFICATION\$\_TABLE Object Type

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for events of type `EVENT_OBJCHANGE`. For query result set changes (event type will be set to `EVENT_QUERYCHANGE`), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type previously named `SYS.CHNF$_TDESC`.

### Syntax

```
TYPE SYS.CHNF$_TDESC IS OBJECT (
  opflags          NUMBER,
  table_name       VARCHAR2(2*M_IDEN+1),
  numrows          NUMBER,
  row_desc_array   CQ_NOTIFICATION$_ROW_ARRAY)
```

### Attributes

**Table 38-4** TYPE `SYS.CQ_NOTIFICATION$_TABLE` Object Type

Attribute	Description
<code>opflags</code>	Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an OR of the following bit fields - <code>INSERTOP</code> , <code>UPDATEOP</code> , <code>DELETEOP</code> , <code>DROPOP</code> , <code>ALTEROP</code> , <code>ALL_ROWS</code> . If the <code>ALL_ROWS</code> (0x1) bit is set it means that either the entire table is modified (for example, <code>DELETE * FROM t</code> ) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.
<code>table_name</code>	Name of modified table
<code>numrows</code>	Number of modified rows within the table. <code>numrows</code> will be <code>NULL</code> and hence should not be accessed if the <code>ALL_ROWS</code> bit is set in the table change descriptor.
<code>row_desc_array</code>	Array of row descriptors. This field will be <code>NULL</code> if the <code>ALL_ROWS</code> bit is set in <code>opflags</code> .

## CQ\_NOTIFICATION\$\_TABLE\_ARRAY Object (Array) Type

This type corresponds to an array of CQ\_NOTIFICATION\$\_TABLE objects. It is a synonym for the SYS.CHNF\$\_TDESC\_ARRAY type.

### Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```

## CQ\_NOTIFICATION\$\_ROW Object Type

An array of CQ\_NOTIFICATION\$\_ROW is embedded inside a CQ\_NOTIFICATION\$\_TABLE (table change descriptor) if the QOS\_ROWIDS option was chosen at the time of registration and the ALL\_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF\$\_RDESC.

### Syntax

```
TYPE SYS.CHNF$_RDESC IS OBJECT (
  opflags          NUMBER,
  row_id           VARCAHR2 (2000));
```

### Attributes

**Table 38-5** TYPE SYS.CQ\_NOTIFICATION\$\_ROW Object Type

Attribute	Description
opflags	Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).
row_id	The rowid of the modified row

## CQ\_NOTIFICATION\$\_ROW\_ARRAY Object (Array) Type

This object type corresponds to an array of CQ\_NOTIFICATION\$\_ROW objects and is embedded inside the CQ\_NOTIFICATION\$\_TABLE if QOS\_ROWIDS was specified during registration and the ALL\_ROWS bit is not set in the opflags field of the table change descriptor.

This type is a synonym for the SYS.CHNF\$\_RDESC\_ARRAY type.

### Syntax

```
TYPE CQ_NOTIFICATION$_ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_ROW;
```

## CQ\_NOTIFICATION\$\_REG\_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type previously named `SYS.CHNF$_REG_INFO`.

### Syntax

```
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
  callback                VARCHAR2(20) ,
  quosflags               NUMBER,
  timeout                 NUMBER,
  operations_filter       NUMBER,
  transaction_lag         NUMBER,
  ntfn_grouping_class     NUMBER,
  ntfn_grouping_value     NUMBER,
  ntfn_grouping_type      NUMBER,
  ntfn_grouping_start_time  TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count NUMBER);
```

### Attributes

**Table 38–6** TYPE CQ\_NOTIFICATION\$\_REG\_INFO Object Type

Attribute	Description
callback	Name of the server side PL/SQL procedure to be executed on a notification. Prototype is <code>&lt;callbackname&gt;(ntfnds IN SYS.chnf\$_desc)</code>
quosflags	Quality of service flags. Can be set to an OR of the following values: <ul style="list-style-type: none"> <li>▪ <code>QOS_RELIABLE (0x1)</code>: Notifications are reliable (persistent) and survive instance death. This means that on an instance death in an Oracle RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/ latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown.</li> <li>▪ <code>QOS_DEREG_NFY (0x2)</code>: The registration will be expunged on the first notification</li> <li>▪ <code>QOS_ROWIDS (0x4)</code>: The notification needs to include information about the rowids that were modified</li> <li>▪ <code>QOS_QUERY (0x8)</code>: specifies query result change notification as opposed to object change notification</li> <li>▪ <code>QOS_BEST_EFFORT (0x16)</code>: can register simplified versions of queries and minimizes evaluation with some false positives.</li> </ul>

**Table 38–6 (Cont.) TYPE CQ\_NOTIFICATIONS\$ REG\_INFO Object Type**

Attribute	Description
timeout	If set to a nonzero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the <code>timeout</code> option can be combined with the <code>purge on notification (QOS_DEREG_NFY)</code> option as well.
operations_filter	<p>if nonzero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types:</p> <ul style="list-style-type: none"> <li>▪ 0: Notify on all operations (<code>DBMS_CQ_NOTIFICATION.ALL_OPERATIONS</code>)</li> <li>▪ 0x2: Notify on every INSERT (<code>DBMS_CQ_NOTIFICATION.INSERTOP</code>)</li> <li>▪ 0x4: Notify on every UPDATE (<code>DBMS_CQ_NOTIFICATION.UPDATEOP</code>)</li> <li>▪ 0x8: Notify on every DELETE (<code>DBMS_CQ_NOTIFICATION.DELETEOP</code>)</li> </ul> <p>A combination of operations can be specified by using a bitwise OR.</p> <p>Caution: This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the "GROUPING notification" option.</p>
transaction_lag	<p>Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated.</p> <p><b>Caution:</b> This parameter will be honored for object level registrations but ignored for query result change notification registrations.</p>
ntfn_grouping_class	When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is <code>DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME</code> by which notifications are grouped by time.
ntfn_grouping_value	The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.
ntfn_grouping_type	<p>The type of grouping desired. It can be one of two allowed values</p> <ul style="list-style-type: none"> <li>▪ <code>DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY</code> - all notifications in the group are summarized into a single notification</li> <li>▪ <code>DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST</code> - only the last notification in the group is published and the earlier ones discarded</li> </ul>
ntfn_grouping_start_time	When to start generating notifications. If specified as NULL, it defaults to the current system generated time.

**Table 38–6 (Cont.) TYPE CQ\_NOTIFICATION\$\_REG\_INFO Object Type**

Attribute	Description
ntfn_grouping_repeat_count	How many times the notification should be repeated. Set this to DBMS_CQ_NOTIFICATION.NTFN_GROUPING_FOREVER to receive notifications for the life time of the registration. Set to a nonzero value if only a certain number of notifications are desired for the life time of the registration.

## Usage Notes

- The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback          VARCHAR2(20) ,
  quosflags         NUMBER,
  timeout           NUMBER);
```

The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback          VARCHAR2(20) ,
  quosflags         NUMBER,
  timeout           NUMBER,
  operations_filter NUMBER,
  transaction_lag   NUMBER);
```

The third definition contains all the members of the type except `transaction_lag` which is being deprecated:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback          VARCHAR2(20) ,
  quosflags         NUMBER,
  timeout           NUMBER,
  operations_filter NUMBER,
  ntfn_grouping_class      NUMBER,
  ntfn_grouping_value      NUMBER,
  ntfn_grouping_type       NUMBER,
  ntfn_grouping_start_time  TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count NUMBER);
```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format `schema_name.procedure_name`. The procedure must have the following signature:

```
PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
```

CHNF\$\_DESC describes the change notification descriptor.

- The `init.ora` parameter `job_queue_processes` must be set to a nonzero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

## Summary of DBMS\_CQ\_NOTIFICATION Subprograms

**Table 38–7** *DBMS\_CQ\_NOTIFICATION Package Subprograms*

Subprogram	Description
<a href="#">CQ_NOTIFICATION_QUERYID Function</a> on page 38-27	Returns the queryid of the most recent query that was attempted to be registered in a registration block
<a href="#">DEREGISTER Procedure</a> on page 38-28	De-subscribes the client with the supplied registration identifier (ID)
<a href="#">ENABLE_REG Procedure</a> on page 38-29	Begins a registration block using an existing registration identifier (ID)
<a href="#">NEW_REG_START Function</a> on page 38-30	Begins a new registration block
<a href="#">REG_END Procedure</a> on page 38-31	Ends the registration boundary
<a href="#">SET_ROWID_THRESHOLD Procedure</a> on page 38-32	Configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction

## **CQ\_NOTIFICATION\_QUERYID Function**

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

### **Syntax**

```
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID  
RETURN NUMBER;
```

### **Return Values**

Returns the queryid of the most recently registered query.

## DEREGISTER Procedure

This procedure desubscribes the client with the specified registration identifier (ID).

### Syntax

```
DBMS_CQ_NOTIFICATION.DEREGISTER (  
    regid IN NUMBER);
```

### Parameters

**Table 38–8** *DEREGISTER Procedure Parameters*

Parameter	Description
regid	Client registration ID

### Usage Notes

Only the user that created the registration (or the SYS user) will be able to desubscribe the registration.

## ENABLE\_REG Procedure

This procedure adds objects to an existing registration identifier (ID). It is similar to the interface for creating a new registration, except that it takes an existing `regid` to which to add objects.

Subsequent execution of queries causes the objects referenced in the queries to be added to the specified `regid`, and the registration is completed on invoking the [REG\\_END Procedure](#).

### Syntax

```
DBMS_CQ_NOTIFICATION.ENABLE_REG (  
    regid IN NUMBER);
```

### Parameters

**Table 38–9** *ENABLE\_REG Procedure Parameters*

Parameter	Description
<code>regid</code>	Client registration ID

### Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

## NEW\_REG\_START Function

This procedure begins a new registration block. Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the REG\_END procedure.

### Syntax

```
DBMS_CQ_NOTIFICATION.NEW_REG_START (
  regds IN sys.chnf$_reg_info)
RETURN NUMBER;
```

### Parameters

**Table 38–10 NEW\_REG\_START Function Parameters**

Parameter	Description
sys.chnf\$_reg_info	Registration descriptor describing the notification handler and other properties of the registration

### Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

### Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the CHANGE\_NOTIFICATION system privilege and SELECT privileges on any objects to be registered.
- The SYS user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

## **REG\_END Procedure**

This procedure marks the end of the registration block. No newly executed queries are tracked.

### **Syntax**

```
DBMS_CQ_NOTIFICATION.REG_END;
```

## SET\_ROWID\_THRESHOLD Procedure

This procedure configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction.

### Syntax

```
DBMS_CQ_NOTIFICATION.SET_ROWID_THRESHOLD (  
  tbnname      IN VARCHAR2,  
  threshold    IN NUMBER);
```

### Parameters

**Table 38–11** SET\_ROWID\_THRESHOLD Procedure Parameters

Parameter	Description
tbnname	Table name qualified by the schema name in the form <code>schemaname.tablename</code>
threshold	Maximum number of modified rows of the table to be published in the change notification

### Usage Notes

- The table needs to be registered for change notification either at object change granularity or at query result set granularity.
- The threshold set by means of this subprogram applies to that instance only and does not persist across instance startup/shutdown.

DBMS\_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

**See Also:** *Oracle Database Security Guide* for further information about using this package and about encrypting data in general.

- [Security Model](#)
- [Types](#)
- [Algorithms](#)
- [Restrictions](#)
- [Exceptions](#)
- [Operational Notes](#)

## Overview

DBMS\_CRYPT0 contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS\_CRYPT0 package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, and SHA-1 cryptographic hashes
- MD5 and SHA-1 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS\_CRYPT0. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 39–1 lists the DBMS\_CRYPT0 package features in comparison to the other PL/SQL encryption package, the DBMS\_OBFUSCATION\_TOOLKIT.

**Table 39–1 DBMS\_CRYPT0 and DBMS\_OBFUSCATION\_TOOLKIT Feature Comparison**

Package Feature	DBMS_CRYPT0	DBMS_OBFUSCATION_TOOLKIT
Cryptographic algorithms	DES, 3DES, AES, RC4, 3DES_2KEY	DES, 3DES
Padding forms	PKCS5, zeroes	none supported
Block cipher chaining modes	CBC, CFB, ECB, OFB	CBC
Cryptographic hash algorithms	MD5, SHA-1, MD4	MD5
Keyed hash (MAC) algorithms	HMAC_MD5, HMAC_SH1	none supported
Cryptographic pseudo-random number generator	RAW, NUMBER, BINARY_INTEGER	RAW, VARCHAR2
Database types	RAW, CLOB, BLOB	RAW, VARCHAR2

DBMS\_CRYPT0 is intended to replace the DBMS\_OBFUSCATION\_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES\_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, or SHA-1.

## Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

## Types

Parameters for the DBMS\_CRYPT0 subprograms use these datatypes:

**Table 39–2 DBMS\_CRYPT0 Datatypes**

Type	Description
BLOB	A source or destination binary LOB
CLOB	A source or destination character LOB (excluding NCLOB)
PLS_INTEGER	Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)
RAW	A source or destination RAW buffer

## Algorithms

The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

**Table 39–3 DBMS\_CRYPTO Cryptographic Hash Functions**

Name	Description
HASH_MD4	Produces a 128-bit hash, or message digest of the input message
HASH_MD5	Also produces a 128-bit hash, but is more complex than MD4
HASH_SH1	Secure Hash Algorithm (SHA). Produces a 160-bit hash.

**Table 39–4 DBMS\_CRYPTO MAC (Message Authentication Code) Functions**

Name	Description
HMAC_MD5 <sup>1</sup>	Same as MD5 hash function, except it requires a secret key to verify the hash value.
HMAC_SH1 <sup>1</sup>	Same as SHA hash function, except it requires a secret key to verify the hash value.

<sup>1</sup> Complies with IETF RFC 2104 standard

**Table 39–5 DBMS\_CRYPTO Encryption Algorithms**

Name	Description
ENCRYPT_DES	Data Encryption Standard. Block cipher. Uses key length of 56 bits.
ENCRYPT_3DES_2KEY	Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.
ENCRYPT_3DES	Data Encryption Standard. Block cipher. Operates on a block 3 times.
ENCRYPT_AES128	Advanced Encryption Standard. Block cipher. Uses 128-bit key size.
ENCRYPT_AES192	Advanced Encryption Standard. Block cipher. Uses 192-bit key size.
ENCRYPT_AES256	Advanced Encryption Standard. Block cipher. Uses 256-bit key size.
ENCRYPT_RC4	Stream cipher. Uses a secret, randomly generated key unique to each session.

**Table 39–6 DBMS\_CRYPTO Block Cipher Suites**

Name	Description
DES_CBC_PKCS5	ENCRYPT_DES <sup>1</sup> + CHAIN_CBC <sup>2</sup> + PAD_PKCS5 <sup>3</sup>
DES3_CBC_PKCS5	ENCRYPT_3DES <sup>1</sup> + CHAIN_CBC <sup>2</sup> + PAD_PKCS5 <sup>3</sup>

<sup>1</sup> See Table 39–5, "DBMS\_CRYPTO Encryption Algorithms"

<sup>2</sup> See Table 39–7, "DBMS\_CRYPTO Block Cipher Chaining Modifiers"

<sup>3</sup> See Table 39–8, "DBMS\_CRYPTO Block Cipher Padding Modifiers"

**Table 39–7 DBMS\_CRYPT0 Block Cipher Chaining Modifiers**

<b>Name</b>	<b>Description</b>
CHAIN_ECB	Electronic Codebook. Encrypts each plaintext block independently.
CHAIN_CBC	Cipher Block Chaining. Plaintext is XORed with the previous ciphertext block before it is encrypted.
CHAIN_CFB	Cipher-Feedback. Enables encrypting units of data smaller than the block size.
CHAIN_OFB	Output-Feedback. Enables running a block cipher as a synchronous stream cipher. Similar to CFB, except that <i>n</i> bits of the previous output block are moved into the right-most positions of the data queue waiting to be encrypted.

**Table 39–8 DBMS\_CRYPT0 Block Cipher Padding Modifiers**

<b>Name</b>	<b>Description</b>
PAD_PKCS5	Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard
PAD_NONE	Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.
PAD_ZERO	Provides padding consisting of zeroes.

## Restrictions

The `VARCHAR2` datatype is not directly supported by `DBMS_CRYPTO`. Before you can perform cryptographic operations on data of the type `VARCHAR2`, you must convert it to the uniform database character set `AL32UTF8`, and then convert it to the `RAW` datatype. After performing these conversions, you can then encrypt it with the `DBMS_CRYPTO` package.

**See Also:** ["Conversion Rules"](#) on page 39-11 for information about converting datatypes.

## Exceptions

Table 39–9 lists exceptions that have been defined for DBMS\_CRYPT0.

**Table 39–9 DBMS\_CRYPT0 Exceptions**

Exception	Code	Description
CipherSuiteInvalid	28827	The specified cipher suite is not defined.
CipherSuiteNull	28829	No value has been specified for the cipher suite to be used.
KeyNull	28239	The encryption key has not been specified or contains a NULL value.
KeyBadSize	28234	DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.
DoubleEncryption	28233	Source data was previously encrypted.

## Operational Notes

- [When to Use Encrypt and Decrypt Procedures or Functions](#)
- [When to Use Hash or Message Authentication Code \(MAC\) Functions](#)
- [About Generating and Storing Encryption Keys](#)
- [Conversion Rules](#)

### When to Use Encrypt and Decrypt Procedures or Functions

This package includes both `ENCRYPT` and `DECRYPT` procedures and functions. The procedures are used to encrypt or decrypt LOB datatypes (overloaded for CLOB and BLOB datatypes). In contrast, the `ENCRYPT` and `DECRYPT` functions are used to encrypt and decrypt RAW datatypes. Data of type `VARCHAR2` must be converted to RAW before you can use `DBMS_CRYPTO` functions to encrypt it.

### When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the `HASH` function and the `MAC` function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, Laurel runs `DBMS_CRYPTO.HASH` against the stored data to create a hash value. When she returns the stored data at a later date, she can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.

The `HASH` function included with `DBMS_CRYPTO`, is a one-way hash function that you can use to generate a hash value from either RAW or LOB data. The `MAC` function is also a one-way hash function, but with the addition of a secret key. It works the same way as the `DBMS_CRYPTO.HASH` function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

### About Generating and Storing Encryption Keys

The `DBMS_CRYPTO` package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by `DBMS_CRYPTO` occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although DBMS\_CRYPT0 cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the RANDOMBYTES function to generate random material for keys. (Calls to the RANDOMBYTES function behave like calls to the DESGETKEY and DES3GETKEY functions of the DBMS\_OBFUSCATION\_TOOLKIT package.)

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

**See Also:**

- *Oracle Database Advanced Security Administrator's Guide* for information about configuring network encryption and SSL.
- ["Key Management"](#) on page 96-5 for a full discussion about securely storing encryption keys
- ["RANDOMBYTES Function"](#) on page 39-20

## Conversion Rules

- To convert VARCHAR2 to RAW, use the UTL\_I18N.STRING\_TO\_RAW function to perform the following steps:
  1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

Syntax example:

```
UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
```

- To convert RAW to VARCHAR2, use the UTL\_I18N.RAW\_TO\_CHAR function to perform the following steps:
  1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

Syntax example:

```
UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
```

**See Also:** [Chapter 225, "UTL\\_I18N"](#) for information about using the UTL\_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL\_ENCODE.BASE64\_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

## Examples

The following listing shows PL/SQL block encrypting and decrypting pre-defined 'input\_string' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
    input_string      VARCHAR2 (200) := 'Secret Message';
    output_string     VARCHAR2 (200);
    encrypted_raw     RAW (2000);           -- stores encrypted binary text
    decrypted_raw     RAW (2000);           -- stores decrypted binary text
    num_key_bytes     NUMBER := 256/8;     -- key length 256 bits (32 bytes)
    key_bytes_raw     RAW (32);            -- stores 256-bit encryption key
    encryption_type   PLS_INTEGER :=      -- total encryption type
        DBMS_CRYPTO.ENCRYPT_AES256
        + DBMS_CRYPTO.CHAIN_CBC
        + DBMS_CRYPTO.PAD_PKCS5;
BEGIN
    DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
    key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
    encrypted_raw := DBMS_CRYPTO.ENCRYPT
    (
        src => UTL_I18N.STRING_TO_RAW (input_string, 'AL32UTF8'),
        typ => encryption_type,
        key => key_bytes_raw
    );
    -- The encrypted value "encrypted_raw" can be used here

    decrypted_raw := DBMS_CRYPTO.DECRYPT
    (
        src => encrypted_raw,
        typ => encryption_type,
        key => key_bytes_raw
    );
    output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

    DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```

---

## Summary of DBMS\_CRYPTO Subprograms

**Table 39–10 DBMS\_CRYPTO Package Subprograms**

Subprogram	Description
<a href="#">DECRYPT Function</a> on page 39-14	Decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector)
<a href="#">DECRYPT Procedures</a> on page 39-15	Decrypts LOB data using a stream or block cipher with a user supplied key and optional IV
<a href="#">ENCRYPT Function</a> on page 39-16	Encrypts RAW data using a stream or block cipher with a user supplied key and optional IV
<a href="#">ENCRYPT Procedures</a> on page 39-17	Encrypts LOB data using a stream or block cipher with a user supplied key and optional IV
<a href="#">HASH Function</a> on page 39-18	Applies one of the supported cryptographic hash algorithms (MD4, MD5, or SHA-1) to data
<a href="#">MAC Function</a> on page 39-19	Applies Message Authentication Code algorithms (MD5 or SHA-1) to data to provide keyed message protection
<a href="#">RANDOMBYTES Function</a> on page 39-20	Returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys
<a href="#">RANDOMINTEGER Function</a> on page 39-21	Returns a random BINARY_INTEGER
<a href="#">RANDOMNUMBER Function</a> on page 39-22	Returns a random 128-bit integer of the NUMBER datatype

## DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

### Syntax

```
DBMS_CRYPTO.DECRYPT (
  src IN RAW,
  typ IN PLS_INTEGER,
  key IN RAW,
  iv IN RAW DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references (decrypt, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 39–11 DECRYPT Function Parameters**

Parameter Name	Description
src	RAW data to be decrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is NULL.

### Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.
 

**See Also:** ["Usage Notes"](#) for the ENCRYPT function on page 39-16 for additional information about the ciphers and modifiers available with this package.
- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL\_I18N package.
 

**See Also:** ["Conversion Rules"](#) on page 39-11 for a discussion of the VARCHAR2 to RAW conversion process.

## DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

### Syntax

```
DBMS_CRYPTO.DECRYPT (
  dst IN OUT NOCOPY BLOB,
  src IN          BLOB,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN           RAW          DEFAULT NULL);
```

```
DBMS_CRYPT.DECRYPT (
  dst IN OUT NOCOPY CLOB          CHARACTER SET ANY_CS,
  src IN          BLOB,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN           RAW          DEFAULT NULL);
```

### Pragmas

```
pragma restrict_references (decrypt, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 39–12** *DECRYPT Procedure Parameters*

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is all zeroes.

## ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

### Syntax

```
DBMS_CRYPTO.ENCRYPT (
  src IN RAW,
  typ IN PLS_INTEGER,
  key IN RAW,
  iv IN RAW          DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references (encrypt, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 39–13 ENCRYPT Function Parameters**

Parameter Name	Description
src	RAW data to be encrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

### Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See [Table 39–7](#) and [Table 39–8](#) on page 39-7 for block cipher chaining and padding modifier constants that have been defined for this package.

- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

```
DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
                                     + DBMS_CRYPTO.CHAIN_CBC
                                     + DBMS_CRYPTO.PAD_NONE;
```

See [Table 39–6](#) on page 39-6 for the block cipher suites already defined as constants for this package.

- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

**See Also:** ["Conversion Rules"](#) on page 39-11 for a discussion of the conversion process.

- Stream ciphers, such as RC4, are not recommended for stored data encryption.

## ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

### Syntax

```
DBMS_CRYPT0.ENCRYPT (
  dst IN OUT NOCOPY BLOB,
  src IN          BLOB,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN           RAW          DEFAULT NULL);
```

```
DBMS_CRYPT0.ENCRYPT (
  dst IN OUT NOCOPY BLOB,
  src IN          CLOB          CHARACTER SET ANY_CS,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN           RAW          DEFAULT NULL);
```

### Pragmas

```
pragma restrict_references (encrypt, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 39–14 ENCRYPT Procedure Parameters**

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

### Usage Notes

See "[Conversion Rules](#)" on page 39-11 for usage notes about using the ENCRYPT procedure.

## HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a *hash value*. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to ["When to Use Hash or Message Authentication Code \(MAC\) Functions"](#) on page 39-10 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in [Table 39-3](#) on page 39-6.

### Syntax

```
DBMS_CRYPTO.Hash (
    src IN RAW,
    typ IN PLS_INTEGER)
RETURN RAW;

DBMS_CRYPTO.Hash (
    src IN BLOB,
    typ IN PLS_INTEGER)
RETURN RAW;

DBMS_CRYPTO.Hash (
    src IN CLOB CHARACTER SET ANY_CS,
    typ IN PLS_INTEGER)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references (hash, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 39-15 HASH Function Parameters**

Parameter Name	Description
src	The source data to be hashed.
typ	The hash algorithm to be used.

### Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm), specified with the constant, `HASH_SH1`, because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.

## MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "[HASH Function](#)" on page 39-18, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "[When to Use Hash or Message Authentication Code \(MAC\) Functions](#)" on page 39-10 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See [Table 39-4](#) on page 39-6 for a list of MAC algorithms that have been defined for this package.

### Syntax

```
DBMS_CRYPT0.MAC (
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW)
RETURN RAW;

DBMS_CRYPT0.MAC (
    src IN BLOB,
    typ IN PLS_INTEGER
    key IN RAW)
RETURN RAW;

DBMS_CRYPT0.MAC (
    src IN CLOB CHARACTER SET ANY_CS,
    typ IN PLS_INTEGER
    key IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references (mac, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 39-16 MAC Function Parameters**

Parameter Name	Description
src	Source data to which MAC algorithms are to be applied.
typ	MAC algorithm to be used.
key	Key to be used for MAC algorithm.

## RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator).

### Syntax

```
DBMS_CRYPTO.RANDOMBYTES (  
    number_bytes IN POSITIVE)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references (randombytes, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 39–17** RANDOMBYTES Function Parameter

Parameter Name	Description
number_bytes	The number of pseudo-random bytes to be generated.

### Usage Note

The number\_bytes value should not exceed the maximum length of a RAW variable.

## RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle `BINARY_INTEGER` datatype.

### Syntax

```
DBMS_CRYPT0.RANDOMINTEGER  
RETURN BINARY_INTEGER;
```

### Pragmas

```
pragma restrict_references (randominteger, WNDS, RNDS, WNPS, RNPS);
```

## RANDOMNUMBER Function

This function returns an integer in the Oracle NUMBER datatype in the range of  $[0..2^{128}-1]$ .

### Syntax

```
DBMS_CRYPTO.RANDOMNUMBER  
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references (randomnumber, WNDS, RNDS, WNPS, RNPS);
```

## DBMS\_CSX\_ADMIN

The DBMS\_CSX\_ADMIN package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

The chapter contains the following topics:

- [Using DBMS\\_CSX\\_ADMIN](#)
  - Overview
  - Security Model
  - Constants
- [Summary of DBMS\\_CSX\\_ADMIN](#)

## Using DBMS\_CSX\_ADMIN

- [Overview](#)
- [Security Model](#)
- [Constants](#)

## Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.

## Security Model

Owned by XDB, the DBMS\_CSX\_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.

## Constants

The DBMS\_CSX\_ADMIN package uses the constants shown in [Table 40-1](#):

**Table 40-1 DBMS\_CSX\_ADMIN Constants**

Name	Type	Value	Description
DEFAULT_LEVEL	BINARY_INTEGER	0	Default token table
TAB_LEVEL	BINARY_INTEGER	1	Token table set associated with tables, not tablespaces
TBS_LEVEL	BINARY_INTEGER	2	Token table set associated with a tablespace
NO_CREATE	BINARY_INTEGER	0	Token tables already exist, associate them with the given table/tablespace
NO_INDEXES	BINARY_INTEGER	1	Do not create indexes on the new set of token tables
WITH_INDEXES	BINARY_INTEGER	2	Create indexes on the token tables
DEFAULT_TOKS	BINARY_INTEGER	0	Prepopulate the token tables with default token mappings
NO_DEFAULT_TOKS	BINARY_INTEGER	1	Do not prepopulate the token tables with default token mappings

## Examples

### Example 1: Register a New Set of Token Tables for the Tablespace

To prepare a tablespace CSXTS for export, the DBA can register a new set of token tables for the tablespace with the following PL/SQL:

```
DECLARE
    tsno    number;
    stmt    varchar2(2000);
BEGIN
    stmt := 'SELECT ts# FROM ts$ WHERE (name = '' || 'CSXTS' || '' )';
    EXECUTE IMMEDIATE stmt INTO tsno;
    DBMS_CSX_ADMIN.REGISTER_TOKENTABLESET(
        tstabno => tsno,
        guid    => NULL,
        flags   => DBMS_CSX_ADMIN.TBS_LEVEL,
        tocreate => DBMS_CSX_ADMIN.WITH_INDEXES,
        defaulttoks => DBMS_CSX_ADMIN.DEFAULT_TOKS);
    COMMIT;
END;
/
```

In this example, the new token tables are indexed, populated with default token mappings, and associated with all tables in the CSXTS tablespace. All subsequent loads of binary XML data in CSXTS will make use of the new set of token tables. The advantage is that no loading of binary XML data in other tablespaces will affect the size of the token tables used by CSXTS and exported during a tablespace export of CSXTS. This setup is suited to the case in which the tablespace does not yet contain binary XML data.

### Example 2: Copying the Default Token Tables in a New Set

If binary XML data already exists in the tablespace to be exported, the DBA has the option of copying the default token tables in a new set.

```
DECLARE
    tsno    number;
    stmt    varchar2(2000);
    qntab   varchar2(34);
    nmtab   varchar2(34);
    pttab   varchar2(34);
BEGIN
    stmt := 'select ts# from ts$ where (name = '' || 'CSXTS' || '' )';
    EXECUTE IMMEDIATE stmt INTO tsno;
    DBMS_CSX_ADMIN.COPYDEFAULT_TOKENTABLESET(
        tstabno => tsno, qntab, nmtab, pttab);
    COMMIT;
END;
/
```

This setup is suited to the case in which the DBA wishes to optimize the export of a tablespace that already contains binary XML data, and does not have associated a token table set. After cloning the default token table set, all subsequent loads of binary XML data in CSXTS will make use of the new set of token tables.

---

## Summary of DBMS\_CSX\_ADMIN

**Table 40–2 DBMS\_CSX\_ADMIN Package Subprograms**

Subprogram	Description
<a href="#">COPYDEFAULTTOKENTABLESET Procedure</a> on page 40-8	Creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables
<a href="#">GETTOKENTABLEINFO Procedure &amp; Function</a> on page 40-9	Returns the GUID of the token table set where token mappings for this table
<a href="#">GETTOKENTABLEINFOBYTABLESPACE Procedure</a> on page 40-10	Returns the GUID and the token table names for this tablespace
<a href="#">NAMESPACEIDTABLE Function</a> on page 40-11	Returns default namespace-ID token table
<a href="#">PATHIDTABLE Function</a> on page 40-12	Returns the default path-ID token table
<a href="#">QNAMEIDTABLE Function</a> on page 40-13	Returns the default qname-ID token table.
<a href="#">REGISTERTOKENTABLESET Procedure</a> on page 40-14	Registers a new token table set, creates (if required) the token tables (with the corresponding indexes)

## COPYDEFAULTTOKENTABLESET Procedure

This procedure creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables.

### Syntax

```
DBMS_CSX_ADMIN.COPYDEFAULTTOKENTABLESET (
    tsno          IN    NUMBER,
    qnametable    OUT   VARCHAR2,
    nmspctable    OUT   VARCHAR2,
    pttable       OUT   VARCHAR2);
```

### Parameters

**Table 40-3** *COPYDEFAULTTOKENTABLESET Procedure Parameters*

Parameter	Description
tsno	Tablespace number the new set of token tables will be associated with
qnametable	Name of the qname-ID table in the new set
nmspctable	Name of the namespace-ID table in the new set
pttable	Name of the path-id table in the new set

## GETTOKENTABLEINFO Procedure & Function

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

### Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO (
  ownername      IN  VARCHAR2,
  tablename      IN  VARCHAR2,
  guid           OUT RAW,
  qnametable     OUT  VARCHAR2,
  nmspctable    OUT  VARCHAR2,
  level         OUT  NUMBER,
  tabno         OUT  NUMBER);
```

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO (
  tabno         IN  NUMBER,
  guid         OUT  RAW);
RETURN BOOLEAN;
```

### Parameters

**Table 40–4** GETTOKENTABLEINFO Procedure & Function Parameters

Parameter	Description
ownername	Owner of the table
tablename	Name of the table
guid	GUID of the token table set used by the given table
qnametable	Name of the qname-ID table in the new set
nmspctable	Name of the namespace-ID table in the new set
level	DEFAULT_LEVEL if default token table set, TBS_LEVEL if same token table set is used by all tables in the same tablespace as the given table, TAB_LEVEL otherwise
tabno	Table object number

## GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

### Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE (
    tsname          IN  VARCHAR2,
    tablespaceno    IN  NUMBER,
    guid            OUT RAW,
    qnametable      OUT VARCHAR2,
    nmspctable      OUT VARCHAR2,
    isdefault       OUT BOOLEAN,
    containTokTab   OUT BOOLEAN);
```

### Parameters

**Table 40–5** GETTOKENTABLEINFOBYTABLESPACE Procedure Parameters

Parameter	Description
tsname	Tablespace name
tablespaceno	Tablespace number
guid	GUID of the token table set associated with this tablespace (if any)
qnametable	Name of the qname-ID table
nmspctable	Name of the namespace-ID table
isdefault	TRUE if the token table is the default one
containTokTab	TRUE if the tablespace contains its own token table set

## **NAMESPACEIDTABLE Function**

This procedure returns default namespace-ID token table.

### **Syntax**

```
DBMS_CSX_ADMIN.NAMESPACEIDTABLE  
RETURN VARCHAR2;
```

## PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing `EXPLAIN PLAN` for a query on an XML table with an XML index.

### Syntax

```
DBMS_CSX_ADMIN.PATHIDTABLE  
RETURN VARCHAR2;
```

## QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

### Syntax

```
DBMS_CSX_ADMIN.QNAMEIDTABLE  
RETURN VARCHAR2;
```

## REGISTERTOKENTABLESET Procedure

This procedure registers a new token table set, creates (if required) the token tables (with the corresponding indexes).

### Syntax

```
DBMS_CSX_ADMIN.REGISTERTOKENTABLESET (
  tstabno      IN  NUMBER  DEFAULT NULL,
  guid         IN  RAW      DEFAULT NULL,
  flags        IN  NUMBER  DEFAULT TBS_LEVEL,
  tocreate     IN  NUMBER  DEFAULT WITH_INDEXES,
  defaulttoks IN  NUMBER  DEFAULT DEFAULT_TOKS);
```

### Parameters

**Table 40–6** *REGISTERTOKENTABLESET Procedure Parameters*

Parameter	Description
tstabno	Tablespace/table number of the tablespace/table using the set of token table we register
guid	GUID of the token table set. If NULL, a new identifier is created, provided the user is SYS.
flags	TAB_LEVEL for table level, TBS_LEVEL for tablespace level
tocreate	Possible values: <ul style="list-style-type: none"> <li>■ NO_CREATE if no token tables are created</li> <li>■ NO_INDEXES if token tables are created, but no indexes</li> <li>■ WITH_INDEXES if token tables and corresponding indexes are created</li> </ul>
defaulttoks	If DEFAULT_TOKS, insert default token mappings

DBMS\_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

**See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- [Using DBMS\\_CUBE](#)
- [Using SQL Aggregation Management](#)
- [Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g](#)
- [Summary of DBMS\\_CUBE Subprograms](#)

## Using DBMS\_CUBE

Cubes and cube dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Cubes can be enabled as cube materialized views for automatic refresh of the cubes and dimensions, and for query rewrite. Several DBMS\_CUBE subprograms support the creation and maintenance of cube materialized views as a replacement for relational materialized views. These subprograms are discussed in ["Using SQL Aggregation Management"](#) on page 41-4.

The metadata for cubes and dimensions is defined in XML documents, called *templates*, which you can derive from relational materialized views using the CREATE\_CUBE or DERIVE\_FROM\_MVIEW functions. Using a graphical tool named Analytic Workspace Manager, you can enhance the cube with analytic content or create the metadata for new cubes and cube dimensions from scratch.

Several other DBMS\_CUBE subprograms provide a SQL alternative to Analytic Workspace Manager for creating an analytic workspace from an XML template and for refreshing the data stored in cubes and dimensions. The IMPORT\_XML procedure creates an analytic workspace with its cubes and cube dimensions from an XML template. The BUILD procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying.

## Security Model

The following roles and system privileges are required to use this package:

**To create dimensional objects in the user's own schema:**

- OLAP\_USER role
- CREATE SESSION privilege

**To create dimensional objects in different schemas:**

- OLAP\_DBA role
- CREATE SESSION privilege

**To create cube materialized views in the user's own schema:**

- CREATE MATERIALIZED VIEW privilege
- CREATE DIMENSION privilege
- ADVISOR privilege

**To create cube materialized views in different schemas:**

- CREATE ANY MATERIALIZED VIEW privilege
- CREATE ANY DIMENSION privilege
- ADVISOR privilege

If the source tables are in a different schema, then the owner of the dimensional objects needs SELECT object privileges on those tables.

## Using SQL Aggregation Management

SQL Aggregation Management is a group of PL/SQL subprograms in `DBMS_CUBE` that supports the rapid deployment of cube materialized views from existing relational materialized views. Cube materialized views are cubes that have been enhanced to use the automatic refresh and query rewrite features of Oracle Database. A single cube materialized view can replace many of the relational materialized views of summaries on a fact table, providing uniform response time to all summary data.

Cube materialized views bring the fast update and fast query capabilities of the OLAP option to applications that query summaries of detail relational tables. The summary data is generated and stored in a cube, and query rewrite automatically redirects queries to the cube materialized views. Applications experience excellent querying performance.

In the process of creating the cube materialized views, `DBMS_CUBE` also creates a fully functional analytic workspace including a cube and the cube dimensions. The cube stores the data for a cube materialized view instead of the table that stores the data for a relational materialized view. A cube can also support a wide range of analytic functions that enhance the database with information-rich content.

Cube materialized views are registered in the data dictionary along with all other materialized views. A `CB$` prefix identifies a cube materialized view.

The `DBMS_CUBE` subprograms also support life-cycle management of cube materialized views.

**See Also:** *Oracle OLAP User's Guide* for more information about cube materialized views and enhanced OLAP analytics.

## Subprograms in SQL Aggregation Management

These subprograms are included in SQL Aggregation Management:

- [CREATE\\_MVIEW](#) Function
- [DERIVE\\_FROM\\_MVIEW](#) Function
- [DROP\\_MVIEW](#) Procedure
- [REFRESH\\_MVIEW](#) Procedure

## Requirements for the Relational Materialized View

SQL Aggregation Management uses an existing relational materialized view to derive all the information needed to generate a cube materialized view. The relational materialized view determines the detail level of data that is stored in the cube materialized view. The related relational dimension objects determine the scope of the aggregates, from the lowest level specified in the `GROUP BY` clause of the materialized view subquery, to the highest level of the dimension hierarchy.

The relational materialized view must conform to these requirements:

- Explicit `GROUP BY` clause for one or more columns.
  - No expressions in the select list or `GROUP BY` clause.
  - At least one of these numeric aggregation methods: `SUM`, `MIN`, `MAX`, or `AVG`.
  - No outer joins.
  - Summary keys with at least one simple column associated with a relational dimension.
- or*
- Summary keys with at least one simple column and no hierarchies or levels.
- Numeric data type of any type for the fact columns. All facts are converted to `NUMBER`.
  - Eligible for rewrite. `REWRITE_CAPABILITY` should be `GENERAL`; it cannot be `NONE`. Refer to the `ALL_MVIEWS` entry in the *Oracle Database Reference*.
  - Cannot use the `DISTINCT` or `UNIQUE` keywords with an aggregate function in the defining query. For example, `AVG (DISTINCT units)` causes an error in `STRICT` mode and is ignored in `LOOSE` mode.

You can choose between two modes when rendering the cube materialized view, `LOOSE` and `STRICT`. In `STRICT` mode, any deviation from the requirements raises an exception and prevents the materialized view from being created. In `LOOSE` mode (the default), some deviations are allowed, but they affect the content of the materialized view. These elements in the relational materialized view generate warning messages:

- Complex expressions in the defining query are ignored and do not appear in the cube materialized view.
- The `AVG` function is changed to `SUM` and `COUNT`.
- The `COUNT` function without a `SUM`, `MIN`, `MAX`, or `AVG` function is ignored.
- The `STDDEV` and `VARIANCE` functions are ignored.

You can also choose how conditions in the `WHERE` clause are filtered. When filtering is turned off, the conditions are ignored. When turned on, valid conditions are rendered in the cube materialized view, but asymmetric conditions among dimension levels raise an exception.

## Permissions for Managing and Querying Cube Materialized Views

To create cube materialized views, you must have these privileges:

- CREATE [ANY] MATERIALIZED VIEW privilege
- CREATE [ANY] DIMENSION privilege
- ADVISOR privilege

To access cube materialized views from another schema using query rewrite, you must have these privileges:

- GLOBAL QUERY REWRITE privilege
- SELECT privilege on the relational source tables
- SELECT privilege on the analytic workspace (*AW\$name*) that supports the cube materialized view
- SELECT privilege on the cube
- SELECT privilege on the dimensions of the cube

Note that you need SELECT privileges on the database objects that *support* the cube materialized views, but not on the cube materialized views.

## Example of SQL Aggregation Management

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL\_MONTH\_SALES\_MV and FWEEK\_PSCAT\_SALES\_MV.

### About Relational Materialized View CAL\_MONTH\_SALES\_MV

This example uses CAL\_MONTH\_SALES\_MV as the basis for creating a cube materialized view. The following query was used to create CAL\_MONTH\_SALES\_MV. CAL\_MONTH\_SALES\_MV summarizes the daily sales data stored in the SALES table by month.

```
SELECT query FROM user_mviews
      WHERE mview_name='CAL_MONTH_SALES_MV';
```

```
QUERY
```

```
-----
SELECT  t.calendar_month_desc
      ,   sum(s.amount_sold) AS dollars
FROM    sales s
      ,   times t
WHERE   s.time_id = t.time_id
GROUP BY t.calendar_month_desc
```

DBMS\_CUBE uses relational dimensions to derive levels and hierarchies for the cube materialized view. The SH schema has relational dimensions for most dimension tables in the schema, as shown by the following query.

```
SELECT dimension_name FROM user_dimensions;
```

```
DIMENSION_NAME
```

```
-----
CUSTOMERS_DIM
PRODUCTS_DIM
TIMES_DIM
CHANNELS_DIM
PROMOTIONS_DIM
```

### Creating the Cube Materialized View

This PL/SQL script uses the CREATE\_MVIEW function to create a cube materialized view from CAL\_MONTH\_SALES\_MV. CREATE\_MVIEW sets the optional BUILD parameter to refresh the cube materialized view immediately.

```
SET serverout ON format wrapped
```

```
DECLARE
```

```
    salesaw varchar2(30);
```

```
BEGIN
```

```
    salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV',
                                     'build=immediate');
```

```
END;
```

```
/
```

These messages confirm that the script created and refreshed CB\$CAL\_MONTH\_SALES successfully:

```
Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20081112 08:42:58.0
```

03.  
 Created cube organized materialized view "CB\$CAL\_MONTH\_SALES" for rewrite at 20081112 08:42:58.004.

The following query lists the materialized views in the SH schema:

```
SELECT mview_name FROM user_mvviews;
```

```
MVIEW_NAME
-----
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
```

Two new materialized views are registered in the data dictionary:

- CB\$CAL\_MONTH\_SALES: Cube materialized view
- CB\$TIMES\_DIM\_D1\_CAL\_ROLLUP: Cube dimension materialized view for the TIME\_DIM Calendar Rollup hierarchy

Cube dimension materialized views support refresh of the cube materialized view. You do not directly administer dimension materialized views.

## Disabling the Relational Materialized Views

After creating a cube materialized view, disable query rewrite on all relational materialized views for the facts now supported by the cube materialized view. You can drop them when you are sure that you created the cube materialized view with the optimal parameters.

```
ALTER MATERIALIZED VIEW cal_month_sales_mv DISABLE QUERY REWRITE;
```

Materialized view altered.

You can also use the `DISABLEQRW` parameter in the `CREATE_MVIEW` function, which disables query rewrite on the source materialized view as described in [Table 41-7](#).

## Creating Execution Plans for Cube Materialized Views

You can create execution plans for cube materialized views the same as for relational materialized views. The following command generates an execution plan for a query against the `SALES` table, which contains data at the day level. The answer set requires data summarized by quarter. Query rewrite would not use the original relational materialized view for this query, because its data is summarized by month. However, query rewrite can use the new cube materialized view for summary data for months, quarters, years, and all years.

```
EXPLAIN PLAN FOR SELECT
    t.calendar_quarter_desc,
    sum(s.amount_sold) AS dollars
FROM    sales s,
        times t
WHERE   s.time_id = t.time_id
AND     t.calendar_quarter_desc LIKE '2001%'
GROUP BY t.calendar_quarter_desc
ORDER BY t.calendar_quarter_desc;
```

The query returns these results:

```
CALENDAR_QUARTER_DESC    DOLLARS
```

```

-----
2001-01                6547097.44
2001-02                6922468.39
2001-03                7195998.63
2001-04                7470897.52

```

The execution plan shows that query rewrite returned the summary data from the cube materialized view, CB\$CAL\_MONTH\_SALES, instead of recalculating it from the SALES table.

```
SELECT plan_table_output FROM TABLE(dbms_xplan.display());
```

```
PLAN_TABLE_OUTPUT
```

```
-----
Plan hash value: 2999729407
```

```

-----
| Id | Operation                               | Name                | Rows | Bytes | Cost (%CPU)| Time     |
-----
|  0 | SELECT STATEMENT                         |                     |     1 |    30 |    3 (34) | 00:00:01 |
|  1 | SORT GROUP BY                             |                     |     1 |    30 |    3 (34) | 00:00:01 |
|*  2 |  MAT_VIEW REWRITE CUBE ACCESS            | CB$CAL_MONTH_SALES |     1 |    30 |    2 (0)  | 00:00:01 |
-----

```

```
Predicate Information (identified by operation id):
```

```

-----
2 - filter("CB$CAL_MONTH_SALES"."D1_CALENDAR_QUARTER_DESC" LIKE '2001%' AND
          "CB$CAL_MONTH_SALES"."SYS_GID"=63)

```

```
15 rows selected.

## Maintaining Cube Materialized Views

You can create a cube materialized view that refreshes automatically. However, you can force a refresh at any time using the [REFRESH\\_MVIEW Procedure](#):

```

BEGIN
    dbms_cube.refresh_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/

```

```
Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20081112
14:30:59.534.
```

If you want to drop a cube materialized view, use the [DROP\\_MVIEW Procedure](#) so that all supporting database objects (analytic workspace, cube, cube dimensions, and so forth) are also dropped:

```

BEGIN
    dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/

```

```
Dropped cube organized materialized view "SH"."CAL_MONTH_SALES" including
container analytic workspace "SH"."CAL_MONTH_SALES_AW" at 20081112 13:38:47.878.
```

## New Database Objects

The CREATE\_MVIEW function creates several first class database objects in addition to the cube materialized views. You can explore these objects through the data dictionary by querying views such as ALL\_CUBES and ALL\_CUBE\_DIMENSIONS.

This example created the following supporting objects:

- Analytic workspace CAL\_MONTH\_SALES\_AW (AW\$CAL\_MONTH\_SALES\_AW table)
- Cube CAL\_MONTH\_SALES
- Cube dimension TIMES\_DIM\_D1
- Dimension hierarchy CAL\_ROLLUP
- Dimension levels ALL\_TIMES\_DIM, YEAR, QUARTER, and MONTH
- Numerous attributes for levels in the CAL\_ROLLUP hierarchy

## Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g

You can upgrade an Oracle OLAP 10g analytic workspace to OLAP 11g by saving the metadata in an XML template and using it to create a new analytic workspace. The original analytic workspace remains accessible and unchanged by the upgrade process.

**Tip:** Oracle recommends using Analytic Workspace Manager for performing upgrades. See the *Oracle OLAP User's Guide*.

These subprograms in DBMS\_CUBE support the upgrade process:

- [CREATE\\_EXPORT\\_OPTIONS Procedure](#)
- [CREATE\\_IMPORT\\_OPTIONS Procedure](#)
- [EXPORT\\_XML Procedure](#)
- [EXPORT\\_XML\\_TO\\_FILE Procedure](#)
- [IMPORT\\_XML Procedure](#)
- [INITIALIZE\\_CUBE\\_UPGRADE Procedure](#)
- [UPGRADE\\_AW Procedure](#)

### Prerequisites:

- The OLAP 10g analytic workspace can use CWM metadata or OLAP standard form (AWXML) metadata.
- Customizations to the OLAP 10g analytic workspace may not be exported to the XML template. You must re-create them in OLAP 11g.
- The original relational source data must be available to load into the new analytic workspace. If the data is in a different schema or the table names are different, then you must remap the dimensional objects to the new relational sources after the upgrade.
- You can create the OLAP 11g analytic workspace in the same schema as the OLAP 10g analytic workspace. However, if you prefer to create it in a different schema, then create a new user with the following privileges:
  - SELECT privileges on the OLAP 10g analytic workspace (`GRANT SELECT ON schema.AW$analytic_workspace`).
  - SELECT privileges on all database tables and views that contain the source data for the OLAP 10g analytic workspace.
  - Appropriate privileges for an OLAP administrator.
  - Same default tablespace as the Oracle 10g user.

See the *Oracle OLAP User's Guide*.

## Correcting Naming Conflicts

The namespaces are different in OLAP 11g and OLAP 10g. For a successful upgrade, you must identify any 10g object names that are used multiple times under the 11g naming rules and provide unique names for them.

The following namespaces control the uniqueness of OLAP object names in Oracle 11g:

- **Schema:** The names of cubes, dimensions, and measure folders must be unique within a schema. They cannot conflict with the names of tables, views, indexes, relational dimensions, or any other first class objects. However, these OLAP 11g object names do not need to be distinct from 10g object names, because they are in different namespaces.
- **Cube:** The names of measures must be unique within a cube.
- **Dimension:** The names of hierarchies, levels, and attributes must be unique within a dimension. For example, a dimension cannot have a hierarchy named Customers and a level named Customers.

You can use an initialization table and a rename table to rename objects in the upgraded 11g analytic workspace.

### Initialization Table

The `INITIALIZE_CUBE_UPGRADE` procedure identifies ambiguous names under the OLAP 11g naming rules. For example, a 10g dimension might have a hierarchy and a level with the same name. Because hierarchies and levels are in the same 11g namespace, the name is not unique in 11g; to an 11g client, the hierarchy and the level cannot be differentiated by name.

`INITIALIZE_CUBE_UPGRADE` creates and populates a table named `CUBE_UPGRADE_INFO` with unique names for these levels, hierarchies, and attributes. By using the unique names provided in the table, an 11g client can browse the OLAP 11g metadata. You cannot attach an OLAP 11g client to the analytic workspace or perform an upgrade without a `CUBE_UPGRADE_INFO` table, if the 10g metadata contains ambiguous names.

You can edit `CUBE_UPGRADE_INFO` to change the default unique names to names of your choosing. You can also add rows to change the names of any other objects. When using an 11g client, you see the new object names. When using an 10g client, you see the original names. However, the `INITIALIZE_CUBE_UPGRADE` procedure overwrites this table, so you may prefer to enter customizations in a rename table.

During an upgrade from OLAP 10g, the unique object names in `CUBE_UPGRADE_INFO` are used as the names of 11g objects in the new analytic workspace. However, `INITIALIZE_CUBE_UPGRADE` does not automatically provide unique names for cubes, dimensions, and measure folders. To complete an upgrade, you must assure that these objects have unique names within the 11g namespace. You can provide these objects with new names in the `CUBE_UPGRADE_INFO` table or in a rename table.

OLAP 11g clients automatically use `CUBE_UPGRADE_INFO` when it exists in the same schema as the OLAP 10g analytic workspace.

**See Also:** ["INITIALIZE\\_CUBE\\_UPGRADE Procedure"](#) on page 41-52

## Rename Table

You can create a rename table that contains new object names for an OLAP 11g analytic workspace. You can then use the rename table in the `CREATE_IMPORT_OPTIONS` and `UPGRADE_AW` procedures.

When upgrading within the same schema, you must provide a unique name for the 11g analytic workspace. The `UPGRADE_AW` procedure provides a parameter for this purpose; otherwise, you must provide the new name in the rename table. The duplication of cube names does not create ambiguity because the 11g cubes are created in a different namespace than the 10g cubes.

The names provided in a rename table are used only during an upgrade and overwrite any names entered in the `CUBE_UPGRADE_INFO` table.

### To create a rename table:

1. Open SQL\*Plus or another SQL client, and connect to Oracle Database as the owner of the 10g analytic workspace.
2. Issue a command like the following:

```
CREATE TABLE table_name (
    source_id    VARCHAR2(300),
    new_name     VARCHAR2(30),
    object_type  VARCHAR2(30));
```

3. Populate the rename table with the appropriate values, as follows.

`table_name` is the name of the rename table.

`source_id` is the identifier for an object described in the XML document supplied to `IMPORT_XML`. The identifier must have this format:

```
schema_name.object_name[.subobject_name]
```

`new_name` is the object name given during the import to the object specified by `source_id`.

`object_type` is the object type as described in the XML, such as `StandardDimension` or `DerivedMeasure`.

For example, these SQL statements populate the table with new names for the analytic workspace, a cube, and four dimensions:

```
INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW', 'GLOBAL11', 'AW');
INSERT INTO my_object_map VALUES('GLOBAL_AW.UNITS_CUBE', 'UNIT_SALES_CUBE',
'Cube');
INSERT INTO my_object_map VALUES('GLOBAL_AW.CUSTOMER', 'CUSTOMERS',
'StandardDimension');
INSERT INTO my_object_map VALUES('GLOBAL_AW.CHANNEL', 'CHANNELS',
'StandardDimension');
INSERT INTO my_object_map VALUES('GLOBAL_AW.PRODUCT', 'PRODUCTS',
'StandardDimension');
INSERT INTO my_object_map VALUES('GLOBAL_AW.TIME', 'TIME_PERIODS',
'TimeDimension');
```

**See Also:** ["CREATE\\_IMPORT\\_OPTIONS Procedure"](#) on page 41-34

## Simple Upgrade

A simple upgrade creates an OLAP 11g analytic workspace from an OLAP 10g analytic workspace.

### To perform a simple upgrade of an Oracle OLAP 10g analytic workspace:

1. Open SQL\*Plus or a similar SQL command-line interface and connect to Oracle Database 11g as the schema owner for the OLAP 11g analytic workspace.
2. To rename any objects in the 11g analytic workspace, create a rename table as described in ["Rename Table"](#) on page 41-14. (Optional)
3. Perform the upgrade, as described in ["UPGRADE\\_AW Procedure"](#) on page 41-56.
4. Use the `DBMS_CUBE.BUILD` procedure to load data into the cube.

### **Example 41–1 Performing a Simple Upgrade to the GLOBAL Analytic Workspace**

This example creates an OLAP 11g analytic workspace named `GLOBAL11` from an OLAP 10g analytic workspace named `GLOBAL10`. `GLOBAL10` contains no naming conflicts between cubes, dimensions, measure folders, or tables in the schema, so a rename table is not needed in this example.

```
BEGIN

  -- Upgrade the analytic workspace
  dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL11');

  -- Load and aggregate the data
  dbms_cube.build(script => 'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

## Custom Upgrade

A custom upgrade enables you to set the export and import options.

### To perform a custom upgrade of an Oracle OLAP 10g analytic workspace:

1. Open SQL\*Plus or a similar SQL command-line interface and connect to Oracle Database 11g as the schema owner of the OLAP 11g analytic workspace.
2. Generate an initialization table, as described in ["Initialization Table"](#) on page 41-13. Review the new, default object names and modify them as desired.
3. Create a rename table, as described in ["Rename Table"](#) on page 41-14. If you are upgrading in the same schema, you must use a rename table to provide a unique name for the 11g analytic workspace. Otherwise, a rename table is needed only if names are duplicated among the cubes, dimensions, and measure folders of the analytic workspace, or between those names and the existing cubes, dimensions, measure folders, or tables of the destination schema.
4. Create a SQL script that does the following:
  - a. Create an XML document for the export options, as described in ["CREATE\\_EXPORT\\_OPTIONS Procedure"](#) on page 41-31. The `SUPPRESS_NAMESPACE` option must be set to `TRUE` for the upgrade to occur.
  - b. Create an XML document for the import options, as described in ["CREATE\\_IMPORT\\_OPTIONS Procedure"](#) on page 41-34.
  - c. Create an XML template in OLAP 11g format, as described in ["EXPORT\\_XML Procedure"](#) on page 41-45.
  - d. Create an OLAP 11g analytic workspace from the XML template, as described in ["IMPORT\\_XML Procedure"](#) on page 41-49.
5. Load and aggregate the data in the new analytic workspace, as described in ["BUILD Procedure"](#) on page 41-19.

### **Example 41–2 Performing a Custom Upgrade to the GLOBAL Analytic Workspace**

This example upgrades the `GLOBAL10` analytic workspace from OLAP 10g metadata to OLAP 11g metadata in the `GLOBAL_AW` schema.

The rename table provides the new name of the analytic workspace. These commands define the rename table.

```
CREATE TABLE my_object_map(
    source_id    VARCHAR2(300),
    new_name     VARCHAR2(30),
    object_type  VARCHAR2(30));

INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW', 'GLOBAL11', 'AW');
COMMIT;
```

Following is the script for performing the upgrade.

```
set serverout on

DECLARE
    importClob    clob;
    exportClob    clob;
    exportOptClob clob;
    importOptClob clob;
```

```
BEGIN

  -- Create table of reconciled names
  dbms_cube.initialize_cube_upgrade;

  -- Create a CLOB containing the export options
  dbms_lob.createtemporary(exportOptClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_
namespace=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB containing the import options
  dbms_lob.createtemporary(importOptClob, TRUE);
  dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table =>
'MY_OBJECT_MAP');

  -- Create CLOBs for the metadata
  dbms_lob.createtemporary(importClob, TRUE);
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from a 10g analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_
xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob, out_
xml=>importClob);

  -- Load and aggregate the data
  dbms_cube.build('UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

---

## Summary of DBMS\_CUBE Subprograms

**Table 41–1 DBMS\_CUBE Subprograms**

Subprogram	Description
<a href="#">BUILD Procedure</a> on page 41-19	Loads data into one or more cubes and dimensions, and prepares the data for querying.
<a href="#">CREATE_EXPORT_OPTIONS Procedure</a> on page 41-31	Creates an input XML document of processing options for the EXPORT_XML procedure.
<a href="#">CREATE_IMPORT_OPTIONS Procedure</a> on page 41-34	Creates an input XML document of processing options for the IMPORT_XML procedure.
<a href="#">CREATE_MVIEW Function</a> on page 41-36	Creates a cube materialized view from the definition of a relational materialized view.
<a href="#">DERIVE_FROM_MVIEW Function</a> on page 41-41	Creates an XML template for a cube materialized view from the definition of a relational materialized view.
<a href="#">DROP_MVIEW Procedure</a> on page 41-43	Drops a cube materialized view.
<a href="#">EXPORT_XML Procedure</a> on page 41-45	Exports the XML of an analytic workspace to a CLOB.
<a href="#">EXPORT_XML_TO_FILE Procedure</a> on page 41-47	Exports the XML of an analytic workspace to a file.
<a href="#">IMPORT_XML Procedure</a> on page 41-49	Creates, modifies, or drops an analytic workspace by using an XML template
<a href="#">INITIALIZE_CUBE_UPGRADE Procedure</a> on page 41-52	Processes Oracle OLAP 10g objects with naming conflicts to enable Oracle 11g clients to access them.
<a href="#">REFRESH_MVIEW Procedure</a> on page 41-54	Refreshes a cube materialized view.
<a href="#">UPGRADE_AW Procedure</a> on page 41-56	Upgrades an analytic workspace from Oracle OLAP 10g to 11g.
<a href="#">VALIDATE_XML Procedure</a> on page 41-58	Checks the XML to assure that it is valid, without committing the results to the database.

## BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

### Syntax

```
DBMS_CUBE.BUILD (
    script           IN  VARCHAR2,
    method          IN  VARCHAR2          DEFAULT NULL,
    refresh_after_errors IN  BOOLEAN      DEFAULT FALSE,
    parallelism     IN  BINARY_INTEGER  DEFAULT 0,
    atomic_refresh  IN  BOOLEAN          DEFAULT FALSE,
    automatic_order IN  BOOLEAN          DEFAULT TRUE,
    add_dimensions  IN  BOOLEAN          DEFAULT TRUE,
    scheduler_job   IN  VARCHAR2        DEFAULT NULL,
    master_build_id IN  BINARY_INTEGER  DEFAULT 0,
    nested          IN  BOOLEAN          DEFAULT FALSE);
```

### Parameters

**Table 41–2 BUILD Procedure Parameters**

Parameter	Description
script	A list of cubes and dimensions and their build options (see <a href="#">"SCRIPT Parameter"</a> on page 41-20).
method	<p>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated.</p> <p>You can specify a method for each cube and dimension in sequential order, or a single method to apply to all cubes and dimensions. If you list more objects than methods, then the last method applies to the additional objects.</p> <ul style="list-style-type: none"> <li>■ C: Complete refresh clears all dimension values before loading. (Default)</li> <li>■ F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table.</li> <li>■ ?: Fast refresh if possible, and otherwise a complete refresh.</li> <li>■ P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables.</li> <li>■ S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values.</li> </ul> <p>See the <a href="#">"Usage Notes"</a> on page 41-26 for additional details.</p> <p>Methods do not apply to dimensions.</p>
refresh_after_errors	<p>TRUE to roll back just the cube or dimension with errors, and then continue building the other objects.</p> <p>FALSE to roll back all objects in the build.</p>
parallelism	Number of parallel processes to allocate to this job (see <a href="#">Usage Notes</a> ).

**Table 41–2 (Cont.) BUILD Procedure Parameters**

Parameter	Description
<code>atomic_refresh</code>	<p><code>TRUE</code> prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state.</p> <p><code>FALSE</code> enables users to access intermediate results during a build.</p>
<code>automatic_order</code>	<p><code>TRUE</code> enables optimization of the build order. Dimensions are loaded before cubes.</p> <p><code>FALSE</code> builds objects in the order you list them in the script.</p>
<code>add_dimensions</code>	<p><code>TRUE</code> automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script.</p> <p><code>FALSE</code> includes only dimensions specifically listed in the script.</p>
<code>scheduler_job</code>	Any text identifier for the job, which will appear in the log table. The string does not need to be unique.
<code>master_build_id</code>	A unique name for the build.
<code>nested</code>	<p><code>TRUE</code> performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.</p> <p>All objects must reside in a single analytic workspace.</p>

## SCRIPT Parameter

The `SCRIPT` parameter identifies the objects that will be included in the build, and specifies the type of processing that will be performed on each one. The parameter has this syntax:

```
[VALIDATE | NO COMMIT] objects [ USING ( commands ) ][,...]
```

*Where:*

`VALIDATE` checks all steps of the build and sends the planned steps to `CUBE_BUILD_LOG` without executing the steps. You can view all generated SQL in the `OUTPUT` column of the log table.

`NO COMMIT` builds the objects in the current attach mode (or Read Only when the analytic workspace is not attached) but does not commit the changes. This option supports what-if analysis, since it enables you to change data values temporarily. See ["SCRIPT Parameter: USING Clause: SET command"](#) on page 41-25.

`objects` is the qualified name of one or more cubes or dimensions, separated by commas, in the form `[aw_name. ]object`, such as `UNITS_CUBE` or `GLOBAL.UNITS_CUBE`.

## SCRIPT Parameter: USING Clause

The `USING` clause specifies the processing options. It consists of one or more commands separated by commas.

---

---

**Note:** A cube with a rewrite materialized view cannot have a USING clause, except for the ANALYZE command. It uses the default build options.

---

---

The commands can be any of the following.

- AGGREGATE USING [MEASURE]

Generates aggregate values using the syntax described in "[SCRIPT Parameter: USING Clause: AGGREGATE command](#)".

- ANALYZE

Runs DBMS\_AW\_STATS .ANALYZE, which generates and stores optimizer statistics for cubes and dimensions.

- CLEAR [VALUES | LEAVES | AGGREGATES] [SERIAL | PARALLEL]

Prepares the cube for a data refresh. It can also be used on dimensions, but CLEAR removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

These optional arguments control the refresh method. If you omit the argument, then the behavior of CLEAR depends on the refresh method. The 'C' (complete) refresh method runs CLEAR VALUES, and all other refresh methods run CLEAR LEAVES.

- VALUES: Clears all data in the cube. All facts must be reloaded and all aggregates must be recomputed. This option supports the COMPLETE refresh method. (Default for the C and F methods)
- LEAVES: Clears the detail data and retains the aggregates. All facts must be reloaded, and the aggregates for any new or changed facts must be computed. This option supports the FAST refresh method. (Default for the ? method)
- AGGREGATES: Retains the detail data and clears the aggregates. All aggregates must be recomputed.

These optional arguments control the load method, and can be combined with any of the refresh options:

- PARALLEL: Each partition is cleared separately. (Default)
- SERIAL: All partitions are cleared together.

If you omit the CLEAR command, DBMS\_CUBE loads new and updated facts, but does not delete any old detail data. This is equivalent to a LOAD NO SYNC for dimensions.

- COMPILE [SORT | NO SORT | SORT ONLY]

Creates the supporting structures for the dimension. (Dimensions only)

These options control the use of a sort order attribute:

- SORT: The user-defined sort order attribute populates the sort column in the embedded-total (ET) view. (Default)
- NO SORT: Any sort order attribute is ignored. This option is for very large dimensions where sorting could consume too many resources.
- SORT ONLY: The compile step only runs the sort.

- EXECUTE PLSQL string

Executes a PL/SQL command or script in the database.

- EXECUTE OLAP DML *string* [PARALLEL | SERIAL]

Executes an OLAP DML command or program in the analytic workspace. The options control execution of the command or program:

- PARALLEL: Execute the command or program once for each partition. This option can be used to provide a performance boost to complex DML operations, such as forecasts and models.
- SERIAL: Execute the command or program once for the entire cube. (Default)

- [INSERT | MERGE] INTO [ALL HIERARCHIES | HIERARCHIES (*dimension.hierarchy*)] VALUES (*dim\_key*, *level\_name*, *parent*)

Adds a dimension member to one or more hierarchies. INSERT throws an error if the member already exists, while MERGE does not. See "[Dimension Maintenance Example](#)" on page 41-29.

*dimension.hierarchy*: The name of a hierarchy the new member belongs to. Enclose each part of the name in double quotes, for example, "PRODUCT" . "PRIMARY".

*dim\_key*: The DIM\_KEY value of the dimension member.

*level\_name*: The level of the dimension key.

*parent*: The parent of the dimension key.

- UPDATE [ALL HIERARCHIES | HIERARCHIES (*dimension.hierarchy*)] SET PARENT = *parent*, LEVEL=*level\_name* WHERE MEMBER = *dim\_key*

Alters the level or parent of an existing dimension member. See INSERT for a description of the options. Also see "[Dimension Maintenance Example](#)" on page 41-29.

- DELETE FROM DIMENSION WHERE MEMBER=*dim\_key*

Deletes a dimension member. See "[Dimension Maintenance Example](#)" on page 41-29.

*dim\_key*: The DIM\_KEY value of the dimension member to be deleted.

- SET *dimension.attribute[qdr]* = CAST('attribute\_value' AS VARCHAR2)

Sets the value of an attribute for a dimension member. See "[Dimension Maintenance Example](#)" on page 41-29.

*dimension.attribute*: The name of the attribute. Enclose each part of the name in double quotes, for example, "PRODUCT" . "LONG\_DESCRIPTION".

*qdr*: The dimension member being given an attribute value in the form of a qualified data reference, such as "PRODUCT"='OPT MOUSE'.

*attribute\_value*: The value of the attribute, such as 'Optical Mouse'.

- FOR *dimension\_clause* *measure\_clause* BUILD (*commands*)

Restricts the build to particular measures and dimension values, using the following arguments. See "[FOR Clause Example](#)" on page 41-28.

- *dimension\_clause*:

*dimension* ALL | NONE | WHERE *condition* | LEVELS (*level* [, *level*...])

*dimension* is the name of a dimension of the cube.

ALL sets the dimension status to all members before executing the list of commands.

NONE loads values for no dimension members.

WHERE loads values for those dimension members that match the condition.

LEVELS loads values for dimension members in the named levels.

*level* is a level of the named dimension.

– *measure\_clause*:

MEASURES (*measure* [, *measure* . . . ])

*measure* is the name of a measure in the cube.

– *commands*: Any of the other USING commands.

- LOAD [SYNCH | NO SYNCH] [PRUNE | PARALLEL | SERIAL] [WHERE *condition*]

Loads data into the dimension or cube.

– WHERE limits the load to those values in the mapped relational table that match *condition*.

– *condition* is a valid predicate based on the columns of the mapped table. See the "Examples" on page 41-27.

These optional arguments apply only to dimensions:

- SYNCH matches the dimension keys to the relational data source. (Default)
- NO SYNCH loads new dimension keys but does not delete old keys.

These optional arguments apply only to cubes:

- PRUNE: Runs a full table scan on the fact table to determine which partitions to load. For example, if a cube is partitioned by month and the fact table has values only for the last two months, then jobs are only started to load the partitions for the last two months.
- PARALLEL: Each partition is loaded separately. (Default)
- SERIAL: All partitions are loaded in one SELECT statement.

- MODEL *model\_name* [PARALLEL | SERIAL]

Executes a model previously created for the cube. It accepts these arguments:

- PARALLEL: The model runs separately on each partition.
- SERIAL: The model runs on all cubes at the same time. (Default)

- SET

Supports write-back to the cube using the syntax described in "[SCRIPT Parameter: USING Clause: SET command](#)" on page 41-25. (Cubes only)

- SOLVE [PARALLEL | SERIAL]

Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)

It accepts these arguments:

- PARALLEL: Each partition is solved separately. (Default)

- SERIAL: All partitions are solved at the same time.

**SCRIPT Parameter: USING Clause: AGGREGATE command**

The AGGREGATE command in a script specifies the aggregation rules for one or more measures.

---

---

**Note:** The AGGREGATE command is available only for uncompressed cubes.

---

---

AGGREGATE has the following syntax:

```
{ AGGREGATE USING MEASURE
  WHEN measure1 THEN operator1
  WHEN measure2 THEN operator2...
  ELSE default_operator
|
  [AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES (hierarchy)}
```

**USING MEASURE Clause**

This clause enables you to specify different aggregation operators for different measures in the cube.

**Operator Clause**

The operator\_clause has this syntax:

```
operator(WEIGHTBY expression | SCALEBY expression)
```

WEIGHTBY multiplies each data value by an expression before aggregation.

SCALEBY adds the value of an expression to each data value before aggregation.

**Table 41-3 Aggregation Operators**

Operator	Option	Description
AVG	WEIGHTBY	Adds data values, then divides the sum by the number of data values that were added together.
FIRST	WEIGHTBY	The first real data value.
HIER_AVG	WEIGHTBY	Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike AVERAGE, which counts only non-NA children, HAVERAGE counts all of the logical children of a parent, regardless of whether each child does or does not have a value.
HIER_FIRST	WEIGHTBY	The first data value in the hierarchy, even when that value is NA.
HIER_LAST	WEIGHTBY	The last data value in the hierarchy, even when that value is NA.
LAST	WEIGHTBY	The last real data value.
MAX	WEIGHTBY	The largest data value among the children of each parent.
MIN	WEIGHTBY	The smallest data value among the children of each parent.
SUM	SCALEBY   WEIGHTBY	Adds data values. (Default)

## Processing Options

You can specify these processing options for aggregation:

- (ALLOW | DISALLOW) OVERFLOW
 

Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.

  - ALLOW: A calculation that generates overflow executes without error and produces null results. (Default)
  - DISALLOW: A calculation involving overflow stops executing and generates an error message.
- (ALLOW | DISALLOW) DIVISION BY ZERO
 

Specifies whether to allow division by zero.

  - ALLOW: A calculation involving division by zero executes without error but returns a null value. (Default)
  - DISALLOW: A calculation involving division by zero stops executing and generates an error message.
- (CONSIDER | IGNORE) NULLS
 

Specifies whether nulls are included in the calculations.

  - CONSIDER: Nulls are included in the calculations. A calculation that includes a null value returns a null value.
  - IGNORE: Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)
- MAINTAIN COUNT
 

Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

## SCRIPT Parameter: USING Clause: SET command

The SET command in a script assigns values to one or more cells in a stored measure. It has this syntax:

```
SET target = expression
```

Where:

*target* is a measure or a qualified data reference.

*expression* returns values of the appropriate data type for *target*.

### Qualified Data References

Qualified data references (QDRs) limit a dimensional object to a single member in one or more dimensions for the duration of a query.

A QDR has the following syntax:

```
expression [ { dimension = member } [ , { dimension = member } ... ] ]
```

Where:

*expression* is a dimensional expression, typically the name of a measure.

*dimension* is a primary dimension of expression.

*member* is a value of dimension.

The outside square brackets shown in bold are literal syntax elements; they do not indicate an optional argument. The inside square brackets shown in regular text delimit an optional argument and are not syntax elements.

This example returns Sales values for calendar year 2007:

```
global.sales[global.time = 'CY2007'  
]
```

The next example returns Sales values only for the United States in calendar year 2007:

```
sales[customer = 'US', time = 'CY2007'  
]
```

See the Examples for qualified data references in SET commands.

## Usage Notes

### Build Methods

The *C*, *S*, and *?* methods always succeed and can be used on any cube.

The *F* and *P* methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

### Parallelism

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually allocated by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the `PARALLELISM` argument of the `BUILD` procedure.
- Setting of the `JOB_QUEUE_PROCESSES` database initialization parameter.

Suppose `UNITS_CUBE` has 12 partitions, `PARALLELISM` is set to 10, and `JOB_QUEUE_PROCESSES` is set to 4. OLAP uses four processes, which appear as slave processes in the build log.

The SQL engine may allocate additional processes when the `PARALLEL_DEGREE_POLICY` database initialization parameter is set to `AUTO` or `LIMITED`. For example, if OLAP allocates four processes, the SQL engine might determine that two of those processes should be done by four processes instead, for a total of six processes.

### Build Logs

OLAP generates three logs that provide diagnostic information about builds:

- Cube build log
- Rejected values log
- Cube dimension compile log

Analytic Workspace Manager creates these logs automatically as tables in the same schema as the analytic workspace. If you do not use Analytic Workspace Manager, you can create and manage the logs in PL/SQL using the `DBMS_CUBE_LOG` package.

You can also create the cube log file by running `$ORACLE_HOME/olap/admin/utl_olaplog.sql`. This script creates three additional views:

- CUBE\_BUILD\_LATEST: Returns rows only from the last build.
- CUBE\_BUILD\_REPORT: Returns one row for each command with elapsed times.
- CUBE\_BUILD\_REPORT\_LATEST: Returns a report like CUBE\_BUILD\_REPORT only from the last build.

This report shows a successfully completed build of the objects in the GLOBAL analytic workspace, which has four dimensions and two cubes.

```
SELECT command, status, build_object, build_object_type type
FROM cube_build_report_latest;
```

COMMAND	STATUS	BUILD_OBJECT	TYPE
BUILD	COMPLETED		BUILD
FREEZE	COMPLETED		BUILD
LOAD NO SYNCH	COMPLETED	CHANNEL	DIMENSION
COMPILE	COMPLETED	CHANNEL	DIMENSION
UPDATE/COMMIT	COMPLETED	CHANNEL	DIMENSION

THAW	COMPLETED		BUILD

31 rows selected.

## Examples

This example uses the default parameters to build UNITS\_CUBE.

```
EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS_CUBE');
```

The next example builds UNITS\_CUBE and explicitly builds two of its dimensions, TIME and CHANNEL. The dimensions use the complete (C) method, and the cube uses the fast solve (S) method.

```
BEGIN
  DBMS_CUBE.BUILD(
    script=>'GLOBAL."TIME", GLOBAL.CHANNEL, GLOBAL.UNITS_CUBE',
```

```

        method=>'CCS',
        parallelism=>2);
END;
/

```

The following example loads only the selection of data identified by the WHERE clause:

```

BEGIN
  DBMS_CUBE.BUILD(q'!
  GLOBAL."TIME",
  GLOBAL.CHANNEL,
  GLOBAL.CUSTOMER,
  GLOBAL.PRODUCT,
  GLOBAL.UNITS_CUBE USING (LOAD NO SYNCH
  WHERE UNITS_FACT.MONTH_ID LIKE '2006%'
  AND UNITS_FACT.SALES > 5000)!');
END;
/

```

### FOR Clause Example

In this example, the Time dimension is partitioned by calendar year, and DBMS\_CUBE builds only the partition identified by CY2006. The HIER\_ANCESTOR is an analytic function in the OLAP expression syntax.

```

BEGIN
  dbms_cube.build(q'!
  UNITS_CUBE USING
  (
  FOR "TIME"
  WHERE HIER_ANCESTOR(WITHIN "TIME".CALENDAR LEVEL "TIME".CALENDAR_YEAR) =
  'CY2006'
  BUILD (LOAD, SOLVE)
  )!',
  parallelism=>1);
END;
/

```

The next example uses a FOR clause to limit the build to the SALES measure in 2006. All objects are built using the complete (C) method.

```

BEGIN
  DBMS_CUBE.BUILD(
  script => '
  GLOBAL."TIME",
  GLOBAL.CHANNEL,
  GLOBAL.CUSTOMER,
  GLOBAL.PRODUCT,
  GLOBAL.UNITS_CUBE USING
  (
  FOR MEASURES(GLOBAL.UNITS_CUBE.SALES)
  BUILD(LOAD NO SYNCH WHERE GLOBAL.UNITS_FACT.MONTH_ID LIKE ''2006%'')
  )',
  method => 'C',
  parallelism => 2);
END;
/

```

### Write-Back Examples

The following examples show various use of the SET command in a USING clause.

This example sets Sales Target to Sales increased by 5%:

```
DBMS_CUBE.BUILD('UNITS_CUBE USING (
  SET UNITS_CUBE.SALES_TARGET = UNITS_CUBE.SALES * 1.05, SOLVE)');
```

This example sets the price of the Deluxe Mouse in May 2007 to \$29.99:

```
DBMS_CUBE.BUILD('PRICE_CUBE USING (
  SET PRICE_CUBE.UNIT_PRICE["TIME"='2007.05', "PRODUCT"='DLX MOUSE']
  = 29.99, SOLVE)');
```

The next example contains two SET commands, but does not reaggregate the cube:

```
DBMS_CUBE.BUILD('PRICE_CUBE USING (
  SET PRICE_CUBE.UNIT_PRICE["TIME"='2006.12', "PRODUCT"='DLX MOUSE']
  = 29.49,
  SET PRICE_CUBE.UNIT_PRICE["TIME"='2007.05', "PRODUCT"='DLX MOUSE']
  = 29.99)');
```

### Dimension Maintenance Example

This script shows dimension maintenance. It adds a new dimension member named OPT MOUSE to all hierarchies, alters its position in the Primary hierarchy, assigns it a long description, then deletes it from the dimension.

```
BEGIN
dbms_output.put_line('Add optical mouse');
dbms_cube.build(q'!
  "PRODUCT" using (MERGE INTO ALL HIERARCHIES
    VALUES ('ITEM_OPT MOUSE', 'CLASS_SFT', "PRODUCT"."FAMILY"))
!');

dbms_output.put_line('Alter optical mouse');
dbms_cube.build(q'!
  "PRODUCT" using (UPDATE HIERARCHIES ("PRODUCT"."PRIMARY")
    SET PARENT = 'FAMILY_ACC', LEVEL = "PRODUCT"."ITEM"
    WHERE MEMBER = 'ITEM_OPT MOUSE')
!');

dbms_output.put_line('Provide attributes to optical mouse');
dbms_cube.build(q'!
  "PRODUCT" USING (SET "PRODUCT"."LONG_DESCRIPTION"["PRODUCT" = 'ITEM_OPT MOUSE']
    = CAST('Optical Mouse' AS VARCHAR2))
!');

dbms_output.put_line('Delete optical mouse');
dbms_cube.build(q'!
  "PRODUCT" USING (DELETE FROM DIMENSION WHERE MEMBER='ITEM_OPT MOUSE')
!');

END;
/
```

### OLAP DML Example

This example uses the OLAP DML to add comments to the cube build log:

```
BEGIN
DBMS_CUBE.BUILD(q'!
global.units_cube USING (
EXECUTE OLAP DML 'SHOW STATLEN(units_cube_prt_list)' PARALLEL,
EXECUTE OLAP DML 'SHOW LIMIT(units_cube_prt_list KEEP ALL)' PARALLEL,
EXECUTE OLAP DML 'SHOW STATLEN(time)' parallel,
EXECUTE OLAP DML 'SHOW LIMIT(time KEEP time_levelrel 'CALENDAR_YEAR')'
```

```
parallel!'),
  parallelism=>2,
  add_dimensions=>false);
END;
/
```

This query shows the comments in the cube build log:

```
SELECT partition, slave_number, TO_CHAR(output) output
FROM cube_build_log
WHERE command = 'OLAP DML'
AND status = 'COMPLETED'
ORDER BY slave_number, time;
```

PARTITION	SLAVE_NUMBER	OUTPUT
P10:CY2007	1	<OLAPDMLExpression Expression="TO_CHAR(statlen(units_cube_prt_list))" Value="1"/>
P10:CY2007	1	<OLAPDMLExpression Expression="TO_CHAR(limit(units_cube_prt_list keep al 1))" Value="P10"/>
P10:CY2007	1	<OLAPDMLExpression Expression="TO_CHAR(statlen(time))" Value="17"/>
P10:CY2007	1	<OLAPDMLExpression Expression="TO_CHAR(limit(time keep time_levelrel &ap os;CALENDAR_YEAR&apos;))" Value="CALENDAR_YEAR_CY2007"/>
P9:CY2006	2	<OLAPDMLExpression Expression="TO_CHAR(statlen(units_cube_prt_list))" Value="1"/>
P9:CY2006	2	<OLAPDMLExpression Expression="TO_CHAR(limit(units_cube_prt_list keep al 1))" Value="P9"/>
P9:CY2006	2	<OLAPDMLExpression Expression="TO_CHAR(statlen(time))" Value="17"/>
	.	
	.	
	.	

## CREATE\_EXPORT\_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the [EXPORT\\_XML Procedure](#) on page 41-45 and the [EXPORT\\_XML\\_TO\\_FILE Procedure](#) on page 41-47.

### Syntax

```
DBMS_CUBE.CREATE_EXPORT_OPTIONS (
    out_options_xml      IN/OUT  CLOB,
    target_version       IN      VARCHAR2  DEFAULT NULL,
    suppress_owner       IN      BOOLEAN   DEFAULT FALSE,
    suppress_namespace   IN      BOOLEAN   DEFAULT FALSE,
    preserve_table_owners IN      BOOLEAN   DEFAULT FALSE,
    metadata_changes     IN      CLOB      DEFAULT NULL);
```

### Parameters

**Table 41–4 CREATE\_EXPORT\_OPTIONS Procedure Parameters**

Parameter	Description
out_options_xml	Contains the generated XML document, which can be passed into the options_xml parameter of the <a href="#">EXPORT_XML Procedure</a> .
target_version	Specifies the version of Oracle Database in which the XML document generated by EXPORT_XML or EXPORT_XML_TO_FILE will be imported. You can specify two to five digits, such as 11.2 or 11.2.0.2.0. This parameter defaults to the current database version, and so can typically be omitted.
suppress_owner	Controls the use of the Owner attribute in XML elements and the owner qualifier in object names. Enter <code>True</code> to drop the owner from the XML, or enter <code>False</code> to retain it. Enter <code>True</code> if you plan to import the exported metadata into a different schema.
suppress_namespace	Controls the use of Namespace attributes in XML elements and the namespace qualifier in object names. Enter <code>True</code> to drop the namespace from the XML, or enter <code>False</code> to retain it (default). Enter <code>True</code> when upgrading to Oracle OLAP 11g metadata.  Namespaces allow objects created in Oracle 10g to coexist with objects created in Oracle 11g. You cannot set or change namespaces.
preserve_table_owners	Controls the use of the owner in qualifying table names in the mapping elements, such as GLOBAL.UNITS_HISTORY_FACT instead of UNITS_HISTORY_FACT. Enter <code>True</code> to retain the table owner, or enter <code>False</code> to default to the current schema for table mappings. If you plan to import the exported metadata to a different schema, you must set this option to <code>True</code> to load data from tables and views in the original schema, unless the destination schema has its own copies of the tables and views.
metadata_changes	Contains an 11g XML description of an object that overwrites the exported object description. The XML document must contain all parent XML elements of the modified element with the attributes needed to uniquely identify them. Use the Name attribute if it exists. See the Examples.

### Examples

The following example generates an XML document of export options:

```

DECLARE
    optionsClob CLOB;

BEGIN
    dbms_lob.createtemporary(optionsClob, false, dbms_lob.CALL);
    dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_
namespace=>TRUE);
    dbms_output.put_line(optionsClob);
END;
/

```

The DBMS\_OUTPUT.PUT\_LINE procedure displays this XML document (formatted for readability):

```

<?xml version="1.0"?>
<Export TargetVersion="11.2.0.2">
  <ExportOptions>
    <Option Name="SuppressOwner" Value="FALSE"/>
    <Option Name="SuppressNamespace" Value="TRUE"/>
    <Option Name="PreserveTableOwners" Value="FALSE"/>
  </ExportOptions>
</Export>

```

The next example generates an XML document with a metadata change to the mapping of the American long description attribute of the CHANNEL dimension.

```

DECLARE
    importClob      clob;
    exportClob      clob;
    overClob        clob;
    exportOptClob   clob;
    importOptClob   clob;

BEGIN
    dbms_lob.createtemporary(overClob, TRUE);
    dbms_lob.open(overClob, DBMS_LOB.LOB_READWRITE);
    dbms_lob.writeappend(overClob,58, '<Metadata Version="1.3"
MinimumDatabaseVersion="11.2.0.2">');
    dbms_lob.writeappend(overClob,34, '<StandardDimension Name="CHANNEL">');
    dbms_lob.writeappend(overClob,75, '<Description Type="Description"
Language="AMERICAN" Value="Sales Channel"/>');
    dbms_lob.writeappend(overClob,20, '</StandardDimension>');
    dbms_lob.writeappend(overClob,11, '</Metadata>');
    dbms_lob.close(overClob);

    -- Enable 11g clients to access 10g metadata
    dbms_cube.initialize_cube_upgrade;

    -- Create a CLOB containing the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_
namespace=>TRUE, metadata_changes=>overClob);

    -- Create a CLOB containing the import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table =>
'MY_OBJECT_MAP');

    -- Create CLOBs for the metadata
    dbms_lob.createtemporary(importClob, TRUE);
    dbms_lob.createtemporary(exportClob, TRUE);

```

```
-- Export metadata from a 10g analytic workspace to a CLOB
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_
xml=>exportClob);

-- Import metadata from the CLOB
dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob, out_
xml=>importClob);

-- Load and aggregate the data
dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

The following is the content of `exportClob` (formatting added for readability). The XML document changes the description of Channel to Sales Channel.

```
<Metadata Version="1.3" MinimumDatabaseVersion="11.2.0.2">
  <StandardDimension Name="CHANNEL">
    <Description Type="Description" Language="AMERICAN" Value="Sales Channel"/>
  </StandardDimension>
</Metadata>
```

## CREATE\_IMPORT\_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the [IMPORT\\_XML Procedure](#) on page 41-49.

### Syntax

```
DBMS_CUBE.CREATE_IMPORT_OPTIONS (
    out_options_xml  IN/OUT  CLOB,
    validate_only    IN      BOOLEAN  DEFAULT FALSE,
    rename_table     IN      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 41–5 CREATE\_IMPORT\_OPTIONS Procedure Parameters**

Parameter	Description
out_options_xml	Contains the generated XML document, which can be passed to the options_xml parameter of the <a href="#">IMPORT_XML Procedure</a> .
validate_only	TRUE causes the IMPORT_XML procedure to validate the metadata described in the input file or the in_xml parameter, without committing the changes to the metadata.
rename_table	The name of a table identifying new names for the imported objects, in the form [schema_name.]table_name. The IMPORT_XML procedure creates objects using the names specified in the table instead of the ones specified in the XML document. See the Usage Notes for the format of the rename table.

### Usage Notes

See "[Rename Table](#)" on page 41-14.

### Examples

This example specifies validation only and a rename table. For an example of the import CLOB being used in an import, see "[IMPORT\\_XML Procedure](#)" on page 41-49.

```
DECLARE
importClob  clob;

BEGIN
    dbms_lob.createtemporary(importClob, TRUE);

    dbms_cube.create_import_options(out_options_xml => importClob, rename_table =>
'MY_OBJECT_MAP', validate_only => TRUE);

    dbms_output.put_line(importClob);
END;
/
```

It generates the following XML document:

```
<?xml version="1.0"?>
<Import>
  <ImportOptions>
    <Option Name="ValidateOnly" Value="TRUE"/>
    <Option Name="RenameTable" Value="MY_OBJECT_MAP"/>
  </ImportOptions>
</Import>
```

</Import>

## CREATE\_MVIEW Function

This function creates a cube materialized view from the definition of a relational materialized view.

### Syntax

```
DBMS_CUBE.CREATE_MVIEW (
    mvowner      IN  VARCHAR2,
    mvname       IN  VARCHAR2,
    sam_parameters IN CLOB  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 41–6 CREATE\_MVIEW Function Parameters**

Parameter	Description
mvowner	Owner of the relational materialized view.
mvname	Name of the relational materialized view. For restrictions, see <a href="#">"Requirements for the Relational Materialized View"</a> on page 41-6.  A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.
sam_parameters	Parameters in the form ' <i>parameter1=value1, parameter2=value2,...</i> '. See <a href="#">"SQL Aggregation Management Parameters"</a> .

### SQL Aggregation Management Parameters

The CREATE\_MVIEW and DERIVE\_FROM\_MVIEW functions use the SQL aggregation management (SAM) parameters described in [Table 41–7](#). Some parameters support the development of cubes with advanced analytics. Other parameters support the development of Java applications. The default settings are appropriate for cube materialized views that are direct replacements for relational materialized views.

**Table 41–7 SQL Aggregation Management Parameters**

Parameter	Description
ADDTOPS	Adds a top level and a level member to every dimension hierarchy in the cube. If the associated relational dimension has no hierarchy, then a dimension hierarchy is created.  TRUE: Creates levels named <i>ALL_dimension</i> with level members <i>All_dimension</i> . (Default)  FALSE: Creates only the hierarchies and levels identified by the relational dimensions.
ADDUNIQUEKEYPREFIX	Controls the creation of dimension keys.  TRUE: Creates cube dimension keys by concatenating the level name with the relational dimension key. This practice assures that the dimension keys are unique across all levels, such as <i>CITY_NEW_YORK</i> and <i>STATE_NEW_YORK</i> . (Default)  FALSE: Uses the relational dimension keys as cube dimension keys.

**Table 41–7 (Cont.) SQL Aggregation Management Parameters**

Parameter	Description
ATRMAPTTYPE	<p>Specifies whether attributes are mapped by hierarchy levels, dimension levels, or both.</p> <p>HIER_LEVEL: Maps attributes to the levels of a particular dimension hierarchy. (Default)</p> <p>DIM_LEVEL: Maps attributes to the levels of the dimension regardless of hierarchy.</p> <p>BOTH: Maps attributes to both dimension and hierarchy levels.</p> <p>AUTO: Maps attributes to the levels of the dimension for a star schema and to the levels of a particular dimension hierarchy for a snowflake schema.</p>
AWNAME	<p>Provides the name of the analytic workspace that owns the cube. Choose a simple database object name of 1 to 30 bytes. The default name is <i>fact_tablename_AWn</i>.</p>
BUILD	<p>Specifies whether a data refresh will immediately follow creation of the cube materialized view.</p> <p>IMMEDIATE: Refreshes immediately.</p> <p>DEFERRED: Does not perform a data refresh. (Default)</p> <p><b>Note:</b> Only the CREATE_MVIEW function uses this parameter.</p>
CUBEMVOPTION	<p>Controls validation and creation of a cube materialized view. Regardless of this setting, the function creates an analytic workspace containing a cube and its related cube dimensions.</p> <p>COMPLETE_REFRESH: Creates a complete refresh cube materialized view (full update).</p> <p>FAST_REFRESH: Creates a fast refresh materialized view (incremental update).</p> <p>REWRITE_READY: Runs validation checks for a rewrite cube materialized view, but does not create it.</p> <p>REWRITE: Creates a rewrite cube materialized view.</p> <p>REWRITE_WITH_ATTRIBUTES: Creates a rewrite cube materialized view that includes columns with dimension attributes, resulting in faster query response times. (Default)</p> <p><b>Note:</b> <i>The following settings do not create a cube materialized view. Use Analytic Workspace Manager to drop an analytic workspace that does not have a cube materialized view. You can use the DROP_MVIEW procedure to delete an analytic workspace only when it supports a cube materialized view.</i></p> <p>NONE: Does not create a cube materialized view.</p> <p>COMPLETE_REFRESH_READY: Runs validation checks for a complete refresh cube materialized view, but does not create it.</p> <p>FAST_REFRESH_READY: Runs validation checks for fast refresh, but does not create the cube materialized view.</p>
CUBENAME	<p>Provides the name of the cube derived from the relational materialized view. Choose simple database object name of 1 to 30 bytes. The default name is <i>fact_tablename_Cn</i>.</p>

**Table 41–7 (Cont.) SQL Aggregation Management Parameters**

Parameter	Description
DIMJAVABINDVARS	<p>Supports access by Java programs to the XML document.</p> <p>TRUE: Generates an XML template that uses Java bind variable notation for the names of dimensions. No XML validation is performed. You cannot use the <code>IMPORT_XML</code> procedure to create a cube using this template.</p> <p>FALSE: Generates an XML template that does not support Java bind variables. (Default)</p>
DISABLEQRW	<p>Controls disabling of query rewrite on the source relational materialized view.</p> <p>TRUE: Issues an <code>ALTER MATERIALIZED VIEW <i>mview_name</i> DISABLE QUERY REWRITE</code> command.</p> <p>FALSE: No action.</p> <p><b>Note:</b> Only the <code>CREATE_MVIEW</code> function with <code>BUILD=IMMEDIATE</code> uses this parameter.</p>
EXPORTXML	<p>Exports the XML that defines the dimensional objects to a file, which you specify as <code>dir/filename</code>. Both the directory and the file name are case sensitive.</p> <p><i>dir</i>: Name of a database directory.</p> <p><i>filename</i>: The name of the file, typically given an XML filename extension.</p>
FILTERPARTITIONANCESTORLEVELS	<p>Controls the generation of aggregate values above the partitioning level of a partitioned cube.</p> <p>TRUE: Removes levels above the partitioning level from the cube. Requests for summary values above the partitioning level are solved by SQL.</p> <p>FALSE: All levels are retained in the cube. Requests for summary values are solved by OLAP. (Default)</p>
LOGDEST	<p>Directs and stores log messages. By default, the messages are not available.</p> <p>SERVEROUT: Sends messages to server output (typically the screen), which is suitable when working interactively such as in SQL*Plus or SQL Developer.</p> <p>TRACEFILE: Sends messages to the session trace file.</p>
PARTITIONOPTION	<p>Controls partitioning of the cube.</p> <p>NONE: Prevents partitioning.</p> <p>DEFAULT: Allows the Sparsity Advisor to determine whether partitioning is needed and how to partition the cube. (Default)</p> <p>FORCE: Partitions the cube even when the Sparsity Advisor recommends against it. The Sparsity Advisor identifies the best dimension, hierarchy, and level to use for partitioning.</p> <p><i>dimension.hierarchy.level</i>: Partitions the cube using the specified dimension, hierarchy, and level.</p>
POPULATELINEAGE	<p>Controls the appearance of attributes in a cube materialized view.</p> <p>TRUE: Includes all dimension attributes in the cube materialized view. (Default)</p> <p>FALSE: Omits all dimension attributes from the cube materialized view.</p>

**Table 41-7 (Cont.) SQL Aggregation Management Parameters**

Parameter	Description
PRECOMPUTE	<p>Identifies a percentage of the data that is aggregated and stored. The remaining values are calculated as required by queries during the session.</p> <p><i>precompute_percentage[:precompute_top_percentage]</i></p> <p>Specify the top percentage for partitioned cubes. The default value is 35:0, which specifies precomputing 35% of the bottom partition and 0% of the top partition. If the cube is not partitioned, then the second number is ignored.</p>
REMAPCOMPOSITEKEYS	<p>Controls how multicolumn keys are rendered in the cube.</p> <p>TRUE: Creates a unique key attribute whose values are concatenated string expressions with an underscore between the column values. For example, the value BOSTON_MA_USA might be an expression produced from a multicolumn key composed of CITY, STATE, and COUNTRY columns. In addition, an attribute is created for each individual column to store the relational keys. (Default)</p> <p>FALSE: Creates a unique key attribute for each column.</p>
RENDERINGMODE	<p>Controls whether a loss in fidelity between the relational materialized view and the cube materialized view results in a warning message or an exception. See <a href="#">"Requirements for the Relational Materialized View"</a> on page 41-6.</p> <p>LOOSE: Losses are noted in the optional logs generated by the <a href="#">CREATE_MVIEW Function</a> and the <a href="#">DERIVE_FROM_MVIEW Function</a>. No exceptions are raised. (Default)</p> <p>STRICT: Any loss in fidelity raises an exception so that no XML template is created.</p>
SEEFILTERS	<p>Controls whether conditions in the WHERE clause of the relational materialized view's defining query are retained or ignored.</p> <p>TRUE: Renders valid conditions in the XML template. (Default)</p> <p>FALSE: Ignores all conditions.</p>
UNIQUENAMES	<p>Controls whether top level dimensional objects have unique names. Cross namespace conflicts may occur because dimensional objects have different namespaces than relational objects.</p> <p>TRUE: Modifies all relational names when they are rendered in the cube.(Default)</p> <p>FALSE: Duplicates relational names in the cube unless a naming conflict is detected. In that case, a unique name is created.</p>
UNKNOWNKEYASDIM	<p>Controls handling of simple columns with no levels or hierarchies in the GROUP BY clause of the relational materialized view's defining query.</p> <p>TRUE: Renders a simple column without a relational dimension as a cube dimension with no levels or hierarchies.</p> <p>FALSE: Raises an exception when no relational dimension is found for the column. (Default)</p>
VALIDATEXML	<p>Controls whether the generated XML document is validated.</p> <p>TRUE: Validates the template using the VALIDATE_XML procedure. (Default)</p> <p>FALSE: No validation is done.</p>

## Returns

The name of the cube materialized view created by the function.

## Usage Notes

See ["Using SQL Aggregation Management"](#) on page 41-4

## Examples

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL\_MONTH\_SALES\_MV and FWEEK\_PSCAT\_SALES\_MV.

The following script creates a cube materialized view using CAL\_MONTH\_SALES\_MV as the relational materialized view. It uses all default options.

```
SET serverout ON format wrapped
```

```
DECLARE
    salesaw varchar2(30);

BEGIN
    salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV');
END;
/
```

The next example sets several parameters for creating a cube materialized view from FWEEK\_PSCAT\_SALES\_MV. These parameters change the cube materialized view in the following ways:

- **ADDTOPS:** Adds a top level consisting of a single value to the hierarchies. All of the dimensions in Sales History have a top level already.
- **PRECOMPUTE:** Changes the percentage of materialized aggregates from 35:0 to 40:10.
- **EXPORTXML:** Creates a text file for the XML document.
- **BUILD:** Performs a data refresh.

```
DECLARE
    salescubemv varchar2(30);
    sam_param clob := 'ADDTOPS=FALSE,
                     PRECOMPUTE=40:10,
                     EXPORTXML=WORK_DIR/sales.xml,
                     BUILD=IMMEDIATE';

BEGIN
    salescubemv := dbms_cube.create_mview('SH', 'FWEEK_PSCAT_SALES_MV',
                                         sam_param);
END;
/
```

## DERIVE\_FROM\_MVIEW Function

This function generates an XML template that defines a cube with materialized view capabilities, using the information derived from an existing relational materialized view.

### Syntax

```
DBMS_CUBE.DERIVE_FROM_MVIEW (
    mvowner      IN  VARCHAR2,
    mvname       IN  VARCHAR2,
    sam_parameters IN CLOB  DEFAULT NULL)
RETURN CLOB;
```

### Parameters

**Table 41–8** *DERIVE\_FROM\_MVIEW Function Parameters*

Parameter	Description
mvowner	Owner of the relational materialized view.
mvname	Name of the relational materialized view. For restrictions, see <a href="#">"Requirements for the Relational Materialized View"</a> on page 41-6.  A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.
sam_parameters	Optional list of parameters in the form ' <i>parameter1=value1, parameter2=value2,...</i> '. See <a href="#">"SQL Aggregation Management Parameters"</a> on page 41-36.

### Returns

An XML template that defines an analytic workspace containing a cube enabled as a materialized view.

### Usage Notes

To create a cube materialized view from an XML template, use the `IMPORT_XML` procedure. Then use the `REFRESH_MVIEW` procedure to refresh the cube materialized view with data.

See ["Using SQL Aggregation Management"](#) on page 41-4.

### Examples

The following example generates an XML template named `sales_cube.xml` from the `CAL_MONTH_SALES_MV` relational materialized view in the `SH` schema.

```
DECLARE
    salescubexml  clob := null;
    sam_param     clob := 'exportXML=WORK_DIR/sales_cube.xml';

BEGIN
    salescubexml := dbms_cube.derive_from_mview('SH', 'CAL_MONTH_SALES_MV',
    sam_param);
END;
```

/

## DROP\_MVIEW Procedure

This procedure drops a cube materialized view and all associated objects from the database. These objects include the dimension materialized views, cubes, cube dimensions, levels, hierarchies, and the analytic workspace.

### Syntax

```
DBMS_CUBE.DROP_MVIEW (
    mvowner      IN  VARCHAR2,
    mvname       IN  VARCHAR2,
    sam_parameters IN CLOB  DEFAULT NULL);
```

### Parameters

**Table 41–9 DROP\_MVIEW Procedure Parameters**

Parameter	Description
mvowner	Owner of the cube materialized view
mvname	Name of the cube materialized view
sam_parameters	EXPORTXML: Exports the XML that drops the dimensional objects to a file, which you specify as <i>dir/filename</i> . Both the directory and the file name are case sensitive.  <i>dir</i> : Name of a database directory.  <i>filename</i> : The name of the file, typically given an XML filename extension.

### Usage Notes

Use this procedure to drop a cube materialized view that you created using the CREATE\_MVIEW and DERIVE\_FROM\_MVIEW functions. If you make modifications to the cubes or dimensions, then DROP\_MVIEW may not be able to drop the cube materialized view.

Some of the CUBEMVOPTION parameters used by the CREATE\_MVIEW and DERIVE\_FROM\_MVIEW functions do not create a materialized view. Use Analytic Workspace Manager to drop the analytic workspace, cubes, and cube dimensions.

If you use the EXPORTXML parameter, then you can use the XML document to drop the cube materialized view, after you re-create it. Use the IMPORT\_XML procedure.

See ["Using SQL Aggregation Management"](#) on page 41-4.

### Examples

The current schema has four materialized views. CB\$CAL\_MONTH\_SALES is a cube materialized view for the SALES table. CB\$TIMES\_DIM\_D1\_CAL\_ROLLUP is a cube dimension materialized view for the TIMES\_DIM dimension on the TIMES dimension table. The others are relational materialized views.

```
SELECT mview_name FROM user_mvviews;
```

```
MVIEW_NAME
-----
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
```

FWEEK\_PSCAT\_SALES\_MV

The following command drops both CB\$CAL\_MONTH\_SALES and CB\$TIMES\_DIM\_D1\_CAL\_ROLLUP.

```
EXECUTE dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
```

Dropped cube organized materialized view "SH"."CAL\_MONTH\_SALES" including container analytic workspace "SH"."CAL\_MONTH\_SALES\_AW" at 20081110 16:31:40.056.

This query against the data dictionary confirms that the materialized views have been dropped.

```
SELECT mview_name FROM user_mviews;
```

MVIEW\_NAME

-----

CAL\_MONTH\_SALES\_MV

FWEEK\_PSCAT\_SALES\_MV

## EXPORT\_XML Procedure

This procedure writes OLAP metadata to a CLOB.

### Syntax

```
DBMS_CUBE.EXPORT_XML
  (object_ids      IN      VARCHAR2,
   out_xml         IN/OUT CLOB;
```

```
DBMS_CUBE.EXPORT_XML
  (object_ids      IN      VARCHAR2,
   options_xml     IN      CLOB,
   out_xml         IN/OUT CLOB;
```

```
DBMS_CUBE.EXPORT_XML
  (object_ids      IN      VARCHAR2,
   options_dirname IN      VARCHAR2,
   options_filename IN     VARCHAR2,
   out_xml         IN/OUT CLOB;
```

### Parameters

**Table 41–10 EXPORT\_XML Procedure Parameters**

Parameter	Description
object_ids	<p>Any of these identifiers.</p> <ul style="list-style-type: none"> <li>■ The name of a schema, such as GLOBAL.</li> <li>■ The fully qualified name of an analytic workspace in the form <i>owner.aw_name.AW</i>, such as GLOBAL.GLOBAL.AW.</li> <li>■ Cube</li> <li>■ Dimension</li> <li>■ Named build process</li> <li>■ Measure folder</li> </ul> <p>You can specify multiple objects by separating the names with commas.</p> <p><b>Note:</b> When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when exporting a cube, you must also export the dimensions of the cube.</p>
options_dirname	The case-sensitive name of a database directory that contains <i>options_filename</i> .
options_filename	A file containing an XML document of export options.
options_xml	A CLOB variable that contains an XML document of export options. Use the <a href="#">CREATE_EXPORT_OPTIONS Procedure</a> to generate this document.
out_xml	A CLOB variable that will store the XML document of OLAP metadata for the objects listed in <i>object_ids</i> .

### Export Options

The default settings for the export options are appropriate in many cases, so you can omit the *options\_xml* parameter or the *options\_dirname* and *options\_filename* parameters. However, when upgrading Oracle OLAP 10g metadata to

OLAP 11g, you must specify an XML document that changes the default settings. This example changes all of the parameters from False to True; set them appropriately for your schema.

```
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the [CREATE\\_EXPORT\\_OPTIONS Procedure](#) on page 41-31.

## Usage Notes

See "[Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g](#)" on page 41-12.

## Example

For an example of using EXPORT\_XML in an upgrade to the same schema, see "[Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g](#)" on page 41-12.

The following PL/SQL script copies an OLAP 11g analytic workspace named GLOBAL11 from the GLOBAL\_AW schema to the GLOBAL schema. No upgrade is performed.

To upgrade into a different schema, change the example as follows:

- Call the INITIALIZE\_CUBE\_UPGRADE procedure.
- Call the CREATE\_EXPORT\_OPTIONS procedure with the additional parameter setting SUPPRESS\_NAMESPACE=>TRUE.

The PL/SQL client must be connected to the database as GLOBAL. The GLOBAL user must have SELECT permissions on GLOBAL\_AW.AW\$GLOBAL and on all relational data sources.

```
BEGIN
  -- Create a CLOB for the export options
  dbms_lob.createtemporary(optionsClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_
owner=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from an analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW.GLOBAL11.AW', options_
xml=>optionsClob, out_xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml=>exportClob);

  -- Load and aggregate the data
  dbms_cube.build(script=>'GLOBAL.UNITS_CUBE, GLOBAL.PRICE_AND_COST_CUBE');

END;
/
```

## EXPORT\_XML\_TO\_FILE Procedure

This procedure exports OLAP metadata to a file. This file can be imported into a new or existing analytic workspace using the `IMPORT_XML` procedure. In this way, you can create a copy of the analytic workspace in another schema or database.

This procedure can also be used as part of the process for upgrading CWM or OLAP standard form (AWXML) metadata contained in an Oracle OLAP 10g analytic workspace to OLAP 11g format.

### Syntax

```
DBMS_CUBE.EXPORT_XML_TO_FILE
    (object_ids      IN      VARCHAR2,
     output_dirname  IN      VARCHAR2,
     output_filename IN      VARCHAR2;

DBMS_CUBE.EXPORT_XML_TO_FILE
    (object_ids      IN      VARCHAR2,
     options_dirname IN      VARCHAR2,
     options_filename IN     VARCHAR2,
     output_dirname  IN      VARCHAR2,
     output_filename IN     VARCHAR2;
```

### Parameters

**Table 41–11 EXPORT\_XML\_TO\_FILE Procedure Parameters**

Parameter	Description
<code>object_ids</code>	<p>Any of these identifiers.</p> <ul style="list-style-type: none"> <li>■ The name of a schema, such as <code>GLOBAL</code>.</li> <li>■ The fully qualified name of an analytic workspace in the form <code>owner.aw_name.AW</code>, such as <code>GLOBAL.GLOBAL.AW</code>.</li> <li>■ Cube</li> <li>■ Dimension</li> <li>■ Named build process</li> <li>■ Measure folder</li> </ul> <p>You can specify multiple objects by separating the names with commas.</p> <p><b>Note:</b> When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when you export a cube, you must also export the dimensions of the cube.</p>
<code>options_dirname</code>	The case-sensitive name of a database directory that contains <code>options_filename</code> . See "Export Options".
<code>options_filename</code>	The name of a file containing an XML document of export options. See "Export Options".
<code>output_dirname</code>	The case-sensitive name of a database directory where <code>output_filename</code> is created.
<code>output_filename</code>	The name of the template file created by the procedure.

### Export Options

The default settings for the export options are appropriate in most cases, and you can omit the `options_dirname` and `options_filename` parameters. However, when

upgrading Oracle OLAP 10g metadata to OLAP 11g, you must specify an XML document that changes the default settings, like the following:

```
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the [CREATE\\_EXPORT\\_OPTIONS Procedure](#) on page 41-31.

## Usage Notes

See "[Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g](#)" on page 41-12.

## Examples

The following example generates an XML file named `global.xml` in OLAP 11g format using the default export settings. The metadata is derived from all analytic workspaces and CWM metadata in the `GLOBAL_AW` schema. The output file is generated in the `WORK_DIR` database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW', 'WORK_DIR', 'global.xml');
```

The next example also generates an XML file named `global.xml` in OLAP 11g format using the export options set in `options.xml`. The metadata is derived from the `GLOBAL` analytic workspace in the `GLOBAL_AW` schema. Both the options file and the output file are in the `WORK_DIR` database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW.GLOBAL.AW', 'WORK_DIR',
'options.xml', 'WORK_DIR', 'global.xml');
```

## IMPORT\_XML Procedure

This procedure creates, modifies, or drops an analytic workspace by using an XML template.

### Syntax

```
DBMS_CUBE.IMPORT_XML
  (dirname          IN      VARCHAR2,
   filename         IN      VARCHAR2 );
```

```
DBMS_CUBE.IMPORT_XML
  (dirname          IN      VARCHAR2,
   filename         IN      VARCHAR2,
   out_xml          IN/OUT  CLOB );
```

```
DBMS_CUBE.IMPORT_XML
  (input_dirname    IN      VARCHAR2,
   input_filename   IN      VARCHAR2,
   options_dirname  IN      VARCHAR2,
   options_filename IN      VARCHAR2,
   out_xml          IN/OUT  CLOB );
```

```
DBMS_CUBE.IMPORT_XML
  (in_xml           IN      CLOB );
```

```
DBMS_CUBE.IMPORT_XML
  (in_xml           IN      CLOB,
   out_xml          IN/OUT  CLOB );
```

```
DBMS_CUBE.IMPORT_XML
  (in_xml           IN      CLOB,
   options_xml      IN      CLOB,
   out_xml          IN/OUT  CLOB );
```

### Parameters

**Table 41–12** *IMPORT\_XML Procedure Parameters*

Parameter	Description
dirname	The case-sensitive name of a database directory containing the XML document describing an analytic workspace.
filename	A file containing an XML document describing an analytic workspace.
in_xml	A CLOB containing an XML document describing an analytic workspace.
input_dirname	The case-sensitive name of a database directory containing the XML document describing an analytic workspace.
input_filename	A file containing an XML document describing an analytic workspace.
options_dirname	The case-sensitive name of a database directory containing a file of import options.
options_filename	A file of import options.

**Table 41–12 (Cont.) IMPORT\_XML Procedure Parameters**

Parameter	Description
options_xml	An XML document describing the import options. Use the <a href="#">CREATE_IMPORT_OPTIONS Procedure</a> on page 41-34 to generate this document.
out_xml	An XML document that either describes the analytic workspace or, for validation only, describes any errors. It may contain changes that DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.

## Usage Notes

The XML can define, modify, or drop an entire analytic workspace, or one or more cubes or dimensions. When defining just cubes or dimensions, you must do so within an existing analytic workspace.

You can also use `IMPORT_XML` to drop an analytic workspace by using the XML document generated by the `DROP_MVIEW` procedure with the `EXPORTXML` parameter.

See "[Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g](#)" on page 41-12.

## Example

This example loads an XML template from a file named `GLOBAL.XML` and located in a database directory named `XML_DIR`.

```
EXECUTE dbms_cube.import_xml('XML_DIR', 'GLOBAL.XML');
```

The next example exports an OLAP 10g template and uses `IMPORT_XML` to validate it before an upgrade to 11g.

```
DECLARE

    exportOptClob clob;
    importOptClob clob;
    importClob    clob;
    exportClob    clob;

BEGIN

    -- Create a CLOB for the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_
namespace=>TRUE, preserve_table_owners=>TRUE);

    -- Create a CLOB for the XML template
    dbms_lob.createtemporary(exportClob, TRUE);

    -- Create a CLOB for import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob, validate_
only=>TRUE);

    -- Create a CLOB for the change log
    dbms_lob.createtemporary(importClob, TRUE);

    -- Enable 11g clients to access 10g metadata
    dbms_cube.initialize_cube_upgrade;

    -- Export metadata from an analytic workspace to a CLOB
```

```
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_
xml=>exportClob);

/* Import metadata from the CLOB. No objects are committed to the database
because the validate_only parameter of CREATE_IMPORT_OPTIONS is set to
TRUE.
*/

dbms_cube.import_xml(in_xml=>exportClob, options_xml=>importOptClob, out_
xml=>importClob);

-- Output the metadata changes
dbms_output.put_line('This is the validation log:');
dbms_output.put_line(importClob);

END;
/
```

The contents of `importClob` show that the XML is valid. Otherwise, error messages appear in the `<RootCommitResult>` element.

```
This is the validation log:
<?xml version="1.0" encoding="UTF-16"?>
<RootCommitResult>

</RootCommitResult>
```

For an example of `IMPORT_XML` within the context of an upgrade from 10g to 11g metadata, see ["Custom Upgrade"](#) on page 41-16.

## INITIALIZE\_CUBE\_UPGRADE Procedure

This procedure processes analytic workspaces created in Oracle OLAP 10g so they can be used by Oracle OLAP 11g clients. It processes all analytic workspaces in the current schema. Run this procedure once for each schema in which there are 10g analytic workspaces.

Without this processing step, 11g clients cannot connect to a database containing a 10g analytic workspace with subobjects of a dimension or cube having the same name. Additionally, some DBMS\_CUBE procedures and functions, such as EXPORT\_XML and EXPORT\_XML\_TO\_FILE, do not work on the 10g metadata.

After processing, OLAP 11g clients can connect and use the alternate names provided by INITIALIZE\_CUBE\_UPGRADE for the conflicting subobjects. OLAP 10g clients continue to use the original names.

INITIALIZE\_CUBE\_UPGRADE does not upgrade any OLAP 10g objects to OLAP 11g format.

See ["Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g"](#) on page 41-12.

### Syntax

```
DBMS_CUBE.INITIALIZE_CUBE_UPGRADE;
```

### Usage Notes

This procedure creates and populates a table named CUBE\_UPGRADE\_INFO. If it already exists, the table is truncated and repopulated.

While the 10g namespace allowed subobjects with the same name in the same dimension or cube, the 11g namespace does not. When INITIALIZE\_CUBE\_UPGRADE detects a name conflict among subobjects such as levels, hierarchies, and dimension attributes, it creates a row in CUBE\_UPGRADE\_INFO providing a new, unique name for each one. Rows may also be created for objects that do not require renaming; these rows are distinguished by a value of 0 or null in the CONFLICT column. Top-level objects, such as dimensions and cubes, are not listed.

You can edit the table using SQL INSERT and UPDATE if you want to customize the names of OLAP 10g objects on OLAP 11g clients.

The UPGRADE\_AW, EXPORT\_XML and EXPORT\_XML\_TO\_FILE procedures use the names specified in the NEW\_NAME column of the table to identify objects in CWM or OLAP standard form (AWXML) analytic workspaces, rather than the original names.

The following table describes the columns of CUBE\_UPGRADE\_INFO.

Column	Datatype	NULL	Description
OWNER	VARCHAR2	NOT NULL	Owner of the analytic workspace.
AW	VARCHAR2	NOT NULL	Name of the analytic workspace.
AWXML_ID	VARCHAR2	NOT NULL	Full logical name of the object requiring modification, in the form <i>simple_name</i> . [ <i>subtype_name</i> ]. <i>object_type</i> . For example, TIME.DIMENSION and PRODUCT.COLOR.ATTRIBUTE.
NEW_NAME	VARCHAR2	NOT NULL	The name the object will have in Oracle 11g after the upgrade.

Column	Datatype	NULL	Description
OBJECT_CLASS	VARCHAR2	--	DerivedMeasure for calculated measures, or empty for all other object types.
CONFLICT	NUMBER	--	Indicates the reason that the row was added to CUBE_UPGRADE_INFO: <ul style="list-style-type: none"> <li>■ 0: The object does not have a naming conflict but appears in the table for other reasons.</li> <li>■ 1: Two objects have the same name and would create a conflict in the OLAP 11g namespace. The object type (such as level or hierarchy) will be added to the names.</li> </ul>

## Examples

The following command creates and populates the CUBE\_UPGRADE\_INFO table:

```
EXECUTE dbms_cube.initialize_cube_upgrade;
```

The table shows that the OLAP 10g analytic workspace has a hierarchy and a level named MARKET\_SEGMENT, which will be renamed. The table also contains rows for calculated measures, but these objects do not require renaming: The value of CONFLICT is 0.

```
SELECT awxml_id, new_name, conflict FROM cube_upgrade_info;
```

AWXML_ID	NEW_NAME	CONFLICT
CUSTOMER.MARKET_SEGMENT.HIERARCHY	MARKET_SEGMENT_HIERARCHY	1
CUSTOMER.MARKET_SEGMENT.LEVEL	MARKET_SEGMENT_LEVEL	1
UNITS_CUBE.EXTENDED_COST.MEASURE	EXTENDED_COST	0
UNITS_CUBE.EXTENDED_MARGIN.MEASURE	EXTENDED_MARGIN	0
UNITS_CUBE.CHG_SALES_PP.MEASURE	CHG_SALES_PP	0
UNITS_CUBE.CHG_SALES_PY.MEASURE	CHG_SALES_PY	0
UNITS_CUBE.PCTCHG_SALES_PP.MEASURE	PCTCHG_SALES_PP	0
UNITS_CUBE.PCTCHG_SALES_PY.MEASURE	PCTCHG_SALES_PY	0
UNITS_CUBE.PRODUCT_SHARE.MEASURE	PRODUCT_SHARE	0
UNITS_CUBE.CHANNEL_SHARE.MEASURE	CHANNEL_SHARE	0
UNITS_CUBE.MARKET_SHARE.MEASURE	MARKET_SHARE	0
UNITS_CUBE.CHG_EXTMRGN_PP.MEASURE	CHG_EXTMRGN_PP	0
UNITS_CUBE.CHG_EXTMRGN_PY.MEASURE	CHG_EXTMRGN_PY	0
UNITS_CUBE.PCTCHG_EXTMRGN_PP.MEASURE	PCTCHG_EXTMRGN_PP	0
UNITS_CUBE.PCTCHG_EXTMRGN_PY.MEASURE	PCTCHG_EXTMRGN_PY	0
UNITS_CUBE.CHG_UNITS_PP.MEASURE	CHG_UNITS_PP	0
UNITS_CUBE.EXTMRGN_PER_UNIT.MEASURE	EXTMRGN_PER_UNIT	0
UNITS_CUBE.SALES_YTD.MEASURE	SALES_YTD	0
UNITS_CUBE.SALES_YTD_PY.MEASURE	SALES_YTD_PY	0
UNITS_CUBE.PCTCHG_SALES_YTD_PY.MEASURE	PCTCHG_SALES_YTD_PY	0
UNITS_CUBE.SALES_QTD.MEASURE	SALES_QTD	0
UNITS_CUBE.CHG_UNITS_PY.MEASURE	CHG_UNITS_PY	0

## REFRESH\_MVIEW Procedure

This procedure refreshes the data in a cube materialized view.

### Syntax

```
DBMS_CUBE.REFRESH_MVIEW (
    mvowner          IN  VARCHAR2,
    mvname           IN  VARCHAR2,
    method           IN  VARCHAR2          DEFAULT NULL,
    refresh_after_errors IN  BOOLEAN        DEFAULT FALSE,
    parallelism      IN  BINARY_INTEGER    DEFAULT 0,
    atomic_refresh   IN  BOOLEAN          DEFAULT FALSE,
    scheduler_job    IN  VARCHAR2          DEFAULT NULL,
    sam_parameters   IN  CLOB              DEFAULT NULL,
    nested           IN  BOOLEAN          DEFAULT FALSE );
```

### Parameters

**Table 41–13 REFRESH\_MVIEW Procedure Parameters**

Parameter	Description
mvowner	Owner of the cube materialized view.
mvname	Name of the cube materialized view.
method	<p>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated.</p> <p>You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes.</p> <ul style="list-style-type: none"> <li>■ C: Complete refresh clears all dimension values before loading. (Default)</li> <li>■ F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table.</li> <li>■ ?: Fast refresh if possible, and otherwise a complete refresh.</li> <li>■ P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables.</li> <li>■ S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values.</li> </ul> <p>See the "Usage Notes" for the BUILD procedure on page 41-26 for additional details.</p>
refresh_after_errors	<p>TRUE to roll back just the cube or dimension with errors, and then continue building the other objects.</p> <p>FALSE to roll back all objects in the build.</p>
parallelism	<p>Number of parallel processes to allocate to this job.</p> <p>See the "Usage Notes" for the BUILD procedure for additional details.</p>

**Table 41–13 (Cont.) REFRESH\_MVIEW Procedure Parameters**

Parameter	Description
atomic_refresh	TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state.  FALSE enables users to access intermediate results during an build.
scheduler_job	Any text identifier for the job, which will appear in the log table. The string does not need to be unique.
sam_parameters	None.
nested	TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.  All objects must reside in a single analytic workspace.

## Usage Notes

REFRESH\_MVIEW changes *mvname* to the name of the cube, then passes the cube name and all parameters to the BUILD procedure. Thus, you can use the BUILD procedure to refresh a cube materialized view. See the ["BUILD Procedure"](#) on page 41-19 for additional information about the parameters.

## Examples

The following example uses the default settings to refresh a cube materialized view named CB\$F WEEK\_PSCAT\_SALES.

```
SET serverout ON format wrapped
```

```
EXECUTE dbms_cube.refresh_mview('SH', 'CB$F WEEK_PSCAT_SALES');
```

The next example changes the refresh method to use fast refresh if possible, continue refreshing after an error, and use two parallel processes.

```
EXECUTE dbms_cube.refresh_mview('SH', 'CB$F WEEK_PSCAT_SALES', '?', TRUE, 2);
```

After successfully refreshing the cube materialized view, REFRESH\_MVIEW returns a message like the following:

```
Completed refresh of cube mview "SH"."CB$F WEEK_PSCAT_SALES" at 20081114
15:04:46.370.
```

## UPGRADE\_AW Procedure

This procedure creates an Oracle OLAP 11g analytic workspace from a copy of the metadata contained in an OLAP 10g analytic workspace. The original OLAP 10g analytic workspace is not affected and can exist at the same time and in the same schema as the OLAP 11g analytic workspace.

UPGRADE\_AW automatically runs INITIALIZE\_CUBE\_UPGRADE if the CUBE\_UPGRADE\_INFO table does not exist. If it does exist, then UPGRADE\_AW does not overwrite it, thus preserving any changes you made to the table.

See ["Upgrading Analytic Workspaces From OLAP 10g to OLAP 11g"](#) on page 41-12.

### Syntax

```
DBMS_CUBE.UPGRADE_AW
  (sourceaw          IN VARCHAR2,
   destaw            IN VARCHAR2,
   upgoptions        IN CLOB DEFAULT NULL);
```

### Parameters

**Table 41-14 UPGRADE\_AW Procedure Parameters**

Parameter	Description
sourceaw	The name of a 10g analytic workspace.
destaw	A new name for the generated 11g analytic workspace. It cannot be the same as <i>sourceaw</i> .
upgoptions	<p>One or more of these upgrade options, as a string in the form 'OPTION=VALUE'. Separate multiple options with commas.</p> <ul style="list-style-type: none"> <li> <p>■ PRESERVE_TABLE_OWNERS:</p> <p>YES preserves the original source table mappings. Use this option when creating an OLAP 11g analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the original schema. (Default)</p> <p>NO removes the schema owner from the source table mappings. Use this option when creating an OLAP 11g analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the destination schema.</p> </li> <li> <p>■ RENAME_TABLE: The name of a table that specifies new names for objects as they are created in OLAP 11g format. These changes are in addition to those specified by the INITIALIZE_CUBE_UPGRADE procedure. See <a href="#">"CREATE_IMPORT_OPTIONS Procedure"</a> on page 41-34 for information about creating a rename table.</p> </li> </ul>

### Examples

This example upgrades an OLAP 10g analytic workspace named GLOBAL10 to an OLAP 11g analytic workspace named GLOBAL11, using a rename table named MY\_OBJECT\_MAP:

```
BEGIN
  -- Upgrade the analytic workspace
  dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL11', upgoptions =>
```

```
'RENAME_TABLE=MY_OBJECT_MAP');  
  
-- Load and aggregate the data  
dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');  
  
END;  
/
```

## VALIDATE\_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

### Syntax

```
DBMS_CUBE.VALIDATE_XML
  (dirname          IN  VARCHAR2,
   filename         IN  VARCHAR2 );

DBMS_CUBE.VALIDATE_XML
  (in_xml          IN  CLOB );
```

### Parameters

**Table 41–15** VALIDATE\_XML Procedure Parameters

Parameter	Description
dirname	The case-sensitive name of a database directory.
filename	The name of a file containing an XML template.
IN_XML	The name of a CLOB containing an XML template.

### Usage Notes

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

### Example

This example reports a problem in the schema:

```
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
BEGIN dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML'); END;

*
ERROR at line 1:
ORA-37162: OLAP error
'GLOBAL.PRICE_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for
cube "GLOBAL.PRICE_CUBE" contains multiple BuildSpecifications with the same
name.
'GLOBAL.UNITS_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for
cube "GLOBAL.UNITS_CUBE" contains multiple BuildSpecifications with the same
name.
XOQ-01400: invalid metadata objects
ORA-06512: at "SYS.DBMS_CUBE", line 411
ORA-06512: at "SYS.DBMS_CUBE", line 441
ORA-06512: at "SYS.DBMS_CUBE", line 501
ORA-06512: at "SYS.DBMS_CUBE", line 520
ORA-06512: at line 1
```

After the problems are corrected, the procedure reports no errors:

```
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');

PL/SQL procedure successfully completed.
```

This example loads an XML template into a temporary CLOB, then validates it. The script is named GLOBAL.XML, and it is located in a database directory named XML\_DIR.

```
DEFINE xml_file = 'GLOBAL.XML';

SET ECHO ON;
SET SERVEROUT ON;

DECLARE
    xml_file      BFILE := bfilename('XML_DIR', '&xml_file');
    in_xml        CLOB;
    out_xml       CLOB := NULL;
    dest_offset   INTEGER := 1;
    src_offset    INTEGER := 1;
    lang_context  INTEGER := 0;
    warning       INTEGER;
BEGIN
    -- Setup the clob from a file
    DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
    DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
    DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
    DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
        dest_offset, src_offset, 0, lang_context, warning);

    -- Validate the xml
    DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/
```

## DBMS\_CUBE\_ADVISE

DBMS\_CUBE\_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topics:

- [Using DBMS\\_CUBE\\_ADVISE](#)
- [Summary of DBMS\\_CUBE\\_ADVISE Subprograms](#)

**See Also:** *Oracle OLAP User's Guide* for information about cube materialized views

---

## Using DBMS\_CUBE\_ADVISE

- [Security Model](#)

## Security Model

The `MV_CUBE_ADVICE` function requires the `ADVISOR` privilege.

## Summary of DBMS\_CUBE\_ADVISE Subprograms

**Table 42-1 Summary of DBMS\_CUBE\_ADVISE Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">MV_CUBE_ADVICE Function</a> on page 42-5	Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.
<a href="#">SET_CNS_EXCEPTION_LOG Procedure</a> on page 42-8	Identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.
<a href="#">TRACE Procedure</a> on page 42-9	Displays or suppresses diagnostic messages for MV_CUBE_ADVICE.

## MV\_CUBE\_ADVICE Function

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and materialized view logs that allow the broadest range of query rewrite transformations and log-based fast refresh of the cube materialized view.

### Syntax

```
DBMS_CUBE_ADVICE.MV_CUBE_ADVICE (
    owner          IN  VARCHAR2  DEFAULT USER,
    mvname         IN  VARCHAR2,
    reqtype        IN  VARCHAR2  DEFAULT '0',
    validate       IN  NUMBER    DEFAULT 0)
RETURN COAD_ADVICE_T PIPELINED;
```

### Parameters

**Table 42–2 MV\_CUBE\_ADVICE Function Parameters**

Parameter	Description
owner	Owner of the cube materialized view
mvname	Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB\$UNITS_CUBE
reqtype	Type of advice to generate: <ul style="list-style-type: none"> <li>■ 0: All applicable advice types</li> <li>■ 1: Column NOT NULL constraints</li> <li>■ 2: Primary key constraints</li> <li>■ 3: Foreign key constraints</li> <li>■ 4: Relational dimension objects</li> <li>■ 5: Cube materialized view logs with primary key</li> </ul>
validate	Validation option: <ul style="list-style-type: none"> <li>■ 0: Validate the constraints</li> <li>■ 1: Do not validate the constraints</li> </ul>

### Returns

A table of type COAD\_ADVICE\_T, consisting of a set of rows of type COAD\_ADVICE\_REC. [Table 42–3](#) describes the columns.

**Table 42–3 MV\_CUBE\_ADVICE Return Values**

Column	Data Type	Description
OWNER	VARCHAR2 (30)	Owner of the dimensional object identified in APIOBJECT.
APIOBJECT	VARCHAR2 (30)	Name of a cube enhanced with materialized view capabilities, such as UNITS_CUBE.
SQLOBJOWN	VARCHAR2 (30)	Owner of the relational object identified in SQLOBJECT.
SQLOBJECT	VARCHAR2 (65)	Name of the master table, such as UNITS_FACT, or the cube materialized view, such as CB\$UNITS_CUBE.

**Table 42–3 (Cont.) MV\_CUBE\_ADVICE Return Values**

Column	Data Type	Description
ADVICETYPE	NUMBER(38,0)	Type of recommendation: <ul style="list-style-type: none"> <li>■ 1: Create NOT NULL constraints on the foreign key columns</li> <li>■ 2: Create primary key constraints on the master table</li> <li>■ 3: Create primary key constraints on the master view</li> <li>■ 4: Create foreign key constraints on the master table</li> <li>■ 5: Create foreign key constraints on the master view</li> <li>■ 6: Create relational dimensions on the master dimension tables</li> <li>■ 7: Create a materialized view log</li> <li>■ 8: Compile the materialized view</li> </ul>
DISPOSITION	CLOB	Pre-existing conditions that conflict with the recommendations and should be resolved before SQLTEXT can be executed.
SQLTEXT	CLOB	SQL statement that implements the recommendation.
DROPTTEXT	CLOB	SQL statement that reverses SQLTEXT. Pre-existing conditions may prevent these statements from restoring the schema to its previous state.

## Usage Notes

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

MV\_CUBE\_ADVICE generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL DROP MATERIALIZED VIEW LOG statement in the DROPTTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

## Examples

The following query displays the SQL statements recommended by MV\_CUBE\_ADVICE. UNITS\_FACT is the master table for UNITS\_CUBE, and MV\_CUBE\_ADVICE generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the CB\$UNITS\_CUBE cube materialized view.

```
SQL> SELECT apiobject, sqlobject, sqltext
       FROM TABLE(dbms_cube_advise.mv_cube_advise('GLOBAL', 'CB$UNITS_CUBE'));
```

```
APIOBJECT      SQLOBJECT      SQLTEXT
-----
UNITS_CUBE    UNITS_FACT     alter table "GLOBAL"."UNITS_FACT" add constr
int "COAD_PK000208" PRIMARY KEY ("CHANNEL_ID"
```

```
        , "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") rely d  
        isable novalidate  
  
UNITS_CUBE    CB$UNITS_CUBE    alter materialized view "GLOBAL"."CB$UNITS_CU  
              BE" compile
```

## SET\_CNS\_EXCEPTION\_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by MV\_CUBE\_ADVICE.

### Syntax

```
DBMS_CUBE_ADVICE.SET_CNS_EXCEPTION_LOG (
    exceptlogtab    IN    VARCHAR2    DEFAULT user.EXCEPTIONS);
```

### Parameters

**Table 42–4 SET\_CNS\_EXCEPTION\_LOG Procedure Parameters**

Parameter	Description
exceptlogtab	The name of an existing exception log.

### Usage Notes

To create an exception log, use the `utlexcpt.sql` or the `utlexpt1.sql` script before executing `SET_CNS_EXCEPTION_LOG`.

The `validate` parameter of `MV_CUBE_ADVICE` must be set to 1.

### Examples

The `utlexcpt.sql` script creates a table named `EXCEPTIONS`, and the `SET_CNS_EXCEPTION_LOG` procedure identifies it as the exception log for `MV_CUBE_ADVICE`. The `ALTER TABLE` statement now includes the clause `VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS"`.

```
SQL> @utlexcpt
Table created.
```

```
SQL> EXECUTE dbms_cube_advice.set_cns_exception_log;
PL/SQL procedure successfully completed.
```

```
SQL> SELECT apiobject, sqlobject, advicetype type, sqltext
       FROM TABLE(
           dbms_cube_advice.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));
```

APIOBJECT	SQLOBJECT	TYPE	SQLTEXT
UNITS_CUBE	UNITS_FACT	2	alter table "GLOBAL"."UNITS_FACT" add constraint "COAD_PK000219" PRIMARY KEY ("CHANNEL_ID", "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") norely enable validate exceptions into "GLOBAL"."EXCEPTIONS"
UNITS_CUBE	CB\$UNITS_CUBE	8	alter materialized view "GLOBAL"."CB\$UNITS_CUBE" compile

## TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the MV\_CUBE\_ADVISE function.

### Syntax

```
DBMS_CUBE_ADVISE.TRACE (
    diaglevel          IN BINARY_INTEGER DEFAULT 0);
```

### Parameters

**Table 42–5 TRACE Procedure Parameters**

Parameter	Description
diaglevel	0 to turn tracing off, or 1 to turn tracing on.

### Examples

The following example directs the diagnostic messages to server output. The SQL\*Plus SERVEROUTPUT setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE dbms_cube_advise.trace(1);
DBMS_COAD_DIAG: Changing diagLevel from [0] to [1]
```

PL/SQL procedure successfully completed.

```
SQL> SELECT sqlobject, sqltext, droptext
FROM TABLE(
    dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'))
WHERE apiobject='UNITS_CUBE';
```

SQLOBJECT	SQLTEXT	DROPTEXT
UNITS_FACT	alter table "GLOBAL"."UNITS_FACT" add constraint "COAD_PK000222" PRIMARY KEY ("CHANNEL_ID", "ITEM_ID", "SHIP_TO_ID", "MONTH_ID")	alter table "GLOBAL"."UNITS_FACT" drop constraint "COAD_PK000222" cascade
CB\$UNITS_CUBE	alter materialized view "GLOBAL"."CB\$UNITS_CUBE" compile	alter materialized view "GLOBAL"."CB\$UNITS_CUBE" compile

```

## DBMS\_CUBE\_LOG

DBMS\_CUBE\_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.

**See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- [Using DBMS\\_CUBE\\_LOG](#)
- [Summary of DBMS\\_CUBE\\_LOG Subprograms](#)

## Using DBMS\_CUBE\_LOG

DBMS\_CUBE\_LOG manages several logs. These logs enable you to track the progress of long running processes, then use the results to profile performance characteristics. They provide information to help you diagnose and remedy problems that may occur during development and maintenance of a cube: Hierarchies that are improperly structured in the relational source tables, records that fail to load, or data refreshes that take too long to complete. They also help diagnose performance problems in querying cubes.

Analytic Workspace Manager creates the logs automatically using the default names and types. It also disables the logs when Analytic Workspace Manager is closed. To use the same logs outside of Analytic Workspace Manager, you must first enable them. Alternatively, you can create and manage different logs for use outside of Analytic Workspace Manager.

This section contains the following topics:

- [Logging Types](#)
- [Logging Targets](#)
- [Verbosity Levels](#)
- [Security Model](#)
- [Creating Cube Logs](#)
- [Cube Build Log](#)
- [Cube Dimension Compile Log](#)
- [Cube Operations Log](#)
- [Cube Rejected Records Log](#)

## Logging Types

Several logs are available, each one dedicated to storing messages of a particular type. You may use all of them or only those that you find particularly valuable. The logs and their contents are described later in this topic.

- [Cube Build Log](#)
- [Cube Dimension Compile Log](#)
- [Cube Operations Log](#)
- [Cube Rejected Records Log](#)

DBMS\_CUBE\_LOG provides functions that return the binary integer for each log type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS\_CUBE\_LOG procedures and functions. Refer to these descriptions:

- [TYPE\\_BUILD Function](#)
- [TYPE\\_DIMENSION\\_COMPILE Function](#)
- [TYPE\\_OPERATIONS Function](#)
- [TYPE\\_REJECTED\\_RECORDS Function](#)

## Logging Targets

The `TABLE_CREATE` procedure creates database tables for storing the logs. Using the `ENABLE` procedure, you can create additional targets with changes in the destination or logging level. For example, you might target the Cube Operations log to both a table and a disk file. These are the available targets:

- Disk file
- LOB
- Database table
- Trace file

See "[ENABLE Procedure](#)" on page 43-17 for more information about creating multiple targets.

`DBMS_CUBE_LOG` provides functions that return the binary integer for each target type. You can produce more readable code by using these functions instead of integers for the argument values of other `DBMS_CUBE_LOG` procedures and functions. Refer to these descriptions:

- [TARGET\\_FILE Function](#)
- [TARGET\\_LOB Function](#)
- [TARGET\\_TABLE Function](#)
- [TARGET\\_TRACE Function](#)

## Verbosity Levels

You can decide how much information is recorded in a log. You may want fewer details when leaving a job to run overnight than when you are monitoring the success of a new build. You can choose from these verbosity levels. Each level adds to the preceding level.

- **LOWEST:** Logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records. This is the basic logging level.
- **LOW:** Logs messages from the OLAP engine, such as start and finish records for SQL Import, Aggregate, and Update.
- **MEDIUM:** Logs messages at the level used by Analytic Workspace Manager.
- **HIGH:** Logs messages that provide tuning information, such as composite lengths, partitioning details, object sizes, and aggregation work lists. This level is intended for use by Oracle Field Services.
- **HIGHEST:** Logs debugging messages and other information typically sent to a trace file. This level is intended for use by Oracle Support Services.

DBMS\_CUBE\_LOG provides functions that return the binary integer for each verbosity level. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS\_CUBE\_LOG procedures and functions. Refer to these descriptions:

- [LEVEL\\_LOWEST Function](#)
- [LEVEL\\_LOW Function](#)
- [LEVEL\\_MEDIUM Function](#)
- [LEVEL\\_HIGH Function](#)
- [LEVEL\\_HIGHEST Function](#)

## Security Model

The `TABLE_CREATE` procedure requires the `CREATE TABLE` privilege.

## Creating Cube Logs

To store logging information in a database table, you must create that table using the TABLE\_CREATE procedure. Cube Build logs are always stored in tables. The ENABLE procedure creates the other target types for the other logs.

### To create a Cube Build log:

- Execute the TABLE\_CREATE procedure.

The following command creates a Cube Build log with the default name of CUBE\_BUILD\_LOG:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_build);
```

### To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a database table target:

1. Execute the TABLE\_CREATE procedure to create the table.
2. Execute the ENABLE procedure to begin logging.

These commands create and enable a Cube Operations table with the default name of CUBE\_OPERATIONS\_LOG and the default verbosity level:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_operations);  
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations);
```

### To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a trace file, disk file, or LOB target:

- Execute the ENABLE procedure.

This command enables the Cube Rejected Records log, sets verbosity to the lowest level, and directs the output to a disk file named rejects.log in the WORK\_DIR database directory:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_rejected_records, -  
    dbms_cube_log.target_file, dbms_cube_log.level_lowest, -  
    'WORK_DIR/rejects.log');
```

## Cube Build Log

The Cube Build log provides information about what happened during a build. Use this log to determine whether the build produced the results you were expecting, and if not, why not.

The contents of the Cube Build log is refreshed continuously during a build. You can query the log at any time to evaluate the progress of the build and to estimate the time to completion.

The default name of the Cube Build log is CUBE\_BUILD\_LOG. The following table describes its contents.

---

---

**Note:** To manage a Cube Build log, use only the TABLE\_CREATE and VERSION procedures.

---

---

Column	Datatype	NULL	Description
BUILD_ID	NUMBER	--	A unique sequence number for the build. The same number is used for slave processes in a parallel build.
SLAVE_NUMBER	NUMBER	--	A counter for slave processes in a parallel build: 0 is the master process, 1 is the first slave, 2 is the second slave, and so forth.
STATUS	VARCHAR2 (10)	--	The current status of the command: STARTED, COMPLETED, FAILED, or WORKING.
COMMAND	VARCHAR2 (25)	--	The name of the command being executed, such as BUILD, LOAD, and SOLVE.
BUILD_OBJECT	VARCHAR2 (500)	--	The name of the cube or cube dimension being processed.
BUILD_OBJECT_TYPE	VARCHAR2 (10)	--	The type of object: CUBE, DIMENSION, or BUILD.
OUTPUT	CLOB	--	Information structured like an XML document about the command, or NULL when there is no additional information, such as for a STARTED row.
AW	VARCHAR2 (30)	--	The name of the analytic workspace that contains the objects of the build.
OWNER	VARCHAR2 (30)		The owner of the analytic workspace and all the objects of the build.
PARTITION	VARCHAR2 (10)	--	The name of the partition being processed, or NULL when the current operation does not correspond to a partition.
SCHEDULER_JOB	VARCHAR2 (100)	--	A user-specified string to identify the build.
TIME	TIMESTAMP (6)	--	The time the row is added to the table.
BUILD_SCRIPT	CLOB	--	The cube build script. Populated only in rows where COMMAND is BUILD.
BUILD_TYPE	VARCHAR2 (22)	--	The origin of the build: DBMS_CUBE, DBMS_MVIEW, JAVA, or SLAVE.
COMMAND_DEPTH	NUMBER (2)	--	The nesting depth of the command. For example, COMPILE HIERARCHIES is a component step of COMPILE, so if COMPILE has a depth of 1, then COMPILE HIERARCHIES has a depth of 2.

---

<b>Column</b>	<b>Datatype</b>	<b>NULL</b>	<b>Description</b>
BUILD_SUB_OBJECT	VARCHAR2 (30)	--	The name of a subobject being processed, such as a measure that does not inherit the aggregation rules of the cube.
REFRESH_METHOD	VARCHAR2 (1)	--	The refresh method, such as C or F, that is associated with the current command. The refresh method is important only for the CLEAR step.
SEQ_NUMBER	NUMBER	--	Not currently used.
COMMAND_NUMBER	NUMBER	--	The sequence number of the command in the current process, which can be used to distinguish the same command on different objects. For example, a LOAD on PRODUCT and a LOAD on TIME.
IN_BRANCH	NUMBER (1)	--	Not currently used.
COMMAND_STATUS_NUMBER	NUMBER	--	Identifies the sequence number of all rows for a particular command. For example, a particular command might be represented by four rows: The first row has a status of STARTED and the last row has a status of COMPLETED. This column is used for sorting.

---

## Cube Dimension Compile Log

When solving a cube, OLAP checks the dimension hierarchies to make sure they are valid. Errors that occur during this validation are written to the Cube Dimension Compile log. The checks include:

- **Circularity:** Hierarchies are defined by parent-child relations among dimension members. Circularity occurs when a dimension member is specified as its own ancestor or descendant.
- **Hierarchy type:** Hierarchies can be level based or value based. You can define a cube so that only level-based hierarchies are valid, such as a cube materialized view.
- **Level options:** Level-based hierarchies can be regular, ragged, or skip level. You can define a dimension so that only regular hierarchies are valid, such as a Time dimension.

The default name of the Cube Dimension Compile log is CUBE\_DIMENSION\_COMPILE. The following table describes its contents.

Column	Datatype	NULL	Description
ID	NUMBER	--	Current operation identifier
SEQ_NUMBER	NUMBER	--	Sequence number in the Cube Build log
ERROR#	NUMBER (8)	NOT NULL	Number of the error being reported
ERROR_MESSAGE	VARCHAR2 (2000)	--	Error message associated with the error
DIMENSION	VARCHAR2 (100)	--	Name of the dimension being compiled
DIMENSION_MEMBER	VARCHAR2 (100)	--	Faulty dimension member
MEMBER_ANCESTOR	VARCHAR2 (100)	--	Parent of DIMENSION_MEMBER
HIERARCHY1	VARCHAR2 (100)	--	First hierarchy involved in the error
HIERARCHY2	VARCHAR2 (100)	--	Second hierarchy involved in the error
ERROR_CONTEXT	CLOB	--	Additional information about the error

## Cube Operations Log

The Cube Operations log contains messages and debugging information for all OLAP engine events. You can track current operations at a very detailed level. Using the `SQL_ID` column, you can join the Cube Operations log to dynamic performance views such as `V$SQL`, `V$SESSION`, and `V$SESSION_LONGOPS` to see cube operations in the context of other database operations such as I/O Wait and CPU.

The default name of the Cube Operations log is `CUBE_OPERATIONS_LOG`. The following table describes its contents.

Column	Datatype	NULL	Description
<code>INST_ID</code>	NUMBER	NOT NULL	Instance identifier
<code>SID</code>	NUMBER	NOT NULL	Session identifier
<code>SERIAL#</code>	NUMBER	NOT NULL	Session serial number
<code>USER#</code>	NUMBER	NOT NULL	User identifier
<code>SQL_ID</code>	VARCHAR2 (13)	--	Executing SQL statement identifier
<code>JOB</code>	NUMBER	--	Job identifier
<code>ID</code>	NUMBER	--	Current operation identifier
<code>PARENT_ID</code>	NUMBER	--	Parent operation identifier
<code>SEQ_NUMBER</code>	NUMBER	--	Sequence number in the Cube Build log
<code>TIME</code>	TIMESTAMP (6) WITH TIME ZONE	NOT NULL	Time the record was added to the Cube Operations log
<code>LOG_LEVEL</code>	NUMBER (4)	NOT NULL	Verbosity level of the record, as specified by the <code>DBMS_CUBE_LOG.ENABLE</code> procedure.
<code>DEPTH</code>	NUMBER (4)	--	Nesting depth of the record. For example, a level of 0 indicates that the operation and suboperation are not nested within other operations and suboperations.
<code>OPERATION</code>	VARCHAR2 (15)	NOT NULL	Current operation, such as <code>AGGREGATE</code> , <code>ROWSOURCE</code> , or <code>SQLIMPORT</code> .
<code>SUBOPERATION</code>	VARCHAR2 (20)	--	Current suboperation, such as <code>Loading</code> or <code>Import</code>
<code>STATUS</code>	VARCHAR2 (10)	NOT NULL	Current status of the operation, such as <code>START</code> , <code>TRACE</code> , <code>COMPLETED</code> , or <code>Failed</code> .
<code>NAME</code>	VARCHAR2 (20)	NOT NULL	Name of the record, such as <code>ROWS LOADED</code> , <code>AVE_ROW_LEN</code> , and <code>PAGEPOOLSIZ</code>
<code>VALUE</code>	VARCHAR2 (4000)	--	Value of <code>NAME</code>
<code>DETAILS</code>	CLOB	--	Additional information about <code>NAME</code> .

## Cube Rejected Records Log

The Cube Rejected Records log contains a summary of the loader job and any records that were rejected because they did not meet the expected format.

A single row in the source table may have errors in more than one field. Each field will generate an error in log, resulting in multiple rows with the same rowid in the SOURCE\_ROW column.

The default name of the Cube Rejected Records log is CUBE\_REJECTED\_RECORDS. The following table describes its contents.

Column	Datatype	NULL	Description
ID	NUMBER	--	Current operation identifier
SEQ_NUMBER	NUMBER	--	Sequence number in the Cube Build log
ERROR#	NUMBER (8)	NOT NULL	Number of the error triggered by the record
ERROR_MESSAGE	VARCHAR2	--	Error message associated with the error
RECORD#	NUMBER (38)	--	Input record number
SOURCE_ROW	ROWID	--	Rowid of the row in the source table; null when the source is a view or a query

## Summary of DBMS\_CUBE\_LOG Subprograms

**Table 43-1 DBMS\_CUBE\_LOG Subprograms**

Subprogram	Description
<a href="#">DEFAULT_NAME Function</a> on page 43-15	Returns the default table names of the various log types.
<a href="#">DISABLE Procedure</a> on page 43-16	Turns logging off for the duration of a session.
<a href="#">ENABLE Procedure</a> on page 43-17	Turns on logging for the duration of a session, redirects logging to additional output types, and changes the verbosity level in the logs.
<a href="#">FLUSH Procedure</a> on page 43-19	Forces all buffered messages to be written to the logs.
<a href="#">GET_LOG Procedure</a> on page 43-20	Returns the current settings for the level and location of a particular log.
<a href="#">GET_LOG_SPEC Function</a> on page 43-22	Retrieves a description of all active logs.
<a href="#">GET_PARAMETER Function</a> on page 43-23	Returns the current values of the options that control various aspects of logging.
<a href="#">LEVEL_HIGH Function</a> on page 43-24	Returns the integer value of the high verbosity level.
<a href="#">LEVEL_HIGHEST Function</a> on page 43-25	Returns the integer value of the highest verbosity level.
<a href="#">LEVEL_LOW Function</a> on page 43-26	Returns the integer value of the low verbosity level.
<a href="#">LEVEL_LOWEST Function</a> on page 43-27	Returns the integer value of the lowest verbosity level.
<a href="#">LEVEL_MEDIUM Function</a> on page 43-28	Returns the integer value of the medium verbosity level.
<a href="#">SET_LOG_SPEC Procedure</a> on page 43-29	Sets all logging to the values specified in the input string.
<a href="#">SET_PARAMETER Procedure</a> on page 43-30	Sets options that control various aspects of logging.
<a href="#">TABLE_CREATE Procedure</a> on page 43-32	Creates the table targets for the OLAP logs.
<a href="#">TARGET_FILE Function</a> on page 43-33	Returns the integer value of a disk file target.
<a href="#">TARGET_LOB Function</a> on page 43-34	Returns the integer value of a LOB target.
<a href="#">TARGET_TABLE Function</a> on page 43-35	Returns the integer value of a database table target.
<a href="#">TARGET_TRACE Function</a> on page 43-36	Returns the integer value of a trace file target.
<a href="#">TYPE_BUILD Function</a> on page 43-37	Returns the integer value of the Cube Build log.
<a href="#">TYPE_DIMENSION_COMPILE Function</a> on page 43-38	Returns the integer value of the Cube Dimension Compile log.

**Table 43-1 (Cont.) DBMS\_CUBE\_LOG Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">TYPE_OPERATIONS Function</a> on page 43-39	Returns the integer value of the Cube Operations log.
<a href="#">TYPE_REJECTED_RECORDS Function</a> on page 43-40	Returns the integer value of the Cube Rejected Records log.
<a href="#">VERSION Function</a> on page 43-41	Returns the version number of a specific log table or the current version number of a specific log type.

## DEFAULT\_NAME Function

This function returns the default table names of the various log types.

### Syntax

```
DBMS_CUBE_LOG.DEFAULT_NAME (
    LOG_TYPE          IN  BINARY_INTEGER  DEFAULT TYPE_OPERATIONS)
RETURN VARCHAR2;
```

### Parameters

**Table 43–2** *DEFAULT\_NAME Function Parameters*

Parameter	Description
log_type	One of the following log types: <ul style="list-style-type: none"> <li>■ 1: TYPE_OPERATIONS</li> <li>■ 2: TYPE_REJECTED_RECORDS</li> <li>■ 3: TYPE_DIMENSION_COMPILE</li> <li>■ 4: TYPE_BUILD</li> </ul> See <a href="#">"Logging Types"</a> on page 43-3.

### Returns

The default table name of the specified log type.

### Examples

This example returns the default name of the Cube Operations log:

```
SELECT dbms_cube_log.default_name FROM dual;
```

```
DEFAULT_NAME
-----
CUBE_OPERATIONS_LOG
```

The next example returns the default name of the Cube Rejected Records log:

```
select dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
       "Default Name" from dual;
```

```
Default Name
-----
CUBE_REJECTED_RECORDS
```

## DISABLE Procedure

This procedure turns logging off for the duration of a session, unless logging is explicitly turned on again with the `ENABLE` procedure.

### Syntax

```
DBMS_CUBE_LOG.DISABLE (
    LOG_TYPE      IN  BINARY_INTEGER  DEFAULT,
    LOG_TARGET    IN  BINARY_INTEGER  DEFAULT);
```

### Parameters

**Table 43–3** *DISABLE Procedure Parameters*

Parameter	Description
log_type	<p>One of the following log types:</p> <ul style="list-style-type: none"> <li>■ 1: TYPE_OPERATIONS</li> <li>■ 2: TYPE_REJECTED_RECORDS</li> <li>■ 3: TYPE_DIMENSION_COMPILE</li> </ul> <p><b>Note:</b> You cannot disable the Cube Build log with this procedure.</p> <p>See "<a href="#">Logging Types</a>" on page 43-3.</p>
log_target	<p>One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the <code>ENABLE</code> procedure.</p> <ul style="list-style-type: none"> <li>■ 1: TARGET_TABLE</li> <li>■ 2: TARGET_TRACE</li> <li>■ 3: TARGET_FILE</li> <li>■ 4: TARGET_LOB</li> </ul> <p>See "<a href="#">Logging Targets</a>" on page 43-4</p>

### Example

This command disables the dimension compilation error log table:

```
EXECUTE dbms_cube_log.disable(dbms_cube_log.type_dimension_compile);
```

## ENABLE Procedure

This procedure turns on logging for the duration of a session or until it is turned off using the `DISABLE` procedure.

The `ENABLE` procedure also allows you to direct logging to additional output types and to change the amount of detail in the logs. You can enable a log type to each of the log targets. For example, you can enable the Cube Operations log to the trace file, a table, and a file at different verbosity levels, but you cannot enable the Cube Operations log to two files at the same time.

This procedure also checks the format of the logs and updates them if necessary.

### Syntax

```
DBMS_CUBE_LOG.ENABLE (
    LOG_TYPE      IN      BINARY_INTEGER DEFAULT NULL,
    LOG_TARGET    IN      BINARY_INTEGER DEFAULT NULL,
    LOG_LEVEL     IN      BINARY_INTEGER DEFAULT NULL);
```

```
DBMS_CUBE_LOG.ENABLE (
    LOG_TYPE      IN      BINARY_INTEGER DEFAULT NULL,
    LOG_TARGET    IN      BINARY_INTEGER DEFAULT NULL,
    LOG_LEVEL     IN      BINARY_INTEGER DEFAULT NULL,
    LOG_LOCATION  IN      VARCHAR2      DEFAULT NULL);
```

```
DBMS_CUBE_LOG.ENABLE (
    LOG_TYPE      IN      BINARY_INTEGER DEFAULT NULL,
    LOG_TARGET    IN      BINARY_INTEGER DEFAULT NULL,
    LOG_LEVEL     IN      BINARY_INTEGER DEFAULT NULL,
    LOG_LOCATION  IN/OUT CLOB );
```

### Parameters

**Table 43–4** *ENABLE Procedure Parameters*

Parameter	Description
<code>log_type</code>	<p>One of the following log types:</p> <ul style="list-style-type: none"> <li>■ 1: <code>TYPE_OPERATIONS</code></li> <li>■ 2: <code>TYPE_REJECTED_RECORDS</code></li> <li>■ 3: <code>TYPE_DIMENSION_COMPILE</code></li> </ul> <p><b>Note:</b> You cannot disable the Cube Build log with this procedure.</p> <p>See "<a href="#">Logging Types</a>" on page 43-3.</p>
<code>log_target</code>	<p>One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the <code>ENABLE</code> procedure.</p> <ul style="list-style-type: none"> <li>■ 1: <code>TARGET_TABLE</code></li> <li>■ 2: <code>TARGET_TRACE</code></li> <li>■ 3: <code>TARGET_FILE</code></li> <li>■ 4: <code>TARGET_LOB</code></li> </ul> <p>See "<a href="#">Logging Targets</a>" on page 43-4</p>

**Table 43–4 (Cont.) ENABLE Procedure Parameters**

Parameter	Description
log_level	<p>One of the following log verbosity levels. Each level adds new types of messages to the previous level.</p> <ul style="list-style-type: none"> <li>▪ 1: LEVEL_LOWEST</li> <li>▪ 2: LEVEL_LOW</li> <li>▪ 3: LEVEL_MEDIUM</li> <li>▪ 4: LEVEL_HIGH</li> <li>▪ 5: LEVEL_HIGHEST</li> </ul> <p>See "<a href="#">Verbosity Levels</a>" on page 43-5.</p>
log_location	The full identity of the log, such as <i>owner.table_name</i> when <i>log_target</i> is a table.

## Examples

The following command enables all cube logs:

```
EXECUTE dbms_cube_log.enable;
```

The following PL/SQL procedure sets the log level to LEVEL\_LOWEST:

```
BEGIN
  dbms_cube_log.disable(dbms_cube_log.type_rejected_records);
  dbms_cube_log.enable(dbms_cube_log.type_rejected_records,
    dbms_cube_log.target_table, dbms_cube_log.level_lowest);
END;
/
```

## FLUSH Procedure

This procedure forces all buffered messages to be written to the logs. The buffers are flushed automatically throughout a session, but manually flushing them before viewing the logs assures that you can view all of the messages.

### Syntax

```
DBMS_CUBE_LOG.FLUSH ( );
```

### Example

The following example flushes the buffers for all of the logs:

```
EXECUTE dbms_cube_log.flush;
```

## GET\_LOG Procedure

This procedure returns the current settings for the level and location of a particular log.

### Syntax

```
DBMS_CUBE_LOG.GET_LOG (
    LOG_TYPE      IN  BINARY_INTEGER  DEFAULT TYPE_OPERATIONS,
    LOG_TARGET    IN  BINARY_INTEGER  DEFAULT TARGET_TABLE,
    LOG_LEVEL     OUT BINARY_INTEGER,
    LOG_LOCATION  OUT  VARCHAR2 );
```

### Parameters

**Table 43–5** GET\_LOG Procedure Parameters

Parameter	Description
log_type	<p>One of the following log types:</p> <ul style="list-style-type: none"> <li>■ 1: TYPE_OPERATIONS</li> <li>■ 2: TYPE_REJECTED_RECORDS</li> <li>■ 3: TYPE_DIMENSION_COMPILE</li> </ul> <p>See <a href="#">"Logging Types"</a> on page 43-3.</p>
log_target	<p>One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure.</p> <ul style="list-style-type: none"> <li>■ 1: TARGET_TABLE</li> <li>■ 2: TARGET_TRACE</li> <li>■ 3: TARGET_FILE</li> <li>■ 4: TARGET_LOB</li> </ul> <p>See <a href="#">"Logging Targets"</a> on page 43-4</p>
log_level	<p>One of the following log verbosity levels. Each level adds new types of messages to the previous level.</p> <ul style="list-style-type: none"> <li>■ 1: LEVEL_LOWEST</li> <li>■ 2: LEVEL_LOW</li> <li>■ 3: LEVEL_MEDIUM</li> <li>■ 4: LEVEL_HIGH</li> <li>■ 5: LEVEL_HIGHEST</li> </ul> <p>See <a href="#">"Verbosity Levels"</a> on page 43-5.</p>
log_location	<p>The full identity of the log, such as <i>owner.table_name</i> when log_target is a table.</p>

### Usage Notes

If log\_type is not active, then log\_level and log\_location are null. Use DBMS\_CUBE\_LOG.ENABLE to activate a log.

### Examples

This PL/SQL procedure provides information about the Cube Rejected Records log:

```
SET serverout ON format wrapped
```

```
DECLARE
    myloglevel  binary_integer;
    mylogtarget varchar2(128);

BEGIN
    dbms_cube_log.get_log(dbms_cube_log.type_rejected_records,
        dbms_cube_log.target_table, myloglevel, mylogtarget);

    dbms_output.put_line('Log Level: ' || myloglevel);
    dbms_output.put_line('Log Target: ' || mylogtarget);
END;
/
```

The procedure generates results like the following:

Log Level: 5

Log Target: GLOBAL.CUBE\_REJECTED\_RECORDS

## GET\_LOG\_SPEC Function

This function retrieves a description of all active Cube Operations logs, Cube Rejected Records logs, and Cube Dimension Compile logs.

### Syntax

```
DBMS_CUBE_LOG.GET_LOG_SPEC ( )  
    RETURN VARCHAR2;
```

### Returns

The type and target of all active logs.

### Usage Notes

You can use the output from this function as the input to SET\_LOG\_SPEC.

### Examples

The following example shows that the Cube Operations log, Cube Rejected Records log, and Cube Dimension Compile log are active. The Cube Operations log is stored in the session trace file and the other logs are stored in tables.

```
SELECT dbms_cube_log.get_log_spec FROM dual;
```

```
GET_LOG_SPEC
```

```
-----  
OPERATIONS(TABLE, TRACE) REJECTED_RECORDS(TABLE[DEBUG])
```

## GET\_PARAMETER Function

This function returns the current values of the options that control various aspects of logging. To set these options, use the `SET_PARAMETER` function.

### Syntax

```
DBMS_CUBE_LOG.GET_PARAMETER (
    LOG_TYPE      IN  BINARY_INTEGER,
    LOG_PARAMETER IN  BINARY_INTEGER )
RETURN BINARY_INTEGER;
```

### Parameters

**Table 43–6** *GET\_PARAMETER Function Parameters*

Parameter	Description
<code>log_type</code>	One of the following log types: <ul style="list-style-type: none"> <li>■ 1: TYPE_OPERATIONS</li> <li>■ 2: TYPE_REJECTED_RECORDS</li> <li>■ 3: TYPE_DIMENSION_COMPILE</li> </ul> See " <a href="#">Logging Types</a> " on page 43-3.
<code>log_parameter</code>	One of the following options: <ul style="list-style-type: none"> <li>■ 1: MAX_ERRORS</li> <li>■ 2: FLUSH_INTERVAL</li> <li>■ 3: LOG_FULL_RECORD</li> <li>■ 4: LOG_EVERY_N</li> <li>■ 5: ALLOW_ERRORS</li> </ul> See " <a href="#">SET_PARAMETER Procedure</a> " on page 43-30.

### Returns

The value of the specified `log_parameter`.

### Examples

This example shows the current maximum number of errors in the Cube Rejected Records log before logging stops. This parameter was previously set with the `SET_PARAMETER` procedure.

```
SELECT dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1) -
       "Maximum Records" FROM dual;
```

```
Maximum Records
-----
                100
```

## LEVEL\_HIGH Function

This function returns the integer value of the high verbosity level.

### Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGH ()  
    RETURN BINARY_INTEGER;
```

### Returns

4

### Usage Notes

Use this function instead of its binary integer equivalent for the *LOG\_LEVEL* parameter in DBMS\_CUBE\_LOG subprograms. See "[Verbosity Levels](#)" on page 43-5.

### Example

This command sets the verbosity level of the cube operations table to high:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -  
    dbms_cube_log.target_table, dbms_cube_log.level_high);
```

## LEVEL\_HIGHEST Function

This function returns the integer value of the highest verbosity level.

### Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGHEST ()  
    RETURN BINARY_INTEGER;
```

### Returns

5

### Usage Notes

Use this function instead of its binary integer equivalent for the LOG\_LEVEL parameter in DBMS\_CUBE\_LOG subprograms. See "[Verbosity Levels](#)" on page 43-5.

### Example

This command sets the verbosity level of the cube operations table to highest:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -  
    dbms_cube_log.target_table, dbms_cube_log.level_highest);
```

## LEVEL\_LOW Function

This function returns the integer value of the low verbosity level.

### Syntax

```
DBMS_CUBE_LOG.LEVEL_LOW ()  
    RETURN BINARY_INTEGER;
```

### Returns

2

### Usage Notes

Use this function instead of its binary integer equivalent for the LOG\_LEVEL parameter in DBMS\_CUBE\_LOG subprograms. See "[Verbosity Levels](#)" on page 43-5.

### Example

This command sets the verbosity level of the cube operations table to low:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -  
    dbms_cube_log.target_table, dbms_cube_log.level_low);
```

## LEVEL\_LOWEST Function

This function returns the integer value of the lowest verbosity level. This level logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records.

### Syntax

```
DBMS_CUBE_LOG.LEVEL_LOWEST ()  
    RETURN BINARY_INTEGER;
```

### Returns

1

### Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_LEVEL` parameter in `DBMS_CUBE_LOG` subprograms. See "[Verbosity Levels](#)" on page 43-5.

### Example

This command sets the verbosity level of the cube operations table to lowest:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -  
    dbms_cube_log.target_table, dbms_cube_log.level_lowest);
```

## LEVEL\_MEDIUM Function

This function returns the integer value of the medium verbosity level.

### Syntax

```
DBMS_CUBE_LOG.LEVEL_MEDIUM (  
    RETURN BINARY_INTEGER;
```

### Returns

3

### Usage Notes

Use this function instead of its binary integer equivalent for the LOG\_LEVEL parameter in DBMS\_CUBE\_LOG subprograms. See "[Verbosity Levels](#)" on page 43-5.

### Example

This command sets the verbosity level of the cube operations table to medium:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -  
    dbms_cube_log.target_table, dbms_cube_log.level_medium);
```

## SET\_LOG\_SPEC Procedure

This procedure sets all logging to the values specified in the input string.

### Syntax

```
DBMS_CUBE_LOG.SET_LOG_SPEC (
    LOG_SPEC      IN  VARCHAR2 );
```

### Parameters

**Table 43–7 SET\_LOG\_SPEC Procedure Parameters**

Parameter	Description
log_spec	<p>A string consisting of <i>type(target)</i> pairs.</p> <p><i>Type</i> can be:</p> <ul style="list-style-type: none"> <li>■ OPERATIONS</li> <li>■ REJECTED_RECORDS</li> <li>■ DIMENSION_COMPILE</li> </ul> <p><i>Target</i> can be:</p> <ul style="list-style-type: none"> <li>■ TABLE</li> <li>■ TRACE</li> <li>■ FILE</li> <li>■ LOB</li> </ul>

### Usage Notes

The GET\_LOG\_SPEC function returns a properly formatted string for SET\_LOG\_SPEC.

### Examples

This PL/SQL procedure disables all logs, verifies that they are disabled, then activates the Cube Operations log and the Cube Rejected Records log.

```
BEGIN
    dbms_cube_log.disable;
    dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);

    dbms_cube_log.set_log_spec('OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)');
    dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);
END;
/
```

The output from the procedure verifies that the DISABLE function de-activated all logs, and the SET\_LOG\_SPEC function activated two logs:

Cube Logs:

```
Cube Logs: OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)
```

## SET\_PARAMETER Procedure

This procedure sets options that control various aspects of logging. To obtain the current value of these options, use the GET\_PARAMETER function.

### Syntax

```
DBMS_CUBE_LOG.SET_PARAMETER (
    LOG_TYPE      IN  BINARY_INTEGER,
    LOG_PARAMETER IN  BINARY_INTEGER,
    VALUE         IN  BINARY_INTEGER );
```

### Parameters

**Table 43–8 SET\_PARAMETER Procedure Parameters**

Parameter	Description
log_type	<p>One of the following log types:</p> <ul style="list-style-type: none"> <li>■ 1: TYPE_OPERATIONS</li> <li>■ 2: TYPE_REJECTED_RECORDS</li> <li>■ 3: TYPE_DIMENSION_COMPILE</li> <li>■ 4: TYPE_BUILD</li> </ul> <p>See "<a href="#">Logging Types</a>" on page 43-3.</p>
log_parameter	<p>One of the following parameters:</p> <ul style="list-style-type: none"> <li>■ 1: MAX_ERRORS <ul style="list-style-type: none"> <li>Maximum number of records before signalling an end to logging, such as the number of rejected records in the Cube Rejected Records log or the number of compilation errors in the dimension compilation error log.</li> </ul> </li> <li>■ 2: FLUSH_INTERVAL <ul style="list-style-type: none"> <li>The number of seconds to buffer the records before writing them to a log. When this parameter is 0, the records are written directly to the logs without buffering.</li> </ul> </li> <li>■ 3: LOG_FULL_RECORD <ul style="list-style-type: none"> <li>Controls logging of rejected records. Set this parameter to one of the following constants: <ul style="list-style-type: none"> <li>0: FULL_RECORD_AUTO: Log the full record when no row ID is available.</li> <li>1: FULL_RECORD_ALWAYS: Always log the full record.</li> <li>2: FULL_RECORD_NEVER: Never log the full record.</li> </ul> </li> </ul> </li> <li>■ 4: LOG_EVERY_N <ul style="list-style-type: none"> <li>Enters a progress message every <i>n</i> rows during data maintenance.</li> </ul> </li> <li>■ 5: ALLOW_ERRORS: Displays logging errors, which are initially turned off to allow processing to proceed.</li> </ul>
value	The new value of <i>log_parameter</i> .

### Examples

This PL/SQL procedure sets the two parameters, then uses the GET\_PARAMETER function to show the settings:

```
BEGIN
  dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 1, 150);
  dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 2, 5);

  dbms_output.put_line('Max rejected records: ' ||
    dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1));

  dbms_output.put_line('Buffer time: ' ||
    dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 2) ||
    ' seconds');
END;
/
```

The procedure displays this information:

Max rejected records: 150

Buffer time: 5 seconds

## TABLE\_CREATE Procedure

This procedure creates the table targets for the OLAP logs. You must have the CREATE TABLE privilege to use this procedure.

TABLE\_CREATE also upgrades existing log tables to the current version while preserving the data.

### Syntax

```
DBMS_CUBE_LOG.TABLE_CREATE (
    LOG_TYPE      IN   BINARY_INTEGER  DEFAULT,
    TBLNAME       IN   VARCHAR2        DEFAULT );
```

### Parameters

**Table 43–9** TABLE\_CREATE Procedure Parameters

Parameter	Description
log_type	One of the following log types: <ul style="list-style-type: none"> <li>▪ 1: TYPE_OPERATIONS</li> <li>▪ 2: TYPE_REJECTED_RECORDS</li> <li>▪ 3: TYPE_DIMENSION_COMPILE</li> <li>▪ 4: TYPE_BUILD</li> </ul> See " <a href="#">Logging Types</a> " on page 43-3.
tblname	A table name for the log. These are the default names: <ul style="list-style-type: none"> <li>▪ CUBE_OPERATIONS_LOG</li> <li>▪ CUBE_REJECTED_RECORDS</li> <li>▪ CUBE_DIMENSION_COMPILE</li> <li>▪ CUBE_BUILD_LOG</li> </ul>

### Examples

The

This example creates a Cube Operations log table named CUBE\_OPERATIONS\_LOG:

```
EXECUTE dbms_cube_log.table_create;
```

This example creates a Cube Rejected Records log table named CUBE\_REJECTED\_RECORDS:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_rejected_records);
```

The next example creates a Cube Build log table named MY\_BUILD\_LOG:

```
EXECUTE dbms_cube_log.table_create -
    (dbms_cube_log.type_build, 'MY_BUILD_LOG');
```

## TARGET\_FILE Function

This function returns the integer value of a file target in DBMS\_CUBE\_LOG subprograms.

### Syntax

```
DBMS_CUBE_LOG.TARGET_FILE ()  
    RETURN BINARY_INTEGER;
```

### Returns

3

### Usage Notes

Use this function instead of its binary integer equivalent for the *LOG\_LEVEL* parameter in DBMS\_CUBE\_LOG subprograms. See "[Logging Targets](#)" on page 43-4.

### Example

This command disables the Cube Operations log file:

```
EXECUTE dbms_cube_log.disable -  
    (dbms_cube_log.type_operations, dbms_cube_log.target_file);
```

## TARGET\_LOB Function

This function returns the integer value of a LOB target.

### Syntax

```
DBMS_CUBE_LOG.TARGET_LOB ()  
    RETURN BINARY_INTEGER;
```

### Returns

4

### Usage Notes

Use this function instead of its binary integer equivalent for the *LOG\_LEVEL* parameter in DBMS\_CUBE\_LOG subprograms. See "[Logging Targets](#)" on page 43-4.

### Example

This command disables the Cube Operations log LOB:

```
EXECUTE dbms_cube_log.disable -  
    (dbms_cube_log.type_operations, dbms_cube_log.target_lob);
```

## TARGET\_TABLE Function

This function returns the integer value of a table target.

### Syntax

```
DBMS_CUBE_LOG.TARGET_TABLE (  
    RETURN BINARY_INTEGER;
```

### Returns

1

### Usage Notes

Use this function instead of its binary integer equivalent for the LOG\_TARGET parameter in DBMS\_CUBE\_LOG subprograms. See "[Logging Targets](#)" on page 43-4.

### Example

This command disables the Cube Operations log table:

```
EXECUTE dbms_cube_log.disable -  
    (dbms_cube_log.type_operations, dbms_cube_log.target_table);
```

## TARGET\_TRACE Function

This function returns the integer value of a trace file target.

### Syntax

```
DBMS_CUBE_LOG.TARGET_TRACE ()  
    RETURN BINARY_INTEGER;
```

### Returns

2

### Usage Notes

Use this function instead of its binary integer equivalent for the LOG\_TARGET parameter in DBMS\_CUBE\_LOG subprograms. See "[Logging Targets](#)" on page 43-4.

### Example

This command disables the Cube Operations log trace file:

```
EXECUTE dbms_cube_log.disable -  
    (dbms_cube_log.type_operations, dbms_cube_log.target_trace);
```

## TYPE\_BUILD Function

This function returns the integer value of the Cube Build log.

### Syntax

```
DBMS_CUBE_LOG.TYPE_BUILD ()  
    RETURN BINARY_INTEGER;
```

### Returns

4

### Usage Notes

Use this function instead of its binary integer equivalent for the LOG\_TYPE parameter in DBMS\_CUBE\_LOG subprograms. See "[Logging Types](#)" on page 43-3.

### Example

This query returns the default name of a Cube Build log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_build) "Log Name" -  
       FROM dual;
```

```
Log Name
```

```
-----  
CUBE_BUILD_LOG
```

## TYPE\_DIMENSION\_COMPILE Function

This function returns the integer value of the Cube Dimension Compile log.

### Syntax

```
DBMS_CUBE_LOG.TYPE_DIMENSION_COMPILE ()  
    RETURN BINARY_INTEGER;
```

### Returns

3

### Usage Notes

Use this function instead of its binary integer equivalent for the LOG\_TYPE parameter in DBMS\_CUBE\_LOG subprograms. See "[Logging Types](#)" on page 43-3.

### Example

This query returns the default name of a Cube Dimension Compile log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_dimension_compile) -  
       "Log Name" FROM dual;
```

```
Log Name  
-----  
CUBE_DIMENSION_COMPILE
```

## TYPE\_OPERATIONS Function

This function returns the integer value of the Cube Operations log.

### Syntax

```
DBMS_CUBE_LOG.TYPE_OPERATIONS (  
    RETURN BINARY_INTEGER;
```

### Returns

1

### Usage Notes

Use this function instead of its binary integer equivalent for the LOG\_TYPE parameter in DBMS\_CUBE\_LOG subprograms. See "[Logging Types](#)" on page 43-3.

### Example

This query returns the default name of a Cube Dimension Compile log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_operations) "Log Name" -  
       FROM dual;
```

```
Log Name  
-----  
CUBE_OPERATIONS_LOG
```

## TYPE\_REJECTED\_RECORDS Function

This function returns the integer value of the cube Cube Rejected Records log.

### Syntax

```
DBMS_CUBE_LOG.TYPE_REJECTED_RECORDS (  
    RETURN BINARY_INTEGER;
```

### Returns

2

### Usage Notes

Use this function instead of its binary integer equivalent for the LOG\_TYPE parameter in DBMS\_CUBE\_LOG subprograms. See "[Logging Types](#)" on page 43-3.

### Example

This query returns the default name of a Cube Rejected Records log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -  
       "Log Name" FROM dual;
```

```
Log Name  
-----  
CUBE_REJECTED_RECORDS
```

## VERSION Function

This function returns the version number of a specific log table or the current version number of a specific log type.

### Syntax

```
DBMS_CUBE_LOG.VERSION (
    LOG_TYPE      IN   BINARY_INTEGER  DEFAULT 1,
    TBLNAME       IN   VARCHAR2        DEFAULT NULL)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 43–10** *VERSION Function Parameters*

Parameter	Description
log_type	One of the following log types: <ul style="list-style-type: none"> <li>■ 1: TYPE_OPERATIONS</li> <li>■ 2: TYPE_REJECTED_RECORDS</li> <li>■ 3: TYPE_DIMENSION_COMPILE</li> <li>■ 4: TYPE_BUILD</li> </ul> See " <a href="#">Logging Types</a> " on page 43-3.
tblname	The name of the log table whose version is returned.

### Returns

A version number

### Examples

This example returns the current version of the Cube Operations log:

```
SELECT dbms_cube_log.version FROM dual;
```

```
VERSION
-----
      2
```

This example returns the version number of an existing Cube Rejected Records log named CUBE\_REJECTED\_RECORDS.

```
SELECT dbms_cube_log.version(dbms_cube_log.type_rejected_records, -
    'CUBE_REJECTED_RECORDS') version FROM dual;
```

```
VERSION
-----
      2
```

---

## DBMS\_DATA\_MINING

Oracle Data Mining is an analytical technology that derives actionable information from data in an Oracle Database. You can use Oracle Data Mining to evaluate the probability of future events and discover unsuspected associations and groupings within your data.

The `DBMS_DATA_MINING` package is the programmatic interface for creating and managing data mining models (mining model schema objects). Oracle Data Mining also supports a family of SQL functions for deploying data mining models.

Oracle Data Miner, a graphical interface to Oracle Data Mining, is available for download from the Oracle Technology Network at:

<http://www.oracle.com/technetwork/database/options/odm/>

### See Also:

- [Chapter 45, "DBMS\\_DATA\\_MINING\\_TRANSFORM"](#). This package supports data pre-processing for data mining models.
- [Chapter 104, "DBMS\\_PREDICTIVE\\_ANALYTICS"](#). This package supports several routines that perform automated data mining.
- *Oracle Database SQL Language Reference* for information about the SQL Data Mining scoring functions.
- *Oracle Data Mining Concepts* for an introduction to Oracle Data Mining.
- *Oracle Data Mining Concepts* for new features in Oracle Data Mining.

This chapter contains the following topics:

- [Using DBMS\\_DATA\\_MINING](#)
  - Overview
  - Mining Model Objects
  - Security Model
  - Deprecated Subprograms
  - Mining Functions
  - Model Settings
  - Data Types
- [Summary of DBMS\\_DATA\\_MINING Subprograms](#)

---

## Using DBMS\_DATA\_MINING

This section contains topics that relate to using the DBMS\_DATA\_MINING package.

- [Overview](#)
- [Mining Model Objects](#)
- [Security Model](#)
- [Deprecated Subprograms](#)
- [Mining Functions](#)
- [Model Settings](#)
- [Data Types](#)

## Overview

Oracle Data Mining supports both **supervised** and **unsupervised** data mining. Supervised data mining predicts a target value based on historical data. Unsupervised data mining discovers natural groupings and does not use a target.

**See Also:** *Oracle Data Mining Concepts* for more information

A data mining **function** refers to the methods for solving a given class of data mining problems. The mining function must be specified when a model is created. See "[Mining Functions](#)" on page 44-9.

---

**Note on Terminology:** In data mining terminology, a *function* is a general type of problem to be solved by a given approach to data mining. In SQL language terminology, a *function* is an operator that returns a value.

In Oracle Data Mining documentation, the term *function*, or *mining function* refers to a data mining function; the term *SQL function* or *SQL Data Mining function* refers to a SQL function for scoring (deploying) data mining models. The SQL Data Mining functions are documented in *Oracle Database SQL Language Reference*.

---

Supervised data mining functions include:

- Classification
- Regression
- Attribute Importance

Unsupervised data mining functions include:

- Clustering
- Association
- Feature Extraction
- Anomaly Detection (one-class classification)

The steps you use to build and apply a mining model depend on the data mining function and the algorithm being used. The algorithms supported by Oracle Data Mining are listed in [Table 44-1](#).

**Table 44-1 Oracle Data Mining Algorithms**

Algorithm	Abbreviation	Function
Adaptive Bayes Network (deprecated)	ABN	Classification
Apriori	AP	Association
Decision Tree	DT	Classification
Generalized Linear Model	GLM	Classification and Regression
<i>k</i> -Means (default clustering algorithm)	KM	Clustering
Minimal Descriptor Length	MDL	Attribute Importance

**Table 44–1 (Cont.) Oracle Data Mining Algorithms**

<b>Algorithm</b>	<b>Abbreviation</b>	<b>Function</b>
Naive Bayes (default classification algorithm)	NB	Classification
Non-Negative Matrix Factorization	NMF	Feature Extraction
Orthogonal Partitioning Clustering	O-Cluster	Clustering
Support Vector Machine (default regression algorithm)	SVM	Classification and regression (and anomaly detection through one-class classification)

## Mining Model Objects

Mining models are Oracle Database schema objects. They support the standard security features of Oracle Database. Mining models are also supported by SQL COMMENT and SQL AUDIT.

### See Also:

- *Oracle Data Mining Administrator's Guide* for information about mining model objects, SQL COMMENT, and SQL AUDIT
- *Oracle Data Mining Administrator's Guide* for information about mining model security
- *Oracle Data Mining Administrator's Guide* for information about the sample Data Mining programs

## ALL\_MINING\_MODELS

You can query the data dictionary view ALL\_MINING\_MODELS to obtain a list of accessible mining models.

### Example 44-1 ALL\_MINING\_MODELS

```
SQL> describe all_mining_models
```

Name	Null?	Type
OWNER	NOT NULL	VARCHAR2 (30)
MODEL_NAME	NOT NULL	VARCHAR2 (30)
MINING_FUNCTION		VARCHAR2 (30)
ALGORITHM		VARCHAR2 (30)
CREATION_DATE	NOT NULL	DATE
BUILD_DURATION		NUMBER
MODEL_SIZE		NUMBER
COMMENTS		VARCHAR2 (4000)

**See Also:** *Oracle Data Mining Application Developer's Guide* for more information about ALL\_MINING\_MODELS and related views

## Mining Model Naming Restrictions

The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

- It must be 25 or fewer characters long.
- It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (\_), dollar sign (\$), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

Naming requirements for schema objects are fully documented in *Oracle Database SQL Language Reference*.

## ALL\_MINING\_MODEL\_ATTRIBUTES

You can query the data dictionary view ALL\_MINING\_MODEL\_ATTRIBUTES to obtain a list of the **data attributes** for each accessible mining model. Data attributes are the

columns of data used by an algorithm to build a model. Some or all of these columns must be present in the data to which the model is applied.

Data attributes are referred to as the **model signature**. The `ALL_MINING_MODEL_ATTRIBUTES` view lists the data attributes in the model signature, including the target if the model is supervised.

An algorithm builds an internal representation of the data attributes and uses them as either **categoricals** (data that classifies or categorizes) or as **numericals** (continuous data). These internal **model attributes** can be viewed using the `GET_MODEL_DETAILS` functions.

#### **Example 44–2 ALL\_MINING\_MODEL\_ATTRIBUTES**

```
SQL> describe all_mining_model_attributes
```

Name	Null?	Type
OWNER	NOT NULL	VARCHAR2 (30)
MODEL_NAME	NOT NULL	VARCHAR2 (30)
ATTRIBUTE_NAME	NOT NULL	VARCHAR2 (30)
ATTRIBUTE_TYPE		VARCHAR2 (11)
DATA_TYPE		VARCHAR2 (12)
DATA_LENGTH		NUMBER
DATA_PRECISION		NUMBER
DATA_SCALE		NUMBER
USAGE_TYPE		VARCHAR2 (8)
TARGET		VARCHAR2 (3)

**See Also:** *Oracle Data Mining Application Developer's Guide* for more information about attributes and `ALL_MINING_MODEL_ATTRIBUTES`

## **ALL\_MINING\_MODEL\_SETTINGS**

The view `ALL_MINING_MODEL_SETTINGS` returns the **settings** for each accessible mining model. Settings control various characteristics of mining models.

All settings have default values. The values of some settings are generated by the algorithm by default. You can override the default value of a setting by specifying its value in a settings table for the model. All settings, both default and user-specified, are listed in `ALL_MINING_MODEL_SETTINGS`.

#### **Example 44–3 ALL\_MINING\_MODEL\_SETTINGS**

```
SQL> describe all_mining_model_settings
```

Name	Null?	Type
OWNER	NOT NULL	VARCHAR2 (30)
MODEL_NAME	NOT NULL	VARCHAR2 (30)
SETTING_NAME	NOT NULL	VARCHAR2 (30)
SETTING_VALUE		VARCHAR2 (4000)
SETTING_TYPE		VARCHAR2 (7)

**See Also:**

- [Model Settings](#) on page 44-10
- *Oracle Data Mining Application Developer's Guide* for more information about `ALL_MINING_MODEL_SETTINGS`

## Security Model

The DBMS\_DATA\_MINING package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The DBMS\_DATA\_MINING package exposes APIs that are leveraged by the Oracle Data Mining option. Users who wish to create mining models in their own schema require the CREATE MINING MODEL system privilege (as well as the CREATE TABLE and CREATE VIEW system privilege). Users who wish to create mining models in other schemas require the CREATE ANY MINING MODEL system privilege (as well as the corresponding table and view creation privileges).

Users have full control over managing models that exist within their own schema. Additional system privileges necessary for managing data mining models in other schemas include ALTER ANY MINING MODEL, DROP ANY MINING MODEL, SELECT ANY MINING MODEL, COMMENT ANY MINING MODEL, and AUDIT ANY.

Individual object privileges on mining models, ALTER MINING MODEL and SELECT MINING MODEL, can be used to selectively grant privileges on a model to a different user.

**See Also:** *Oracle Data Mining Administrator's Guide* for more information about the security features of Oracle Data Mining

## Deprecated Subprograms

The following subprograms were deprecated in Oracle Data Mining 11g Release 1 (11.1).

- GET\_DEFAULT\_SETTINGS

Replaced with data dictionary views:  
USER/ALL/DBA\_MINING\_MODEL\_SETTINGS

- GET\_MODEL\_SETTINGS

Replaced with data dictionary views:  
USER/ALL/DBA\_MINING\_MODEL\_SETTINGS

- GET\_MODEL\_SIGNATURE

Replaced with data dictionary views:  
USER/ALL/DBA\_MINING\_MODEL\_ATTRIBUTES

The following view was deprecated in Oracle Data Mining 11g Release 1 (11.1).

- DM\_USER\_MODELS

Replaced with data dictionary views: USER/ALL/DBA\_MINING\_MODELS

The Adaptive Bayes Network algorithm was deprecated in Oracle Data Mining 11g Release 1 (11.1).

---

---

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

---

Since 11g Release 1 (11.1), the DMSYS schema is no longer present in the database. Oracle Data Mining metadata now resides in SYS.

## Mining Functions

The constants that specify the mining function of a model are listed in [Table 44-2](#). The concept of a "mining function" is introduced in ["Overview"](#) on page 44-3.

All models are created with a mining function. The mining function is a required argument to the [CREATE\\_MODEL Procedure](#).

**Table 44-2 Mining Functions**

Value	Description
ASSOCIATION	<p>Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set.</p> <p>Association models use the Apriori algorithm.</p>
ATTRIBUTE_IMPORTANCE	<p>Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome.</p> <p>Attribute Importance models use the Minimal Descriptor Length algorithm.</p>
CLASSIFICATION	<p>Classification is a predictive mining function. A classification model uses historical data to predict a categorical target.</p> <p>Classification models can use: Naive Bayes, Adaptive Bayes Network (deprecated), Decision Tree, Logistic Regression, or Support Vector Machine algorithms. The default is Naive Bayes.</p> <p>The classification function can also be used for <b>anomaly detection</b>. In this case, the SVM algorithm with a null target is used (One-Class SVM).</p>
CLUSTERING	<p>Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set.</p> <p>Clustering models can use: <i>k</i>-Means or O-Cluster algorithms. The default is <i>k</i>-Means.</p>
FEATURE_EXTRACTION	<p>Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model.</p> <p>Feature extraction models use the Non-Negative Matrix Factorization algorithm.</p>
REGRESSION	<p>Regression is a predictive mining function. A regression model uses historical data to predict a numerical target.</p> <p>Regression models can use Support Vector Machine or Linear Regression. The default is Support Vector Machine.</p>

## Model Settings

Oracle Data Mining uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a mining function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, you must create a settings table. The settings table must have the column names and data types shown in [Table 44-3](#).

**Table 44-3 Required Columns in the Model Settings Table**

Column Name	Data Type
SETTING_NAME	VARCHAR2 (30)
SETTING_VALUE	VARCHAR2 (4000)

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the [CREATE\\_MODEL Procedure](#).

You can find the settings used by a model by querying the data dictionary view `ALL_MINING_MODEL_SETTINGS`. This view lists the model settings used by the mining models to which you have access. All the setting values are included in the view, whether default or user-specified. See "[ALL\\_MINING\\_MODEL\\_SETTINGS](#)" on page 44-6.

## Algorithm Names

The `ALGO_NAME` setting specifies the model algorithm. The values for the `ALGO_NAME` setting are listed in [Table 44-4](#).

**Table 44-4 Algorithm Names**

ALGO_NAME Value	Description	Mining Function
ALGO_ADAPTIVE_BAYES_NETWORK	Adaptive Bayes Network (deprecated)	Classification
ALGO_DECISION_TREE	Decision Tree	Classification
ALGO_NAIVE_BAYES	Naive Bayes	Classification
ALGO_GENERALIZED_LINEAR_MODEL	Generalized Linear Model	Classification and Regression
ALGO_SUPPORT_VECTOR_MACHINES	Support Vector Machine	Classification and Regression
ALGO_KMEANS	Enhanced <i>k</i> -Means	Clustering
ALGO_O_CLUSTER	O-Cluster	Clustering
ALGO_AI_MDL	Minimum Description Length	Attribute Importance
ALGO_APRIORI_ASSOCIATION_RULES	Apriori	Association Rules
ALGO_NONNEGATIVE_MATRIX_FACTOR	Non-Negative Matrix Factorization	Feature Extraction

Oracle Data Mining supports more than one algorithm for the classification, regression, and clustering mining functions. Each of these mining functions has a default algorithm, as shown in [Table 44-5](#).

**Table 44–5 Default Algorithms**

Mining Function	Default Algorithm
Classification	Naive Bayes
Regression	Support Vector Machine
Clustering	<i>k</i> -Means

## Automatic Data Preparation

The **PREP\_AUTO** setting indicates whether or not the model will use Automatic Data Preparation (ADP). By default ADP is disabled.

When you enable ADP, the model uses heuristics to transform the build data according to the requirements of the algorithm. The transformation instructions are stored with the model and reused whenever the model is applied. You can view the transformation instructions in the model details.

You can choose to supplement automatic data preparations by specifying additional transformations in the `xform_list` parameter when you build the model. (See "[CREATE\\_MODEL Procedure](#)" on page 44-50.)

If you do not use ADP (default) *and* do not specify transformations in the `xform_list` parameter to `CREATE_MODEL` (also the default), you will continue to operate in 10.2 mode. This means that you must implement your own transformations separately in the build, test, and scoring data; you must take special care to implement the exact same transformations in each data set.

If you do not use ADP, but you *do* specify transformations in the `xform_list` parameter to `CREATE_MODEL`, Oracle Data Mining embeds the transformation definitions in the model and prepares the test and scoring data to match the build data. Because of automatic and embedded data preparation, mining models are known as **supermodels**.

The values for the `PREP_AUTO` setting are described in [Table 44–6](#).

**Table 44–6 PREP\_AUTO Setting**

PREP_AUTO Value	Description
PREP_AUTO_OFF	Disable Automatic Data Preparation (default).
PREP_AUTO_ON	Enable Automatic Data Preparation.

**See Also:** *Oracle Data Mining Concepts* for information about data preparation

## Mining Function Settings

The settings described in [Table 44–7](#) apply to a mining function.

**Table 44–7 Mining Function Settings**

Mining Function	Setting Name	Setting Value	Description
Association	ASSO_MAX_RULE_LENGTH	TO_CHAR (2<= numeric_exp r <=20)	Maximum rule length for association rules. Default is 4.
Association	ASSO_MIN_CONFIDENCE	TO_CHAR (0<= numeric_exp r <=1)	Minimum confidence for association rules. Default is 0.1.
Association	ASSO_MIN_SUPPORT	TO_CHAR (0<= numeric_exp r <=1)	Minimum support for association rules. Default is 0.1.
Classification	CLAS_COST_TABLE_NAME	table_name	(Decision Tree only) Name of a table that stores a cost matrix to be used by the algorithm in building the model. The cost matrix specifies the costs associated with misclassifications.  Only Decision Tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time.  The cost matrix table is user-created. See <a href="#">"ADD_COST_MATRIX Procedure"</a> on page 44-25 for the column requirements.  See <i>Oracle Data Mining Concepts</i> for information about costs.
Classification	CLAS_PRIORS_TABLE_NAME	table_name	(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data.  The priors table is user-created. See <i>Oracle Data Mining Application Developer's Guide</i> for the column requirements. See <i>Oracle Data Mining Concepts</i> for additional information about priors.
Classification	CLAS_WEIGHTS_TABLE_NAME	table_name	(GLM and SVM only) Name of a table that stores weighting information for individual target values in SVM classification and GLM logistic regression models. The weights are used by the algorithm to bias the model in favor of higher weighted classes.  The class weights table is user-created. See <i>Oracle Data Mining Application Developer's Guide</i> for the column requirements. See <i>Oracle Data Mining Concepts</i> for additional information about class weights.
Clustering	CLUS_NUM_CLUSTERS	TO_CHAR ( numeric_exp r >=1)	Maximum number of leaf clusters generated by a clustering algorithm. (Oracle Data Mining clustering algorithms are hierarchical, as described in <i>Oracle Data Mining Concepts</i> .)  Enhanced <i>k</i> -Means usually produces the exact number of clusters specified by CLUS_NUM_CLUSTERS, unless there are fewer distinct data points.  O-Cluster may produce fewer clusters than the number specified by CLUS_NUM_CLUSTERS, depending on the data.  Default is 10.
Feature Extraction	FEAT_NUM_FEATURES	TO_CHAR ( numeric_exp r >=1)	Number of features to be extracted by a feature extraction model.  The default is estimated from the data by the algorithm.

**See Also:** *Oracle Data Mining Concepts* for information about mining functions

## Global Settings

The settings in [Table 44–8](#) are applicable to any type of model, but are currently only implemented for specific algorithms.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_MINING_MODEL_SETTINGS`.

**Table 44–8 Global Settings**

Setting Name	Setting Value	Description
ODMS_ITEM_ID_COLUMN_NAME	<i>column_name</i>	<p>(Association Rules only) Name of a column that contains the items in a transaction. When this setting is specified, the algorithm expects the data to be presented in native transactional format, consisting of two columns:</p> <ul style="list-style-type: none"> <li>▪ Case ID, either categorical or numerical</li> <li>▪ Item ID, either categorical or numerical, specified by <code>ODMS_ITEM_ID_COLUMN_NAME</code></li> </ul> <p>A typical example of transactional data is market basket data, wherein a case represents a basket that may contain many items. Each item is stored in a separate row, and many rows may be needed to represent a case. The case ID values do not uniquely identify each row. Transactional data is also called multi-record case data.</p> <p>Association Rules is normally used with transactional data, but it can also be applied to single-record case data (similar to other algorithms).</p> <p>For more information about single-record and multi-record case data, see <i>Oracle Data Mining Application Developer's Guide</i>.</p>

**Table 44–8 (Cont.) Global Settings**

Setting Name	Setting Value	Description
ODMS_ITEM_VALUE_COLUMN_NAME	<i>column_name</i>	<p>(Association Rules only) Name of a column that contains a value associated with each item in a transaction. This setting is only used when a value has been specified for ODMS_ITEM_ID_COLUMN_NAME indicating that the data is presented in native transactional format.</p> <p>When ODMS_ITEM_VALUE_COLUMN_NAME is specified, the algorithm expects the build data to consist of three columns:</p> <ul style="list-style-type: none"> <li>▪ Case ID, either categorical or numerical</li> <li>▪ Item ID, either categorical or numerical, specified by ODMS_ITEM_ID_COLUMN_NAME</li> <li>▪ Item value, either categorical or numerical, specified by ODMS_ITEM_VALUE_COLUMN_NAME</li> </ul> <p>The item value column may specify information such as the number of items (for example, three apples) or the type of the item (for example, macintosh apples).</p>
ODMS_MISSING_VALUE_TREATMENT	ODMS_MISSING_VALUE_MEAN_MODE ODMS_MISSING_VALUE_DELETE_ROW	<p>(GLM only) How to treat missing values in the training data. This setting does not affect the scoring data.</p> <p>Oracle Data Mining replaces missing values with the mean (numeric attributes) or the mode (categorical attributes) both at build time and apply time. You can set ODMS_MISSING_VALUE_TREATMENT to ODMS_MISSING_VALUE_DELETE_ROW to override this behavior in the training data. When ODMS_MISSING_VALUE_TREATMENT is set to ODMS_MISSING_VALUE_DELETE_ROW, the rows in the training data that contain missing values are deleted. However, if you want to replicate this missing value treatment in the scoring data, you must perform the transformation explicitly. For instructions, see <i>Oracle Data Mining Concepts</i>.</p> <p>The value ODMS_MISSING_VALUE_DELETE_ROW is only valid for tables without nested columns. If this value is used with nested data, an exception is raised.</p>
ODMS_ROW_WEIGHT_COLUMN_NAME	<i>column_name</i>	<p>(GLM only) Name of a column in the training data that contains a weighting factor for the rows.</p> <p>Row weights can be used as a compact representation of repeated rows, as in the design of experiments where a specific configuration is repeated several times. Row weights can also be used to emphasize certain rows during model construction. For example, to bias the model towards rows that are more recent and away from potentially obsolete data.</p>

**See Also:**

*Oracle Data Mining Concepts* for information about GLM

*Oracle Data Mining Concepts* for information about Association Rules

**Algorithm Settings: Adaptive Bayes Network (deprecated)**

These settings affect the behavior of the Adaptive Bayes Network algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_MINING_MODEL_SETTINGS`.

**Table 44–9 ABN Settings**

Setting	Value	Description
ABNS_MAX_BUILD_MINUTES	TO_CHAR( numeric_expr >=0)	Maximum time to complete an ABN model build. Default is 0, which implies no time limit.
ABNS_MAX_NB_PREDICTORS	TO_CHAR( numeric_expr >0)	Maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type <code>abns_naive_bayes</code> . Default is 10.
ABNS_MAX_PREDICTORS	TO_CHAR( numeric_expr >0)	Maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type <code>abns_single_feature</code> or <code>abns_multi_feature</code> . Default is 25.
ABNS_MODEL_TYPE	ABNS_MULTI_FEATURE ABNS_NAIVE_BAYES ABNS_SINGLE_FEATURE	Type of ABN model. The default is <code>multi_feature</code> .

### Algorithm Settings: Decision Tree

These settings affect the behavior of the Decision Tree algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the `ALL`, `USER`, or `DBA` prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_MINING_MODEL_SETTINGS`.

**Table 44–10 Decision Tree Settings**

Setting	Value	Description
TREE_IMPURITY_METRIC	TREE_IMPURITY_ENTROPY TREE_IMPURITY_GINI	Tree impurity metric for Decision Tree. Tree algorithms seek the best test question for splitting data at each node. The best splitter and split value are those that result in the largest increase in target value homogeneity (purity) for the entities in the node. Purity is measured in accordance with a metric. Decision trees can use either gini ( <code>TREE_IMPURITY_GINI</code> ) or entropy ( <code>TREE_IMPURITY_ENTROPY</code> ) as the purity metric. By default, the algorithm uses gini.
TREE_TERM_MAX_DEPTH	TO_CHAR( 2<= numeric_expr <=20)	Criteria for splits: maximum tree depth (the maximum number of nodes between the root and any leaf node, including the leaf node). Default is 7.
TREE_TERM_MINPCT_MODE	TO_CHAR( 0<= numeric_expr <=10)	No child shall have fewer records than this number, which is expressed as a percentage of the training rows. Default is 0.05, indicating 0.05%.
TREE_TERM_MINPCT_SPLIT	TO_CHAR( 0 <= numeric_expr <=20)	Criteria for splits: minimum number of records in a parent node expressed as a percent of the total number of records used to train the model. No split is attempted if number of records is below this value. Default is 0.1, indicating 0.1%.
TREE_TERM_MINREC_NODE	TO_CHAR( numeric_expr >=0)	No child shall have fewer records than this number. Default is 10.
TREE_TERM_MINREC_SPLIT	TO_CHAR( numeric_expr >=0)	Criteria for splits: minimum number of records in a parent node expressed as a value. No split is attempted if number of records is below this value. Default is 20.

## Algorithm Settings: Generalized Linear Models

These settings affect the behavior of GLM models. GLM can be used for classification (logistic regression) or regression (linear regression).

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the `ALL`, `USER`, or `DBA` prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_MINING_MODEL_SETTINGS`.

**Table 44–11 GLM Settings**

Setting Name	Setting Value	Description
GLMS_CONF_LEVEL	TO_CHAR (0 < numeric_expr < 1)	The confidence level for coefficient confidence intervals. The default confidence level is 0.95.
GLMS_DIAGNOSTICS_TABLE_NAME	table_name	The name of a table to contain row-level diagnostic information for a GLM model. The table is created during model build.  If you want to create a diagnostics table, you must specify a case ID when you build the model. (See the <a href="#">CREATE_MODEL Procedure</a> .) If you specify a diagnostics table but do not provide a case ID, an exception is raised.  For information on GLM diagnostics, see <i>Oracle Data Mining Concepts</i> .
GLMS_REFERENCE_CLASS_NAME	target_value	The target value to be used as the reference value in a logistic regression model. Probabilities will be produced for the other (non-reference) class.  By default, the algorithm chooses the value with the highest prevalence (the most cases) for the reference class.
GLMS_RIDGE_REGRESSION	GLMS_RIDGE_REG_ENABLE GLMS_RIDGE_REG_DISABLE	Whether or not ridge regression will be enabled.  By default, the algorithm determines whether or not to use ridge. You can explicitly enable ridge by setting <code>GLMS_RIDGE_REGRESSION</code> to <code>GLMS_RIDGE_REG_ENABLE</code> .  Ridge applies to both regression and classification mining functions.  When ridge is enabled, no prediction bounds are produced by the <code>PREDICTION_BOUNDS</code> SQL operator.
GLMS_RIDGE_VALUE	TO_CHAR (0 < numeric_expr)	The value for the ridge parameter used by the algorithm. This setting is only used when you explicitly enable ridge regression by setting <code>GLMS_RIDGE_REGRESSION</code> to <code>GLMS_RIDGE_REG_ENABLE</code> .  If ridge regression is enabled internally by the algorithm, the ridge parameter is determined by the algorithm.
GLMS_VIF_FOR_RIDGE	GLMS_VIF_RIDGE_ENABLE GLMS_VIF_RIDGE_DISABLE	(Linear regression only) Whether or not to produce Variance Inflation Factor (VIF) statistics when ridge is being used.  By default, VIF is not produced when ridge is enabled.  When you explicitly enable ridge regression by setting <code>GLMS_RIDGE_REGRESSION</code> to <code>GLMS_RIDGE_REG_ENABLE</code> , you can request VIF statistics by setting <code>GLMS_VIF_FOR_RIDGE</code> to <code>GLMS_VIF_RIDGE_ENABLE</code> ; the algorithm will produce VIF if enough system resources are available.

**See Also:** *Oracle Data Mining Concepts* for information about GLM

## Algorithm Settings: k-Means

These settings affect the behavior of the *k*-Means algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_MINING_MODEL_SETTINGS`.

**Table 44–12 k-Means Settings**

Setting Name	Setting Value	Description
KMNS_BLOCK_GROWTH	TO_CHAR (1< numeric_expr <=5)	Growth factor for memory allocated to hold cluster data Default value is 2
KMNS_CONV_TOLERANCE	TO_CHAR (0< numeric_expr <=0.5)	Convergence tolerance for <i>k</i> -Means algorithm Default is 0.01
KMNS_DISTANCE	KMNS_COSINE KMNS_EUCLIDEAN KMNS_FAST_COSINE	Distance Function for <i>k</i> -Means Clustering. The default is euclidean.
KMNS_ITERATIONS	TO_CHAR (0< numeric_expr <=20)	Number of iterations for <i>k</i> -Means algorithm Default is 3
KMNS_MIN_PCT_ATTR_SUPPORT	TO_CHAR (0<= numeric_expr <=1)	The fraction of attribute values that must be non-null in order for the attribute to be included in the rule description for the cluster.  Setting the parameter value too high in data with missing values can result in very short or even empty rules. Default is 0.1.
KMNS_NUM_BINS	TO_CHAR (numeric_expr >0)	Number of histogram bins. Specifies the number of bins in the attribute histogram produced by <i>k</i> -Means. The bin boundaries for each attribute are computed globally on the entire training data set. The binning method is equi-width. All attributes have the same number of bins with the exception of attributes with a single value that have only one bin.  Default is 10.
KMNS_SPLIT_CRITERION	KMNS_SIZE KMNS_VARIANCE	Split criterion for <i>k</i> -Means Clustering. The default criterion is the variance.

**See Also:** *Oracle Data Mining Concepts* for information about *k*-Means.

### Algorithm Settings: Naive Bayes

These settings affect the behavior of the Naive Bayes Algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_MINING_MODEL_SETTINGS`.

**Table 44–13 Naive Bayes Settings**

Setting Name	Setting Value	Description
NABS_PAIRWISE_THRESHOLD	TO_CHAR (0<= numeric_expr <=1)	Value of pairwise threshold for NB algorithm Default is 0.01.
NABS_SINGLETON_THRESHOLD	TO_CHAR (0<= numeric_expr <=1)	Value of singleton threshold for NB algorithm Default value is 0.01

**See Also:** *Oracle Data Mining Concepts* for information about Naive Bayes

## Algorithm Settings: Non-Negative Matrix Factorization

These settings affect the behavior of the Non-Negative Matrix Factorization algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_MINING_MODEL_SETTINGS`.

**Table 44–14 NMF Settings**

Setting Name	Setting Value	Description
NMFS_CONV_TOLERANCE	TO_CHAR(0 < numeric_expr <= 0.5)	Convergence tolerance for NMF algorithm Default is 0.05
NMFS_NONNEGATIVE_SCORING	NMFS_NONNEG_SCORING_ENABLE NMFS_NONNEG_SCORING_DISABLE	Whether negative numbers should be allowed in scoring results. When set to NMFS_NONNEG_SCORING_ENABLE, negative feature values will be replaced with zeros. When set to NMFS_NONNEG_SCORING_DISABLE, negative feature values will be allowed. Default is NMFS_NONNEG_SCORING_ENABLE
NMFS_NUM_ITERATIONS	TO_CHAR(1 <= numeric_expr <= 500)	Number of iterations for NMF algorithm Default is 50
NMFS_RANDOM_SEED	TO_CHAR(numeric_expr)	Random seed for NMF algorithm. Default is -1.

**See Also:** *Oracle Data Mining Concepts* for information about NMF

## Algorithm Settings: O-Cluster

These settings affect the behavior of the O-Cluster algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_ALL_MINING_MODEL_SETTINGS`.

**Table 44–15 O-Cluster Settings**

Setting Name	Setting Value	Description
OCLT_MAX_BUFFER	TO_CHAR(numeric_expr > 0)	Buffer size for O-Cluster. Default is 50,000.
OCLT_SENSITIVITY	TO_CHAR(0 <= numeric_expr <= 1)	A fraction that specifies the peak density required for separating a new cluster. The fraction is related to the global uniform density. Default is 0.5.

**See Also:** *Oracle Data Mining Concepts* for information about O-Cluster

## Algorithm Settings: Support Vector Machine

These settings affect the behavior of the Support Vector Machine algorithm. SVM can be used for classification or regression, or for anomaly detection (classification with a null target).

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_MINING_MODEL_SETTINGS`.

**Table 44–16 SVM Settings**

Setting Name	Setting Value	Description
SVMS_ACTIVE_LEARNING	SVMS_AL_DISABLE SVMS_AL_ENABLE	Whether active learning is enabled or disabled. By default, active learning is enabled.  When active learning is enabled, the SVM algorithm uses active learning to build a reduced size model. When active learning is disabled, the SVM algorithm builds a standard model.
SVMS_COMPLEXITY_FACTOR	TO_CHAR( <i>numeric_exp</i> <i>r</i> >0)	Value of complexity factor for SVM algorithm (both classification and regression).  Default value estimated from the data by the algorithm.
SVMS_CONV_TOLERANCE	TO_CHAR( <i>numeric_exp</i> <i>r</i> >0)	Convergence tolerance for SVM algorithm.  Default is 0.001.
SVMS_EPSILON	TO_CHAR( <i>numeric_exp</i> <i>r</i> >0)	Value of epsilon factor for SVM regression.  Default value estimated from the data by the algorithm.
SVMS_KERNEL_CACHE_SIZE	TO_CHAR( <i>numeric_exp</i> <i>r</i> >0)	Value of kernel cache size for SVM algorithm. Applies to Gaussian kernel only.  Default is 50000000 bytes.
SVMS_KERNEL_FUNCTION	svm_gaussian svms_linear	Kernel for Support Vector Machine. The default is determined by the algorithm based on the number of attributes in the training data. When there are many attributes, the algorithm uses a linear kernel, otherwise it uses a nonlinear (Gaussian) kernel.  The number of attributes does not correspond to the number of columns in the training data. The algorithm explodes categorical attributes to binary, numeric attributes. In addition, Oracle Data Mining handles each row in a nested column as a separate attribute. SVM takes these factors into account when choosing the kernel function.
SVMS_OUTLIER_RATE	TO_CHAR( <i>0</i> < <i>numeric_expr</i> <1)	The desired rate of outliers in the training data. Valid for One-Class SVM models only (anomaly detection).  Default is .1.
SVMS_STD_DEV	TO_CHAR( <i>numeric_exp</i> <i>r</i> >0)	Value of standard deviation for SVM algorithm.  This is applicable only for Gaussian kernel.  Default value estimated from the data by the algorithm.

**See Also:** *Oracle Data Mining Concepts* for information about SVM

## Data Types

The `DBMS_DATA_MINING` package uses object data types to store information about model attributes. Most of these types are returned by the table functions `GET_n`, where *n* identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows.

For a list of the `GET` functions, see "[Summary of DBMS\\_DATA\\_MINING Subprograms](#)" on page 44-23.

Oracle Data Mining also uses object data types for handling transactional data. These types, `DM_NESTED_NUMERICALS` and `DM_NESTED_CATEGORICALS` specify nested tables that can be used for storing a set of mining attributes in a single column. For more information on nested tables, see the *Oracle Data Mining Application Developer's Guide*.

All the table functions use **pipelining**, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the *Oracle Database PL/SQL Language Reference*.

The Data Mining object data types are described in [Table 44-17](#).

**Table 44-17 DBMS\_DATA\_MINING Summary of Data Types**

Data Type	Description
<code>DM_ABN_DETAIL</code>	Information about an attribute in an Adaptive Bayes Network model.
<code>DM_ABN_DETAILS</code>	A collection of <code>DM_ABN_DETAIL</code> . Returned by <a href="#">GET_MODEL_DETAILS_ABN Function</a> .
<code>DM_CENTROID</code>	The centroid of a cluster.
<code>DM_CENTROIDS</code>	A collection of <code>DM_CENTROID</code> . A member of <code>DM_CLUSTER</code> .
<code>DM_CHILD</code>	A child node of a cluster.
<code>DM_CHILDREN</code>	A collection of <code>DM_CHILD</code> . A member of <code>DM_CLUSTER</code> .
<code>DM_CLUSTER</code>	A cluster. A cluster includes <code>DM_PREDICATES</code> , <code>DM_CHILDREN</code> , <code>DM_CENTROIDS</code> , and <code>DM_HISTOGRAMS</code> . It also includes a <code>DM_RULE</code> .
<code>DM_CLUSTERS</code>	A collection of <code>DM_CLUSTER</code> . Returned by <a href="#">GET_MODEL_DETAILS_KM Function</a> and <a href="#">GET_MODEL_DETAILS_OC Function</a> .
<code>DM_CONDITIONAL</code>	The conditional probability of an attribute in a Naive Bayes model.
<code>DM_CONDITIONALS</code>	A collection of <code>DM_CONDITIONAL</code> . Returned by <a href="#">GET_MODEL_DETAILS_NB Function</a> .
<code>DM_COST_ELEMENT</code>	The actual and predicted values in a cost matrix.
<code>DM_COST_MATRIX</code>	A collection of <code>DM_COST_ELEMENT</code> . Returned by <a href="#">GET_MODEL_COST_MATRIX Function</a> .
<code>DM_GLM_COEFF</code>	The coefficient and associated statistics of an attribute in a Generalized Linear Model.
<code>DM_GLM_COEFF_SET</code>	A collection of <code>DM_GLM_COEFF</code> . Returned by <a href="#">GET_MODEL_DETAILS_GLM Function</a> .
<code>DM_HISTOGRAM_BIN</code>	A histogram associated with a cluster.

**Table 44–17 (Cont.) DBMS\_DATA\_MINING Summary of Data Types**

<b>Data Type</b>	<b>Description</b>
DM_HISTOGRAMS	A collection of DM_HISTOGRAM_BIN. A member of DM_CLUSTER.
DM_ITEM	An item in an association rule.
DM_ITEMS	A collection of DM_ITEM.
DM_ITEMSET	A collection of DM_ITEMS.
DM_ITEMSETS	A collection of DM_ITEMSET. Returned by <a href="#">GET_FREQUENT_ITEMSETS Function</a> .
DM_MODEL_GLOBAL_DETAIL	High-level statistics about a model.
DM_MODEL_GLOBAL_DETAILS	A collection of DM_MODEL_GLOBAL_DETAIL. Returned by <a href="#">GET_MODEL_DETAILS_GLOBAL Function</a> .
DM_MODEL_SETTING	A model setting.
DM_MODEL_SETTINGS	A collection of DM_MODEL_SETTING. Returned by <a href="#">GET_MODEL_SETTINGS Function</a> and <a href="#">GET_DEFAULT_SETTINGS Function</a> .
DM_MODEL_SIGNATURE_ATTRIBUTE	An attribute in the model signature.
DM_MODEL_SIGNATURE	A collection of DM_MODEL_SIGNATURE. Returned by <a href="#">GET_MODEL_SIGNATURE Function</a> .
DM_NB_DETAIL	Information about an attribute in a Naive Bayes model.
DM_NB_DETAILS	A collection of DM_DB_DETAIL. Returned by <a href="#">GET_MODEL_DETAILS_NB Function</a> .
DM_NESTED_CATEGORICAL	The name and value of a categorical attribute.
DM_NESTED_CATEGORICALS	A collection of DM_NESTED_CATEGORICAL. A collection of attributes defined as a single model attribute. Transactional data must be defined as nested attributes for Data Mining.
DM_NESTED_NUMERICAL	The name and value of a numerical attribute.
DM_NESTED_NUMERICALS	A collection of DM_NESTED_NUMERICAL. A collection of attributes defined as a single model attribute. Transactional data must be defined as nested attributes for Data Mining.
DM_NMF_ATTRIBUTE	An attribute in a feature of a Non-Negative Matrix Factorization model.
DM_NMF_ATTRIBUTE_SET	A collection of DM_NMF_ATTRIBUTE. A member of DM_NMF_FEATURE.
DM_NMF_FEATURE	A feature in a Non-Negative Matrix Factorization model.
DM_NMF_FEATURE_SET	A collection of DM_NMF_FEATURE. Returned by <a href="#">GET_MODEL_DETAILS_NMF Function</a> .
DM_PREDICATE	Antecedent and consequent attributes.
DM_PREDICATES	A collection of DM_PREDICATE. A member of DM_RULE, DM_CLUSTER, and DM_ABN_DETAIL.
DM_RANKED_ATTRIBUTE	An attribute ranked by its importance in an Attribute Importance model.
DM_RANKED_ATTRIBUTES	A collection of DM_RANKED_ATTRIBUTE. Returned by <a href="#">GET_MODEL_DETAILS_AI Function</a> .

**Table 44–17 (Cont.) DBMS\_DATA\_MINING Summary of Data Types**

Data Type	Description
DM_RULE	<p>A rule that defines a conditional relationship.</p> <p>The rule can be one of the association rules returned by <a href="#">GET_ASSOCIATION_RULES Function</a>, or it can be a rule associated with a cluster in the collection of clusters returned by <a href="#">GET_MODEL_DETAILS_KM Function</a> and <a href="#">GET_MODEL_DETAILS_OC Function</a>.</p>
DM_RULES	<p>A collection of DM_RULE. Returned by <a href="#">GET_ASSOCIATION_RULES Function</a>.</p>
DM_SVM_ATTRIBUTE	<p>The name, value, and coefficient of an attribute in a Support Vector Machine model.</p>
DM_SVM_ATTRIBUTE_SET	<p>A collection of DM_SVM_ATTRIBUTE. Returned by <a href="#">GET_MODEL_DETAILS_SVM Function</a>. Also a member of DM_SVM_LINEAR_COEFF.</p>
DM_SVM_LINEAR_COEFF	<p>The linear coefficient of each attribute in a Support Vector Machine model.</p>
DM_SVM_LINEAR_COEFF_SET	<p>A collection of DM_SVM_LINEAR_COEFF. Returned by <a href="#">GET_MODEL_DETAILS_SVM Function</a> for an SVM model built using the linear kernel.</p>
DM_TRANSFORM	<p>The transformation and reverse transformation expressions for an attribute.</p>
DM_TRANSFORMS	<p>A collection of DM_TRANSFORM. Returned by <a href="#">GET_MODEL_TRANSFORMATIONS Function</a>.</p>
TRANSFORM_LIST	<p>A list of user-specified transformations for a model. Accepted as a parameter by the <a href="#">CREATE_MODEL Procedure</a>.</p> <p>This collection type is defined in the <a href="#">DBMS_DATA_MINING_TRANSFORM</a> package.</p>

## Summary of DBMS\_DATA\_MINING Subprograms

Table 44–18 summarizes the subprograms included in the DBMS\_DATA\_MINING package.

**Table 44–18 DBMS\_DATA\_MINING Package Subprograms**

Data Type	Purpose
<a href="#">ADD_COST_MATRIX Procedure</a> on page 44-25	Adds a cost matrix to a classification model
<a href="#">ALTER_REVERSE_EXPRESSION Procedure</a> on page 44-27	Changes the reverse transformation expression to an expression that you specify
<a href="#">APPLY Procedure</a> on page 44-30	Applies a model to a data set (scores the data)
<a href="#">COMPUTE_CONFUSION_MATRIX Procedure</a> on page 44-34	Computes the confusion matrix from the <code>APPLY</code> results on test data for a classification model; also provides the accuracy of the model
<a href="#">COMPUTE_LIFT Procedure</a> on page 44-40	Computes lift for a given positive target value from the <code>APPLY</code> results on test data for a classification model
<a href="#">COMPUTE_ROC Procedure</a> on page 44-45	Computes Receiver Operating Characteristic (ROC) for a classification model
<a href="#">CREATE_MODEL Procedure</a> on page 44-50	Creates (builds) a model
<a href="#">DROP_MODEL Procedure</a> on page 44-54	Drops a model
<a href="#">EXPORT_MODEL Procedure</a> on page 44-55	Exports a model to a dump file
<a href="#">GET_ASSOCIATION_RULES Function</a> on page 44-58	Returns the rules from an association model
<a href="#">GET_DEFAULT_SETTINGS Function</a> on page 44-62	Returns all the default settings for all mining functions and algorithms
<a href="#">GET_FREQUENT_ITEMSETS Function</a> on page 44-63	Returns the frequent itemsets for an association model
<a href="#">GET_MODEL_COST_MATRIX Function</a> on page 44-65	Returns the cost matrix for a model
<a href="#">GET_MODEL_DETAILS_ABN Function</a> on page 44-67	Returns the details of an Adaptive Bayes Network model
<a href="#">GET_MODEL_DETAILS_AI Function</a> on page 44-69	Returns the details of an Attribute Importance model
<a href="#">GET_MODEL_DETAILS_GLM Function</a> on page 44-71	Returns the details of a Generalized Linear Model
<a href="#">GET_MODEL_DETAILS_GLOBAL Function</a> on page 44-74	Returns high-level statistics about a model
<a href="#">GET_MODEL_DETAILS_KM Function</a> on page 44-77	Returns the details of a <i>k</i> -Means model
<a href="#">GET_MODEL_DETAILS_NB Function</a> on page 44-80	Returns the details of a Naive Bayes model
<a href="#">GET_MODEL_DETAILS_NMF Function</a> on page 44-82	Returns the details of an NMF model

**Table 44–18 (Cont.) DBMS\_DATA\_MINING Package Subprograms**

<b>Data Type</b>	<b>Purpose</b>
<a href="#">GET_MODEL_DETAILS_OC Function</a> on page 44-84	Returns the details of an O-Cluster model
<a href="#">GET_MODEL_DETAILS_SVM Function</a> on page 44-88	Returns the details of an SVM model with a linear kernel
<a href="#">GET_MODEL_DETAILS_XML Function</a> on page 44-90	Returns the details of a Decision Tree model
<a href="#">GET_MODEL_SETTINGS Function</a> on page 44-92	Returns the settings used to build a model
<a href="#">GET_MODEL_SIGNATURE Function</a> on page 44-93	Returns the signature of a model
<a href="#">GET_MODEL_TRANSFORMATIONS Function</a> on page 44-95	Returns the user-specified transformation definitions embedded in the model, as well as many of the ADP transformations
<a href="#">GET_TRANSFORM_LIST Procedure</a> on page 44-97	Converts between two different transformation specification formats
<a href="#">IMPORT_MODEL Procedure</a> on page 44-100	Imports a model into a user schema
<a href="#">RANK_APPLY Procedure</a> on page 44-104	Ranks the predictions from the APPLY results for a classification model
<a href="#">REMOVE_COST_MATRIX Procedure</a> on page 44-107	Removes a cost matrix from a model
<a href="#">RENAME_MODEL Procedure</a> on page 44-108	Renames a model

## ADD\_COST\_MATRIX Procedure

This procedure associates a cost matrix table with a classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes.

The cost matrix is stored with the model and taken into account when the model is scored. The stored cost matrix is the default scoring matrix for the model.

You can also specify a cost matrix inline when you invoke a Data Mining SQL function for scoring. When an inline cost matrix is specified, it is used instead of the default, stored cost matrix (if one exists).

To obtain the default scoring matrix for a model, use the `GET_MODEL_COST_MATRIX` function. To remove the default scoring matrix from a model, use the `REMOVE_COST_MATRIX` procedure. See "[GET\\_MODEL\\_COST\\_MATRIX Function](#)" on page 44-65 and "[REMOVE\\_COST\\_MATRIX Procedure](#)" on page 44-107.

### See Also:

- "Biasing a Classification Model" in *Oracle Data Mining Concepts* for more information about costs
- *Oracle Database SQL Language Reference* for syntax of inline cost matrix

## Syntax

```
DBMS_DATA_MINING.ADD_COST_MATRIX (
    model_name           IN VARCHAR2,
    cost_matrix_table_name IN VARCHAR2,
    cost_matrix_schema_name IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 44–19 ADD\_COST\_MATRIX Procedure Parameters**

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is assumed.
<code>cost_matrix_table_name</code>	Name of the cost matrix table (described in <a href="#">Table 44–20</a> ).
<code>cost_matrix_schema_name</code>	Schema of the cost matrix table. If no schema is specified, the current schema is used.

## Usage Notes

1. If the model is not in your schema, then `ADD_COST_MATRIX` requires the `ALTER ANY MINING MODEL` system privilege or the `ALTER` object privilege for the mining model.
2. The cost matrix table must have the columns shown in [Table 44–20](#). Note that the actual and predicted target values must have the same data type.

**Table 44–20 Required Columns in a Cost Matrix Table**

Column Name	Data Type
<code>ACTUAL_TARGET_VALUE</code>	<code>VARCHAR2 (4000)</code> for categorical targets <code>NUMBER</code> for numeric targets

**Table 44–20 (Cont.) Required Columns in a Cost Matrix Table**

Column Name	Data Type
PREDICTED_TARGET_VALUE	VARCHAR2 (4000) for categorical targets NUMBER for numeric targets
COST	NUMBER

- Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the `costs` column of the cost matrix table.
- All classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the `CLAS_COST_TABLE_NAME` setting in the settings table for the model. See [Table 44–7, "Mining Function Settings"](#).

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the `REMOVE_COST_MATRIX` procedure to remove the cost matrix and the `ADD_COST_MATRIX` procedure to add a new one.

## Example

This example creates a cost matrix table called `COSTS_NB` and adds it to a Naive Bayes model called `NB_SH_CLAS_SAMPLE`. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of .25 to misclassifications of customers who do not respond and a cost of .75 to misclassifications of customers who do respond. This means that it is three times more costly to misclassify responders than it is to misclassify non-responders.

```
CREATE TABLE costs_nb (
  actual_target_value      NUMBER,
  predicted_target_value   NUMBER,
  cost                     NUMBER);
INSERT INTO costs_nb values (0, 0, 0);
INSERT INTO costs_nb values (0, 1, .25);
INSERT INTO costs_nb values (1, 0, .75);
INSERT INTO costs_nb values (1, 1, 0);
COMMIT;

EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');

SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION(nb_sh_clas_sample COST MODEL
  USING cust_marital_status, education, household_size) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

C	CNT	AVG_AGE
F	72	39
M	555	44

## ALTER\_REVERSE\_EXPRESSION Procedure

This procedure replaces a reverse transformation expression with an expression that you specify. If the attribute does not have a reverse expression, the procedure creates one from the specified expression.

You can also use this procedure to customize the output of clustering, feature extraction, and anomaly detection models.

### Syntax

```
DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION (
    model_name          VARCHAR2,
    expression          CLOB,
    attribute_name      VARCHAR2 DEFAULT NULL,
    attribute_subname   VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 44–21 ALTER\_REVERSE\_EXPRESSION Procedure Parameters**

Parameter	Description
model_name	Name of the model in the form [ <i>schema_name</i> .] <i>model_name</i> . If you do not specify a schema, your own schema is used.
expression	A SQL expression
attribute_name	Name of the attribute. Specify NULL if you wish to apply <i>expression</i> to a cluster, feature, or One-Class SVM prediction.
attribute_subname	Name of the nested attribute if <i>attribute_name</i> is a nested column, otherwise NULL.

### Usage Notes

1. For purposes of model transparency, Oracle Data Mining provides reverse transformations for transformations that are embedded in a model. Reverse transformations are used in model details and in the results of scoring.

**See Also:** [About Transformation Lists](#) in [Chapter 45](#)

---

**Note:** Use caution when altering the reverse expression for the target of a model that has a cost matrix. If you specify a reverse expression that is inconsistent with the target values in the cost matrix table, you will not be able to score the model.

See "[ADD\\_COST\\_MATRIX Procedure](#)" on page 44-25 and *Oracle Data Mining Concepts* for information about cost matrixes.

---

2. To prevent reverse transformation of an attribute, you can specify NULL for *expression*.
3. You can use ALTER\_REVERSE\_EXPRESSION to label clusters produced by clustering models and features produced by feature extraction.

You can use ALTER\_REVERSE\_EXPRESSION to replace the zeros and ones returned by anomaly-detection models. By default, anomaly-detection models label anomalous records with 0 and all other records with 1.

**See Also:** *Oracle Data Mining Concepts* for information about anomaly detection

## Examples

1. In this example, the target (`affinity_card`) of the model `CLASS_MODEL` is manipulated internally as `yes` or `no` instead of `1` or `0` but returned as `1s` and `0s` when scored. The `ALTER_REVERSE_EXPRESSION` procedure causes the target values to be returned as `TRUE` or `FALSE`.

The data sets `MINING_DATA_BUILD` and `MINING_DATA_TEST` are included with the Oracle Data Mining sample programs. See *Oracle Data Mining Administrator's Guide* for information about the sample programs.

```

DECLARE
    v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
        'affinity_card', NULL,
        'decode(affinity_card, 1, 'yes', 'no')',
        'decode(affinity_card, 'yes', 1, 0)');
    dbms_data_mining.CREATE_MODEL(
        model_name          => 'CLASS_MODEL',
        mining_function     => dbms_data_mining.classification,
        data_table_name    => 'mining_data_build',

100006	Cluster 7
100007	Cluster 18
100008	Cluster 14
100009	Cluster 8
100010	Cluster 8

## APPLY Procedure

This procedure applies a mining model to the data of interest, and generates the results in a table. The apply process is also referred to as **scoring**.

For predictive mining functions, the apply process generates predictions in a target column. For descriptive mining functions such as clustering, the apply process assigns each case to a cluster with a probability.

In Oracle Data Mining, the apply operation is not applicable to association models and attribute importance models.

---

---

**Note:** Scoring can also be performed directly in SQL using the Data Mining functions. See

- "Data Mining Functions" in *Oracle Database SQL Language Reference*
  - "Scoring and Deployment" in *Oracle Data Mining Application Developer's Guide* and
- 
- 

### Syntax

```
DBMS_DATA_MINING.APPLY (
    model_name          IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    case_id_column_name IN VARCHAR2,
    result_table_name   IN VARCHAR2,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 44–22** *APPLY Procedure Parameters*

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.
data_table_name	Name of table or view representing data to be scored
case_id_column_name	Name of the case identifier column
result_table_name	Name of the table to store apply results
data_schema_name	Name of the schema containing the data to be scored

### Usage Notes

1. The data provided for APPLY must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model — both at build time and apply time. (See "[Automatic Data Preparation](#)" on page 44-11.)
2. APPLY creates a table in the user's schema to hold the results. The columns are algorithm-specific.

The columns in the results table are listed in [Table 44–23](#) through [Table 44–27](#). The case ID column name in the results table will match the case ID column name provided by you. The type of the incoming case ID column is also preserved in APPLY output.

---

**Note:** Make sure that the case ID column does not have the same name as one of the columns that will be created by APPLY. For example, when applying a classification model, the case ID in the scoring data must not be 'PREDICTION' or 'PROBABILITY' (See [Table 44-23](#)).

---

- The data type for the 'PREDICTION', 'CLUSTER\_ID', and 'FEATURE\_ID' output columns is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types will conform to the descriptions in the following tables. See "[ALTER\\_REVERSE\\_EXPRESSION Procedure](#)" on page 44-27.

## Classification

The results table for classification has the columns described in [Table 44-23](#). If the target of the model is categorical, the PREDICTION column will have a VARCHAR2 data type. If the target is numerical, the PREDICTION column will have a NUMBER data type.

**Table 44-23** APPLY Results Table for Classification

Column Name	Data Type
<i>Case ID column name</i>	VARCHAR2 or NUMBER
PREDICTION	VARCHAR2 or NUMBER
PROBABILITY	NUMBER

## One-Class SVM (Anomaly Detection)

The results table for anomaly detection has the columns described in [Table 44-24](#).

**Table 44-24** APPLY Results Table for Anomaly Detection

Column Name	Data Type
<i>Case ID column name</i>	VARCHAR2 or NUMBER
PREDICTION	NUMBER
PROBABILITY	NUMBER

Values in the PREDICTION column can be either 0 or 1. When the prediction is 1, the case is a typical example. When the prediction is 0, the case is an outlier.

## Regression using SVM or GLM

The results table for regression has the columns described in [Table 44-25](#).

**Table 44-25** APPLY Results Table for Regression

Column Name	Data Type
<i>Case ID column name</i>	VARCHAR2 or NUMBER
PREDICTION	NUMBER

## Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table has the columns described in [Table 44–26](#).

**Table 44–26** *APPLY Results Table for Clustering*

Column Name	Data Type
<i>Case ID column name</i>	VARCHAR2 or NUMBER
CLUSTER_ID	NUMBER
PROBABILITY	NUMBER

## Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in [Table 44–27](#).

**Table 44–27** *APPLY Results Table for Feature Extraction*

Column Name	Data Type
<i>Case ID column name</i>	VARCHAR2 or NUMBER
FEATURE_ID	NUMBER
MATCH_QUALITY	NUMBER

## Examples

This example applies the GLM regression model `GLMR_SH_REGR_SAMPLE` to the data in the `MINING_DATA_APPLY_V` view. The apply results are output to the table `REGRESSION_APPLY_RESULT`.

```
SQL> BEGIN
      DBMS_DATA_MINING.APPLY (
        model_name      => 'glmr_sh_regr_sample',
        data_table_name => 'mining_data_apply_v',
        case_id_column_name => 'cust_id',
        result_table_name => 'regression_apply_result');
      END;
      /

SQL> SELECT * FROM regression_apply_result WHERE cust_id > 101485;

CUST_ID PREDICTION
-----
101486 22.8048824
101487 25.0261101
101488 48.6146619
101489 51.82595
101490 22.6220714
101491 61.3856816
101492 24.1400748
101493 58.034631
101494 45.7253149
101495 26.9763318
```

101496 48.1433425  
101497 32.0573434  
101498 49.8965531  
101499 56.270656  
101500 21.1153047

## COMPUTE\_CONFUSION\_MATRIX Procedure

This procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The matrix is  $n$ -by- $n$ , where  $n$  is the number of classes. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

COMPUTE\_CONFUSION\_MATRIX accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

### See Also:

*Oracle Data Mining Concepts* for more details about confusion matrixes and other test metrics for classification

["COMPUTE\\_LIFT Procedure"](#) on page 44-40

["COMPUTE\\_ROC Procedure"](#) on page 44-45

## Syntax

```
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy                OUT NUMBER,
    apply_result_table_name IN  VARCHAR2,
    target_table_name       IN  VARCHAR2,
    case_id_column_name     IN  VARCHAR2,
    target_column_name      IN  VARCHAR2,
    confusion_matrix_table_name IN VARCHAR2,
    score_column_name       IN  VARCHAR2 DEFAULT 'PREDICTION',
    score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',
    cost_matrix_table_name  IN  VARCHAR2 DEFAULT NULL,
    apply_result_schema_name IN  VARCHAR2 DEFAULT NULL,
    target_schema_name     IN  VARCHAR2 DEFAULT NULL,
    cost_matrix_schema_name IN  VARCHAR2 DEFAULT NULL,
    score_criterion_type    IN  VARCHAR2 DEFAULT 'PROBABILITY');
```

## Parameters

**Table 44–28 COMPUTE\_CONFUSION\_MATRIX Procedure Parameters**

Parameter	Description
accuracy	Output parameter containing the overall percentage accuracy of the predictions.
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
confusion_matrix_table_name	Table containing the confusion matrix. The table will be created by the procedure in the user's schema. The columns in the confusion matrix table are described in the Usage Notes.
score_column_name	Column containing the predictions in the apply results table. The default column name is PREDICTION, which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 44-30).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 44-30). See the Usage Notes for additional information.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to 'COSTS', the costs in this table will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.

**Table 44–28 (Cont.) COMPUTE\_CONFUSION\_MATRIX Procedure Parameters**

Parameter	Description
score_criterion_type	<p>Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter.</p> <p>The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'.</p> <p>If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring.</p> <p>See the Usage Notes and the Examples.</p>

**Usage Notes**

- The predictive information you pass to COMPUTE\_CONFUSION\_MATRIX may be generated using SQL PREDICTION functions, the DBMS\_DATA\_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.
- Instead of passing a cost matrix to COMPUTE\_CONFUSION\_MATRIX, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION\_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE\_CONFUSION\_MATRIX are in a table or view specified in apply\_result\_table\_name.

```
CREATE TABLE apply_result_table_name AS (
    case_id_column_name          VARCHAR2,
    score_column_name           VARCHAR2,
    score_criterion_column_name VARCHAR2);
```

- A cost matrix must have the columns described in [Table 44–29](#).

**Table 44–29 Columns in a Cost Matrix**

Column Name	Data Type
actual_target_value	NUMBER or VARCHAR2
predicted_target_value	NUMBER or VARCHAR2
cost	NUMBER

**See Also:** *Oracle Data Mining Concepts* for more information about cost matrixes

- The confusion matrix created by COMPUTE\_CONFUSION\_MATRIX has the columns described in [Table 44–30](#).

**Table 44–30 Columns in a Confusion Matrix**

Column Name	Data Type
actual_target_value	NUMBER or VARCHAR2

**Table 44–30 (Cont.) Columns in a Confusion Matrix**

Column Name	Data Type
predicted_target_value	NUMBER or VARCHAR2
value	NUMBER

**See Also:** *Oracle Data Mining Concepts* for more information about confusion matrixes

## Examples

These examples use the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

### Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample USING *) prediction,
         PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
  FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```
DECLARE
  v_accuracy NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY'
    cost_matrix_table_name => null,
    apply_result_schema_name => null,
    target_schema_name => null,
    cost_matrix_schema_name => null,
    score_criterion_type => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The confusion matrix and model accuracy are shown as follows.

```
**** MODEL ACCURACY ****: .7847
```

```
SQL>SELECT * from nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
-----
                1                0                60
                0                0               891
                1                1               286
                0                1               263
```

### Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```
SQL> SELECT * from nb_cost_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      COST
-----
                0                0          0
                0                1          .75
                1                0          .25
                1                1           0
```

This statement shows how to generate the predictions using `APPLY`.

```
BEGIN
  DBMS_DATA_MINING.APPLY(
    model_name      => 'nb_sh_clas_sample',
    data_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    result_table_name => 'nb_apply_results');
END;
/
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named 'PROBABILITY', which is the name generated by `APPLY`.

```
DECLARE
  v_accuracy NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy              => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name     => 'mining_data_test_v',
    case_id_column_name   => 'cust_id',
    target_column_name    => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name     => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY',
    cost_matrix_table_name => 'nb_cost_matrix',
    apply_result_schema_name => null,
    target_schema_name     => null,
    cost_matrix_schema_name => null,
    score_criterion_type  => 'COST');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```
**** MODEL ACCURACY ****: .798

SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
-----
                1                0          91
```

0	0	942
1	1	255
0	1	212

### Compute a Confusion Matrix Based on Embedded Costs

You can use the `ADD_COST_MATRIX` procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```
BEGIN
  DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');
END;
/
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
         PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
  FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```
DECLARE
  v_accuracy          NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy           => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name  => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name  => 'PREDICTION',
    score_criterion_column_name => 'COST',
    cost_matrix_table_name => null,
    apply_result_schema_name => null,
    target_schema_name  => null,
    cost_matrix_schema_name => null,
    score_criterion_type => 'COST');
END;
/
```

The results are:

```
**** MODEL ACCURACY ****: .798
```

```
SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
-----
                1                0            91
                0                0            942
                1                1            255
                0                1            212
```

## COMPUTE\_LIFT Procedure

This procedure computes lift and stores the results in a table in the user's schema.

Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. `COMPUTE_LIFT` compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

`COMPUTE_LIFT` calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, `COMPUTE_LIFT` accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

  score_column_name           IN VARCHAR2 DEFAULT 'PREDICTION',
  score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',
  num_quantiles                IN NUMBER DEFAULT 10,
  cost_matrix_table_name       IN VARCHAR2 DEFAULT NULL,
  apply_result_schema_name    IN VARCHAR2 DEFAULT NULL,
  target_schema_name          IN VARCHAR2 DEFAULT NULL,
  cost_matrix_schema_name     IN VARCHAR2 DEFAULT NULL,
  score_criterion_type        IN VARCHAR2 DEFAULT 'PROBABILITY');
```

## Parameters

**Table 44–31 COMPUTE\_LIFT Procedure Parameters**

Parameter	Description
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
lift_table_name	Table containing the lift statistics. The table will be created by the procedure in the user's schema.  The columns in the lift table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate lift.  If the target column is a NUMBER, you can use the TO_CHAR ( ) operator to provide the value as a string.
score_column_name	Column containing the predictions in the apply results table.  The default column name is 'PREDICTION', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 44-30).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions.  By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted.  The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring.  The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 44-30).  See the Usage Notes for additional information.
num_quantiles	Number of quantiles to be used in calculating lift. The default is 10.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to 'COST', the costs will be used as the scoring criteria.  The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table.  If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets.  If null, the user's schema is assumed.

**Table 44–31 (Cont.) COMPUTE\_LIFT Procedure Parameters**

Parameter	Description
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter.  The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'.  If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring.  See the Usage Notes and the Examples.

**Usage Notes**

- The predictive information you pass to COMPUTE\_LIFT may be generated using SQL PREDICTION functions, the DBMS\_DATA\_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the lift.
- Instead of passing a cost matrix to COMPUTE\_LIFT, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION\_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE\_LIFT are in a table or view specified in apply\_results\_table\_name.

```
CREATE TABLE apply_result_table_name AS (
    case_id_column_name          VARCHAR2,
    score_column_name            VARCHAR2,
    score_criterion_column_name  VARCHAR2);
```

- A cost matrix must have the columns described in [Table 44–32](#).

**Table 44–32 Columns in a Cost Matrix**

Column Name	Data Type
actual_target_value	NUMBER or VARCHAR2
predicted_target_value	NUMBER or VARCHAR2
cost	NUMBER

**See Also:** *Oracle Data Mining Concepts* for more information about cost matrixes

- The table created by COMPUTE\_LIFT has the columns described in [Table 44–33](#)

**Table 44-33 Columns in a Lift Table**

Column Name	Data Type
quantile_number	NUMBER
probability_threshold	NUMBER
gain_cumulative	NUMBER
quantile_total_count	NUMBER
quantile_target_count	NUMBER
percent_records_cumulative	NUMBER
lift_cumulative	NUMBER
target_density_cumulative	NUMBER
targets_cumulative	NUMBER
non_targets_cumulative	NUMBER
lift_quantile	NUMBER
target_density	NUMBER

**See Also:** *Oracle Data Mining Concepts* for details about the information in the lift table

- When a cost matrix is passed to `COMPUTE_LIFT`, the cost threshold is returned in the `probability_threshold` column of the lift table.

## Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The example illustrates lift based on probabilities. For examples that show computation based on costs, see "[COMPUTE\\_CONFUSION\\_MATRIX Procedure](#)" on page 44-34.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id, t.prediction, t.probability
  FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using probabilities as the scoring criterion, you can compute lift as follows.

```
BEGIN
  DBMS_DATA_MINING.COMPUTE_LIFT (
    apply_result_table_name => 'nb_apply_results',
    target_table_name       => 'mining_data_test_v',
    case_id_column_name    => 'cust_id',
    target_column_name     => 'affinity_card',
    lift_table_name        => 'nb_lift',
    positive_target_value  => to_char(1),
    score_column_name     => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY',
    num_quantiles         => 10,
    cost_matrix_table_name => null,
    apply_result_schema_name => null,
    target_schema_name    => null,
```

```
cost_matrix_schema_name => null,  
score_criterion_type    => 'PROBABILITY');  
END;  
/
```

This query displays some of the statistics from the resulting lift table.

```
SQL>SELECT quantile_number, probability_threshold, gain_cumulative,  
           quantile_total_count  
           FROM nb_lift;
```

QUANTILE_NUMBER	PROBABILITY_THRESHOLD	GAIN_CUMULATIVE	QUANTILE_TOTAL_COUNT
1	.989335775	.15034965	55
2	.980534911	.26048951	55
3	.968506098	.374125874	55
4	.958975196	.493006993	55
5	.946705997	.587412587	55
6	.927454174	.66958042	55
7	.904403627	.748251748	55
8	.836482525	.839160839	55
10	.500184953	1	54

## COMPUTE\_ROC Procedure

This procedure computes receiver operating characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. COMPUTE\_ROC compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an X-Y axis. The false positive rate is placed on the X axis. The true positive rate is placed on the Y axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

COMPUTE\_ROC accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

### See Also:

*Oracle Data Mining Concepts* for more details about ROC and test metrics for classification

["COMPUTE\\_CONFUSION\\_MATRIX Procedure"](#) on page 44-34

["COMPUTE\\_LIFT Procedure"](#) on page 44-40

## Syntax

```
DBMS_DATA_MINING.COMPUTE_ROC (
    roc_area_under_curve          OUT NUMBER,
    apply_result_table_name      IN  VARCHAR2,
    target_table_name            IN  VARCHAR2,
    case_id_column_name          IN  VARCHAR2,
    target_column_name           IN  VARCHAR2,
    roc_table_name               IN  VARCHAR2,
    positive_target_value        IN  VARCHAR2,
    score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
    score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
    apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
    target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 44–34 COMPUTE\_ROC Procedure Parameters**

Parameter	Description
<code>roc_area_under_the_curve</code>	Output parameter containing the area under the ROC curve (AUC). The AUC measures the likelihood that an actual positive will be predicted as positive.  The greater the AUC, the greater the flexibility of the model in accommodating trade-offs between positive and negative class predictions. AUC can be especially important when one target class is rarer or more important to identify than another.
<code>apply_result_table_name</code>	Table containing the predictions.
<code>target_table_name</code>	Table containing the known target values from the test data.
<code>case_id_column_name</code>	Case ID column in the apply results table. Must match the case identifier in the targets table.
<code>target_column_name</code>	Target column in the targets table. Contains the known target values from the test data.
<code>roc_table_name</code>	Table containing the ROC output. The table will be created by the procedure in the user's schema.  The columns in the ROC table are described in the Usage Notes.
<code>positive_target_value</code>	The positive class. This should be the class of interest, for which you want to calculate ROC.  If the target column is a NUMBER, you can use the <code>TO_CHAR()</code> operator to provide the value as a string.
<code>score_column_name</code>	Column containing the predictions in the apply results table.  The default column name is 'PREDICTION', which is the default name created by the <code>APPLY</code> procedure (See " <a href="#">APPLY Procedure</a> " on page 44-30).
<code>score_criterion_column_name</code>	Column containing the scoring criterion in the apply results table. Contains the probabilities that determine the predictions.  The default column name is 'PROBABILITY', which is the default name created by the <code>APPLY</code> procedure (See " <a href="#">APPLY Procedure</a> " on page 44-30).
<code>apply_result_schema_name</code>	Schema of the apply results table.  If null, the user's schema is assumed.
<code>target_schema_name</code>	Schema of the table containing the known targets.  If null, the user's schema is assumed.

## Usage Notes

- The predictive information you pass to `COMPUTE_ROC` may be generated using SQL PREDICTION functions, the `DBMS_DATA_MINING.APPLY` procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.
- The predictions that you pass to `COMPUTE_ROC` are in a table or view specified in `apply_results_table_name`.

```
CREATE TABLE apply_result_table_name AS (
    case_id_column_name          VARCHAR2,
    score_column_name            VARCHAR2,
    score_criterion_column_name  VARCHAR2);
```

- The table created by COMPUTE\_ROC has the columns shown in [Table 44–35](#).

**Table 44–35** COMPUTE\_ROC Output

Column	Data Type
probability	NUMBER
true_positives	NUMBER
false_negatives	NUMBER
false_positives	NUMBER
true_negatives	NUMBER
true_positive_fraction	NUMBER
false_positive_fraction	NUMBER

**See Also:** *Oracle Data Mining Concepts* for details about the output of COMPUTE\_ROC

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```
SELECT case_id_column_name
       FROM apply_result_table_name
       WHERE probability > probability_threshold
       ORDER BY probability DESC;
```

- There are two approaches to identifying the most desirable probability threshold. Which approach you use depends on whether or not you know the relative cost of positive versus negative class prediction errors.

If the costs are known, you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like this.

```
WITH cost AS (
    SELECT probability_threshold, 20 * false_negatives + false_positives cost
    FROM ROC_table
    GROUP BY probability_threshold),
minCost AS (
    SELECT min(cost) minCost
    FROM cost)
SELECT max(probability_threshold) probability_threshold
FROM cost, minCost
WHERE cost = minCost;
```

If relative costs are not well known, you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

```
SELECT * FROM ROC_table
       ORDER BY probability_threshold;
```

## Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id, t.prediction, t.probability
  FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```
DECLARE
  v_area_under_curve NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_ROC (
    roc_area_under_curve      => v_area_under_curve,
    apply_result_table_name   => 'nb_apply_results',
    target_table_name         => 'mining_data_test_v',
    case_id_column_name       => 'cust_id',
    target_column_name        => 'affinity_card',
    roc_table_name            => 'nb_roc',
    positive_target_value     => '1',
    score_column_name         => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
    ROUND(v_area_under_curve,4));
END;
```

The resulting AUC and a selection of columns from the ROC table are shown as follows.

```
**** AREA UNDER ROC CURVE ****: .8212
```

```
SQL> SELECT probability, true_positive_fraction, false_positive_fraction
       FROM nb_roc;
```

PROBABILITY	TRUE_POSITIVE_FRACTION	FALSE_POSITIVE_FRACTION
.00000	1	1
.50018	.826589595	.227902946
.53851	.823699422	.221837088

## CREATE\_MODEL Procedure

This procedure creates a mining model with a given mining function.

By passing an `xform_list` to `CREATE_MODEL`, you can specify a list of transformations to be performed on the input data. If the `PREP_AUTO` setting is on, the transformations are used in addition to the automatic transformations. If the `PREP_AUTO` setting is off, the specified transformations are the only ones implemented by the model. In both cases, the transformation definitions are embedded in the model and executed automatically whenever the model is applied. See "[Automatic Data Preparation](#)" on page 44-11.

### Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
    model_name           IN VARCHAR2,
    mining_function      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    case_id_column_name  IN VARCHAR2,
    target_column_name   IN VARCHAR2 DEFAULT NULL,
    settings_table_name  IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    settings_schema_name IN VARCHAR2 DEFAULT NULL,
    xform_list           IN TRANSFORM_LIST DEFAULT NULL);
```

### Parameters

**Table 44–36 CREATE\_MODEL Procedure Parameters**

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used. See also " <a href="#">Mining Model Naming Restrictions</a> " on page 44-5.
<code>mining_function</code>	The mining function. Values are listed in <a href="#">Table 44–2, "Mining Functions"</a> .
<code>data_table_name</code>	Table or view containing the build data.
<code>case_id_column_name</code>	Case identifier column in the build data.
<code>target_column_name</code>	For supervised models, the target column in the build data. <code>NULL</code> for unsupervised models.
<code>settings_table_name</code>	Table containing build settings for the model. <code>NULL</code> if there is no settings table (only default settings are used).
<code>data_schema_name</code>	Schema hosting the build data. If <code>NULL</code> , the user's schema is assumed.
<code>settings_schema_name</code>	Schema hosting the settings table. If <code>NULL</code> , the user's schema is assumed.

**Table 44–36 (Cont.) CREATE\_MODEL Procedure Parameters**

Parameter	Description
xform_list	<p>A list of transformations to be used in addition to or instead of automatic transformations, depending on the value of the PREP_AUTO setting. (See "<a href="#">Automatic Data Preparation</a>" on page 44-11.)</p> <p>The data type is TRANSFORM_LIST, which consists of records of type TRANSFORM_REC.</p> <pre> TYPE   TRANSFORM_REC    IS RECORD (     attribute_name  VARCHAR2(4000),     attribute_subname VARCHAR2(4000),     expression      EXPRESSION_REC,     reverse_expression EXPRESSION_REC,     attribute_spec   VARCHAR2(4000)); </pre> <p>Each TRANSFORM_REC describes the transformation and reverse transformation for an attribute. EXPRESSION_REC stores a SQL expression.</p> <p>The SQL expression stored in EXPRESSION_REC can be manipulated using routines in the DBMS_DATA_MINING_TRANSFORM package. Examples are: SET_EXPRESSION, GET_EXPRESSION, and SET_TRANSFORM.</p> <p>You can use ATTRIBUTE_SPEC to disable Automatic Data Preparation (ADP) for an individual attribute. Specify 'NOPREP' to prevent automatic preparation of this attribute when ADP is on. When ADP is off, the 'NOPREP' value is ignored.</p> <p>The 'NOPREP' value cannot be used for an individual subname of a nested attribute. If 'NOPREP' is specified for an individual subname when ADP is on, an error is generated.</p>

## Usage Notes

You can obtain information about a model by querying these data dictionary views.

```

ALL_MINING_MODELS
ALL_MINING_MODEL_ATTRIBUTES
ALL_MINING_MODEL_SETTINGS

```

Specify the USER prefix instead of ALL to obtain information about models in your own schema only.

**See Also:** *Oracle Data Mining Application Developer's Guide* for information on the data dictionary views

## Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```

-- Create the settings table
CREATE TABLE svm_model_settings (
  setting_name VARCHAR2(30),
  setting_value VARCHAR2(30));

-- Populate the settings table
-- Specify SVM. By default, Naive Bayes is used for classification.
-- Specify ADP. By default, ADP is not used.

```

```

BEGIN
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
    (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
    (dbms_data_mining.prep_auto, dbms_data_mining.prep_auto_on);
  COMMIT;
END;
/
-- Create the model using the specified settings
BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'svm_model',
    mining_function     => dbms_data_mining.classification,
    data_table_name    => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    settings_table_name => 'svm_model_settings');
END;
/

```

You can display the model settings with the following query.

```

SELECT * FROM user_mining_model_settings
       WHERE model_name IN 'SVM_MODEL';

```

MODEL_NAME	SETTING_NAME	SETTING_VALUE	SETTING
SVM_MODEL	ALGO_NAME	ALGO_SUPPORT_VECTOR_MACHINES	INPUT
SVM_MODEL	SVMS_KERNEL_CACHE_SIZE	50000000	DEFAULT
SVM_MODEL	SVMS_ACTIVE_LEARNING	SVMS_AL_ENABLE	DEFAULT
SVM_MODEL	SVMS_STD_DEV	3.004524	DEFAULT
SVM_MODEL	PREP_AUTO	ON	INPUT
SVM_MODEL	SVMS_COMPLEXITY_FACTOR	1.887389	DEFAULT
SVM_MODEL	SVMS_KERNEL_FUNCTION	SVMS_GAUSSIAN	DEFAULT
SVM_MODEL	SVMS_CONV_TOLERANCE	.001	DEFAULT

The second example creates an anomaly detection model. Anomaly detection uses SVM classification without a target. This example uses the same settings table created for the SVM classification model in the first example.

```

BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'anomaly_detect_model',
    mining_function     => dbms_data_mining.classification,
    data_table_name    => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name => null,
    settings_table_name => 'svm_model_settings');
END;
/

```

This query shows that the models created in these examples are the only ones in your schema.

```

SELECT model_name, mining_function, algorithm FROM user_mining_models;

```

MODEL_NAME	MINING_FUNCTION	ALGORITHM
SVM_MODEL	CLASSIFICATION	SUPPORT_VECTOR_MACHINES
ANOMALY_DETECT_MODEL	CLASSIFICATION	SUPPORT_VECTOR_MACHINES

This query shows that only the SVM classification model has a target.

```
SELECT model_name, attribute_name, attribute_type, target
       FROM user_mining_model_attributes
       WHERE target = 'YES';
```

MODEL_NAME	ATTRIBUTE_NAME	ATTRIBUTE_TYPE	TARGET
-----	-----	-----	-----
SVM_MODEL	AFFINITY_CARD	CATEGORICAL	YES

## DROP\_MODEL Procedure

This procedure deletes the specified mining model.

### Syntax

```
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2,  
                             force       IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 44–37** *DROP\_MODEL Procedure Parameters*

Parameter	Description
model_name	Name of the mining model in the form [ <i>schema_name</i> .] <i>model_name</i> . If you do not specify a schema, your own schema is used.
force	Forces the mining model to be dropped even if it is invalid. A mining model may be invalid if a serious system error interrupted the model build process.

### Usage Note

To drop a mining model, you must be the owner or you must have the `DROP ANY MINING MODEL` privilege. See *Oracle Data Mining Administrator's Guide* for information about privileges for data mining.

### Example

You can use the following command to delete a valid mining model named `nb_sh_clas_sample` that exists in your schema.

```
BEGIN  
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'nb_sh_clas_sample');  
END;  
/
```

## EXPORT\_MODEL Procedure

This procedure exports the specified data mining models to a dump file set. To import the models from the dump file set, use the [IMPORT\\_MODEL Procedure](#).

EXPORT\_MODEL and IMPORT\_MODEL use Oracle Data Pump technology.

When Oracle Data Pump is used to export/import an entire schema or database, the mining models in the schema or database are included. However, EXPORT\_MODEL and IMPORT\_MODEL are the only utilities that support the export/import of individual models.

### See Also:

*Oracle Database Utilities* for information about Oracle Data Pump

*Oracle Data Mining Administrator's Guide* for more information about exporting and importing mining models

## Syntax

```
DBMS_DATA_MINING.EXPORT_MODEL (
  filename          IN VARCHAR2,
  directory         IN VARCHAR2,
  model_filter      IN VARCHAR2 DEFAULT NULL,
  filesize          IN VARCHAR2 DEFAULT NULL,
  operation         IN VARCHAR2 DEFAULT NULL,
  remote_link       IN VARCHAR2 DEFAULT NULL,
  jobname           IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 44–38 EXPORT\_MODEL Procedure Parameters**

Parameter	Description
filename	<p>Name of the dump file set to which the models should be exported. The name must be unique within the schema.</p> <p>The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the <code>filesize</code> parameter, or you can use the <code>operation</code> parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created.</p> <p>When the export operation completes successfully, the name of the dump file set is automatically expanded to <code>filename01.dmp</code>, even if there is only one file in the dump set. If there are additional files, they are named sequentially as <code>filename02.dmp</code>, <code>filename03.dmp</code>, and so forth.</p>
directory	<p>Name of a pre-defined directory object that specifies where the dump file set should be created.</p> <p>The exporting user must have read/write privileges on the directory object and on the file system directory that it identifies.</p> <p>See <i>Oracle Database SQL Language Reference</i> for information about directory objects.</p>

**Table 44–38 (Cont.) EXPORT\_MODEL Procedure Parameters**

Parameter	Description
<code>model_filter</code>	<p>Optional parameter that specifies which model or models to export. If you do not specify a value for <code>model_filter</code>, all models in the schema are exported. You can also specify NULL (the default) or 'ALL' to export all models.</p> <p>You can export individual models by name and groups of models based on mining function or algorithm. For instance, you could export all regression models or all Naive Bayes models. Examples are provided in <a href="#">Table 44–39</a>.</p>
<code>filesize</code>	<p>Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB.</p> <p>If the size of the models to export is larger than <code>filesize</code>, one or more additional files are created within the dump set. See the description of the <code>filename</code> parameter for more information.</p>
<code>operation</code>	<p>Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the <code>filesize</code> parameter determines the size of the files.</p> <p>You can specify either of the following values for <code>operation</code>:</p> <ul style="list-style-type: none"> <li>■ 'EXPORT' — Export all or the specified models. (Default)</li> <li>■ 'ESTIMATE' — Estimate the size of the exporting models.</li> </ul>
<code>remote_link</code>	Optional parameter not used in this release. Set to NULL.
<code>jobname</code>	<p>Optional parameter that specifies the name of the export job. By default, the name has the form <code>username_exp_nnnn</code>, where <code>nnnn</code> is a number. For example, a job name in the SCOTT schema might be <code>SCOTT_exp_134</code>.</p> <p>If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters.</p> <p>A log file for the export job, named <code>jobname.log</code>, is created in the same directory as the dump file set.</p>

## Usage Notes

The `model_filter` parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same mining function or algorithm. You can query the `USER_MINING_MODELS` view to list the models in your schema.

```
SQL> describe user_mining_models
```

Name	Null?	Type
MODEL_NAME	NOT NULL	VARCHAR2(30)
MINING_FUNCTION		VARCHAR2(30)
ALGORITHM		VARCHAR2(30)
CREATION_DATE	NOT NULL	DATE
BUILD_DURATION		NUMBER
MODEL_SIZE		NUMBER
COMMENTS		VARCHAR2(4000)

For more information on data dictionary views of mining models, see "[Mining Model Objects](#)" on page 44-5.

Examples of model filters are provided in [Table 44–39](#).

**Table 44–39 Sample Values for the Model Filter Parameter**

Sample Value	Meaning
'mymodel'	Export the model named mymodel
'name= ''mymodel'''	Export the model named mymodel
'name IN (''mymodel2'', ''mymodel3'')'	Export the models named mymodel2 and mymodel3
'ALGORITHM_NAME = ''NAIVE_BAYES'''	Export all Naive Bayes models. See <a href="#">Table 44–4</a> for a list of algorithm names.
'FUNCTION_NAME = ''CLASSIFICATION'''	Export all classification models. See <a href="#">Table 44–2</a> for a list of mining functions.

## Examples

The following statement exports all the models in the DMUSER3 schema to a dump file set called models\_out in the directory \$ORACLE\_HOME/rdbms/log. This directory is mapped to a directory object called DATA\_PUMP\_DIR. The DMUSER3 user has read/write access to the directory and to the directory object.

```
SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
```

You can exit SQL\*Plus and list the resulting dump file and log file.

```
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
```

The following example uses the same directory object and is executed by the same user. It exports the models called NMF\_SH\_SAMPLE and SVMR\_SH\_REGR\_SAMPLE to a different dump file set in the same directory.

```
SQL>execute dbms_data_mining.export_model ( 'models2_out', 'DATA_PUMP_DIR',
      'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
  DMUSER3_exp_924.log  models2_out01.dmp
```

## GET\_ASSOCIATION\_RULES Function

This table function returns the rules from an association model.

You can specify filtering criteria to cause GET\_ASSOCIATION\_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, the greatest performance improvement will result from specifying the `topn` parameter.

### Syntax

```
DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
  model_name          IN VARCHAR2,
  topn                IN NUMBER DEFAULT NULL,
  rule_id             IN INTEGER DEFAULT NULL,
  min_confidence      IN NUMBER DEFAULT NULL,
  min_support         IN NUMBER DEFAULT NULL,
  max_rule_length     IN INTEGER DEFAULT NULL,
  min_rule_length     IN INTEGER DEFAULT NULL,
  sort_order          IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,
  antecedent_items    IN DM_ITEMS DEFAULT NULL,
  consequent_items    IN DM_ITEMS DEFAULT NULL,
  min_lift            IN NUMBER DEFAULT NULL)
RETURN DM_RULES PIPELINED;
```

### Parameters

**Table 44–40** GET\_ASSOCIATION\_RULES Function Parameters

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used.  This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.
<code>topn</code>	Return the <i>n</i> top rules ordered by confidence and then support, both descending. If you specify a sort order, the top <i>n</i> rules are derived after the sort is performed.  If <code>topn</code> is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are <code>RULE_CONFIDENCE</code> and <code>RULE_SUPPORT</code> . If <code>topn</code> is specified and a maximum or minimum rule length is specified, then <code>RULE_CONFIDENCE</code> , <code>RULE_SUPPORT</code> , and <code>NUMBER_OF_ITEMS</code> are allowed in the sort order.
<code>rule_id</code>	Identifier of the rule to return. If you specify a value for <code>rule_id</code> , do not specify values for the other filtering parameters.
<code>min_confidence</code>	Return the rules with confidence greater than or equal to this number
<code>min_support</code>	Return the rules with support greater than or equal to this number
<code>max_rule_length</code>	Return the rules with a length less than or equal to this number.  Rule length refers to the number of items in the rule (See <code>NUMBER_OF_ITEMS</code> in Table 44–41). For example, in the rule <code>A=&gt;B</code> (if A, then B), the number of items is 2.  If <code>max_rule_length</code> is specified, then the <code>NUMBER_OF_ITEMS</code> column is permitted in the sort order.

**Table 44–40 (Cont.) GET\_ASSOCIATION\_RULES Function Parameters**

Parameter	Description
min_rule_length	Return the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length.  If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
sort_order	Sort the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order.  For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you would specify:  ORA_MINING_VARCHAR2_NT ( 'NUMBER_OF_ITEMS DESC' , 'RULE_CONFIDENCE DESC' )  If you specify topn, the results will vary depending on the sort order.  By default, the results are sorted by confidence in descending order, then by support in descending order.  See the examples.
antecedent_items	Return the rules with these items in the antecedent. See the examples.
consequent_items	Return the rules with this item in the consequent. See the examples.
min_lift	Return the rules with lift greater than or equal to this number.

## Return Values

**Table 44–41 GET\_ASSOCIATION\_RULES Function Return Values**

Return Value	Description																																
DM_RULES	Represents a set of rows of type DM_RULE. The rows have the following columns:  <table border="0"> <tr> <td>(rule_id</td> <td>INTEGER,</td> </tr> <tr> <td>antecedent</td> <td>DM_PREDICATES,</td> </tr> <tr> <td>consequent</td> <td>DM_PREDICATES,</td> </tr> <tr> <td>rule_support</td> <td>NUMBER,</td> </tr> <tr> <td>rule_confidence</td> <td>NUMBER,</td> </tr> <tr> <td>rule_lift</td> <td>NUMBER,</td> </tr> <tr> <td>antecedent_support</td> <td>NUMBER,</td> </tr> <tr> <td>consequent_support</td> <td>NUMBER,</td> </tr> <tr> <td>number_of_items</td> <td>INTEGER )</td> </tr> </table> <p>The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:</p> <table border="0"> <tr> <td>(attribute_name</td> <td>VARCHAR2 (4000) ,</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2 (4000) ,</td> </tr> <tr> <td>conditional_operator</td> <td>CHAR (2) / * = , &lt; &gt; , &lt; , &gt; , &lt; = , &gt; = * / ,</td> </tr> <tr> <td>attribute_num_value</td> <td>NUMBER,</td> </tr> <tr> <td>attribute_str_value</td> <td>VARCHAR2 (4000) ,</td> </tr> <tr> <td>attribute_support</td> <td>NUMBER,</td> </tr> <tr> <td>attribute_confidence</td> <td>NUMBER)</td> </tr> </table>	(rule_id	INTEGER,	antecedent	DM_PREDICATES,	consequent	DM_PREDICATES,	rule_support	NUMBER,	rule_confidence	NUMBER,	rule_lift	NUMBER,	antecedent_support	NUMBER,	consequent_support	NUMBER,	number_of_items	INTEGER )	(attribute_name	VARCHAR2 (4000) ,	attribute_subname	VARCHAR2 (4000) ,	conditional_operator	CHAR (2) / * = , < > , < , > , < = , > = * / ,	attribute_num_value	NUMBER,	attribute_str_value	VARCHAR2 (4000) ,	attribute_support	NUMBER,	attribute_confidence	NUMBER)
(rule_id	INTEGER,																																
antecedent	DM_PREDICATES,																																
consequent	DM_PREDICATES,																																
rule_support	NUMBER,																																
rule_confidence	NUMBER,																																
rule_lift	NUMBER,																																
antecedent_support	NUMBER,																																
consequent_support	NUMBER,																																
number_of_items	INTEGER )																																
(attribute_name	VARCHAR2 (4000) ,																																
attribute_subname	VARCHAR2 (4000) ,																																
conditional_operator	CHAR (2) / * = , < > , < , > , < = , > = * / ,																																
attribute_num_value	NUMBER,																																
attribute_str_value	VARCHAR2 (4000) ,																																
attribute_support	NUMBER,																																
attribute_confidence	NUMBER)																																

## Usage Notes

This table function pipes out rows of type `DM_RULES`. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 44-20.

The `ORA_MINING_VARCHAR2_NT` type is defined as a table of `VARCHAR2(4000)`.

## Examples

The following example demonstrates an Association model build followed by several invocations of the `GET_ASSOCIATION_RULES` table function.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE census_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
  model_name => 'market_model',
  function => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'census_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));
```

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following query uses the association model `AR_SH_SAMPLE`, which is created from one of the Oracle Data Mining sample programs. (See *Oracle Data Mining Administrator's Guide* for information about the sample programs.)

```
SELECT * FROM TABLE (
  DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
    'AR_SH_SAMPLE', 10, NULL, 0.5, 0.01, 2, 1,
    ORA_MINING_VARCHAR2_NT (
      'NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
    DM_ITEMS(DM_ITEM('CUSTPRODS', 'Mouse Pad', 1, NULL),
              DM_ITEM('CUSTPRODS', 'Standard Mouse', 1, NULL)),
    DM_ITEMS(DM_ITEM('CUSTPRODS', 'Extension Cable', 1, NULL))));
```

The query returns three rules, shown as follows.

```
13  DM_PREDICATES(
```

```
DM_PREDICATE('CUSTPRODS', 'Mouse Pad', '= ', 1, NULL, NULL, NULL),
DM_PREDICATE('CUSTPRODS', 'Standard Mouse', '= ', 1, NULL, NULL, NULL))
DM_PREDICATES(
  DM_PREDICATE('CUSTPRODS', 'Extension Cable', '= ', 1, NULL, NULL, NULL))
.15532      .84393  2.7075   .18404   .3117   2

11 DM_PREDICATES(
  DM_PREDICATE('CUSTPRODS', 'Standard Mouse', '= ', 1, NULL, NULL, NULL))
DM_PREDICATES(
  DM_PREDICATE('CUSTPRODS', 'Extension Cable', '= ', 1, NULL, NULL, NULL))
.18085      .56291  1.8059   .32128   .3117   1

9  DM_PREDICATES(
  DM_PREDICATE('CUSTPRODS', 'Mouse Pad', '= ', 1, NULL, NULL, NULL))
DM_PREDICATES(
  DM_PREDICATE('CUSTPRODS', 'Extension Cable', '= ', 1, NULL, NULL, NULL))
.17766      .55116  1.7682   .32234   .3117   1
```

## GET\_DEFAULT\_SETTINGS Function

The GET\_DEFAULT\_SETTINGS function was deprecated in Oracle Data Mining 11g Release 1 (11.1). It was replaced with the data dictionary view \*\_MINING\_MODEL\_SETTINGS. USER\_, ALL\_, and DBA\_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

---

**Note:** See ["Deprecated Subprograms"](#) on page 44-8

---

---

This table function returns the default settings for all mining functions and algorithms supported in the DBMS\_DATA\_MINING package.

### Syntax

```
DBMS_DATA_MINING.GET_DEFAULT_SETTINGS
  RETURN DM_MODEL_SETTINGS PIPELINED;
```

### Return Values

**Table 44-42** GET\_DEFAULT\_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns:  (setting_name     VARCHAR2(30), setting_value    VARCHAR2(128))

### Usage Notes

This table function pipes out rows of type DM\_MODEL\_SETTING. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 44-20.

This function is particularly useful if you do not know what settings are associated with a particular function or algorithm, and you want to override some or all of them.

### Examples

For example, if you want to override some or all of *k*-Means clustering settings, you can create a settings table as shown, and update individual settings as required.

```
BEGIN
  CREATE TABLE mysettings AS
  SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
  WHERE setting_name LIKE 'KMNS%';
  -- now update individual settings as required
  UPDATE mysettings
     SET setting_value = 0.02
     WHERE setting_name = DBMS_DATA_MINING.KMNS_MIN_PCT_ATTR_SUPPORT;
END;
/
```

## GET\_FREQUENT\_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. For a detailed description of frequent itemsets, consult *Oracle Data Mining Concepts*.

### Syntax

```
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (
  model_name          IN VARCHAR2,
  topn                IN NUMBER DEFAULT NULL,
  max_itemset_length IN NUMBER DEFAULT NULL)
RETURN DM_ITEMSETS PIPELINED;
```

### Parameters

**Table 44–43** GET\_FREQUENT\_ITEMSETS Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.
topn	When not NULL, return the top <i>n</i> rows ordered by support in descending order
max_itemset_length	Maximum length of an item set.

### Return Values

**Table 44–44** GET\_FREQUENT\_ITEMSETS Function Return Values

Return Value	Description
DM_ITEMSETS	Represents a set of rows of type DM_ITEMSET. The rows have the following columns: (itemsets_id       NUMBER, items             DM_ITEMS, support           NUMBER, number_of_items   NUMBER) The items column returns a nested table of type DM_ITEMS. The rows have type DM_ITEM: (attribute_name    VARCHAR2(4000), attribute_subname  VARCHAR2(4000), attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000))

### Usage Notes

This table function pipes out rows of type DM\_ITEMSETS. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 44-20.

### Examples

The following example demonstrates an Association model build followed by an invocation of GET\_FREQUENT\_ITEMSETS table function from Oracle SQL.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
```

```
        SELECT *
        FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
        WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
   WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name          => 'market_model',
  function            => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name     => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name  => NULL,
  settings_table_name => 'census_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
   FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

```
-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
   FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
```

## GET\_MODEL\_COST\_MATRIX Function

This function returns the rows of the default scoring matrix associated with the specified model.

By default, this function returns the scoring matrix that was added to the model with the `ADD_COST_MATRIX` procedure. If you wish to obtain the cost matrix used to create a model, specify `cost_matrix_type_create` as the `matrix_type`. See [Table 44-45](#).

See also [ADD\\_COST\\_MATRIX Procedure](#).

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_COST_MATRIX (
    model_name          IN VARCHAR2,
    matrix_type         IN VARCHAR2 DEFAULT cost_matrix_type_score)
RETURN DM_COST_MATRIX PIPELINED;
```

### Parameters

**Table 44-45** GET\_MODEL\_COST\_MATRIX Function Parameters

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used.
<code>matrix_type</code>	The type of cost matrix.  <code>COST_MATRIX_TYPE_SCORE</code> — cost matrix used for scoring. (Default.)  <code>COST_MATRIX_TYPE_CREATE</code> — cost matrix used to create the model (Decision Tree only).

### Return Values

**Table 44-46** GET\_MODEL\_COST\_MATRIX Function Return Values

Return Value	Description						
<code>DM_COST_MATRIX</code>	Represents a set of rows of type <code>DM_COST_ELEMENT</code> . The rows have the following columns: <table border="1" data-bbox="760 1415 1143 1505"> <tbody> <tr> <td><code>actual</code></td> <td><code>VARCHAR2(4000)</code>,</td> </tr> <tr> <td><code>predicted</code></td> <td><code>VARCHAR2(4000)</code>,</td> </tr> <tr> <td><code>cost</code></td> <td><code>NUMBER</code></td> </tr> </tbody> </table>	<code>actual</code>	<code>VARCHAR2(4000)</code> ,	<code>predicted</code>	<code>VARCHAR2(4000)</code> ,	<code>cost</code>	<code>NUMBER</code>
<code>actual</code>	<code>VARCHAR2(4000)</code> ,						
<code>predicted</code>	<code>VARCHAR2(4000)</code> ,						
<code>cost</code>	<code>NUMBER</code>						

### Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the `CLAS_COST_TABLE_NAME` setting in the settings table for the model. See [Table 44-7](#), "Mining Function Settings".

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can modify the values in the cost matrix table or you can use the `REMOVE_COST_MATRIX` procedure to remove the cost matrix and the `ADD_COST_MATRIX` procedure to add a new one

**Example**

This example returns the scoring cost matrix associated with the Naive Bayes model NB\_SH\_CLAS\_SAMPLE.

```
column actual format a10
column predicted format a10
SELECT *
   FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
   ORDER BY predicted, actual;
```

ACTUAL	PREDICTED	COST
-----	-----	-----
0	0	.00
1	0	.75
0	1	.25
1	1	.00

## GET\_MODEL\_DETAILS\_ABN Function

The Adaptive Bayes Network algorithm ABN algorithm was deprecated in Oracle Data Mining 11g Release 1 (11.1).

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

---

**Note:** See ["Deprecated Subprograms"](#) on page 44-8

---

---

This table function returns a set of rows that provide the details of an Adaptive Bayes Network model.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN (
    model_name          IN VARCHAR2)
RETURN DM_ABN_DETAILS PIPELINED;
```

### Parameters

**Table 44-47** GET\_MODEL\_DETAILS\_ABN Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

### Return Values

**Table 44-48** GET\_MODEL\_DETAILS\_ABN Function Return Values

Return Value	Description
DM_ABN_DETAILS	<p>Represents a set of rows of type DM_ABN_DETAIL. The rows have the following columns:</p> <pre>(rule_id          INTEGER,  antecedent       DM_PREDICATES,  consequent       DM_PREDICATES,  rule_support     NUMBER)</pre> <p>The antecedent and consequent columns of DM_ABN_DETAIL each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:</p> <pre>(attribute_name   VARCHAR2(4000),  attribute_subname VARCHAR2(4000),  conditional_operator CHAR(2), /*=, &lt;&gt;, &lt;, &gt;, &lt;=, &gt;= */  attribute_num_value NUMBER,  attribute_str_value VARCHAR2(4000),  attribute_support NUMBER,  attribute_confidence NUMBER)</pre>

### Usage Notes

This table function pipes out rows of type DM\_ABN\_DETAIL. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 44-20.

This function returns details only for a single feature ABN model.

## Examples

The following example demonstrates an ABN model build followed by an invocation of GET\_MODEL\_DETAILS\_ABN table function from Oracle SQL.

```
BEGIN
  -- prepare a settings table to override default algorithm and model type
  CREATE TABLE abn_settings (setting_name VARCHAR2(30),
    setting_value
  VARCHAR2(128));
  INSERT INTO abn_settings VALUES (DBMS_DATA_MINING.ALGO_NAME,
    DBMS_DATA_MINING.ALGO_ADAPTIVE_BAYES_NETWORK);
  INSERT INTO abn_settings VALUES
    (DBMS_DATA_MINING.ABNS_MODEL_TYPE,
    DBMS_DATA_MINING.ABNS_SINGLE_FEATURE);
  COMMIT;
  -- create a model
  DBMS_DATA_MINING.CREATE_MODEL (
    model_name          => 'abn_model',
    function             => DBMS_DATA_MINING.CLASSIFICATION,
    data_table_name     => 'abn_build',
    case_id_column_name => 'id',
    target_column_name  => NULL,
    settings_table_name => 'abn_settings');
END;
/
-- View the (unformatted) results from SQL*Plus
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN('abn_model'));
```

## GET\_MODEL\_DETAILS\_AI Function

This table function returns a set of rows that provide the details of an Attribute Importance model.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_AI (
  model_name          IN VARCHAR2)
RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

### Parameters

**Table 44–49** GET\_MODEL\_DETAILS\_AI Function Parameters

Parameter	Description
model_name	Name of the model in the form [ <i>schema_name</i> .] <i>model_name</i> . If you do not specify a schema, your own schema is used.

### Return Values

**Table 44–50** GET\_MODEL\_DETAILS\_AI Function Return Values

Return Value	Description								
DM_RANKED_ATTRIBUTES	Represents a set of rows of type DM_RANKED_ATTRIBUTE. The rows have the following columns: <table border="0" style="margin-left: 20px;"> <tr> <td>attribute_name</td> <td>VARCHAR2(4000,</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>importance_value</td> <td>NUMBER,</td> </tr> <tr> <td>rank</td> <td>NUMBER(38))</td> </tr> </table>	attribute_name	VARCHAR2(4000,	attribute_subname	VARCHAR2(4000),	importance_value	NUMBER,	rank	NUMBER(38))
attribute_name	VARCHAR2(4000,								
attribute_subname	VARCHAR2(4000),								
importance_value	NUMBER,								
rank	NUMBER(38))								

### Examples

The following example returns model details for the attribute importance model `AI_SH_sample`, which was created by the sample program `dmaidemo.sql`. For information about the sample programs, see *Oracle Data Mining Administrator's Guide*.

```
SELECT attribute_name, importance_value, rank

## GET\_MODEL\_DETAILS\_AI Function

---

COUNTRY_NAME	-.01201116	15
CUST_INCOME_LEVEL	-.03951311	16

## GET\_MODEL\_DETAILS\_GLM Function

This table function returns the coefficient statistics for a Generalized Linear Model.

The same set of statistics is returned for both linear and logistic regression, but statistics that do not apply to the mining function are returned as NULL. For more details, see the Usage Notes.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLM (
    model_name          VARCHAR2)
RETURN DM_GLM_COEFF_SET PIPELINED;
```

### Parameters

**Table 44–51** GET\_MODEL\_DETAILS\_GLM Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

### Return Values

**Table 44–52** GET\_MODEL\_DETAILS\_GLM Return Values

Return Value	Description																														
DM_GLM_COEFF_SET	Represents a set of rows of type DM_GLM_COEFF. The rows have the following columns: <table border="0" style="margin-left: 20px;"> <tr> <td>(class</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_name</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_value</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>coefficient</td> <td>NUMBER,</td> </tr> <tr> <td>std_error</td> <td>NUMBER,</td> </tr> <tr> <td>test_statistic</td> <td>NUMBER,</td> </tr> <tr> <td>p_value</td> <td>NUMBER,</td> </tr> <tr> <td>VIF</td> <td>NUMBER,</td> </tr> <tr> <td>std_coefficient</td> <td>NUMBER,</td> </tr> <tr> <td>lower_coeff_limit</td> <td>NUMBER,</td> </tr> <tr> <td>upper_coeff_limit</td> <td>NUMBER,</td> </tr> <tr> <td>exp_coefficient</td> <td>BINARY_DOUBLE,</td> </tr> <tr> <td>exp_lower_coeff_limit</td> <td>BINARY_DOUBLE,</td> </tr> <tr> <td>exp_upper_coeff_limit</td> <td>BINARY_DOUBLE)</td> </tr> </table>	(class	VARCHAR2(4000),	attribute_name	VARCHAR2(4000),	attribute_subname	VARCHAR2(4000),	attribute_value	VARCHAR2(4000),	coefficient	NUMBER,	std_error	NUMBER,	test_statistic	NUMBER,	p_value	NUMBER,	VIF	NUMBER,	std_coefficient	NUMBER,	lower_coeff_limit	NUMBER,	upper_coeff_limit	NUMBER,	exp_coefficient	BINARY_DOUBLE,	exp_lower_coeff_limit	BINARY_DOUBLE,	exp_upper_coeff_limit	BINARY_DOUBLE)
(class	VARCHAR2(4000),																														
attribute_name	VARCHAR2(4000),																														
attribute_subname	VARCHAR2(4000),																														
attribute_value	VARCHAR2(4000),																														
coefficient	NUMBER,																														
std_error	NUMBER,																														
test_statistic	NUMBER,																														
p_value	NUMBER,																														
VIF	NUMBER,																														
std_coefficient	NUMBER,

exp_coefficient	BINARY_DOUBLE,																														
exp_lower_coeff_limit	BINARY_DOUBLE,																														
exp_upper_coeff_limit	BINARY_DOUBLE)																														

GET\_MODEL\_DETAILS\_GLM returns a row of statistics for each attribute and one extra row for the intercept, which is identified by a null value in the attribute name. Each row has the DM\_GLM\_COEFF data type. The statistics are described in [Table 44–53](#).

**Table 44–53 DM\_GLM\_COEFF Data Type Description**

Column	Description
class	<p>The non-reference target class for logistic regression. The model is built to predict the probability of this class.</p> <p>The other class (the reference class) is specified in the model setting <code>GLMS_REFERENCE_CLASS_NAME</code>. See <a href="#">Table 44–11, "GLM Settings"</a>.</p> <p>For linear regression, <code>class</code> is null.</p>
attribute_name	<p>The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of <code>attribute_name</code> is also the name of the column in the case table that is the source for this attribute.</p> <p>For the intercept, <code>attribute_name</code> is null. Intercepts are equivalent to the bias term in SVM models.</p>
attribute_subname	<p>The name of an attribute in a nested table. The full name of a nested attribute has the form:</p> <p><i>attribute_name.attribute_subname</i></p> <p>where <i>attribute_name</i> is the name of the nested column in the case table that is the source for this attribute.</p> <p>If the attribute is not nested, <code>attribute_subname</code> is null. If the attribute is an intercept, both the <code>attribute_name</code> and the <code>attribute_subname</code> are null.</p>
attribute_value	<p>The value of the attribute (categorical attribute only).</p> <p>For numerical attributes, <code>attribute_value</code> is null.</p>
coefficient	The linear coefficient estimate.
std_error	Standard error of the coefficient estimate.
test_statistic	<p>For linear regression, the t-value of the coefficient estimate.</p> <p>For logistic regression, the Wald chi-square value of the coefficient estimate.</p>
p-value	Probability of the <code>test_statistic</code> . Used to analyze the significance of specific attributes in the model.
VIF	Variance Inflation Factor. The value is zero for the intercept. For logistic regression, <code>VIF</code> is null.
std_coefficient	Standardized estimate of the coefficient.
lower_coeff_limit	Lower confidence bound of the coefficient.
upper_coeff_limit	Upper confidence bound of the coefficient.
exp_coefficient	Exponentiated coefficient for logistic regression. For linear regression, <code>exp_coefficient</code> is null.
exp_lower_coeff_limit	Exponentiated coefficient for lower confidence bound of the coefficient for logistic regression. For linear regression, <code>exp_lower_coeff_limit</code> is null.
exp_upper_coeff_limit	Exponentiated coefficient for upper confidence bound of the coefficient for logistic regression. For linear regression, <code>exp_lower_coeff_limit</code> is null.

## Usage Notes

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:

- They do not apply to the mining function. For example, `exp_coefficient` does not apply to linear regression.
- They cannot be computed from a theoretical standpoint. For example, when ridge regression is enabled, the coefficient values are returned with no statistics except VIF if it is enabled. (For information on ridge regression, see [Table 44-11, "GLM Settings"](#).)
- They cannot be computed because of limitations in system resources.
- Their values would be infinity.

## Examples

The following example returns some of the model details for the GLM regression model `GLMR_SH_Regr_sample`, which was created by the sample program `dmglrdem.sql`. For information about the sample programs, see *Oracle Data Mining Administrator's Guide*.

```
SQL> SELECT *
      FROM (SELECT class, attribute_name, attribute_value, coefficient, std_error
            FROM TABLE(dbms_data_mining.get_model_details_glm(
                        'GLMR_SH_Regr_sample'))
            ORDER BY class, attribute_name, attribute_value)
      WHERE ROWNUM < 11;
```

CLASS	ATTRIBUTE_NAME	ATTRIBUTE_VALUE	COEFFICIENT	STD_ERROR

## GET\_MODEL\_DETAILS\_GLOBAL Function

This table function returns statistics about the model as a whole. Global details are available for GLM and for association rules.

Separate global details are returned for linear and logistic regression. When ridge regression is enabled, fewer global details are returned. For information about ridge, see [Table 44–11, "GLM Settings"](#).

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLOBAL (
    model_name      IN VARCHAR2)
RETURN DM_MODEL_GLOBAL_DETAILS PIPELINED;
```

### Parameters

**Table 44–54** GET\_MODEL\_DETAILS\_GLOBAL Function Parameters

Parameter	Description
model_name	Name of the model in the form [ <i>schema_name</i> .] <i>model_name</i> . If you do not specify a schema, your own schema is used.

### Return Values

**Table 44–55** GET\_MODEL\_DETAILS\_GLOBAL Function Return Values

Return Value	Description
DM_MODEL_GLOBAL_DETAILS	A collection of rows of type DM_MODEL_GLOBAL_DETAIL. The rows have the following columns:  (global_detail_name VARCHAR2(30), global_detail_value NUMBER)

### Global Details for GLM: Linear Regression

**Table 44–56** Global Details for Linear Regression

GLOBAL_DETAIL_NAME	Description
MODEL_DF	Model degrees of freedom
MODEL_SUM_SQUARES	Model sum of squares
MODEL_MEAN_SQUARE	Model mean square
F_VALUE	Model <i>F</i> value statistic
MODEL_F_P_VALUE	Model <i>F</i> value probability
ERROR_DF	Error degrees of freedom
ERROR_SUM_SQUARES	Error sum of squares
ERROR_MEAN_SQUARE	Error mean square
CORRECTED_TOTAL_DF	Corrected total degrees of freedom
CORRECTED_TOT_SS	Corrected total sum of squares
ROOT_MEAN_SQ	Root mean square error

**Table 44–56 (Cont.) Global Details for Linear Regression**

<b>GLOBAL_DETAIL_NAME</b>	<b>Description</b>
DEPENDENT_MEAN	Dependent mean
COEFF_VAR	Coefficient of variation
R_SQ	R-Square
ADJUSTED_R_SQUARE	Adjusted R-Square
AIC	Akaike's information criterion
SBIC	Schwarz's Bayesian information criterion
GMSEP	Estimated mean square error of the prediction, assuming multivariate normality
HOCKING_SP	Hocking Sp statistic
J_P	JP statistic (the final prediction error)
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)
NUM_ROWS	Number of rows
MODEL_CONVERGED	Whether or not the model converged. Value is 1 if it converged, or 0 if it did not converge
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if it was not computed

### Global Details for GLM: Logistic Regression

**Table 44–57 Global Details for Logistic Regression**

<b>GLOBAL_DETAIL_NAME</b>	<b>Description</b>
AIC_INTERCEPT	Akaike's criterion for the fit of the intercept only model
AIC_MODEL	Akaike's criterion for the fit of the intercept and the covariates (predictors) mode
SC_INTERCEPT	Schwarz's Criterion for the fit of the intercept only model
SC_MODEL	Schwarz's Criterion for the fit of the intercept and the covariates (predictors) model
NEG2_LL_INTERCEPT	-2 log likelihood of the intercept only model
NEG2_LL_MODEL	-2 log likelihood of the model
LR_DF	Likelihood ratio degrees of freedom
LR_CHI_SQ	Likelihood ratio chi-square value
LR_CHI_SQ_P_VALUE	Likelihood ratio chi-square probability value
PSEUDO_R_SQ_CS	Pseudo R-square Cox and Snell
PSEUDO_R_SQ_N	Pseudo R-square Nagelkerke
DEPENDENT_MEAN	Dependent mean
PCT_CORRECT	Percent of correct predictions
PCT_INCORRECT	Percent of incorrectly predicted rows
PCT_TIED	Percent of cases where probability for both cases is the same
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)

**Table 44–57 (Cont.) Global Details for Logistic Regression**

GLOBAL_DETAIL_NAME	Description
NUM_ROWS	Number of rows
MODEL_CONVERGED	Whether or not the model converged. Value is 1 if it converged, or 0 if it did not converge.
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if the covariance matrix not computed

## Global Detail for Association Rules

A single global detail is produced by an Association model.

**Table 44–58 Global Detail for Association Rules**

GLOBAL_DETAIL_NAME	Description
RULE_COUNT	The number of association rules in the model.

## Examples

The following example returns the global model details for the GLM regression model `GLMR_SH_Regr_sample`, which was created by the sample program `dmglrdem.sql`. For information about the sample programs, see *Oracle Data Mining Administrator's Guide*.

```
SELECT *
  FROM TABLE(dbms_data_mining.get_model_details_global(
              'GLMR_SH_Regr_sample'))
ORDER BY global_detail_name;
GLOBAL_DETAIL_NAME          GLOBAL_DETAIL_VALUE
-----
ADJUSTED_R_SQUARE          .731412557
AIC                        5931.814
COEFF_VAR                  18.1711243
CORRECTED_TOTAL_DF        1499
CORRECTED_TOT_SS          278740.504
DEPENDENT_MEAN             38.892
ERROR_DF                   1433
ERROR_MEAN_SQUARE          49.9440956
ERROR_SUM_SQUARES          71569.8891
F_VALUE                    62.8492452
GMSEP                      52.280819
HOCKING_SP                 .034877162
J_P                        52.1749319
MODEL_CONVERGED            1
MODEL_DF                   66
MODEL_F_P_VALUE            0
MODEL_MEAN_SQUARE          3138.94871
MODEL_SUM_SQUARES          207170.615
NUM_PARAMS                 67
NUM_ROWS                   1500
ROOT_MEAN_SQ               7.06711367
R_SQ                       .743238288
SBIC                       6287.79977
VALID_COVARIANCE_MATRIX    1
```

## GET\_MODEL\_DETAILS\_KM Function

This table function returns a set of rows that provide the details of a *k*-Means clustering model.

You can provide input to `GET_MODEL_DETAILS_KM` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, `GET_MODEL_DETAILS_KM` returns all the information about the model.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_KM (
    model_name          VARCHAR2,
    cluster_id         NUMBER   DEFAULT NULL,
    attribute           VARCHAR2 DEFAULT NULL,
    centroid            NUMBER   DEFAULT 1,
    histogram           NUMBER   DEFAULT 1,
    rules               NUMBER   DEFAULT 2,
    attribute_subname   VARCHAR2 DEFAULT NULL)
RETURN DM_CLUSTERS PIPELINED;
```

### Parameters

**Table 44–59** *GET\_MODEL\_DETAILS\_KM Function Parameters*

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used.
<code>cluster_id</code>	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
<code>attribute</code>	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned.
<code>centroid</code>	This parameter accepts the following values: <ul style="list-style-type: none"> <li>■ 1 — Details about centroids are returned (default)</li> <li>■ 0 — Details about centroids are not returned</li> </ul>
<code>histogram</code>	This parameter accepts the following values: <ul style="list-style-type: none"> <li>■ 1 — Details about histograms are returned (default)</li> <li>■ 0 — Details about histograms are not returned</li> </ul>
<code>rules</code>	This parameter accepts the following values: <ul style="list-style-type: none"> <li>■ 2 — Details about rules are returned (default)</li> <li>■ 1 — Rule summaries are returned</li> <li>■ 0 — No information about rules is returned</li> </ul>

## Return Values

**Table 44–60** GET\_MODEL\_DETAILS\_KM Function Return Values

Return Value	Description
DM_CLUSTERS	<p>Represents a set of rows of type DM_CLUSTER. The rows have the following columns:</p> <pre>(id                NUMBER,  cluster_id        VARCHAR2(4000),  record_count      NUMBER,  parent            NUMBER,  tree_level        NUMBER,  dispersion        NUMBER,  split_predicate   DM_PREDICATES,  child             DM_CHILDREN,  centroid          DM_CENTROIDS,  histogram         DM_HISTOGRAMS,  rule              DM_RULE)</pre>

The `split_predicate` column of `DM_CLUSTER` returns a nested table of type `DM_PREDICATES`. Each row, of type `DM_PREDICATE`, has the following columns:

```
(attribute_name    VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 conditional_operator CHAR(2) /*=, <>, <, >, <=, >=*/,
 attribute_num_value NUMBER,
 attribute_str_value VARCHAR2(4000),
 attribute_support  NUMBER,
 attribute_confidence NUMBER)
```

The `child` column of `DM_CLUSTER` returns a nested table of type `DM_CHILDREN`. The rows, of type `DM_CHILD`, have a single column of type `NUMBER`, which contains the identifiers of each child.

The `centroid` column of `DM_CLUSTER` returns a nested table of type `DM_CENTROIDS`. The rows, of type `DM_CENTROID`, have the following columns:

```
(attribute_name    VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 mean              NUMBER,
 mode_value        VARCHAR2(4000),
 variance          NUMBER)
```

The `histogram` column of `DM_CLUSTER` returns a nested table of type `DM_HISTOGRAMS`. The rows, of type `DM_HISTOGRAM_BIN`, have the following columns:

```
(attribute_name    VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 bin_id            NUMBER,
 lower_bound       NUMBER,
 upper_bound       NUMBER,
 label             VARCHAR2(4000),
 count             NUMBER)
```

**Table 44–60 (Cont.) GET\_MODEL\_DETAILS\_KM Function Return Values**

Return Value	Description
	The rule column of DM_CLUSTER returns a single row of type DM_RULE. The columns are:
	(rule_id                    INTEGER, antecedent                DM_PREDICATES, consequent                DM_PREDICATES, rule_support               NUMBER, rule_confidence          NUMBER, rule_lift                  NUMBER, antecedent_support       NUMBER, consequent_support       NUMBER, number_of_items          INTEGER)
	The antecedent and consequent columns of DM_RULE each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:
	(attribute_name            VARCHAR2(4000), attribute_subname         VARCHAR2(4000), conditional_operator      CHAR(2)/*=,<>,<,>,<=,>=*/, attribute_num_value        NUMBER, attribute_str_value        VARCHAR2(4000), attribute_support          NUMBER, attribute_confidence       NUMBER)

## Usage Notes

The table function pipes out rows of type DM\_CLUSTERS. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 44-20.

## Examples

The following example returns model details for the *k*-Means clustering model KM\_SH\_Clus\_sample, which was created by the sample program dmkmdemo.sql. For information about the sample programs, see *Oracle Data Mining Administrator's Guide*.

```
SELECT T.id                clu_id,
       T.record_count     rec_cnt,
       T.parent            parent,
       T.tree_level       tree_level,
       T.dispersion        dispersion
FROM (SELECT *
      FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_KM(
                  'KM_SH_Clus_sample'))
      ORDER BY id) T
WHERE ROWNUM < 6;
```

CLU_ID	REC_CNT	PARENT	TREE_LEVEL	DISPERSION
1	1500		1	5.9152211
2	638	1	2	3.98458982
3	862	1	2	5.83732097
4	376	3	3	5.05192137
5	486	3	3	5.42901522

## GET\_MODEL\_DETAILS\_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (
    model_name      IN      VARCHAR2)
RETURN DM_NB_DETAILS PIPELINED;
```

### Parameters

**Table 44–61 GET\_MODEL\_DETAILS\_NB Function Parameters**

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

### Return Values

**Table 44–62 GET\_MODEL\_DETAILS\_NB Function Return Values**

Return Value	Description																				
DM_NB_DETAILS	<p>Represents a set of rows of type DM_NB_DETAIL. The rows have the following columns:</p> <table border="0"> <tr> <td>target_attribute_name</td> <td>VARCHAR2(30),</td> </tr> <tr> <td>target_attribute_str_value</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>target_attribute_num_value</td> <td>NUMBER,</td> </tr> <tr> <td>prior_probability</td> <td>NUMBER,</td> </tr> <tr> <td>conditionals</td> <td>DM_CONDITIONALS)</td> </tr> </table> <p>The conditionals column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns:</p> <table border="0"> <tr> <td>attribute_name</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_str_value</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_num_value</td> <td>NUMBER,</td> </tr> <tr> <td>conditional_probability</td> <td>NUMBER)</td> </tr> </table>	target_attribute_name	VARCHAR2(30),	target_attribute_str_value	VARCHAR2(4000),	target_attribute_num_value	NUMBER,	prior_probability	NUMBER,	conditionals	DM_CONDITIONALS)	attribute_name	VARCHAR2(4000),	attribute_subname	VARCHAR2(4000),	attribute_str_value	VARCHAR2(4000),	attribute_num_value	NUMBER,	conditional_probability	NUMBER)
target_attribute_name	VARCHAR2(30),																				
target_attribute_str_value	VARCHAR2(4000),																				
target_attribute_num_value	NUMBER,																				
prior_probability	NUMBER,																				
conditionals	DM_CONDITIONALS)																				
attribute_name	VARCHAR2(4000),																				
attribute_subname	VARCHAR2(4000),																				
attribute_str_value	VARCHAR2(4000),																				
attribute_num_value	NUMBER,																				
conditional_probability	NUMBER)																				

### Usage Notes

The table function pipes out rows of type DM\_NB\_DETAILS. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 44-20.

### Examples

The following query is from the sample program `dmnbdemo.sql`. It returns model details about the model `NB_SH_Clas_sample`. For information about the sample programs, see *Oracle Data Mining Administrator's Guide*.

The query creates labels from the bin boundary tables that were used to bin the training data. It replaces the attribute values with the labels. For numeric bins, the labels are (*lower\_boundary,upper\_boundary*); for categorical bins, the label matches the value it represents. (This method of categorical label representation will

only work for cases where one value corresponds to one bin.) The target was not binned.

```

WITH
  bin_label_view AS (
    SELECT col, bin, (DECODE(bin,'1','[', '(') || lv || ',' || val || ']') label
      FROM (SELECT col,
                   bin,
                   LAST_VALUE(val) OVER (
                     PARTITION BY col ORDER BY val
                     ROWS BETWEEN UNBOUNDED PRECEDING AND 1 PRECEDING) lv,
                   val
             FROM nb_sh_sample_num)
    UNION ALL
    SELECT col, bin, val label
      FROM nb_sh_sample_cat
  ),
  model_details AS (
    SELECT T.target_attribute_name                                tname,
           TO_CHAR(
             NVL(T.target_attribute_num_value,T.target_attribute_str_value)) tval,
           C.attribute_name                                       pname,
           NVL(L.label, NVL(C.attribute_str_value, C.attribute_num_value)) pval,

## GET\_MODEL\_DETAILS\_NMF Function

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF (
    model_name      IN      VARCHAR2)
RETURN DM_NMF_FEATURE_SET PIPELINED;
```

### Parameters

**Table 44–63** GET\_MODEL\_DETAILS\_NMF Function Parameters

Parameter	Description
model_name	Name of the model in the form <i>[schema_name.]model_name</i> . If you do not specify a schema, your own schema is used.

### Return Values

**Table 44–64** GET\_MODEL\_DETAILS\_NMF Function Return Values

Return Value	Description
DM_NMF_FEATURE_SET	<p>Represents a set of rows of DM_NMF_FEATURE. The rows have the following columns:</p> <pre>(feature_id      NUMBER,  mapped_feature_id VARCHAR2(4000),  attribute_set    DM_NMF_ATTRIBUTE_SET)</pre> <p>The attribute_set column of DM_NMF_FEATURE returns a nested table of type DM_NMF_ATTRIBUTE_SET. The rows, of type DM_NMF_ATTRIBUTE, have the following columns:</p> <pre>(attribute_name  VARCHAR2(4000),  attribute_subname VARCHAR2(4000),  attribute_value  VARCHAR2(4000),  coefficient      NUMBER)</pre>

### Usage Notes

The table function pipes out rows of type DM\_NMF\_FEATURE\_SET. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 44-20.

### Examples

The following example returns model details for the feature extraction model NMF\_SH\_Sample, which was created by the sample program `dmmdemo.sql`. For information about the sample programs, see *Oracle Data Mining Administrator's Guide*.

```
SELECT * FROM (
SELECT F.feature_id,
       A.attribute_name,
       A.attribute_value,
       A.coefficient
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF('NMF_SH_Sample')) F,
TABLE(F.attribute_set) A
```

```
ORDER BY feature_id,attribute_name,attribute_value
) WHERE ROWNUM < 11;
```

1	COUNTRY_NAME	Denmark	.000242424084307513

## GET\_MODEL\_DETAILS\_OC Function

This table function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

You can provide input to `GET_MODEL_DETAILS_OC` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, `GET_MODEL_DETAILS_OC` returns all the information about the model.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_OC (
    model_name          VARCHAR2,
    cluster_id         NUMBER   DEFAULT NULL,
    attribute           VARCHAR2 DEFAULT NULL,
    centroid            NUMBER   DEFAULT 1,
    histogram           NUMBER   DEFAULT 1,
    rules              NUMBER   DEFAULT 2)
RETURN DM_CLUSTERS PIPELINED;
```

### Parameters

**Table 44–65** *GET\_MODEL\_DETAILS\_OC Function Parameters*

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used.
<code>cluster_id</code>	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
<code>attribute</code>	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned.
<code>centroid</code>	This parameter accepts the following values: <ul style="list-style-type: none"> <li>■ 1 — Details about centroids are returned (default)</li> <li>■ 0 — Details about centroids are not returned</li> </ul>
<code>histogram</code>	This parameter accepts the following values: <ul style="list-style-type: none"> <li>■ 1 — Details about histograms are returned (default)</li> <li>■ 0 — Details about histograms are not returned</li> </ul>
<code>rules</code>	This parameter accepts the following values: <ul style="list-style-type: none"> <li>■ 2 — Details about rules are returned (default)</li> <li>■ 1 — Rule summaries are returned</li> <li>■ 0 — No information about rules is returned</li> </ul>

## Return Values

**Table 44–66** *GET\_MODEL\_DETAILS\_OC Function Return Values*

Return Value	Description
DM_CLUSTERS	<p>Represents a set of rows of type DM_CLUSTER. The rows have the following columns:</p> <pre>(id          NUMBER,  cluster_id  VARCHAR2(4000),  record_count NUMBER,  parent      NUMBER,  tree_level  NUMBER,  dispersion  NUMBER,  split_predicate DM_PREDICATES,  child       DM_CHILDREN,  centroid    DM_CENTROIDS,  histogram   DM_HISTOGRAMS,  rule        DM_RULE)</pre>

The `split_predicate` column of `DM_CLUSTER` returns a nested table of type `DM_PREDICATES`. Each row, of type `DM_PREDICATE`, has the following columns:

```
(attribute_name  VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 conditional_operator CHAR(2) /*=, <>, <, >, <=, >=*/,
 attribute_num_value NUMBER,
 attribute_str_value VARCHAR2(4000),
 attribute_support NUMBER,
 attribute_confidence NUMBER)
```

The `child` column of `DM_CLUSTER` returns a nested table of type `DM_CHILDREN`. The rows, of type `DM_CHILD`, have a single column of type `NUMBER`, which contains the identifiers of each child.

The `centroid` column of `DM_CLUSTER` returns a nested table of type `DM_CENTROIDS`. The rows, of type `DM_CENTROID`, have the following columns:

```
(attribute_name  VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 mean            NUMBER,
 mode_value      VARCHAR2(4000),
 variance        NUMBER)
```

The `histogram` column of `DM_CLUSTER` returns a nested table of type `DM_HISTOGRAMS`. The rows, of type `DM_HISTOGRAM_BIN`, have the following columns:

```
(attribute_name  VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 bin_id          NUMBER,
 lower_bound     NUMBER,
 upper_bound     NUMBER,
 label           VARCHAR2(4000),
 count           NUMBER)
```

**Table 44-66 (Cont.) GET\_MODEL\_DETAILS\_OC Function Return Values**

Return Value	Description
	The rule column of DM_CLUSTER returns a single row of type DM_RULE. The columns are:
	(rule_id                    INTEGER, antecedent                DM_PREDICATES, consequent                DM_PREDICATES, rule_support              NUMBER, rule_confidence          NUMBER, rule_lift                 NUMBER, antecedent_support       NUMBER, consequent_support       NUMBER, number_of_items          INTEGER)
	The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:
	(attribute_name            VARCHAR2(4000), attribute_subname         VARCHAR2(4000), conditional_operator      CHAR(2)/*=,<>,<,>,<=,>=*/, attribute_num_value       NUMBER, attribute_str_value       VARCHAR2(4000), attribute_support          NUMBER, attribute_confidence      NUMBER)

## Usage Notes

The table function pipes out rows of type DM\_CLUSTER. For information about Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 44-20.

## Examples

The following example returns model details for the clustering model OC\_SH\_Clus\_sample, which was created by the sample program dmocdemo.sql. For information about the sample programs, see *Oracle Data Mining Administrator's Guide*.

For each cluster in this example, the split predicate indicates the attribute and the condition used to assign records to the cluster's children during model build. It provides an important piece of information on how the population within a cluster can be divided up into two smaller clusters.

```
SELECT clu_id, attribute_name, op, s_value
   FROM (SELECT a.id clu_id, sp.attribute_name, sp.conditional_operator op,
              sp.attribute_str_value s_value
          FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC(
                    'OC_SH_Clus_sample')) a,
              TABLE(a.split_predicate) sp
          ORDER BY a.id, op, s_value)
 WHERE ROWNUM < 11;
```

CLU_ID	ATTRIBUTE_NAME	OP	S_VALUE
1	OCCUPATION	IN	?
1	OCCUPATION	IN	Armed-F
1	OCCUPATION	IN	Cleric.
1	OCCUPATION	IN	Crafts
2	OCCUPATION	IN	?

2 OCCUPATION	IN Armed-F
2 OCCUPATION	IN Cleric.
3 OCCUPATION	IN Exec.
3 OCCUPATION	IN Farming
3 OCCUPATION	IN Handler

## GET\_MODEL\_DETAILS\_SVM Function

This table function returns a set of rows that provide the details of a linear Support Vector Machine (SVM) model. If invoked for nonlinear SVM, it returns ORA-40215.

In linear SVM models, only nonzero coefficients are stored. This reduces storage and speeds up model loading. As a result, if an attribute is missing in the coefficient list returned by GET\_MODEL\_DETAILS\_SVM, then the coefficient of this attribute should be interpreted as zero.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM (
    model_name          VARCHAR2,
    reverse_coef       NUMBER DEFAULT 0)
RETURN DM_SVM_LINEAR_COEFF_SET PIPELINED;
```

### Parameters

**Table 44–67** GET\_MODEL\_DETAILS\_SVM Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.
reverse_coef	Whether or not GET_MODEL_DETAILS_SVM should transform the attribute coefficients using the original attribute transformations.  When reverse_coef is set to 0 (default), GET_MODEL_DETAILS_SVM returns the coefficients directly from the model without applying transformations.  When reverse_coef is set to 1, GET_MODEL_DETAILS_SVM transforms the coefficients and bias by applying the normalization shifts and scales that were generated using automatic data preparation.  See Usage Note 4.

### Return Values

**Table 44–68** GET\_MODEL\_DETAILS\_SVM Function Return Values

Return Value	Description
DM_SVM_LINEAR_COEFF_SET	Represents a set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:  (class            VARCHAR2(4000), attribute_set    DM_SVM_ATTRIBUTE_SET)  The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:  (attribute_name    VARCHAR2(4000), attribute_subname  VARCHAR2(4000), attribute_value    VARCHAR2(4000), coefficient        NUMBER)  See Usage Notes.

## Usage Notes

1. This table function pipes out rows of type `DM_SVM_LINEAR_COEFF`. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 44-20.
2. The `class` column of `DM_SVM_LINEAR_COEFF` contains classification target values. For SVM regression models, `class` is null. For each classification target value, a set of coefficients is returned. For binary classification, one-class classification, and regression models, only a single set of coefficients is returned.
3. The `attribute_value` column in `DM_SVM_ATTRIBUTE_SET` is used for categorical attributes.
4. `GET_MODEL_DETAILS` functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information. If you want `GET_MODEL_DETAILS_SVM` to transform the coefficients such that they relate to the original attributes, set the `reverse_coef` parameter to 1.

## Examples

The following example returns model details for the SVM classification model `SVMC_SH_Clas_sample`, which was created by the sample program `dmsvcdem.sql`. For information about the sample programs, see *Oracle Data Mining Administrator's Guide*.

```
WITH
  mod_dtls AS (
    SELECT *
      FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM('SVMC_SH_Clas_sample'))
  ),
  model_details AS (
    SELECT D.class, A.attribute_name, A.attribute_value, A.coefficient
      FROM mod_dtls D,
           TABLE(D.attribute_set) A
     ORDER BY D.class, ABS(A.coefficient) DESC
  )
SELECT class, attribute_name aname, attribute_value aval, coefficient coeff
  FROM model_details
 WHERE ROWNUM < 11;
```

CLASS	ANAME	AVAL	COEFF
1			-2.85
1	BOOKKEEPING_APPLICATION		1.11
1	OCCUPATION	Other	-.94
1	HOUSEHOLD_SIZE	4-5	.88
1	CUST_MARITAL_STATUS	Married	.82
1	YRS_RESIDENCE		.76
1	HOUSEHOLD_SIZE	6-8	-.74
1	OCCUPATION	Exec.	.71
1	EDUCATION	11th	-.71
1	EDUCATION	Masters	.63

## GET\_MODEL\_DETAILS\_XML Function

This function returns an XML object that provides the details of a Decision Tree model.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_XML (
    model_name      IN      VARCHAR2)
RETURN XMLTYPE;
```

### Parameters

**Table 44–69** GET\_MODEL\_DETAILS\_XML Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

### Return Values

**Table 44–70** GET\_MODEL\_DETAILS\_XML Function Return Value

Return Value	Description
XMLTYPE	The XML definition for the decision tree model. See <a href="#">Chapter 259, "XMLTYPE"</a> for details.  The XML conforms to the Data Mining Group Predictive Model Markup Language (PMML) version 2.1 specification. The specification is available at <a href="http://www.dmg.org">http://www.dmg.org</a> .

### Usage Notes

Special characters that cannot be displayed by Oracle XML are converted to '#'.

### Examples

The following statements in SQL\*Plus return the details of the decision tree model dt\_sh\_clas\_sample. This model is created by the program dmdtdemo.sql, one of the sample data mining programs provided with Oracle Database Examples.

Note: The "&quot;" characters you will see in the XML output are a result of SQL\*Plus behavior. To display the XML in proper format, cut and past it into a file and open the file in a browser.

```
column dt_details format a320
SELECT
  dbms_data_mining.get_model_details_xml('dt_sh_clas_sample')
  AS DT_DETAILS
FROM dual;
```

```
DT_DETAILS
```

## GET\_MODEL\_SETTINGS Function

The `GET_MODEL_SETTINGS` function was deprecated in Oracle Data Mining 11g Release 1 (11.1). It was replaced with the data dictionary view `*_MINING_MODEL_SETTINGS`. `USER_`, `ALL_`, and `DBA_` versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

---

**Note:** See ["Deprecated Subprograms"](#) on page 44-8

---

---

This table function returns the list of settings that were used to build the model.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_SETTINGS (
    model_name          IN VARCHAR2)
RETURN DM_MODEL_SETTINGS PIPELINED;
```

### Parameters

**Table 44–71** *GET\_MODEL\_SETTINGS Function Parameters*

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used.

### Return Values

**Table 44–72** *GET\_MODEL\_SETTINGS Function Return Values*

Return Value	Description
<code>DM_MODEL_SETTINGS</code>	Represents a set of rows of type <code>DM_MODEL_SETTING</code> . The rows have the following columns: <div style="margin-left: 20px;"> <code>(setting_name    VARCHAR2(30) ,</code>  <code>setting_value    VARCHAR2(128))</code> </div>

### Usage Notes

The table function pipes out rows of type `DM_MODEL_SETTING`. For information about Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 44-20.

You can use this table function to determine the settings that were used to build the model. This is purely for informational purposes only — you cannot alter the model to adopt new settings.

### Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model settings using Oracle SQL as follows:

```
SELECT setting_name, setting_value
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SETTINGS('census_model'));
```

## GET\_MODEL\_SIGNATURE Function

The GET\_MODEL\_SIGNATURE function was deprecated in Oracle Data Mining 11g Release 1 (11.1). It was replaced with the data dictionary view \*\_MINING\_MODEL\_ATTRIBUTES. USER\_, ALL\_, and DBA\_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

**Note:** See "[Deprecated Subprograms](#)" on page 44-8

---

This table function returns the model signature, which lists the column attributes used to build the model and which should be present in the scoring data.

The case identifier is not considered a mining attribute. For classification and regression models, the target attribute is also not considered part of the model signature.

**See Also:** Instead of using the GET\_MODEL\_SIGNATURE function, you can query the data dictionary view, ALL\_MINING\_MODEL\_ATTRIBUTES. See the *Oracle Data Mining Application Developer's Guide*.

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_SIGNATURE (
    model_name          IN VARCHAR2)
RETURN DM_MODEL_SIGNATURE PIPELINED;
```

### Parameters

**Table 44-73** GET\_MODEL\_SIGNATURE Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

### Return Values

**Table 44-74** GET\_MODEL\_SIGNATURE Function Return Values

Return Value	Description
DM_MODEL_SIGNATURE	Represents a set of rows of type DM_MODEL_SIGNATURE_ATTRIBUTE. The rows have the following columns: (attribute_name        VARCHAR2 (30) , attribute_type        VARCHAR2 (106))

### Usage Notes

This table function pipes out rows of type DM\_MODEL\_SIGNATURE. For information on Data Mining data types and piped output from table functions, see "[Data Types](#)" on page 44-20.

**Examples**

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model details using Oracle SQL as follows:

```
SELECT attribute_name, attribute_type
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SIGNATURE('census_model'));
```

## GET\_MODEL\_TRANSFORMATIONS Function

This function returns the transformation expressions embedded in the specified model.

### See Also:

["About Transformation Lists"](#) on page 45-7

["GET\\_TRANSFORM\\_LIST Procedure"](#) on page 44-97

["CREATE\\_MODEL Procedure"](#) on page 44-50

### Syntax

```
DBMS_DATA_MINING.GET_MODEL_TRANSFORMATIONS (
    model_name      IN VARCHAR2)
RETURN DM_TRANSFORMS PIPELINED;
```

### Parameters

**Table 44-75 GET\_MODEL\_TRANSFORMATIONS Function Parameters**

Parameter	Description
model_name	Name of the model in the form <i>[schema_name.]model_name</i> . If you do not specify a schema, your own schema is used.

### Return Values

**Table 44-76 GET\_MODEL\_TRANSFORMATIONS Function Return Value**

Return Value	Description										
DM_TRANSFORMS	The transformation expressions embedded in <i>model_name</i> . The DM_TRANSFORMS type is a table of DM_TRANSFORM objects. Each DM_TRANSFORM has these fields: <table border="1" data-bbox="649 1249 1088 1375"> <thead> <tr> <th>Field Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>attribute_name</td> <td>VARCHAR2(4000)</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2(4000)</td> </tr> <tr> <td>expression</td> <td>CLOB</td> </tr> <tr> <td>reverse_expression</td> <td>CLOB</td> </tr> </tbody> </table>	Field Name	Type	attribute_name	VARCHAR2(4000)	attribute_subname	VARCHAR2(4000)	expression	CLOB	reverse_expression	CLOB
Field Name	Type										
attribute_name	VARCHAR2(4000)										
attribute_subname	VARCHAR2(4000)										
expression	CLOB										
reverse_expression	CLOB										

### Usage Notes

When Automatic Data Preparation (ADP) is enabled, both automatic and user-defined transformations may be associated with an attribute. In this case, the user-defined transformations are evaluated before the automatic transformations.

### Examples

In this example, several columns in the SH.CUSTOMERS table are used to create a Naive Bayes model. A transformation expression is specified for one of the columns. The model does not use ADP.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_income_level, cust_credit_limit
  FROM sh.customers;
```

```
describe mining_data
Name                                         Null?      Type
```

```

-----
CUST_ID                                NOT NULL NUMBER
CUST_YEAR_OF_BIRTH                     NOT NULL NUMBER(4)
CUST_INCOME_LEVEL                       VARCHAR2(30)

## GET\_TRANSFORM\_LIST Procedure

This procedure converts transformation expressions specified as `DM_TRANSFORMS` to a transformation list (`TRANSFORM_LIST`) that can be used in creating a model. `DM_TRANSFORMS` is returned by the `GET_MODEL_TRANSFORMATIONS` function.

You can also use routines in the `DBMS_DATA_MINING_TRANSFORM` package to construct a transformation list.

## Syntax

```
DBMS_DATA_MINING.GET_TRANSFORM_LIST (
    xform_list          OUT NOCOPY TRANSFORM_LIST,
    model_xforms       IN  DM_TRANSFORMS);
```

## Parameters

**Table 44-77** *GET\_TRANSFORM\_LIST Procedure Parameters*

Parameter	Description										
<code>xform_list</code>	<p>A list of transformation specifications that can be embedded in a model. Accepted as a parameter to the <a href="#">CREATE_MODEL Procedure</a>.</p> <p>The <code>TRANSFORM_LIST</code> type is a table of <code>TRANSFORM_REC</code> objects. Each <code>TRANSFORM_REC</code> has these fields:</p> <table border="0"> <tr> <td><code>attribute_name</code></td> <td><code>VARCHAR2(30)</code></td> </tr> <tr> <td><code>attribute_subname</code></td> <td><code>VARCHAR2(4000)</code></td> </tr> <tr> <td><code>expression</code></td> <td><code>EXPRESSION_REC</code></td> </tr> <tr> <td><code>reverse_expression</code></td> <td><code>EXPRESSION_REC</code></td> </tr> <tr> <td><code>attribute_spec</code></td> <td><code>VARCHAR2(4000)</code></td> </tr> </table> <p>For details about the <code>TRANSFORM_LIST</code> collection type, see <a href="#">Table 45-1, "Data Types in DBMS_DATA_MINING_TRANSFORM"</a>.</p>	<code>attribute_name</code>	<code>VARCHAR2(30)</code>	<code>attribute_subname</code>	<code>VARCHAR2(4000)</code>	<code>expression</code>	<code>EXPRESSION_REC</code>	<code>reverse_expression</code>	<code>EXPRESSION_REC</code>	<code>attribute_spec</code>	<code>VARCHAR2(4000)</code>
<code>attribute_name</code>	<code>VARCHAR2(30)</code>										
<code>attribute_subname</code>	<code>VARCHAR2(4000)</code>										
<code>expression</code>	<code>EXPRESSION_REC</code>										
<code>reverse_expression</code>	<code>EXPRESSION_REC</code>										
<code>attribute_spec</code>	<code>VARCHAR2(4000)</code>										
<code>model_xforms</code>	<p>A list of embedded transformation expressions returned by the <a href="#">GET_MODEL_TRANSFORMATIONS Function</a> for a specific model.</p> <p>The <code>DM_TRANSFORMS</code> type is a table of <code>DM_TRANSFORM</code> objects. Each <code>DM_TRANSFORM</code> has these fields:</p> <table border="0"> <tr> <td><code>attribute_name</code></td> <td><code>VARCHAR2(4000)</code></td> </tr> <tr> <td><code>attribute_subname</code></td> <td><code>VARCHAR2(4000)</code></td> </tr> <tr> <td><code>expression</code></td> <td><code>CLOB</code></td> </tr> <tr> <td><code>reverse_expression</code></td> <td><code>CLOB</code></td> </tr> </table>	<code>attribute_name</code>	<code>VARCHAR2(4000)</code>	<code>attribute_subname</code>	<code>VARCHAR2(4000)</code>	<code>expression</code>	<code>CLOB</code>	<code>reverse_expression</code>	<code>CLOB</code>		
<code>attribute_name</code>	<code>VARCHAR2(4000)</code>										
<code>attribute_subname</code>	<code>VARCHAR2(4000)</code>										
<code>expression</code>	<code>CLOB</code>										
<code>reverse_expression</code>	<code>CLOB</code>										

## Examples

In this example, a model `mod1` is trained using several columns in the `SH.CUSTOMERS` table. The model uses ADP, which automatically bins one of the columns.

A second model `mod2` is trained on the same data without ADP, but it uses a transformation list that was obtained from `mod1`. As a result, both `mod1` and `mod2` have the same embedded transformation expression.

## GET\_TRANSFORM\_LIST Procedure

---

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_income_level, cust_credit_limit
  FROM sh.customers;

```

## IMPORT\_MODEL Procedure

This procedure imports one or more data mining models. The procedure is overloaded. You can call it to import mining models from a dump file set, or you can call it to import a single mining model from a PMML document.

### Import from a dump file set

You can import mining models from a dump file set that was created by the [EXPORT\\_MODEL Procedure](#). `IMPORT_MODEL` and `EXPORT_MODEL` use Oracle Data Pump technology to export to and import from a dump file set.

When Oracle Data Pump is used directly to export/import an entire schema or database, the mining models in the schema or database are included. `EXPORT_MODEL` and `IMPORT_MODEL` export/import mining models only.

### Import from PMML

This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2) Data Mining.

You can import a mining model represented in Predictive Model Markup Language (PMML). The model must be of type `RegressionModel`, either linear regression or binary logistic regression.

PMML is an XML-based standard specified by the Data Mining Group (<http://www.dmg.org>). Applications that are PMML-compliant can deploy PMML-compliant models that were created by any vendor. Oracle Data Mining supports the core features of PMML 3.1 for regression models.

#### See Also:

*Oracle Data Mining Administrator's Guide* for more information about exporting and importing mining models

*Oracle Database Utilities* for information about Oracle Data Pump

<http://www.dmg.org/faq.html> for more information about PMML

## Syntax

Imports a mining model from a dump file set:

```
DBMS_DATA_MINING.IMPORT_MODEL (
    filename      IN  VARCHAR2,
    directory     IN  VARCHAR2,
    model_filter  IN  VARCHAR2 DEFAULT NULL,
    operation     IN  VARCHAR2 DEFAULT NULL,
    remote_link   IN  VARCHAR2 DEFAULT NULL,
    jobname       IN  VARCHAR2 DEFAULT NULL,
    schema_remap IN  VARCHAR2 DEFAULT NULL);
```

Imports a mining model from a PMML document:

```
DBMS_DATA_MINING.IMPORT_MODEL (
    model_name     IN  VARCHAR2,
    pmml_doc       IN  XMLTYPE);
```

## Parameters

**Table 44–78** *IMPORT\_MODEL Procedure Parameters*

Parameter	Description
filename	<p>Name of the dump file set from which the models should be imported. The dump file set must have been created by the EXPORT_MODEL procedure or the expdp export utility of Oracle Data Pump.</p> <p>The dump file set can contain one or more files. (Refer to "EXPORT_MODEL Procedure" on page 44-55 for details.) If the dump file set contains multiple files, you can specify 'filename%U' instead of listing them. For example, if your dump file set contains 3 files, archive01.dmp, archive02.dmp, and archive03.dmp, you can import them by specifying 'archive%U'.</p>
directory	<p>Name of a pre-defined directory object that specifies where the dump file set is located. Both the exporting and the importing user must have read/write access to the directory object and to the file system directory that it identifies.</p> <p>Note: The target database must have also have read/write access to the file system directory.</p>
model_filter	<p>Optional parameter that specifies one or more models to import. If you do not specify a value for model_filter, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models.</p> <p>The value of model_filter can be one or more model names. The following are valid filters.</p> <pre>'mymodel1'</pre> <pre>'name IN ('mymodel2','mymodel3')'</pre> <p>The first causes IMPORT_MODEL to import a single model named mymodel1. The second causes IMPORT_MODEL to import two models, mymodel2 and mymodel3.</p>
operation	<p>Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported.</p> <p>You can specify either of the following values for operation:</p> <ul style="list-style-type: none"> <li>▪ 'IMPORT' — Import the models (Default)</li> <li>▪ 'SQL_FILE' — Write the SQL DDL for creating the models to a text file. The text file is named <i>job_name.sql</i> and is located in the dump set directory.</li> </ul>
remote_link	Optional parameter not used in this release. Set to NULL
jobname	<p>Optional parameter that specifies the name of the import job. By default, the name has the form <i>username_imp_nnnn</i>, where <i>nnnn</i> is a number. For example, a job name in the SCOTT schema might be SCOTT_imp_134.</p> <p>If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters.</p> <p>A log file for the import job, named <i>jobname.log</i>, is created in the same directory as the dump file set.</p>
schema_remap	<p>Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema.</p> <p>If the dump file set belongs to a different schema, you must specify a schema mapping in the form <i>export_user:import_user</i>. For example, you would specify 'SCOTT:MARY' to import a model exported by SCOTT into the MARY schema.</p> <p>Note: In some cases, you may need to have the IMP_FULL_DATABASE privilege or the SYS role to import a model from a different schema.</p>

**Table 44–78 (Cont.) IMPORT\_MODEL Procedure Parameters**

Parameter	Description
model_name	Name for the new model that will be created in the database as a result of an import from PMML. The name must be unique within the user's schema.
pmml.doc	The PMML document representing the model to be imported. The PMML document has an XMLTYPE object type. See <a href="#">Chapter 259, "XMLTYPE"</a> for details.

## Usage Notes

The following notes pertain to mining model import based on Oracle Data Pump.

Mining models are stored in the default tablespace of the mining model owner, or in a tablespace to which the owner has access. The tablespace must also exist in the target database, and the target user must have access to it. If the tablespace does not exist in the target database, you must create it before importing the models.

For example, if the models were created in schema DMUSER and the default tablespace for DMUSER is USERS, then the USERS tablespace must exist in the target database. You can create the USERS tablespace and grant access to a target user with appropriate tablespace quota as follows.

```
connect / as sysdba;
create tablespace USERS datafile 'data_file_name' size 200M autoextend on;
alter user target_user quota unlimited on USERS;
```

## Examples

1. This example shows a model being exported and imported within the schema dmuser2. Then the same model is imported into the dmuser3 schema. The dmuser3 user has the IMP\_FULL\_DATABASE privilege.

```
SQL> connect dmuser2
Enter password: dmuser2_password
Connected.
SQL> select model_name from user_mining_models;

MODEL_NAME
-----
NMF_SH_SAMPLE
SVMO_SH_CLAS_SAMPLE
SVMR_SH_REGR_SAMPLE

-- export the model called NMF_SH_SAMPLE to a dump file in same schema
SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ('NMF_SH_SAMPLE_out',
'DATA_PUMP_DIR',
                                     'name = 'NMF_SH_SAMPLE''');
-- import the model back into the same schema
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
'DATA_PUMP_DIR', 'name = 'NMF_SH_SAMPLE''');

-- connect as different user
-- import same model into that schema
SQL> connect dmuser3
Enter password: dmuser3_password
Connected.
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
'DATA_PUMP_DIR', 'name = 'NMF_SH_SAMPLE'',
'IMPORT', NULL, 'nmf_imp_job', 'dmuser2:dmuser3');
```

The following example shows user MARY importing all models from a dump file, `model_exp_001.dmp`, which was created by user SCOTT. The dump file is located in the file system directory mapped to a directory object called `DM_DUMP`. If user MARY does not have `IMP_FULL_DATABASE` privileges, `IMPORT_MODEL` will raise an error.

```
-- import all models
DECLARE
  file_name      VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.IMPORT_MODEL(
    filename=>file_name,
    directory=>'DM_DUMP',
    schema_remap=>'SCOTT:MARY');
  DBMS_OUTPUT.PUT_LINE(
'DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/
```

2. This example shows how a PMML document called `SamplePMML1.xml` could be imported from a location referenced by directory object `PMMLDIR` into the schema of the current user. The imported model will be called `PMMLMODEL1`.

```
BEGIN
  dbms_data_mining.import_model ('PMMLMODEL1',
    XMLType (bfilename ('PMMLDIR', 'SamplePMML1.xml'),
    nls_charset_id ('AL32UTF8')
  ));
END;
```

## RANK\_APPLY Procedure

This procedure ranks the results of an `APPLY` operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

### Syntax

```
DBMS_DATA_MINING.RANK_APPLY (
    apply_result_table_name      IN VARCHAR2,
    case_id_column_name         IN VARCHAR2,
    score_column_name           IN VARCHAR2,
    score_criterion_column_name IN VARCHAR2,
    ranked_apply_table_name     IN VARCHAR2,
    top_N                        IN INTEGER DEFAULT 1,
    cost_matrix_table_name      IN VARCHAR2 DEFAULT NULL,
    apply_result_schema_name    IN VARCHAR2 DEFAULT NULL,
    cost_matrix_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 44–79 RANK\_APPLY Procedure Parameters**

Parameter	Description
<code>apply_result_table_name</code>	Name of the table or view containing the results of an <code>APPLY</code> operation on the test dataset (see Usage Notes)
<code>case_id_column_name</code>	Name of the case identifier column. This must be the same as the one used for generating <code>APPLY</code> results.
<code>score_column_name</code>	Name of the prediction column in the apply results table
<code>score_criterion_column_name</code>	Name of the probability column in the apply results table
<code>ranked_apply_result_table_name</code>	Name of the table containing the ranked apply results
<code>top_N</code>	Top N predictions to be considered from the <code>APPLY</code> results for precision recall computation
<code>cost_matrix_table_name</code>	Name of the cost matrix table
<code>apply_result_schema_name</code>	Name of the schema hosting the <code>APPLY</code> results table
<code>cost_matrix_schema_name</code>	Name of the schema hosting the cost matrix table

### Usage Notes

You can use `RANK_APPLY` to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of `RANK_APPLY` is similar to that of `APPLY` with respect to other DDL-like operations such as `CREATE_MODEL`, `DROP_MODEL`, and `RENAME_MODEL`. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from `APPLY`.

The main intended use of `RANK_APPLY` is for the generation of the final `APPLY` results against the scoring data in a production setting. You can apply the model against test

data using `APPLY`, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for `RANK_APPLY`.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The `case_id` column will be the same case identifier column as that of the apply results.

### Classification Models — NB, ABN, SVM

For numerical targets, the ranked results table will have the definition as shown:

```
(case_id      VARCHAR2/NUMBER,
prediction    NUMBER,
probability   NUMBER,
cost         NUMBER,
rank         INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```
(case_id      VARCHAR2/NUMBER,
prediction    VARCHAR2,
probability   NUMBER,
cost         NUMBER,
rank         INTEGER)
```

### Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```
(case_id      VARCHAR2/NUMBER,
cluster_id    NUMBER,
probability   NUMBER,
rank         INTEGER)
```

### Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```
(case_id      VARCHAR2/NUMBER,
feature_id    NUMBER,
match_quality NUMBER,
rank         INTEGER)
```

### Examples

```
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if training data was pre-processed in any manner,
 * perform the same pre-processing steps on apply
 * data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
```

```
*/

/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
  apply_result_table_name      => 'census_apply_result',
  case_id_column_name         => 'person_id',
  score_column_name           => 'prediction',
  score_criterion_column_name => 'probability',
  ranked_apply_result_tab_name => 'census_ranked_apply_result',
  top_N                       => 3,
  cost_matrix_table_name      => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
  FROM census_ranked_apply_result;
```

## REMOVE\_COST\_MATRIX Procedure

Removes the default scoring matrix from a classification model.

### See Also:

- ["ADD\\_COST\\_MATRIX Procedure"](#) on page 44-25
- ["REMOVE\\_COST\\_MATRIX Procedure"](#) on page 44-107

### Syntax

```
DBMS_DATA_MINING.REMOVE_COST_MATRIX (
    model_name IN VARCHAR2);
```

### Parameters

**Table 44–80 Remove\_Cost\_Matrix Procedure Parameters**

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

### Usage Notes

If the model is not in your schema, then REMOVE\_COST\_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.

### Example

The Naive Bayes model NB\_SH\_CLAS\_SAMPLE has an associated cost matrix that can be used for scoring the model.

```
SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;
```

```
ACTUAL      PREDICTED      COST
-----
0           0              0
1           0              .75
0           1              .25
1           1              0
```

You can remove the cost matrix with REMOVE\_COST\_MATRIX.

```
SQL>EXECUTE dbms_data_mining.remove_cost_matrix('nb_sh_clas_sample');
```

```
SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;
```

```
no rows selected
```

## RENAME\_MODEL Procedure

This procedure renames a mining model to a new name that you specify.

The model name is in the form `[schema_name.]model_name`. If you do not specify a schema, your own schema is used. For mining model naming restrictions, see ["Mining Model Naming Restrictions"](#) on page 44-5.

### Syntax

```
DBMS_DATA_MINING.RENAME_MODEL (
    model_name          IN VARCHAR2,
    new_model_name      IN VARCHAR2);
```

### Parameters

**Table 44–81** *RENAME\_MODEL Procedure Parameters*

Parameter	Description
<code>model_name</code>	Old name of the model
<code>new_model_name</code>	New name of the model.

### Usage Notes

If an APPLY operation is using a model, and you attempt to rename the model during that time, the RENAME will succeed and APPLY will return indeterminate results.

### Examples

Assume the existence of a model `census_model`. The following example shows how to rename this model.

```
BEGIN
    DBMS_DATA_MINING.RENAME_MODEL(
        model_name      => 'census_model',
        new_model_name  => 'census_new_model');
END;
/
```

---

---

## DBMS\_DATA\_MINING\_TRANSFORM

DBMS\_DATA\_MINING\_TRANSFORM implements a set of transformations that are commonly used in data mining and provides a framework that you can use for specifying your own transformations.

**See Also:**

- [Chapter 44, "DBMS\\_DATA\\_MINING"](#)
- *Oracle Data Mining Concepts*

This chapter contains the following topics:

- [Using DBMS\\_DATA\\_MINING\\_TRANSFORM](#)

  - Operational Notes
  - Security Model
  - Types
  - Constants
- [Summary of DBMS\\_DATA\\_MINING\\_TRANSFORM Subprograms](#)

---

## Using DBMS\_DATA\_MINING\_TRANSFORM

This section contains topics that relate to using the DBMS\_DATA\_MINING\_TRANSFORM package.

- [Overview](#)
- [Operational Notes](#)
- [Security Model](#)
- [Types](#)
- [Constants](#)

## Overview

A transformation is a SQL expression that modifies the data in one or more columns.

Data must typically undergo certain transformations before it can be used to build a mining model. Many data mining algorithms have specific transformation requirements.

Data that will be scored must be transformed in the same way as the data that was used to create (train) the model.

## External or Embedded Transformations

DBMS\_DATA\_MINING\_TRANSFORM offers two approaches to implementing transformations. For a given model, you can either:

- Create a list of transformation expressions and pass it to the [CREATE\\_MODEL Procedure](#)

*or*

- Create a view that implements the transformations and pass the name of the view to the [CREATE\\_MODEL Procedure](#)

If you create a transformation list and pass it to `CREATE_MODEL`, the transformation expressions are embedded in the model and automatically implemented whenever the model is applied.

If you create a view, the transformation expressions are external to the model. You will need to re-create the transformations whenever you apply the model.

---

---

**Note:** Embedded transformations significantly enhance the model's usability while simplifying the process of model management.

---

---

## Automatic Transformations

Oracle Data Mining supports an Automatic Data Preparation (ADP) mode. When ADP is enabled, most algorithm-specific transformations are *automatically* embedded. Any additional transformations must be explicitly provided in an embedded transformation list or in a view.

If ADP is enabled and you create a model with a transformation list, both sets of transformations are embedded. The model will execute the user-specified transformations from the transformation list before executing the automatic transformations specified by ADP.

Within a transformation list, you can selectively disable ADP for individual attributes.

**See Also:**

["Automatic Data Preparation"](#) on page 44-11

*Oracle Data Mining Concepts* for a list of the algorithm-specific transformations implemented by ADP

["About Transformation Lists"](#) on page 45-7

## Transformations in DBMS\_DATA\_MINING\_TRANSFORM

The transformations supported by `DBMS_DATA_MINING_TRANSFORM` are summarized in this section.

## Binning

Binning refers to the mapping of continuous or discrete values to discrete values of reduced cardinality.

- **Supervised Binning (Categorical and Numerical)**  
Binning is based on intrinsic relationships in the data as determined by a decision tree model.  
See ["INSERT\\_BIN\\_SUPER Procedure"](#) on page 45-51.
- **Top-N Frequency Categorical Binning**  
Binning is based on the number of cases in each category.  
See ["INSERT\\_BIN\\_CAT\\_FREQ Procedure"](#) on page 45-39
- **Equi-Width Numerical Binning**  
Binning is based on equal-range partitions.  
See ["INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure"](#) on page 45-44.
- **Quantile Numerical Binning**  
Binning is based on quantiles computed using the SQL `NTILE` function.  
See ["INSERT\\_BIN\\_NUM\\_QTILE Procedure"](#) on page 45-48.

## Linear Normalization

Normalization is the process of scaling continuous values down to a specific range, often between zero and one. Normalization transforms each numerical value by subtracting a number (the **shift**) and dividing the result by another number (the **scale**).

$$x_{\text{new}} = (x_{\text{old}} - \text{shift}) / \text{scale}$$

- **Min-Max Normalization**  
Normalization is based on the minimum and maximum with the following shift and scale:  

```
shift = min  
scale = max-min
```

  
See ["INSERT\\_NORM\\_LIN\\_MINMAX Procedure"](#) on page 45-67.
- **Scale Normalization**  
Normalization is based on the minimum and maximum with the following shift and scale:  

```
shift = 0  
scale = max{abs(max), abs(min)}
```

  
See ["INSERT\\_NORM\\_LIN\\_SCALE Procedure"](#) on page 45-70.
- **Z-Score Normalization**  
Normalization is based on the mean and standard deviation with the following shift and scale:  

```
shift = mean  
scale = standard_deviation
```

  
See ["INSERT\\_NORM\\_LIN\\_ZSCORE Procedure"](#) on page 45-73.

**Outlier Treatment**

An outlier is a numerical value that is located far from the rest of the data. Outliers can artificially skew the results of data mining.

- Winsorizing

Outliers are replaced with the nearest value that is not an outlier.

See "[INSERT\\_CLIP\\_WINSOR\\_TAIL Procedure](#)" on page 45-58

- Trimming

Outliers are set to NULL.

See "[INSERT\\_CLIP\\_TRIM\\_TAIL Procedure](#)" on page 45-55.

**Missing Value Treatment**

Missing data may indicate sparsity or it may indicate that some values are missing at random. DBMS\_DATA\_MINING\_TRANSFORM supports the following transformations for minimizing the effects of missing values:

- Missing numerical values are replaced with the mean.

See "[INSERT\\_MISS\\_NUM\\_MEAN Procedure](#)" on page 45-64.

- Missing categorical values are replaced with the mode.

See "[INSERT\\_MISS\\_CAT\\_MODE Procedure](#)" on page 45-61.

---

---

**Note:** Oracle Data Mining also has default mechanisms for handling missing data. See *Oracle Data Mining Application Developer's Guide* for details.

---

---

## Operational Notes

The `DBMS_DATA_MINING_TRANSFORM` package offers a flexible framework for specifying data transformations. If you choose to embed transformations in the model (the preferred method), you will create a **transformation list** object and pass it to the [CREATE\\_MODEL Procedure](#). If you choose to transform the data without embedding, you will create a view.

When specified in a transformation list, the transformation expressions are executed by the model. When specified in a view, the transformation expressions are executed by the view.

### Transformation Definitions

Transformation definitions are used to generate the SQL expressions that transform the data. For example, the transformation definitions for normalizing a numeric column are the shift and scale values for that data.

With the `DBMS_DATA_MINING_TRANSFORM` package, you can call procedures to compute the transformation definitions, or you can compute them yourself, or you can do both.

### Transformation Definition Tables

`DBMS_DATA_MINING_TRANSFORM` provides **INSERT** procedures that compute transformation definitions and insert them in transformation definition tables. You can modify the values in the transformation definition tables or populate them yourself.

**XFORM** routines use populated definition tables to transform data in external views.

**STACK** routines use populated definition tables to build transformation lists.

**To specify transformations based on definition tables, follow these steps:**

1. Use **CREATE** routines to create transformation definition tables.

The tables have columns to hold the transformation definitions for a given type of transformation. For example, the [CREATE\\_BIN\\_NUM Procedure](#) creates a definition table that has a column for storing data values and another column for storing the associated bin identifiers.

2. Use **INSERT** routines to compute and insert transformation definitions in the tables.

Each **INSERT** routine uses a specific technique for computing the transformation definitions. For example, the [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#) computes bin boundaries by identifying the minimum and maximum values then setting the bin boundaries at equal intervals.

3. Use **STACK** or **XFORM** routines to generate transformation expressions based on the information in the definition tables:
  - Use **STACK** routines to add the transformation expressions to a transformation list. Pass the transformation list to the [CREATE\\_MODEL Procedure](#). The transformation expressions will be assembled into one long SQL query and embedded in the model.
  - Use **XFORM** routines to execute the transformation expressions within a view. The transformations will be external to the model and will need to be re-created whenever the model is applied to new data.

## Transformations Without Definition Tables

STACK routines are not the only method for adding transformation expressions to a transformation list. You can also build a transformation list without using definition tables.

To specify transformations without using definition tables, follow these steps:

1. Write a SQL expression for transforming an attribute.
2. Write a SQL expression for reversing the transformation. (See ["Reverse Transformations and Model Transparency"](#) on page 45-7.)
3. Determine whether or not to disable ADP for the attribute. By default ADP is enabled for the attribute if it is specified for the model. (See ["Disabling Automatic Data Preparation"](#) on page 45-8.)
4. Specify the SQL expressions and ADP instructions in a call to the [SET\\_TRANSFORM Procedure](#), which adds the information to a transformation list.
5. Repeat steps 1 through 4 for each attribute that you wish to transform.
6. Pass the transformation list to the [CREATE\\_MODEL Procedure](#). The transformation expressions will be assembled into one long SQL query and embedded in the model.

---

**Note:** SQL expressions that you specify with `SET_TRANSFORM` must fit within a `VARCHAR2`. To specify a longer expression, you can use the [SET\\_EXPRESSION Procedure](#). With `SET_EXPRESSION`, you can build an expression by appending rows to a `VARCHAR2` array.

---

## About Transformation Lists

The elements of a transformation list are **transformation records**. Each transformation record provides all the information needed by the model for managing the transformation of a single attribute.

Each transformation record includes the following fields:

- *attribute\_name* — Name of the column of data to be transformed
- *attribute\_subname* — Name of the nested attribute if *attribute\_name* is a nested column, otherwise NULL
- *expression* — SQL expression for transforming the attribute
- *reverse\_expression* — SQL expression for reversing the transformation
- *attribute\_spec* — When set to `NOPREP`, disables ADP for the attribute

**See Also:** [Table 45–1](#) for details about the `TRANSFORM_LIST` and `TRANSFORM_REC` object types

## Reverse Transformations and Model Transparency

An algorithm manipulates transformed attributes to train and score a model. The transformed attributes, however, may not be meaningful to an end user. For example, if attribute *x* has been transformed into bins 1 — 4, the bin names 1, 2, 3, and 4 are manipulated by the algorithm, but a user is probably not interested in the model details about bins 1 — 4 or in predicting the numbers 1 — 4.

To return original attribute values in model details and predictions, you can provide a reverse expression in the transformation record for the attribute. For example, if you specify the transformation expression '`log(10, y)`' for attribute *y*, you could specify the reverse transformation expression '`power(10, y)`'.

Reverse transformations enable **model transparency**. They make internal processing transparent to the user.

---

---

**Note:** `STACK` procedures automatically reverse normalization transformations, but they do not provide a mechanism for reversing binning, clipping, or missing value transformations.

You can use the `DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION` procedure to specify or update reverse transformations expressions for an existing model.

---

---

**See Also:**

[Example 45-1, "Stacking a Clipping Transformation"](#)

["ALTER\\_REVERSE\\_EXPRESSION Procedure"](#) on page 44-27

["Summary of DBMS\\_DATA\\_MINING Subprograms"](#) on page 44-23  
for links to the model details functions

**Disabling Automatic Data Preparation**

ADP is controlled by a model-specific setting (`PREP_AUTO`). The `PREP_AUTO` setting affects all model attributes unless you disable it for individual attributes.

If ADP is enabled and you set *attribute\_spec* to `NOPREP`, only the transformations that you specify for that attribute will be evaluated. If ADP is enabled and you do *not* set *attribute\_spec* to `NOPREP`, the automatic transformations will be evaluated *after* the transformations that you specify for the attribute.

If ADP is not enabled for the model, the *attribute\_spec* field of the transformation record is ignored.

**See Also:** ["Automatic Data Preparation"](#) on page 44-11 for information about the `PREP_AUTO` setting

**Adding Transformation Records to a Transformation List**

A transformation list is a stack of transformation records. When a new transformation record is added, it is appended to the top of the stack. (See ["About Stacking"](#) for details.)

When you use `SET_TRANSFORM` to add a transformation record to a transformation list, you can specify values for all the fields in the transformation record.

When you use `STACK` procedures to add transformation records to a transformation list, only the transformation expression field is populated. For normalization transformations, the reverse transformation expression field is also populated.

You can use both `STACK` procedures and `SET_TRANSFORM` to build one transformation list. Each `STACK` procedure call adds transformation records for all the attributes in a specified transformation definition table. Each `SET_TRANSFORM` call adds a transformation record for a single attribute.

## About Stacking

Transformation lists are built by stacking transformation records. Transformation lists are evaluated from bottom to top. Each transformation expression depends on the result of the transformation expression below it in the stack.

### Stack Procedures

STACK procedures create transformation records from the information in transformation definition tables. For example `STACK_BIN_NUM` builds a transformation record for each attribute specified in a definition table for numeric binning. STACK procedures stack the transformation records as follows:

- If an attribute is specified in the definition table but not in the transformation list, the STACK procedure creates a transformation record, computes the reverse transformation (if possible), inserts the transformation and reverse transformation in the transformation record, and appends the transformation record to the top of the transformation list.
- If an attribute is specified in the transformation list but not in the definition table, the STACK procedure takes no action.
- If an attribute is specified in the definition table *and* in the transformation list, the STACK procedure stacks the transformation expression from the definition table on top of the transformation expression in the transformation record and updates the reverse transformation. See [Example 45-1, "Stacking a Clipping Transformation"](#) and [Example 45-4, "Stacking a Nested Normalization Transformation"](#).

#### Example 45-1 Stacking a Clipping Transformation

This example shows how `STACK_CLIP Procedure` would add transformation records to a transformation list. Note that the clipping transformations are not reversed in COL1 and COL2 after stacking (as described in ["Reverse Transformations and Model Transparency"](#) on page 45-7).

#### Refer to:

- [CREATE\\_CLIP Procedure](#) — Creates the definition table
- [INSERT\\_CLIP\\_TRIM\\_TAIL Procedure](#) — Inserts definitions in the table
- [INSERT\\_CLIP\\_WINSOR\\_TAIL Procedure](#) — Inserts definitions in the table
- [Table 45-1](#) — Describes the structure of the transformation list (TRANSFORM\_LIST object)

Assume a clipping definition table populated as follows.

col	att	lcut	lval	rcut	rval
COL1	null	-1.5	-1.5	4.5	4.5
COL2	null	0	0	1	1

Assume the following transformation list before stacking.

```

-----
transformation record #1:
-----
    attribute_name = COL1
    attribute_subname = null
    expression = log(10, COL1)

```

```
reverse_expression = power(10, COL1)
-----
transformation record #2:
-----
attribute_name      = COL3
attribute_subname   = null
expression          = ln(COL3)
reverse_expression  = exp(COL3)
```

**After stacking, the transformation list is as follows.**

```
-----
transformation record #1:
-----
attribute_name      = COL1
attribute_subname   = null
expression          = CASE WHEN log(10, COL1) < -1.5 THEN -1.5
                    WHEN log(10, COL1) > 4.5 THEN 4.5
                    ELSE log(10, COL1)
                    END;
reverse_expression  = power(10, COL1)
-----
transformation record #2:
-----
attribute_name      = COL3
attribute_subname   = null
expression          = ln(COL3)
reverse_expression  = exp(COL3)
-----
transformation record #3:
-----
attribute_name      = COL2
attribute_subname   = null
expression          = CASE WHEN COL2 < 0 THEN 0
                    WHEN COL2 > 1 THEN 1
                    ELSE COL2
                    END;
reverse_expression  = null
```

## Nested Data Transformations

The CREATE routines create transformation definition tables that include two columns, `col` and `att`, for identifying attributes. The column `col` holds the name of a column in the data table. If the data column is not nested, then `att` is null, and the name of the attribute is `col`. If the data column is nested, then `att` holds the name of the nested attribute, and the name of the attribute is `col.att`.

The INSERT and XFORM routines ignore the `att` column in the definition tables. Neither the INSERT nor the XFORM routines support nested data.

Only the STACK procedures and SET\_TRANSFORM support nested data. Nested data transformations are always embedded in the model.

Nested columns in Oracle Data Mining can have either of the following types:

```
DM_NESTED_NUMERICALS
DM_NESTED_CATEGORICALS
```

**See Also:**

"Constants" on page 45-16

*Oracle Data Mining Application Developer's Guide* for details about nested attributes in Oracle Data Mining

**Specifying Nested Attributes in a Transformation Record**

A transformation record (TRANSFORM\_REC) includes two fields, `attribute_name` and `attribute_subname`, for identifying the attribute. The field `attribute_name` holds the name of a column in the data table. If the data column is not nested, then `attribute_subname` is null, and the name of the attribute is `attribute_name`. If the data column is nested, then `attribute_subname` holds the name of the nested attribute, and the name of the attribute is `attribute_name.attribute_subname`.

**Transforming Individual Nested Attributes**

You can specify different transformations for different attributes in a nested column, and you can specify a default transformation for all the remaining attributes in the column. To specify a default nested transformation, specify null in the `attribute_name` field and the name of the nested column in the `attribute_subname` field as shown in [Example 45-2](#). Note that the keyword `VALUE` is used to represent the value of a nested attribute in a transformation expression.

**Example 45-2 Transforming a Nested Column**

The following statement transforms two of the nested attributes in `COL_N1`. Attribute `ATTR1` is transformed with normalization; Attribute `ATTR2` is set to null, which causes attribute removal transformation (`ATTR2` is not used in training the model). All the remaining attributes in `COL_N1` are divided by 10.

```
DECLARE
  stk dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM(
    stk,'COL_N1', 'ATTR1', '(VALUE - (-1.5))/20', 'VALUE *20 + (-1.5)');
  dbms_data_mining_transform.SET_TRANSFORM(
    stk,'COL_N1', 'ATTR2', NULL, NULL);
  dbms_data_mining_transform.SET_TRANSFORM(
    stk, NULL, 'COL_N1', 'VALUE/10', 'VALUE*10');
END;
/
```

The following SQL is generated from this statement.

```
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
  "ATTRIBUTE_NAME",
  DECODE("ATTRIBUTE_NAME",
    'ATTR1', ("VALUE" - (-1.5))/20,
    "VALUE"/10))
  FROM TABLE("COL_N1")
  WHERE "ATTRIBUTE_NAME" IS NOT IN ('ATTR2'))
  AS DM_NESTED_NUMERICALS)
```

If transformations are not specified for `COL_N1.ATTR1` and `COL_N1.ATTR2`, then the default transformation is used for all the attributes in `COL_N1`, and the resulting SQL does not include a `DECODE`.

```
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
  "ATTRIBUTE_NAME",
  "VALUE"/10)
```

```

FROM TABLE("COL_N1")
AS DM_NESTED_NUMERICALS)

```

Since DECODE is limited to 256 arguments, multiple DECODE functions are nested to support an arbitrary number of individual nested attribute specifications.

### Adding a Nested Column

You can specify a transformation that adds a nested column to the data, as shown in [Example 45-3](#).

#### **Example 45-3 Adding a Nested Column to a Transformation List**

```

DECLARE
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
    'YOB_CREDLIM', NULL,
    'dm_nested_numericals(
      dm_nested_numerical(
        'CUST_YEAR_OF_BIRTH', cust_year_of_birth),
      dm_nested_numerical(
        'CUST_CREDIT_LIMIT', cust_credit_limit))',
    NULL);
  dbms_data_mining_transform.SET_TRANSFORM(
    v_xlst, 'CUST_YEAR_OF_BIRTH', NULL, NULL, NULL);
  dbms_data_mining_transform.SET_TRANSFORM(
    v_xlst, 'CUST_CREDIT_LIMIT', NULL, NULL, NULL);
  dbms_data_mining_transform.XFORM_STACK(
    v_xlst, 'mining_data', 'mining_data_v');
END;
/

set long 2000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_V';

TEXT
-----
SELECT "CUST_ID", "CUST_POSTAL_CODE", dm_nested_numericals(
  dm_nested_numerical(
    'CUST_YEAR_OF_BIRTH', cust_year_of_birth),
  dm_nested_numerical(
    'CUST_CREDIT_LIMIT', cust_credit_limit)) "YOB_CREDLIM" FROM mining_data

SELECT * FROM mining_data_v WHERE cust_id = 104500;

CUST_ID CUST_POSTAL_CODE YOB_CREDLIM(ATTRIBUTE_NAME, VALUE)
-----
104500 68524             DM_NESTED_NUMERICALS(DM_NESTED_NUMERICAL(
                        'CUST_YEAR_OF_BIRTH', 1962),
                        DM_NESTED_NUMERICAL('CUST_CREDIT_LIMIT', 15000))

```

### Stacking Nested Transformations

[Example 45-4](#) shows how the [STACK\\_NORM\\_LIN Procedure](#) would add transformation records for nested column COL\_N to a transformation list.

#### Refer to:

- [CREATE\\_NORM\\_LIN Procedure](#) — Creates the definition table
- [INSERT\\_NORM\\_LIN\\_MINMAX Procedure](#) — Inserts definitions in the table

- [INSERT\\_NORM\\_LIN\\_SCALE Procedure](#) — Inserts definitions in the table
- [INSERT\\_NORM\\_LIN\\_ZSCORE Procedure](#) — Inserts definitions in the table
- [Table 45-1](#) — Describes the structure of the transformation list

**Example 45-4 Stacking a Nested Normalization Transformation**

Assume a linear normalization definition table populated as follows.

col	att	shift	scale
COL_N	ATT2	0	20
null	COL_N	0	10

Assume the following transformation list before stacking.

```

-----
transformation record #1:
-----
      attribute_name      = COL_N
      attribute_subname   = ATT1
      expression          = log(10, VALUE)
      reverse_expression  = power(10, VALUE)
-----
transformation record #2:
-----
      attribute_name      = null
      attribute_subname   = COL_N
      expression          = ln(VALUE)
      reverse_expression  = exp(VALUE)

```

After stacking, the transformation list is as follows.

```

-----
transformation record #1:
-----
      attribute_name      = COL_N
      attribute_subname   = ATT1
      expression          = (log(10, VALUE) - 0)/10
      reverse_expression  = power(10, VALUE*10 + 0)
-----
transformation record #2:
-----
      attribute_name      = NULL
      attribute_subname   = COL_N
      expression          = (ln(VALUE)- 0)/10
      reverse_expression  = exp(VALUE *10 + 0)
-----
transformation record #3:
-----
      attribute_name      = COL_N
      attribute_subname   = ATT2
      expression          = (ln(VALUE) - 0)/20
      reverse_expression  = exp(VALUE * 20 + 0)

```

## Security Model

The `DBMS_DATA_MINING_TRANSFORM` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The `DBMS_DATA_MINING_TRANSFORM.INSERT_*` procedures have a `data_table_name` parameter that enables the user to provide the input data for transformation purposes. The value of `data_table_name` can be the name of a physical table or a view. The `data_table_name` parameter can also accept an inline query.

---

---

**Important:** Because an inline query can be used to specify the data for transformation, Oracle strongly recommends that the calling routine perform any necessary SQL injection checks on the input string.

---

---

**See Also:** ["Operational Notes"](#) on page 45-6 for a description of the `DBMS_DATA_MINING_TRANSFORM.INSERT_*` procedures

## Types

DBMS\_DATA\_MINING\_TRANSFORM defines the data types described in [Table 45–1](#).

**Table 45–1 Data Types in DBMS\_DATA\_MINING\_TRANSFORM**

List Type	List Elements	Description
<b>COLUMN_LIST</b>	VARRAY(1000) OF varchar2(32)	COLUMN_LIST stores quoted and non-quoted identifiers for column names.  COLUMN_LIST is the data type of the <i>exclude_list</i> parameter in the INSERT procedures. See <a href="#">"INSERT_AUTOBIN_NUM_EQWIDTH Procedure"</a> on page 45-35 for an example.  See <i>Oracle Database PL/SQL Language Reference</i> for information about populating VARRAY structures.
<b>DESCRIBE_LIST</b>	DBMS_SQL.DESC_TAB2  TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER  TYPE desc_rec2 IS RECORD ( col_type BINARY_INTEGER := 0, col_max_len BINARY_INTEGER := 0, col_name VARCHAR2(32767) := '', col_name_len BINARY_INTEGER := 0, col_schema_name VARCHAR2(32) := '', col_schema_name_len BINARY_INTEGER := 0, col_precision BINARY_INTEGER := 0, col_scale BINARY_INTEGER := 0, col_charsetid BINARY_INTEGER := 0, col_charsetform BINARY_INTEGER := 0, col_null_ok BOOLEAN := TRUE);	DESCRIBE_LIST describes the columns of the data table after the transformation list has been applied. A DESCRIBE_LIST is returned by the <a href="#">DESCRIBE_STACK Procedure</a> .  The DESC_TAB2 and DESC_REC2 types are defined in the DBMS_SQL package. See <a href="#">"DESC_REC2 Record Type"</a> on page 136-27.  The col_type field of DESC_REC2 identifies the data type of the column. The data type is expressed as a numeric constant that represents a built-in data type. For example, a 1 indicates a variable length character string. The codes for Oracle built-in data types are listed in <i>Oracle Database SQL Language Reference</i> . The codes for the Oracle Data Mining nested types are described in <a href="#">"Constants"</a> on page 45-16.  The col_name field of DESC_REC2 identifies the column name. It may be populated with a column name, an alias, or an expression. If the column name is a SELECT expression, it may be very long. If the expression is longer than 30 bytes, it cannot be used in a view unless it is given an alias.
<b>TRANSFORM_LIST</b>	TABLE OF transform_rec  TYPE transform_rec IS RECORD ( attribute_name VARCHAR2(30), attribute_subname VARCHAR2(4000), expression <b>EXPRESSION_REC</b> , reverse_expression <b>EXPRESSION_REC</b> , attribute_spec VARCHAR2(4000));  TYPE expression_rec IS RECORD ( lstmt DBMS_SQL.VARCHAR2A, lb BINARY_INTEGER DEFAULT 1, ub BINARY_INTEGER DEFAULT 0);  TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;	TRANSFORM_LIST is a list of transformations that can be embedded in a model. A TRANSFORM_LIST is accepted as an argument by the <a href="#">CREATE_MODEL Procedure</a> .  Each element in a TRANSFORM_LIST is a TRANSFORM_REC that specifies how to transform a single attribute. The attribute_name is a column name. The attribute_subname is the nested attribute name if the column is nested, otherwise attribute_subname is null.  The expression field holds a SQL expression for transforming the attribute. See <a href="#">"About Transformation Lists"</a> on page 45-7 for an explanation of reverse expressions.  The attribute_spec field can be used to disable ADP for this attribute. Specify the keyword NOPREP to disable ADP. By default attribute_spec is null.  The expressions in a TRANSFORM_REC have type EXPRESSION_REC. The lstmt field stores a VARCHAR2A, which is a table of VARCHAR2(32767). The VARCHAR2A data type allows transformation expressions to be very long, as they can be broken up across multiple rows of VARCHAR2. The VARCHAR2A type is defined in the DBMS_SQL package. See <a href="#">"VARCHAR2A Table Type"</a> on page 136-48.  The ub (upper bound) and lb (lower bound) fields indicate how many rows there are in the VARCHAR2A table. If ub < lb (default) the EXPRESSION_REC is empty; if lb=ub=1 there is one row; if lb=1 and ub=2 there are 2 rows, and so on.

## Constants

DBMS\_DATA\_MINING\_TRANSFORM defines the constants described in [Table 45-2](#).

**Table 45-2 Constants in DBMS\_DATA\_MINING\_TRANSFORM**

Constant	Value	Description
NEST_NUM_COL_TYPE	100001	<p>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_NUMERICALS.</p> <p>Nested numerical attributes are defined as follows:</p> <pre>attribute_name    VARCHAR2 (4000) value             NUMBER</pre>
NEST_CAT_COL_TYPE	100002	<p>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_CATAGORICALS.</p> <p>Nested categorical attributes are defined as follows:</p> <pre>attribute_name    VARCHAR2 (4000) value             VARCHAR2 (4000)</pre>

**See Also:** *Oracle Data Mining Application Developer's Guide* for information about nested data in Oracle Data Mining

## Summary of DBMS\_DATA\_MINING\_TRANSFORM Subprograms

**Table 45-3 DBMS\_DATA\_MINING\_TRANSFORM Package Subprograms**

Subprogram	Purpose
<a href="#">CREATE_BIN_CAT Procedure</a> on page 45-19	Creates a transformation definition table for categorical binning
<a href="#">CREATE_BIN_NUM Procedure</a> on page 45-21	Creates a transformation definition table for numerical binning
<a href="#">CREATE_CLIP Procedure</a> on page 45-23	Creates a transformation definition table for clipping
<a href="#">CREATE_COL_REM Procedure</a> on page 45-25	Creates a transformation definition table for column removal
<a href="#">CREATE_MISS_CAT Procedure</a> on page 45-26	Creates a transformation definition table for categorical missing value treatment
<a href="#">CREATE_MISS_NUM Procedure</a> on page 45-28	Creates a transformation definition table for numerical missing values treatment
<a href="#">CREATE_NORM_LIN Procedure</a> on page 45-30	Creates a transformation definition table for linear normalization
<a href="#">DESCRIBE_STACK Procedure</a> on page 45-32	Describes the transformation list
<a href="#">GET_EXPRESSION Function</a> on page 45-34	Returns a VARCHAR2 chunk from a transformation expression
<a href="#">INSERT_AUTOBIN_NUM_EQW IDTH Procedure</a> on page 45-34	Inserts numeric automatic equi-width binning definitions in a transformation definition table
<a href="#">INSERT_BIN_CAT_FREQ Procedure</a> on page 45-39	Inserts categorical frequency-based binning definitions in a transformation definition table
<a href="#">INSERT_BIN_NUM_EQWIDTH Procedure</a> on page 45-44	Inserts numeric equi-width binning definitions in a transformation definition table
<a href="#">INSERT_BIN_NUM_QTILE Procedure</a> on page 45-48	Inserts numeric quantile binning expressions in a transformation definition table
<a href="#">INSERT_BIN_SUPER Procedure</a> on page 45-51	Inserts supervised binning definitions in numerical and categorical transformation definition tables
<a href="#">INSERT_CLIP_TRIM_TAIL Procedure</a> on page 45-55	Inserts numerical trimming definitions in a transformation definition table
<a href="#">INSERT_CLIP_WINSOR_TAIL Procedure</a> on page 45-58	Inserts numerical winsorizing definitions in a transformation definition table
<a href="#">INSERT_MISS_CAT_MODE Procedure</a> on page 45-61	Inserts categorical missing value treatment definitions in a transformation definition table
<a href="#">INSERT_MISS_NUM_MEAN Procedure</a> on page 45-64	Inserts numerical missing value treatment definitions in a transformation definition table
<a href="#">INSERT_NORM_LIN_MINMAX Procedure</a> on page 45-67	Inserts linear min-max normalization definitions in a transformation definition table
<a href="#">INSERT_NORM_LIN_SCALE Procedure</a> on page 45-70	Inserts linear scale normalization definitions in a transformation definition table
<a href="#">INSERT_NORM_LIN_ZSCORE Procedure</a> on page 45-73	Inserts linear zscore normalization definitions in a transformation definition table

**Table 45-3 (Cont.) DBMS\_DATA\_MINING\_TRANSFORM Package Subprograms**

<b>Subprogram</b>	<b>Purpose</b>
<a href="#">SET_EXPRESSION Procedure</a> on page 45-76	Adds a VARCHAR2 chunk to an expression
<a href="#">SET_TRANSFORM Procedure</a> on page 45-78	Adds a transformation record to a transformation list
<a href="#">STACK_BIN_CAT Procedure</a> on page 45-80	Adds a categorical binning expression to a transformation list
<a href="#">STACK_BIN_NUM Procedure</a> on page 45-82	Adds a numerical binning expression to a transformation list
<a href="#">STACK_CLIP Procedure</a> on page 45-85	Adds a clipping expression to a transformation list
<a href="#">STACK_COL_REM Procedure</a> on page 45-87	Adds a column removal expression to a transformation list
<a href="#">STACK_MISS_CAT Procedure</a> on page 45-89	Adds a categorical missing value treatment expression to a transformation list
<a href="#">STACK_MISS_NUM Procedure</a> on page 45-91	Adds a numerical missing value treatment expression to a transformation list
<a href="#">STACK_NORM_LIN Procedure</a> on page 45-93	Adds a linear normalization expression to a transformation list
<a href="#">XFORM_BIN_CAT Procedure</a> on page 45-95	Creates a view of the data table with categorical binning transformations
<a href="#">XFORM_BIN_NUM Procedure</a> on page 45-97	Creates a view of the data table with numerical binning transformations
<a href="#">XFORM_CLIP Procedure</a> on page 45-100	Creates a view of the data table with clipping transformations
<a href="#">XFORM_COL_REM Procedure</a> on page 45-102	Creates a view of the data table with column removal transformations
<a href="#">XFORM_EXPR_NUM Procedure</a> on page 45-104	Creates a view of the data table with the specified numeric transformations
<a href="#">XFORM_EXPR_STR Procedure</a> on page 45-106	Creates a view of the data table with the specified categorical transformations
<a href="#">XFORM_MISS_CAT Procedure</a> on page 45-109	Creates a view of the data table with categorical missing value treatment
<a href="#">XFORM_MISS_NUM Procedure</a> on page 45-112	Creates a view of the data table with numerical missing value treatment
<a href="#">XFORM_NORM_LIN Procedure</a> on page 45-114	Creates a view of the data table with linear normalization transformations
<a href="#">XFORM_STACK Procedure</a> on page 45-117	Creates a view of the transformation list

## CREATE\_BIN\_CAT Procedure

This procedure creates a transformation definition table for categorical binning. The columns are described in [Table 45-4](#).

**Table 45-4 Columns in a Transformation Definition Table for Categorical Binning**

Name	Data Type	Description
col	VARCHAR2(30)	Name of a column of CHAR, VARCHAR2, or DM_NESTED_CATEGORICALS in the data to be mined.  If col is CHAR or VARCHAR2, the column name is also the attribute name.  For information about attribute names, see <i>Oracle Data Mining Application Developer's Guide</i> . Refer especially to the section, "Scoping of Model Attribute Name".
att	VARCHAR2(4000)	The attribute subname if col is a nested column of DM_NESTED_CATEGORICALS. If col is nested, the attribute name is col.att.  If col is not nested, att is null.
val	VARCHAR2(4000)	Values of the attribute
bin	VARCHAR2(4000)	Bin assignments for the values

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (
    bin_table_name      IN VARCHAR2,
    bin_schema_name    IN VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 45-5 CREATE\_BIN\_CAT Procedure Parameters**

Parameter	Description
bin_table_name	Name of the transformation definition table to be created
bin_schema_name	Schema of bin_table_name. If no schema is specified, the current schema is used.

### Usage Notes

You can use the following procedures to populate the transformation definition table:

- [INSERT\\_BIN\\_CAT\\_FREQ Procedure](#) — frequency-based binning
- [INSERT\\_BIN\\_SUPER Procedure](#) — supervised binning

**See Also:**

"Binning" on page 45-4

"Operational Notes" on page 45-6

### Examples

The following statement creates a table called bin\_cat\_xtbl in the current schema. The table has columns that can be populated with bin assignments for categorical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('bin_cat_xtbl');
END;
/
```

```
DESCRIBE bin_cat_xtbl
```

Name	Null?	Type
COL		VARCHAR2(30)
ATT		VARCHAR2(4000)
VAL		VARCHAR2(4000)
BIN		VARCHAR2(4000)

## CREATE\_BIN\_NUM Procedure

This procedure creates a transformation definition table for numerical binning. The columns are described in [Table 45–6](#).

**Table 45–6 Columns in a Transformation Definition Table for Numerical Binning**

Name	Data Type	Description
col	VARCHAR2 (30)	Name of a column of NUMBER, FLOAT, or DM_NESTED_NUMERICALS in the data to be mined.  If the column is NUMBER or FLOAT, the column name is also the attribute name.  For information about attribute names, see <i>Oracle Data Mining Application Developer's Guide</i> . Refer especially to the section, "Scoping of Model Attribute Name".
att	VARCHAR2 (4000)	The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att.  If col is not nested, att is null.
val	NUMBER	Values of the attribute
bin	VARCHAR2 (4000)	Bin assignments for the values

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
    bin_table_name    IN VARCHAR2,
    bin_schema_name  IN VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 45–7 CREATE\_BIN\_NUM Procedure Parameters**

Parameter	Description
bin_table_name	Name of the transformation definition table to be created
bin_schema_name	Schema of bin_table_name. If no schema is specified, the current schema is used.

### Usage Notes

You can use the following procedures to populate the transformation definition table:

- [INSERT\\_AUTOBIN\\_NUM\\_EQWIDTH Procedure](#) — automatic equi-width binning
- [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#) — user-specified equi-width binning
- [INSERT\\_BIN\\_NUM\\_QTILE Procedure](#) — quantile binning
- [INSERT\\_BIN\\_SUPER Procedure](#) — supervised binning

**See Also:**

"Binning" on page 45-4

"Operational Notes" on page 45-6

## Examples

The following statement creates a table called `bin_num_xtbl` in the current schema. The table has columns that can be populated with bin assignments for numerical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('bin_num_xtbl');
END;
/
```

```
DESCRIBE bin_num_xtbl
```

Name	Null?	Type
COL		VARCHAR2(30)
ATT		VARCHAR2(4000)
VAL		NUMBER
BIN		VARCHAR2(4000)

## CREATE\_CLIP Procedure

This procedure creates a transformation definition table for clipping or winsorizing to minimize the effect of outliers. The columns are described in [Table 45–8](#).

**Table 45–8 Columns in a Transformation Definition Table for Clipping or Winsorizing**

Name	Data Type	Description
col	VARCHAR2 (30)	Name of a column of NUMBER, FLOAT, or DM_NESTED_NUMERICALS in the data to be mined.  If <i>col</i> is NUMBER or FLOAT, the column name is also the attribute name.  For information about attribute names, see <i>Oracle Data Mining Application Developer's Guide</i> . Refer especially to the section, "Scoping of Model Attribute Name".
att	VARCHAR2 (4000)	The attribute subname if <i>col</i> is a nested column of DM_NESTED_NUMERICALS. If <i>col</i> is nested, the attribute name is <i>col.att</i> .  If <i>col</i> is not nested, <i>att</i> is null.
lcut	NUMBER	The lowest typical value for the attribute.  If the attribute values were plotted on an <i>xy</i> axis, <i>lcut</i> would be the left-most boundary of the range of values considered typical for this attribute.  Any values to the left of <i>lcut</i> are outliers.
lval	NUMBER	Value assigned to an outlier to the left of <i>lcut</i>
rcut	NUMBER	The highest typical value for the attribute  If the attribute values were plotted on an <i>xy</i> axis, <i>rcut</i> would be the right-most boundary of the range of values considered typical for this attribute.  Any values to the right of <i>rcut</i> are outliers.
rval	NUMBER	Value assigned to an outlier to the right of <i>rcut</i>

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (
    clip_table_name    IN VARCHAR2,
    clip_schema_name  IN VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 45–9 CREATE\_CLIP Procedure Parameters**

Parameter	Description
clip_table_name	Name of the transformation definition table to be created
clip_schema_name	Schema of <i>clip_table_name</i> . If no schema is specified, the current schema is used.

### Usage Notes

You can use the following procedures to populate the transformation definition table:

- [INSERT\\_CLIP\\_TRIM\\_TAIL Procedure](#) — replaces outliers with nulls

- [INSERT\\_CLIP\\_WINSOR\\_TAIL Procedure](#) — replaces outliers with an average value

**See Also:**

["Outlier Treatment"](#) on page 45-5

["Operational Notes"](#) on page 45-6

## Examples

The following statement creates a table called `clip_xtbl` in the current schema. The table has columns that can be populated with clipping instructions for numerical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('clip_xtbl');
END;
/
```

```
DESCRIBE clip_xtbl
```

Name	Null?	Type
COL		VARCHAR2 (30)
ATT		VARCHAR2 (4000)
LCUT		NUMBER
LVAL		NUMBER
RCUT		NUMBER
RVAL		NUMBER

## CREATE\_COL\_REM Procedure

This procedure creates a transformation definition table for removing columns from the data table. The columns are described in [Table 45–10](#).

**Table 45–10 Columns in a Transformation Definition Table for Column Removal**

Name	Data Type	Description
col	VARCHAR2 (30)	Name of a column in the data to be mined. If <i>col</i> is not nested, the column name is also the attribute name.  For information about attribute names, see <i>Oracle Data Mining Application Developer's Guide</i> . Refer especially to the section, "Scoping of Model Attribute Name".
att	VARCHAR2 (4000)	The attribute subname if <i>col</i> is nested (DM_NESTED_NUMERICALS or DM_NESTED_CATEGORICALS). If <i>col</i> is nested, the attribute name is <i>col.att</i> .  If <i>col</i> is not nested, <i>att</i> is null.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM (
    rem_table_name      VARCHAR2,
    rem_schema_name    VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 45–11 CREATE\_COL\_REM Procedure Parameters**

Parameter	Description
rem_table_name	Name of the transformation definition table to be created
rem_schema_name	Schema of <i>rem_table_name</i> . If no schema is specified, the current schema is used.

### Usage Notes

See "[Operational Notes](#)" on page 45-6.

### Examples

The following statement creates a table called *rem\_att\_xtbl* in the current schema. The table has columns that can be populated with the names of attributes to exclude from the data to be mined.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('rem_att_xtbl');
END;
/
DESCRIBE rem_att_xtbl
```

Name	Null?	Type
COL		VARCHAR2 (30)
ATT		VARCHAR2 (4000)

## CREATE\_MISS\_CAT Procedure

This procedure creates a transformation definition table for replacing categorical missing values. The columns are described in [Table 45–12](#).

**Table 45–12 Columns in a Transformation Definition Table for Categorical Missing Value Treatment**

Name	Data Type	Description
col	VARCHAR2 (30)	Name of a column of CHAR, VARCHAR2, or DM_NESTED_CATEGORICALS in the data to be mined.  If <i>col</i> is CHAR or VARCHAR2, the column name is also the attribute name.  For information about attribute names, see <i>Oracle Data Mining Application Developer's Guide</i> . Refer especially to the section, "Scoping of Model Attribute Name".
att	VARCHAR2 (4000)	The attribute subname if <i>col</i> is a nested column of DM_NESTED_CATEGORICALS. If <i>col</i> is nested, the attribute name is <i>col.att</i> .  If <i>col</i> is not nested, <i>att</i> is null.
val	VARCHAR2 (4000)	Replacement for missing values in the attribute

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
    miss_table_name      IN VARCHAR2,
    miss_schema_name    IN VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 45–13 CREATE\_MISS\_CAT Procedure Parameters**

Parameter	Description
miss_table_name	Name of the transformation definition table to be created
miss_schema_name	Schema of <i>miss_table_name</i> . If no schema is specified, the current schema is used.

### Usage Notes

You can use the [INSERT\\_MISS\\_CAT\\_MODE Procedure](#) to populate the transformation definition table.

**See Also:**

["Missing Value Treatment"](#) on page 45-5

["Operational Notes"](#) on page 45-6

### Examples

The following statement creates a table called `miss_cat_xtbl` in the current schema. The table has columns that can be populated with values for missing data in categorical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('miss_cat_xtbl');
END;
```

/

DESCRIBE miss\_cat\_xtbl

Name	Null?	Type
COL		VARCHAR2(30)
ATT		VARCHAR2(4000)
VAL		VARCHAR2(4000)

## CREATE\_MISS\_NUM Procedure

This procedure creates a transformation definition table for replacing numerical missing values. The columns are described in [Table 45–14](#).

**Table 45–14 Columns in a Transformation Definition Table for Numerical Missing Value Treatment**

Name	Data Type	Description
col	VARCHAR2 (30)	Name of a column of NUMBER, FLOAT, or DM_NESTED_NUMERICALS in the data to be mined.  If the column is NUMBER or FLOAT, the column name is also the attribute name.  For information about attribute names, see <i>Oracle Data Mining Application Developer's Guide</i> . Refer especially to the section, "Scoping of Model Attribute Name".
att	VARCHAR2 (4000)	The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att.  If col is not nested, att is null.
val	NUMBER	Replacement for missing values in the attribute

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (
    miss_table_name      IN VARCHAR2,
    miss_schema_name    IN VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 45–15 CREATE\_MISS\_NUM Procedure Parameters**

Parameter	Description
miss_table_name	Name of the transformation definition table to be created
miss_schema_name	Schema of miss_table_name. If no schema is specified, the current schema is used.

### Usage Notes

You can use the [INSERT\\_MISS\\_NUM\\_MEAN Procedure](#) to populate the transformation definition table.

**See Also:**

["Missing Value Treatment"](#) on page 45-5

["Operational Notes"](#) on page 45-6

### Example

The following statement creates a table called miss\_num\_xtbl in the current schema. The table has columns that can be populated with values for missing data in numerical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('miss_num_xtbl');
END;
```

/

DESCRIBE miss\_num\_xtbl

Name	Null?	Type
COL		VARCHAR2 (30)
ATT		VARCHAR2 (4000)
VAL		NUMBER

## CREATE\_NORM\_LIN Procedure

This procedure creates a transformation definition table for linear normalization. The columns are described in [Table 45–16](#).

**Table 45–16 Columns in a Transformation Definition Table for Linear Normalization**

Name	Data Type	Description
col	VARCHAR2 (30)	Name of a column of NUMBER, FLOAT, or DM_NESTED_NUMERICALS in the data to be mined.  If the column is NUMBER or FLOAT, the column name is also the attribute name.  For information about attribute names, see <i>Oracle Data Mining Application Developer's Guide</i> . Refer especially to the section, "Scoping of Model Attribute Name".
att	VARCHAR2 (4000)	The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att.  If col is not nested, att is null.
shift	NUMBER	A constant to subtract from the attribute values
scale	NUMBER	A constant by which to divide the shifted values

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (
    norm_table_name      IN VARCHAR2,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 45–17 CREATE\_NORM\_LIN Procedure Parameters**

Parameter	Description
norm_table_name	Name of the transformation definition table to be created
norm_schema_name	Schema of norm_table_name. If no schema is specified, the current schema is used.

### Usage Notes

You can use the following procedures to populate the transformation definition table:

- [INSERT\\_NORM\\_LIN\\_MINMAX Procedure](#) — Uses linear min-max normalization
- [INSERT\\_NORM\\_LIN\\_SCALE Procedure](#) — Uses linear scale normalization
- [INSERT\\_NORM\\_LIN\\_ZSCORE Procedure](#) — Uses linear zscore normalization

**See Also:**

["Linear Normalization"](#) on page 45-4

["Operational Notes"](#) on page 45-6

## Examples

The following statement creates a table called `norm_xtbl` in the current schema. The table has columns that can be populated with shift and scale values for normalizing numerical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('norm_xtbl');
END;
/
```

```
DESCRIBE norm_xtbl
```

Name	Null?	Type
COL		VARCHAR2 (30)
ATT		VARCHAR2 (4000)
SHIFT		NUMBER
SCALE		NUMBER

## DESCRIBE\_STACK Procedure

This procedure describes the columns of the data table after a list of transformations has been applied. Only the columns that are specified in the transformation list are transformed. The remaining columns in the data table are included in the output without changes.

To create a view of the data table after the transformations have been applied, use the [XFORM\\_STACK Procedure](#).

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (
  xform_list          IN  TRANSFORM_LIST,
  data_table_name     IN  VARCHAR2,
  describe_list       OUT DESCRIBE_LIST,
  data_schema_name    IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–18 DESCRIBE\_STACK Procedure Parameters**

Parameter	Description
<code>xform_list</code>	A list of transformations. See <a href="#">Table 45–1</a> for a description of the <code>TRANSFORM_LIST</code> object type.
<code>data_table_name</code>	Name of the table containing the data to be transformed
<code>describe_list</code>	Descriptions of the columns in the data table after the transformations specified in <code>xform_list</code> have been applied. See <a href="#">Table 45–1</a> for a description of the <code>DESCRIBE_LIST</code> object type.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

See "[Operational Notes](#)" on page 45-6 for information about transformation lists and embedded transformations.

### Examples

This example shows the column name and data type, the column name length, and the column maximum length for the view `dmuser.cust_info` after the transformation list has been applied. All the transformations are user-specified. The results of `DESCRIBE_STACK` do not include one of the columns in the original table, because the `SET_TRANSFORM` procedure sets that column to `NULL`.

```
CREATE OR REPLACE VIEW cust_info AS
  SELECT a.cust_id, c.country_id, c.cust_year_of_birth,
         CAST(COLLECT(DM_Nested_Numerical(
           b.prod_name, 1))
           AS DM_Nested_Numericals) custprods
  FROM sh.sales a, sh.products b, sh.customers c
  WHERE a.prod_id = b.prod_id AND
         a.cust_id=c.cust_id and
         a.cust_id between 100001 AND 105000
  GROUP BY a.cust_id, country_id, cust_year_of_birth;

describe cust_info
```

Name	Null?	Type
CUST_ID	NOT NULL	NUMBER
COUNTRY_ID	NOT NULL	NUMBER
CUST_YEAR_OF_BIRTH	NOT NULL	NUMBER(4)
CUSTPRODS		SYS.DM_NESTED_NUMERICALS

```

DECLARE
  cust_stack  dbms_data_mining_transform.TRANSFORM_LIST;
  cust_cols   dbms_data_mining_transform.DESCRIBE_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
    'country_id', NULL, 'country_id/10', 'country_id*10');
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
    'cust_year_of_birth', NULL, NULL, NULL);
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
    'custprods', 'Mouse Pad', 'value*100', 'value/100');
  dbms_data_mining_transform.DESCRIBE_STACK(
    xform_list => cust_stack,
    data_table_name => 'cust_info',
    describe_list => cust_cols);
  dbms_output.put_line('====');
  for i in 1..cust_cols.COUNT loop
    dbms_output.put_line('COLUMN_NAME:      ' || cust_cols(i).col_name);

```

## GET\_EXPRESSION Function

This function returns a row from a VARCHAR2 array that stores a transformation expression. The array is built by calls to the [SET\\_EXPRESSION Procedure](#).

The array can be used for specifying SQL expressions that are too long to be used with the [SET\\_TRANSFORM Procedure](#).

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (
    expression          IN EXPRESSION_REC,
    chunk_num          IN PLS_INTEGER DEFAULT NULL);
RETURN VARCHAR2;
```

### Parameters

**Table 45–19 GET\_EXPRESSION Function Parameters**

Parameter	Description
expression	An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array.  There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression.  See <a href="#">Table 45–1</a> for a description of the EXPRESSION_REC type.
chunk	A VARCHAR2 chunk (row) to be appended to <i>expression</i> .

### Usage Notes

1. Chunk numbering starts with one. For chunks outside of the range, the return value is null. When a chunk number is null the whole expression is returned as a string. If the expression is too big, a VALUE\_ERROR is raised.
2. See "[About Transformation Lists](#)" on page 45-7.
3. See "[Operational Notes](#)" on page 45-6.

### Examples

See the example for the [SET\\_EXPRESSION Procedure](#).

## INSERT\_AUTOBIN\_NUM\_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT\_AUTOBIN\_NUM\_EQWIDTH computes the number of bins separately for each column. If you want to use equi-width binning with the same number of bins for each column, use the [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#).

INSERT\_AUTOBIN\_NUM\_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    bin_num              IN PLS_INTEGER DEFAULT 3,
    max_bin_num         IN PLS_INTEGER DEFAULT 100,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    sample_size         IN PLS_INTEGER DEFAULT 50000,
    bin_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL,
    rem_table_name      IN VARCHAR2 DEFAULT NULL,
    rem_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–20** INSERT\_AUTOBIN\_NUM\_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for numerical binning. You can use the <a href="#">CREATE_BIN_NUM Procedure</a> to create the definition table. The following columns are required: COL        VARCHAR2(30) VAL        NUMBER BIN        VARCHAR2(4000) CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_AUTOBIN_NUM_EQWIDTH.
data_table_name	Name of the table containing the data to be transformed
bin_num	Minimum number of bins. If <i>bin_num</i> is 0 or NULL, it is ignored. The default value of <i>bin_num</i> is 3.
max_bin_num	Maximum number of bins. If <i>max_bin_num</i> is 0 or NULL, it is ignored. The default value of <i>max_bin_num</i> is 100.
exclude_list	List of numeric columns to be excluded from the binning process. If you do not specify <i>exclude_list</i> , all numeric columns in the data source are binned. The format of <i>exclude_list</i> is: dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')

**Table 45–20 (Cont.) INSERT\_AUTOBIN\_NUM\_EQWIDTH Procedure Parameters**

Parameter	Description
<code>round_num</code>	<p>Specifies how to round the number in the <code>VAL</code> column of the transformation definition table.</p> <p>When <code>round_num</code> is positive, it specifies the most significant digits to retain. When <code>round_num</code> is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example.</p> <p>The default value of <code>round_num</code> is 6.</p>
<code>sample_size</code>	<p>Size of the data sample. If <code>sample_size</code> is less than the total number of non-NULL values in the column, then <code>sample_size</code> is used instead of the SQL <code>COUNT</code> function in computing the number of bins. If <code>sample_size</code> is 0 or NULL, it is ignored. See the Usage Notes.</p> <p>The default value of <code>sample_size</code> is 50,000.</p>
<code>bin_schema_name</code>	Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>rem_table_name</code>	<p>Name of a transformation definition table for column removal. The table must have the columns described in "<a href="#">CREATE_COL_REM Procedure</a>" on page 45-25.</p> <p>INSERT_AUTOBIN_NUM_EQWIDTH ignores columns with all nulls or only one unique value. If you specify a value for <code>rem_table_name</code>, these columns are removed from the mining data. If you do not specify a value for <code>rem_table_name</code>, these unbinned columns remain in the data.</p>
<code>rem_schema_name</code>	Schema of <code>rem_table_name</code> . If no schema is specified, the current schema is used.

## Usage Notes

- INSERT\_AUTOBIN\_NUM\_EQWIDTH computes the number of bins for a column based on the number of non-null values (`COUNT`), the maximum (`MAX`), the minimum (`MIN`), the standard deviation (`STDDEV`), and the constant  $C=3.49/0.9$ :

$$N = \text{floor}(\text{power}(\text{COUNT}, 1/3) * (\text{max} - \text{min}) / (c * \text{dev}))$$

If the `sample_size` parameter is specified, it is used instead of `COUNT`.

See *Oracle Database SQL Language Reference* for information about the `COUNT`, `MAX`, `MIN`, `STDDEV`, `FLOOR`, and `POWER` functions.
- INSERT\_AUTOBIN\_NUM\_EQWIDTH uses absolute values to compute the number of bins. The sign of the parameters `bin_num`, `max_bin_num`, and `sample_size` has no effect on the result.
- In computing the number of bins, INSERT\_AUTOBIN\_NUM\_EQWIDTH evaluates the following criteria in the following order:

  - The minimum number of bins (`bin_num`)
  - The maximum number of bins (`max_bin_num`)
  - The maximum number of bins for integer columns, calculated as the number of distinct values in the range `max-min+1`.
- The `round_num` parameter controls the rounding of column values in the transformation definition table, as follows:

**For a value of 308.162:**

```

when round_num = 1      result is 300
when round_num = 2      result is 310
when round_num = 3      result is 308
when round_num = 0      result is 308.162
when round_num = -1     result is 308.16
when round_num = -2     result is 308.2

```

**Examples**

In this example, `INSERT_AUTOBIN_NUM_EQWIDTH` computes the bin boundaries for the `cust_year_of_birth` column in `sh.customers` and inserts the transformations in a transformation definition table. The [STACK\\_BIN\\_NUM Procedure](#) creates a transformation list from the contents of the definition table. The [CREATE\\_MODEL Procedure](#) embeds the transformation list in a new model called `nb_model`.

The transformation and reverse transformation expressions embedded in `nb_model` are returned by the [GET\\_MODEL\\_TRANSFORMATIONS Function](#).

```

CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_postal_code
  FROM sh.customers;

```

```

DESCRIBE mining_data

```

## INSERT\_BIN\_CAT\_FREQ Procedure

This procedure performs categorical binning and inserts the transformation definitions in a transformation definition table. The procedure computes the bin boundaries based on frequency.

INSERT\_BIN\_CAT\_FREQ bins all the CHAR and VARCHAR2 columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    bin_num             IN PLS_INTEGER DEFAULT 9,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    default_num         IN PLS_INTEGER DEFAULT 2,
    bin_support          IN NUMBER DEFAULT NULL,
    bin_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–21** INSERT\_BIN\_CAT\_FREQ Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for categorical binning. You can use the <a href="#">CREATE_BIN_CAT Procedure</a> to create the definition table. The following columns are required: COL        VARCHAR2 (30) VAL        VARCHAR2 (4000) BIN        VARCHAR2 (4000) CREATE_BIN_CAT creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_CAT_FREQ.
data_table_name	Name of the table containing the data to be transformed
bin_num	The number of bins to fill using frequency-based binning. The total number of bins will be <i>bin_num</i> +1. The additional bin is the default bin. Classes that are not assigned to a frequency-based bin will be assigned to the default bin.  The default binning order is from highest to lowest: the most frequently occurring class is assigned to the first bin, the second most frequently occurring class is assigned to the second bin, and so on. You can reverse the binning order by specifying a negative number for <i>bin_num</i> . The negative sign causes the binning order to be from lowest to highest.  If the total number of distinct values (classes) in the column is less than <i>bin_num</i> , then a separate bin will be created for each value and the default bin will be empty.  If you specify NULL or 0 for <i>bin_num</i> , no binning is performed.  The default value of <i>bin_num</i> is 9.

**Table 45–21 (Cont.) INSERT\_BIN\_CAT\_FREQ Procedure Parameters**

Parameter	Description
<code>exclude_list</code>	<p>List of CHAR and VARCHAR2 columns to be excluded from the binning process. If you do not specify <code>exclude_list</code>, all CHAR and VARCHAR2 columns in the data source are binned.</p> <p>The format of <code>exclude_list</code> is:</p> <pre>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2',  ... 'coln')</pre>
<code>default_num</code>	<p>The number of class occurrences (rows of the same class) required for assignment to the default bin</p> <p>By default, <code>default_num</code> is the minimum number of occurrences required for assignment to the default bin. For example, if <code>default_num</code> is 3 and a given class occurs only once, it will not be assigned to the default bin. You can change the occurrence requirement from minimum to maximum by specifying a negative number for <code>default_num</code>. For example, if <code>default_num</code> is -3 and a given class occurs only once, it <i>will</i> be assigned to the default bin, but a class that occurs four or more times will not be included.</p> <p>If you specify NULL or 0 for <code>default_bin</code>, there are no requirements for assignment to the default bin.</p> <p>The default value of <code>default_num</code> is 2.</p>
<code>bin_support</code>	<p>The number of class occurrences (rows of the same class) required for assignment to a frequency-based bin. <code>bin_support</code> is expressed as a fraction of the total number of rows.</p> <p>By default, <code>bin_support</code> is the minimum percentage required for assignment to a frequency-based bin. For example, if there are twenty rows of data and you specify .2 for <code>bin_support</code>, then there must be four or more occurrences of a class (.2*20) in order for it to be assigned to a frequency-based bin. You can change <code>bin_support</code> from a minimum percentage to a maximum percentage by specifying a negative number for <code>bin_support</code>. For example, if there are twenty rows of data and you specify -.2 for <code>bin_support</code>, then there must be four or less occurrences of a class in order for it to be assigned to a frequency-based bin.</p> <p>Classes that occur less than a positive <code>bin_support</code> or more than a negative <code>bin_support</code> will be assigned to the default bin.</p> <p>If you specify NULL or 0 for <code>bin_support</code>, then there is no support requirement for frequency-based binning.</p> <p>The default value of <code>bin_support</code> is NULL.</p>
<code>bin_schema_name</code>	Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.

## Usage Notes

If values occur with the same frequency, INSERT\_BIN\_CAT\_FREQ assigns them in descending order when binning is from most to least frequent, or in ascending order when binning is from least to most frequent.

## Examples

1. In this example, INSERT\_BIN\_CAT\_FREQ computes the bin boundaries for the `cust_postal_code` and `cust_city` columns in `sh.customers` and inserts the transformations in a transformation definition table. The [STACK\\_BIN\\_CAT](#)

**Procedure** creates a transformation list from the contents of the definition table, and the **CREATE\_MODEL Procedure** embeds the transformation list in a new model called `nb_model`.

The transformation and reverse transformation expressions embedded in `nb_model` are returned by the **GET\_MODEL\_TRANSFORMATIONS Function**.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_city
    FROM sh.customers;
```

```
DESCRIBE mining_data
```

'4', ''78558'', NULL, 'NULL', '5', 'DEFAULT')

```

- The binning order in example 1 is from most frequent to least frequent. The following example shows reverse order binning (least frequent to most frequent). The binning order is reversed by setting *bin\_num* to -4 instead of 4.

```

BEGIN
  dbms_data_mining_transform.CREATE_BIN_CAT(
    bin_table_name => 'bin_tbl_reverse');
  dbms_data_mining_transform.INSERT_BIN_CAT_FREQ (
    bin_table_name => 'bin_tbl_reverse',
    data_table_name => 'mining_data',
    bin_num         => -4);
END;
/

column col format a20
SELECT col, val, bin
       FROM bin_tbl_reverse
       ORDER BY col ASC, bin ASC;

```

## INSERT\_BIN\_NUM\_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT\_BIN\_NUM\_EQWIDTH computes a specified number of bins ( $n$ ) and assigns  $(max-min)/n$  values to each bin. The number of bins is the same for each column. If you want to use equi-width binning, but you want the number of bins to be calculated on a per-column basis, use the [INSERT\\_AUTOBIN\\_NUM\\_EQWIDTH Procedure](#).

INSERT\_BIN\_NUM\_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    bin_num             IN PLS_INTEGER DEFAULT 10,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    bin_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–22** INSERT\_BIN\_NUM\_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the transformation definition table for numerical binning. You can use the <a href="#">CREATE_BIN_NUM Procedure</a> to create the definition table. The following columns are required: <pre>COL      VARCHAR2(30) VAL      NUMBER BIN      VARCHAR2(4000)</pre> CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_NUM_EQWIDTH.
data_table_name	Name of the table containing the data to be transformed
bin_num	Number of bins. No binning occurs if <i>bin_num</i> is 0 or NULL. The default number of bins is 10.
exclude_list	List of numeric columns to be excluded from the binning process. If you do not specify <i>exclude_list</i> , all numeric columns in the data source are binned. The format of <i>exclude_list</i> is: <pre>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2',  ... 'coln')</pre>
round_num	Specifies how to round the number in the VAL column of the transformation definition table. When <i>round_num</i> is positive, it specifies the most significant digits to retain. When <i>round_num</i> is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example. The default value of <i>round_num</i> is 6.

**Table 45–22 (Cont.) INSERT\_BIN\_NUM\_EQWIDTH Procedure Parameters**

Parameter	Description
<code>bin_schema_name</code>	Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.

## Usage Notes

- The `round_num` parameter controls the rounding of column values in the transformation definition table, as follows:

**For a value of 308.162:**

```

when round_num = 1      result is 300
when round_num = 2      result is 310
when round_num = 3      result is 308
when round_num = 0      result is 308.162
when round_num = -1     result is 308.16
when round_num = -2     result is 308.2

```

- INSERT\_BIN\_NUM\_EQWIDTH ignores columns with all NULL values or only one unique value.

## Examples

In this example, INSERT\_BIN\_NUM\_EQWIDTH computes the bin boundaries for the `affinity_card` column in `mining_data_build` and inserts the transformations in a transformation definition table. The [STACK\\_BIN\\_NUM Procedure](#) creates a transformation list from the contents of the definition table. The [CREATE\\_MODEL Procedure](#) embeds the transformation list in a new model called `glm_model`.

The transformation and reverse transformation expressions embedded in `glm_model` are returned by the [GET\\_MODEL\\_TRANSFORMATIONS Function](#).

```

CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_income_level, cust_gender, affinity_card
  FROM mining_data_build;

```

```

DESCRIBE mining_data

```

```

Name                               Null?    Type
-----
CUST_ID                             NOT NULL NUMBER
CUST_INCOME_LEVEL                   VARCHAR2(30)
CUST_GENDER                          VARCHAR2(1)
AFFINITY_CARD                        NUMBER(10)

```

```

BEGIN

```

```

  dbms_data_mining_transform.CREATE_BIN_NUM(
    bin_table_name => 'bin_tbl');

## INSERT\_BIN\_NUM\_QTILE Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure calls the SQL `NTILE` function to order the data and divide it equally into the specified number of bins (quantiles).

`INSERT_BIN_NUM_QTILE` bins all the `NUMBER` and `FLOAT` columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
  bin_table_name      IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  bin_num             IN PLS_INTEGER DEFAULT 10,
  exclude_list        IN COLUMN_LIST DEFAULT NULL,
  bin_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–23** *INSERT\_BIN\_NUM\_QTILE Procedure Parameters*

Parameter	Description						
<code>bin_table_name</code>	Name of the transformation definition table for numerical binning. You can use the <a href="#">CREATE_BIN_NUM Procedure</a> to create the definition table. The following columns are required: <table border="0"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>VAL</td> <td>NUMBER</td> </tr> <tr> <td>BIN</td> <td>VARCHAR2(4000)</td> </tr> </table> <code>CREATE_BIN_NUM</code> creates an additional column, <code>ATT</code> , which may be used for specifying nested attributes. This column is not used by <code>INSERT_BIN_NUM_QTILE</code> .	COL	VARCHAR2(30)	VAL	NUMBER	BIN	VARCHAR2(4000)
COL	VARCHAR2(30)						
VAL	NUMBER						
BIN	VARCHAR2(4000)						
<code>data_table_name</code>	Name of the table containing the data to be transformed						
<code>bin_num</code>	Number of bins. No binning occurs if <code>bin_num</code> is 0 or <code>NULL</code> . The default number of bins is 10.						
<code>exclude_list</code>	List of numeric columns to be excluded from the binning process. If you do not specify <code>exclude_list</code> , all numeric columns in the data source are binned. The format of <code>exclude_list</code> is: <code>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')</code>						
<code>bin_schema_name</code>	Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used.						
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.						

### Usage Notes

- After dividing the data into quantiles, the `NTILE` function distributes any remainder values one for each quantile, starting with the first. See *Oracle Database SQL Language Reference* for details.
- Columns with all `NULL` values are ignored by `INSERT_BIN_NUM_QTILE`.

## Examples

In this example, `INSERT_BIN_NUM_QTILE` computes the bin boundaries for the `cust_year_of_birth` and `cust_credit_limit` columns in `sh.customers` and inserts the transformations in a transformation definition table. The [STACK\\_BIN\\_NUM Procedure](#) creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in `STACK_VIEW`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
    FROM sh.customers;
```

```
DESCRIBE mining_data
```

Name	Null?	Type
CUST_ID	NOT NULL	NUMBER
CUST_YEAR_OF_BIRTH	NOT NULL	NUMBER(4)
CUST_CREDIT_LIMIT		NUMBER
CUST_CITY	NOT NULL	VARCHAR2(30)

```
BEGIN
    dbms_data_mining_transform.CREATE_BIN_NUM(
        bin_table_name => 'bin_tbl');

,"CUST_CITY" FROM mining_data

```

## INSERT\_BIN\_SUPER Procedure

This procedure performs numerical and categorical binning and inserts the transformation definitions in transformation definition tables. The procedure computes bin boundaries based on intrinsic relationships between predictors and a target.

INSERT\_BIN\_SUPER uses an intelligent binning technique known as **supervised binning**. It builds a single-predictor decision tree and derives the bin boundaries from splits within the tree.

INSERT\_BIN\_SUPER bins all the VARCHAR2, CHAR, NUMBER, and FLOAT columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (
  num_table_name      IN VARCHAR2,
  cat_table_name      IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  target_column_name  IN VARCHAR2,
  max_bin_num         IN PLS_INTEGER DEFAULT 1000,
  exclude_list        IN COLUMN_LIST  DEFAULT NULL,
  num_schema_name     IN VARCHAR2     DEFAULT NULL,
  cat_schema_name     IN VARCHAR2     DEFAULT NULL,
  data_schema_name    IN VARCHAR2     DEFAULT NULL,
  rem_table_name      IN VARCHAR2     DEFAULT NULL,
  rem_schema_name     IN VARCHAR2     DEFAULT NULL);
```

### Parameters

**Table 45–24** INSERT\_BIN\_SUPER Procedure Parameters

Parameter	Description						
num_table_name	Name of the transformation definition table for numerical binning. You can use the <a href="#">CREATE_BIN_NUM Procedure</a> to create the definition table. The following columns are required: <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2 (30)</td> </tr> <tr> <td>VAL</td> <td>VNUMBER</td> </tr> <tr> <td>BIN</td> <td>VARCHAR2 (4000)</td> </tr> </table> CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_SUPER.	COL	VARCHAR2 (30)	VAL	VNUMBER	BIN	VARCHAR2 (4000)
COL	VARCHAR2 (30)						
VAL	VNUMBER						
BIN	VARCHAR2 (4000)						
cat_table_name	Name of the transformation definition table for categorical binning. You can use the <a href="#">CREATE_BIN_CAT Procedure</a> to create the definition table. The following columns are required: <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2 (30)</td> </tr> <tr> <td>VAL</td> <td>VARCHAR2 (4000)</td> </tr> <tr> <td>BIN</td> <td>VARCHAR2 (4000)</td> </tr> </table> CREATE_BIN_CAT creates an additional column, ATT, which is used for specifying nested attributes. This column is not used by INSERT_BIN_SUPER.	COL	VARCHAR2 (30)	VAL	VARCHAR2 (4000)	BIN	VARCHAR2 (4000)
COL	VARCHAR2 (30)						
VAL	VARCHAR2 (4000)						
BIN	VARCHAR2 (4000)						
data_table_name	Name of the table containing the data to be transformed						
target_column_name	Name of a column to be used as the target for the decision tree models						
max_bin_num	The maximum number of bins. The default is 1000.						

**Table 45–24 (Cont.) INSERT\_BIN\_SUPER Procedure Parameters**

Parameter	Description
<code>exclude_list</code>	List of columns to be excluded from the binning process. If you do not specify <code>exclude_list</code> , all CHAR, VARCHAR2, NUMBER, and FLOAT columns in the data source are binned.  The format of <code>exclude_list</code> is:  <code>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')</code>
<code>num_schema_name</code>	Schema of <code>num_table_name</code> . If no schema is specified, the current schema is used.
<code>cat_schema_name</code>	Schema of <code>cat_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>rem_table_name</code>	Name of a column removal definition table. The table must have the columns described in " <a href="#">CREATE_COL_REM Procedure</a> " on page 45-25. You can use <code>CREATE_COL_REM</code> to create the table. See Usage Notes.
<code>rem_schema_name</code>	Schema of <code>rem_table_name</code> . If no schema is specified, the current schema is used.

## Usage Notes

- Columns that have no significant splits are not binned. You can remove the unbinned columns from the mining data by specifying a column removal definition table. If you do not specify a column removal definition table, the unbinned columns remain in the mining data.
- See *Oracle Data Mining Concepts* to learn more about decision trees in Oracle Data Mining

## Examples

In this example, `INSERT_BIN_SUPER` computes the bin boundaries for predictors of `cust_credit_limit` and inserts the transformations in transformation definition tables. One predictor is numerical, the other is categorical. (`INSERT_BIN_SUPER` determines that the `cust_postal_code` column is not a significant predictor.) `STACK` procedures create transformation lists from the contents of the definition tables.

The SQL expressions that compute the transformations are shown in the views `MINING_DATA_STACK_NUM` and `MINING_DATA_STACK_CAT`. The views are for display purposes only; they cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_marital_status,
         cust_postal_code, cust_credit_limit
  FROM sh.customers;
```

```

## INSERT\_CLIP\_TRIM\_TAIL Procedure

This procedure replaces numeric outliers with nulls and inserts the transformation definitions in a transformation definition table.

INSERT\_CLIP\_TRIM\_TAIL computes the boundaries of the data based on a specified percentage. It removes the values that fall outside the boundaries (tail values) from the data. If you wish to replace the tail values instead of removing them, use the [INSERT\\_CLIP\\_WINSOR\\_TAIL Procedure](#).

INSERT\_CLIP\_TRIM\_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
  clip_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  tail_frac            IN NUMBER DEFAULT 0.025,
  exclude_list         IN COLUMN_LIST DEFAULT NULL,
  clip_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–25** INSERT\_CLIP\_TRIM\_TAIL Procedure Parameters

Parameter	Description										
clip_table_name	Name of the transformation definition table for numerical clipping. You can use the <a href="#">CREATE_CLIP Procedure</a> to create the definition table. The following columns are required: <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>LCUT</td> <td>NUMBER</td> </tr> <tr> <td>LVAL</td> <td>NUMBER</td> </tr> <tr> <td>RCUT</td> <td>NUMBER</td> </tr> <tr> <td>RVAL</td> <td>NUMBER</td> </tr> </table> CREATE_CLIP creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_CLIP_TRIM_TAIL.	COL	VARCHAR2(30)	LCUT	NUMBER	LVAL	NUMBER	RCUT	NUMBER	RVAL	NUMBER
COL	VARCHAR2(30)										
LCUT	NUMBER										
LVAL	NUMBER										
RCUT	NUMBER										
RVAL	NUMBER										
data_table_name	Name of the table containing the data to be transformed										
tail_frac	The percentage of non-null values to be designated as outliers at each end of the data. For example, if <i>tail_frac</i> is .01, then 1% of the data at the low end and 1% of the data at the high end will be treated as outliers.  If <i>tail_frac</i> is greater than or equal to .5, no clipping occurs. The default value of <i>tail_frac</i> is 0.025.										
exclude_list	List of NUMBER columns to be excluded from the clipping process. If you do not specify <i>exclude_list</i> , all NUMBER columns in the data are clipped.  The format of <i>exclude_list</i> is:  dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')										
clip_schema_name	Schema of <i>clip_table_name</i> . If no schema is specified, the current schema is used.										

**Table 45–25 (Cont.) INSERT\_CLIP\_TRIM\_TAIL Procedure Parameters**

Parameter	Description
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.

## Usage Notes

The `DBMS_DATA_MINING_TRANSFORM` package provides two clipping procedures: `INSERT_CLIP_TRIM_TAIL` and `INSERT_CLIP_WINSOR_TAIL`. Both procedures compute the boundaries as follows:

- Count the number of non-null values, ***n***, and sort them in ascending order
- Calculate the number of outliers, ***t***, as ***n\*tail\_frac***
- Define the lower boundary ***lcut*** as the value at position ***1+floor(t)***
- Define the upper boundary ***rcut*** as the value at position ***n-floor(t)***  
(The SQL `FLOOR` function returns the largest integer less than or equal to ***t***.)
- All values that are  $\leq$  ***lcut*** or  $\geq$  ***rcut*** are designated as outliers.

`INSERT_CLIP_TRIM_TAIL` replaces the outliers with nulls, effectively removing them from the data.

`INSERT_CLIP_WINSOR_TAIL` assigns ***lcut*** to the low outliers and ***rcut*** to the high outliers.

## Examples

In this example, `INSERT_CLIP_TRIM_TAIL` trims 10% of the data in two columns (5% from the high end and 5% from the low end) and inserts the transformations in a transformation definition table. The [STACK\\_CLIP Procedure](#) creates a transformation list from the contents of the definition table.

The SQL expression that computes the trimming is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
    FROM sh.customers;

## INSERT\_CLIP\_WINSOR\_TAIL Procedure

This procedure replaces numeric outliers with the upper or lower boundary values. It inserts the transformation definitions in a transformation definition table.

INSERT\_CLIP\_WINSOR\_TAIL computes the boundaries of the data based on a specified percentage. It replaces the values that fall outside the boundaries (tail values) with the related boundary value. If you wish to set tail values to null, use the [INSERT\\_CLIP\\_TRIM\\_TAIL Procedure](#).

INSERT\_CLIP\_WINSOR\_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (
  clip_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  tail_frac            IN NUMBER DEFAULT 0.025,
  exclude_list         IN COLUMN_LIST DEFAULT NULL,
  clip_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–26** INSERT\_CLIP\_WINSOR\_TAIL Procedure Parameters

Parameter	Description										
clip_table_name	Name of the transformation definition table for numerical clipping. You can use the <a href="#">CREATE_CLIP Procedure</a> to create the definition table. The following columns are required: <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>LCUT</td> <td>NUMBER</td> </tr> <tr> <td>LVAL</td> <td>NUMBER</td> </tr> <tr> <td>RCUT</td> <td>NUMBER</td> </tr> <tr> <td>RVAL</td> <td>NUMBER</td> </tr> </table> CREATE_CLIP creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_CLIP_WINSOR_TAIL.	COL	VARCHAR2(30)	LCUT	NUMBER	LVAL	NUMBER	RCUT	NUMBER	RVAL	NUMBER
COL	VARCHAR2(30)										
LCUT	NUMBER										
LVAL	NUMBER										
RCUT	NUMBER										
RVAL	NUMBER										
data_table_name	Name of the table containing the data to be transformed										
tail_frac	The percentage of non-null values to be designated as outliers at each end of the data. For example, if <i>tail_frac</i> is .01, then 1% of the data at the low end and 1% of the data at the high end will be treated as outliers.  If <i>tail_frac</i> is greater than or equal to .5, no clipping occurs. The default value of <i>tail_frac</i> is 0.025.										
exclude_list	List of NUMBER columns to be excluded from the clipping process. If you do not specify <i>exclude_list</i> , all NUMBER columns in the data are clipped.  The format of <i>exclude_list</i> is: <pre>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2',  ... 'coln')</pre>										
clip_schema_name	Schema of <i>clip_table_name</i> . If no schema is specified, the current schema is used.										

**Table 45–26 (Cont.) INSERT\_CLIP\_WINSOR\_TAIL Procedure Parameters**

Parameter	Description
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.

## Usage Notes

The DBMS\_DATA\_MINING\_TRANSFORM package provides two clipping procedures: INSERT\_CLIP\_WINSOR\_TAIL and INSERT\_CLIP\_TRIM\_TAIL. Both procedures compute the boundaries as follows:

- Count the number of non-null values, ***n***, and sort them in ascending order
- Calculate the number of outliers, ***t***, as ***n\*tail\_frac***
- Define the lower boundary ***lcut*** as the value at position ***1+floor(t)***
- Define the upper boundary ***rcut*** as the value at position ***n-floor(t)***  
(The SQL FLOOR function returns the largest integer less than or equal to ***t***.)
- All values that are ***<= lcut*** or ***=> rcut*** are designated as outliers.

INSERT\_CLIP\_WINSOR\_TAIL assigns ***lcut*** to the low outliers and ***rcut*** to the high outliers.

INSERT\_CLIP\_TRIM\_TAIL replaces the outliers with nulls, effectively removing them from the data.

## Examples

In this example, INSERT\_CLIP\_WINSOR\_TAIL winsorizes 10% of the data in two columns (5% from the high end, and 5% from the low end) and inserts the transformations in a transformation definition table. The [STACK\\_CLIP Procedure](#) creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING\_DATA\_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
    FROM sh.customers;

## INSERT\_MISS\_CAT\_MODE Procedure

This procedure replaces missing categorical values with the value that occurs most frequently in the column (the mode). It inserts the transformation definitions in a transformation definition table.

INSERT\_MISS\_CAT\_MODE replaces missing values in all VARCHAR2 and CHAR columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–27** INSERT\_MISS\_CAT\_MODE Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table for categorical missing value treatment. You can use the <a href="#">CREATE_MISS_CAT Procedure</a> to create the definition table. The following columns are required: COL            VARCHAR2 (30) VAL            VARCHAR2 (4000) CREATE_MISS_CAT creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_MISS_CAT_MODE.
data_table_name	Name of the table containing the data to be transformed
exclude_list	List of VARCHAR2 and CHAR columns to be excluded from missing value treatment. If you do not specify <i>exclude_list</i> , all VARCHAR2 and CHAR columns are transformed. The format of <i>exclude_list</i> is: dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')
miss_schema_name	Schema of <i>miss_table_name</i> . If no schema is specified, the current schema is used.
data_schema_name	Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used.

### Usage Notes

If you wish to replace categorical missing values with a value other than the mode, you can edit the transformation definition table.

**See Also:** *Oracle Data Mining Application Developer's Guide* for information about default missing value treatment in Oracle Data Mining

## Example

In this example, `INSERT_MISS_CAT_MODE` computes missing value treatment for `cust_city` and inserts the transformation in a transformation definition table. The [STACK\\_MISS\\_CAT Procedure](#) creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_city
    FROM sh.customers;

## INSERT\_MISS\_NUM\_MEAN Procedure

This procedure replaces missing numerical values with the average (the mean) and inserts the transformation definitions in a transformation definition table.

INSERT\_MISS\_NUM\_MEAN replaces missing values in all NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–28** INSERT\_MISS\_NUM\_MEAN Procedure Parameters

Parameter	Description				
miss_table_name	Name of the transformation definition table for numerical missing value treatment. You can use the <a href="#">CREATE_MISS_NUM Procedure</a> to create the definition table.  The following columns are required by INSERT_MISS_NUM_MEAN:  <table border="1"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>VAL</td> <td>NUMBER</td> </tr> </table> CREATE_MISS_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_MISS_NUM_MEAN.	COL	VARCHAR2(30)	VAL	NUMBER

## INSERT\_NORM\_LIN\_MINMAX Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. `INSERT_NORM_LIN_MINMAX` computes the minimum and maximum values from the data and sets the value of *shift* and *scale* as follows:

```
shift = min
scale = max - min
```

Normalization is computed as:

```
x_new = (x_old - shift)/scale
```

`INSERT_NORM_LIN_MINMAX` rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

`INSERT_NORM_LIN_MINMAX` normalizes all the `NUMBER` and `FLOAT` columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    exclude_list         IN COLUMN_LIST DEFAULT NULL,
    round_num            IN PLS_INTEGER DEFAULT 6,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–29** INSERT\_NORM\_LIN\_MINMAX Procedure Parameters

Parameter	Description						
<code>norm_table_name</code>	Name of the transformation definition table for linear normalization. You can use the <a href="#">CREATE_NORM_LIN Procedure</a> to create the definition table. The following columns are required: <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>SHIFT</td> <td>NUMBER</td> </tr> <tr> <td>SCALE</td> <td>NUMBER</td> </tr> </table> <code>CREATE_NORM_LIN</code> creates an additional column, <code>ATT</code> , which may be used for specifying nested attributes. ## INSERT\_NORM\_LIN\_SCALE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. `INSERT_NORM_LIN_SCALE` computes the minimum and maximum values from the data and sets the value of *shift* and *scale* as follows:

```
shift = 0
scale = max(abs(max), abs(min))
```

Normalization is computed as:

```
x_new = (x_old) / scale
```

`INSERT_NORM_LIN_SCALE` rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

`INSERT_NORM_LIN_SCALE` normalizes all the `NUMBER` and `FLOAT` columns in the data source unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    exclude_list         IN COLUMN_LIST DEFAULT NULL,
    round_num            IN PLS_INTEGER DEFAULT 6,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–30** INSERT\_NORM\_LIN\_SCALE Procedure Parameters

Parameter	Description						
<code>norm_table_name</code>	Name of the transformation definition table for linear normalization. You can use the <a href="#">CREATE_NORM_LIN Procedure</a> to create the definition table. The following columns are required: <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>SHIFT</td> <td>NUMBER</td> </tr> <tr> <td>SCALE</td> <td>NUMBER</td> </tr> </table> <code>CREATE_NORM_LIN</code> creates an additional column, <code>ATT</code> , which may be used for specifying nested attributes. ## INSERT\_NORM\_LIN\_ZSCORE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. `INSERT_NORM_LIN_ZSCORE` computes the mean and the standard deviation from the data and sets the value of *shift* and *scale* as follows:

```
shift = mean
scale = stddev
```

Normalization is computed as:

$$x_{new} = (x_{old} - shift) / scale$$

`INSERT_NORM_LIN_ZSCORE` rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

`INSERT_NORM_LIN_ZSCORE` normalizes all the `NUMBER` and `FLOAT` columns in the data unless you specify a list of columns to ignore.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    exclude_list         IN COLUMN_LIST DEFAULT NULL,
    round_num            IN PLS_INTEGER DEFAULT 6,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–31** INSERT\_NORM\_LIN\_ZSCORE Procedure Parameters

Parameter	Description						
<code>norm_table_name</code>	Name of the transformation definition table for linear normalization. You can use the <a href="#">CREATE_NORM_LIN Procedure</a> to create the definition table. The following columns are required: <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>SHIFT</td> <td>NUMBER</td> </tr> <tr> <td>SCALE</td> <td>NUMBER</td> </tr> </table> <code>CREATE_NORM_LIN</code> creates an additional column, <code>ATT</code> , which may be used for specifying nested attributes. This column is not used by <code>INSERT_NORM_LIN_ZSCORE</code> .	COL	VARCHAR2(30)	SHIFT	NUMBER	SCALE	NUMBER
COL	VARCHAR2(30)						
SHIFT	NUMBER						
SCALE	NUMBER						
<code>data_table_name</code>	Name of the table containing the data to be transformed						
<code>exclude_list</code>	List of <code>NUMBER</code> columns to be excluded from normalization. If you do not specify <i>exclude_list</i> , all <code>NUMBER</code> columns are transformed. <p>The format of <i>exclude_list</i> is:</p> <pre>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2',  ...'coln')</pre>						
<code>round_num</code>	The number of significant digits to use for <i>scale</i> . The default number is 6.						
<code>norm_schema_name</code>	Schema of <i>norm_table_name</i> . If no schema is specified, the current schema is used.						

**Table 45–31 (Cont.) INSERT\_NORM\_LIN\_ZSCORE Procedure Parameters**

Parameter	Description
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.

## Examples

In this example, `INSERT_NORM_LIN_ZSCORE` normalizes the `cust_year_of_birth` column and inserts the transformation in a transformation definition table. The [STACK\\_NORM\\_LIN Procedure](#) creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_gender, cust_year_of_birth
  FROM sh.customers;

DESCRIBE mining_data
Name                               Null?    Type
-----
CUST_ID                            NOT NULL NUMBER
CUST_GENDER                        NOT NULL CHAR(1)
CUST_YEAR_OF_BIRTH                 NOT NULL NUMBER(4)

BEGIN
  dbms_data_mining_transform.CREATE_NORM_LIN(
    norm_table_name => 'norm_tbl');

## SET\_EXPRESSION Procedure

This procedure appends a row to a VARCHAR2 array that stores a SQL expression. The array can be used for specifying a transformation expression that is too long to be used with the [SET\\_TRANSFORM Procedure](#).

The [GET\\_EXPRESSION Function](#) returns a row in the array.

When you use SET\_EXPRESSION to build a transformation expression, you must build a corresponding reverse transformation expression, create a transformation record, and add the transformation record to a transformation list.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION (
    expression    IN OUT NOCOPY EXPRESSION_REC,
    chunk         VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–32 SET\_EXPRESSION Procedure Parameters**

Parameter	Description
<code>expression</code>	An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array.  There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression.  See <a href="#">Table 45–1</a> for a description of the EXPRESSION_REC type.
<code>chunk</code>	A VARCHAR2 chunk (row) to be appended to <code>expression</code> .

### Notes

1. You can pass NULL in the `chunk` argument to SET\_EXPRESSION to clear the previous chunk. The default value of `chunk` is NULL.
2. See "[About Transformation Lists](#)" on page 45-7.
3. See "[Operational Notes](#)" on page 45-6.

### Examples

In this example, two calls to SET\_EXPRESSION construct a transformation expression and two calls construct the reverse transformation.

---

**Note:** This example is for illustration purposes only. It shows how SET\_EXPRESSION appends the text provided in `chunk` to the text that already exists in `expression`. The SET\_EXPRESSION procedure is meant for constructing very long transformation expressions that cannot be specified in a VARCHAR2 argument to SET\_TRANSFORM.

Similarly while transformation lists are intended for embedding in a model, the transformation list `v_xlst` is shown in an external view for illustration purposes.

---

```

CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_credit_limit
    FROM sh.customers;

## SET\_TRANSFORM Procedure

This procedure appends the transformation instructions for an attribute to a transformation list.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (
    xform_list          IN OUT NOCOPY TRANSFORM_LIST,
    attribute_name      VARCHAR2,
    attribute_subname   VARCHAR2,
    expression          VARCHAR2,
    reverse_expression  VARCHAR2,
    attribute_spec      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–33** SET\_TRANSFORM Procedure Parameters

Parameter	Description
xform_list	A transformation list. See <a href="#">Table 45–1</a> for a description of the TRANSFORM_LIST object type.
attribute_name	Name of the attribute to be transformed
attribute_subname	Name of the nested attribute if <i>attribute_name</i> is a nested column, otherwise NULL.
expression	A SQL expression that specifies the transformation of the attribute.
reverse_expression	A SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target)
attribute_spec	You can specify the value NOPREP for <i>attribute_spec</i> to prevent this attribute from being automatically transformed when Automatic Data Preparation is being used.

### Usage Notes

- See ["Operational Notes"](#) on page 45-6. The following sections are especially relevant:
  - ["About Transformation Lists"](#) on page 45-7
  - ["Nested Data Transformations"](#) on page 45-10
- As shown in the following example, you can eliminate an attribute by specifying a null transformation expression and reverse expression. You can also use the STACK interface to remove a column ([CREATE\\_COL\\_REM Procedure](#) and [STACK\\_COL\\_REM Procedure](#)).

### Examples

This example uses SET\_TRANSFORM to append transformations to *cust\_stack* for the data set *cust\_info* and displays one row of the transformed data.

SET\_TRANSFORM divides the *country\_id* column by 10, removes the *cust\_year\_of\_birth* column, and multiplies the nested attribute 'custprods.mouse pad' by 10. (See ["DESCRIBE\\_STACK Procedure"](#) on page 45-32 for the definition of *cust\_info*.)

```

describe cust_info
Name                                     Null?   Type
-----
CUST_ID                                 NOT NULL NUMBER
COUNTRY_ID                             NOT NULL NUMBER
CUST_YEAR_OF_BIRTH                      NOT NULL NUMBER(4)
CUSTPRODS                               SYS.DM_NESTED_NUMERICALS

```

```

DECLARE
  cust_stack dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
    'country_id', NULL, 'country_id/10', 'country_id*10');
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
    'cust_year_of_birth', NULL, NULL, NULL);
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
    'custprods', 'Mouse Pad', 'value*100', 'value/100');
  dbms_data_mining_transform.XFORM_STACK (cust_stack,
    'cust_info', 'xform_cust_view');
END;
/

```

```
select * from xform_cust_view where cust_id = 100004;
```

```

CUST_ID  COUNTRY_ID  CUSTPRODS(ATTRIBUTE_NAME, VALUE)
-----
100004   5279       DM_NESTED_NUMERICALS(DM_NESTED_NUMERICAL
('External 8X CD-ROM', 1),
DM_NESTED_NUMERICAL('Keyboard Wrist Rest', 1))

```

## STACK\_BIN\_CAT Procedure

This procedure adds categorical binning transformations to a transformation list.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (
  bin_table_name      IN          VARCHAR2,
  xform_list          IN OUT NOCOPY TRANSFORM_LIST,
  literal_flag        IN          BOOLEAN DEFAULT FALSE,
  bin_schema_name     IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–34** STACK\_BIN\_CAT Procedure Parameters

Parameter	Description
<code>bin_table_name</code>	Name of the transformation definition table for categorical binning. You can use the <a href="#">CREATE_BIN_CAT Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_BIN_CAT</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for categorical binning or you can write your own SQL.  See <a href="#">Table 45–4, "Columns in a Transformation Definition Table for Categorical Binning"</a>
<code>xform_list</code>	A transformation list. See <a href="#">Table 45–1</a> for a description of the <code>TRANSFORM_LIST</code> object type.
<code>literal_flag</code>	Indicates whether the values in the <code>bin</code> column in the transformation definition table are valid SQL literals. When <code>literal_flag</code> is <code>FALSE</code> (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes.  Set <code>literal_flag</code> to <code>TRUE</code> if the bin identifiers are numbers that should have a numeric data type, as is the case for an O-Cluster model.  See <a href="#">"INSERT_BIN_NUM_EQWIDTH Procedure"</a> on page 45-44 for an example.
<code>bin_schema_name</code>	Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

See ["Operational Notes"](#) on page 45-6. The following sections are especially relevant:

- ["About Transformation Lists"](#) on page 45-7
- ["About Stacking"](#) on page 45-9
- ["Nested Data Transformations"](#) on page 45-10

### Examples

This example shows how a binning transformation for the categorical column `cust_postal_code` could be added to a stack called `mining_data_stack`.

---

**Note:** This example invokes the [XFORM\\_STACK Procedure](#) to show how the data is transformed by the stack. XFORM\_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE\_MODEL in the xform\_list parameter. See [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#) for an example.

---

```

CREATE or REPLACE VIEW mining_data AS
  SELECT cust_id, cust_postal_code, cust_credit_limit
     FROM sh.customers
     WHERE cust_id BETWEEN 100050 AND 100100;
BEGIN
  dbms_data_mining_transform.CREATE_BIN_CAT ('bin_cat_tbl');
  dbms_data_mining_transform.INSERT_BIN_CAT_FREQ (
    bin_table_name => 'bin_cat_tbl',
    data_table_name => 'mining_data',
    bin_num        => 3);
END;
/
DECLARE
  MINING_DATA_STACK  dbms_data_mining_transform.TRANSFORM_LIST;

  100052 4                    5000
  100053 4                    7000

```

## STACK\_BIN\_NUM Procedure

This procedure adds numerical binning transformations to a transformation list.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (
  bin_table_name      IN          VARCHAR2,
  xform_list          IN OUT NOCOPY TRANSFORM_LIST,
  literal_flag        IN          BOOLEAN DEFAULT FALSE,
  bin_schema_name     IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–35** *STACK\_BIN\_NUM Procedure Parameters*

Parameter	Description
<code>bin_table_name</code>	Name of the transformation definition table for numerical binning. You can use the <a href="#">CREATE_BIN_NUM Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_BIN_NUM</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for numerical binning or you can write your own SQL.  See <a href="#">Table 45–6, "Columns in a Transformation Definition Table for Numerical Binning"</a> .
<code>xform_list</code>	A transformation list. See <a href="#">Table 45–1</a> for a description of the <code>TRANSFORM_LIST</code> object type.
<code>literal_flag</code>	Indicates whether the values in the <code>bin</code> column in the transformation definition table are valid SQL literals. When <code>literal_flag</code> is <code>FALSE</code> (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes.  Set <code>literal_flag</code> to <code>TRUE</code> if the bin identifiers are numbers that should have a numeric data type, as is the case for an O-Cluster model.  See <a href="#">"INSERT_BIN_NUM_EQWIDTH Procedure"</a> on page 45-44 for an example.
<code>bin_schema_name</code>	Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

See ["Operational Notes"](#) on page 45-6. The following sections are especially relevant:

- ["About Transformation Lists"](#) on page 45-7
- ["About Stacking"](#) on page 45-9
- ["Nested Data Transformations"](#) on page 45-10

### Examples

This example shows how a binning transformation for the numerical column `cust_credit_limit` could be added to a stack called `mining_data_stack`.

---

**Note:** This example invokes the [XFORM\\_STACK Procedure](#) to show how the data is transformed by the stack. XFORM\_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE\_MODEL in the xform\_list parameter. See [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#) for an example.

## STACK\_CLIP Procedure

This procedure adds clipping transformations to a transformation list.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_CLIP (
    clip_table_name      IN          VARCHAR2,
    xform_list           IN OUT NOCOPY TRANSFORM_LIST,
    clip_schema_name     IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–36** STACK\_CLIP Procedure Parameters

Parameter	Description
<code>clip_table_name</code>	Name of the transformation definition table for clipping. You can use the <a href="#">CREATE_CLIP Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_CLIP</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for clipping or you can write your own SQL.  See <a href="#">Table 45–8, "Columns in a Transformation Definition Table for Clipping or Winsorizing"</a>
<code>xform_list</code>	A transformation list. See <a href="#">Table 45–1</a> for a description of the <code>TRANSFORM_LIST</code> object type.
<code>clip_schema_name</code>	Schema of <code>clip_table_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

See ["Operational Notes"](#) on page 45-6. The following sections are especially relevant:

- ["About Transformation Lists"](#) on page 45-7
- ["About Stacking"](#) on page 45-9
- ["Nested Data Transformations"](#) on page 45-10

### Examples

This example shows how a clipping transformation for the numerical column `cust_credit_limit` could be added to a stack called `mining_data_stack`.

---

**Note:** This example invokes the [XFORM\\_STACK Procedure](#) to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#) for an example.

---

```
CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_postal_code, cust_credit_limit
FROM sh.customers
WHERE cust_id BETWEEN 100050 AND 100100;
```

```

BEGIN
  dbms_data_mining_transform.create_clip ('clip_tbl');
  dbms_data_mining_transform.insert_clip_winsor_tail (
    clip_table_name => 'clip_tbl',
    data_table_name => 'mining_data',
    tail_frac       => 0.25,
    exclude_list    => dbms_data_mining_transform.COLUMN_LIST('cust_id'));
END;
/
DECLARE
  MINING_DATA_STACK dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.STACK_CLIP (
    clip_table_name => 'clip_tbl',
    xform_list      => mining_data_stack);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list      => mining_data_stack,
    data_table_name => 'mining_data',
    xform_view_name => 'mining_data_stack_view');
END;
/
-- Before transformation
SELECT cust_id, cust_postal_code, round(cust_credit_limit)
   FROM mining_data
      WHERE cust_id BETWEEN 100050 AND 100054
      ORDER BY cust_id;

CUST_ID  CUST_POSTAL_CODE  ROUND(CUST_CREDIT_LIMIT)
-----  -
100050   76486              1500
100051   73216              9000
100052   69499              5000
100053   45704              7000
100054   88021              11000

-- After transformation
SELECT cust_id, cust_postal_code, round(cust_credit_limit)
   FROM mining_data_stack_view
      WHERE cust_id BETWEEN 100050 AND 100054
      ORDER BY cust_id;

CUST_ID  CUST_POSTAL_CODE  ROUND(CUST_CREDIT_LIMIT)
-----  -
100050   76486              5000
100051   73216              9000
100052   69499              5000
100053   45704              7000
100054   88021              11000

```

## STACK\_COL\_REM Procedure

This procedure adds column removal transformations to a transformation list.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_COL_REM (
    rem_table_name      IN          VARCHAR2,
    xform_list          IN OUT NOCOPY TRANSFORM_LIST,
    rem_schema_name     IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–37** STACK\_COL\_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the transformation definition table for column removal. You can use the <a href="#">CREATE_COL_REM Procedure</a> to create the definition table. See <a href="#">Table 45–10</a> , "Columns in a Transformation Definition Table for Column Removal".  The table must be populated with column names before you call STACK_COL_REM. The <a href="#">INSERT_BIN_SUPER Procedure</a> and the <a href="#">INSERT_AUTOBIN_NUM_EQWIDTH Procedure</a> can optionally be used to populate the table. You can also use SQL INSERT statements.
xform_list	A transformation list. See <a href="#">Table 45–1</a> for a description of the TRANSFORM_LIST object type.
rem_schema_name	Schema of <i>rem_table_name</i> . If no schema is specified, the current schema is used.

### Usage Notes

See ["Operational Notes"](#) on page 45-6. The following sections are especially relevant:

- ["About Transformation Lists"](#) on page 45-7
- ["About Stacking"](#) on page 45-9
- ["Nested Data Transformations"](#) on page 45-10

### Examples

This example shows how the column `cust_credit_limit` could be removed in a transformation list called `mining_data_stack`.

---

**Note:** This example invokes the [XFORM\\_STACK Procedure](#) to show how the data is transformed by the stack. XFORM\_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE\_MODEL in the `xform_list` parameter. See [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#) for an example.

---

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, country_id, cust_postal_code, cust_credit_limit
  FROM sh.customers;
```

```

BEGIN
    dbms_data_mining_transform.create_col_rem ('rem_tbl');
END;
/

INSERT into rem_tbl VALUES (upper('cust_postal_code'), null);

DECLARE
    MINING_DATA_STACK  dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.stack_col_rem (
        rem_table_name => 'rem_tbl',
        xform_list      => mining_data_stack);
    dbms_data_mining_transform.XFORM_STACK (
        xform_list      => mining_data_stack,
        data_table_name => 'mining_data',
        xform_view_name => 'mining_data_stack_view');
END;
/

SELECT * FROM mining_data

```

## STACK\_MISS\_CAT Procedure

This procedure adds categorical missing value transformations to a transformation list.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_CAT (
    miss_table_name      IN      VARCHAR2,
    xform_list           IN OUT  NOCOPY TRANSFORM_LIST,
    miss_schema_name     IN      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–38** STACK\_MISS\_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table for categorical missing value treatment. You can use the <a href="#">CREATE_MISS_CAT Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_MISS_CAT</code> . To populate the table, you can use the <a href="#">INSERT_MISS_CAT_MODE Procedure</a> or you can write your own SQL.  See <a href="#">Table 45–12</a> , "Columns in a Transformation Definition Table for Categorical Missing Value Treatment".
xform_list	A transformation list. See <a href="#">Table 45–1</a> for a description of the <code>TRANSFORM_LIST</code> object type.
miss_schema_name	Schema of <i>miss_table_name</i> . If no schema is specified, the current schema is used.

### Usage Notes

See "Operational Notes" on page 45-6. The following sections are especially relevant:

- ["About Transformation Lists"](#) on page 45-7
- ["About Stacking"](#) on page 45-9
- ["Nested Data Transformations"](#) on page 45-10

### Examples

This example shows how the missing values in the column `cust_marital_status` could be replaced with the mode in a transformation list called `mining_data_stack`.

---

**Note:** This example invokes the [XFORM\\_STACK Procedure](#) to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#) for an example.

---

```
CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, country_id, cust_marital_status
FROM sh.customers
where cust_id BETWEEN 1 AND 10;
```

```

BEGIN
  dbms_data_mining_transform.create_miss_cat ('miss_cat_tbl');
  dbms_data_mining_transform.insert_miss_cat_mode ('miss_cat_tbl', 'mining_data');
END;
/

```

```

DECLARE
  MINING_DATA_STACK dbms_data_mining_transform.TRANSFORM_LIST;

```

```

BEGIN
  dbms_data_mining_transform.stack_miss_cat (
    miss_table_name => 'miss_cat_tbl',
    xform_list      => mining_data_stack);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list      => mining_data_stack,
    data_table_name => 'mining_data',
    xform_view_name => 'mining_data_stack_view');

```

```

END;
/
SELECT * FROM mining_data
ORDER BY cust_id;

10	52790	widow

## STACK\_MISS\_NUM Procedure

This procedure adds numeric missing value transformations to a transformation list.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_NUM (
    miss_table_name    IN      VARCHAR2,
    xform_list         IN OUT  NOCOPY TRANSFORM_LIST,
    miss_schema_name   IN      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–39** STACK\_MISS\_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the transformation definition table for numerical missing value treatment. You can use the <a href="#">CREATE_MISS_NUM Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_MISS_NUM</code> . To populate the table, you can use the <a href="#">INSERT_MISS_NUM_MEAN Procedure</a> or you can write your own SQL.  See <a href="#">Table 45–14</a> , "Columns in a Transformation Definition Table for Numerical Missing Value Treatment".
xform_list	A transformation list. See <a href="#">Table 45–1</a> for a description of the <code>TRANSFORM_LIST</code> object type.
miss_schema_name	Schema of <i>miss_table_name</i> . If no schema is specified, the current schema is used.

### Usage Notes

See ["Operational Notes"](#) on page 45-6. The following sections are especially relevant:

- ["About Transformation Lists"](#) on page 45-7
- ["About Stacking"](#) on page 45-9
- ["Nested Data Transformations"](#) on page 45-10

### Examples

This example shows how the missing values in the column `cust_credit_limit` could be replaced with the mean in a transformation list called `mining_data_stack`.

---

**Note:** This example invokes the [XFORM\\_STACK Procedure](#) to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#) for an example.

## STACK\_NORM\_LIN Procedure

This procedure adds linear normalization transformations to a transformation list.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_NORM_LIN (
    norm_table_name      IN          VARCHAR2,
    xform_list           IN OUT      NOCOPY TRANSFORM_LIST,
    norm_schema_name     IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–40** STACK\_NORM\_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the transformation definition table for linear normalization. You can use the <a href="#">CREATE_NORM_LIN Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_NORM_LIN</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for normalization or you can write your own SQL.  See <a href="#">Table 45–16, "Columns in a Transformation Definition Table for Linear Normalization"</a> .
xform_list	A transformation list. See <a href="#">Table 45–1</a> for a description of the <code>TRANSFORM_LIST</code> object type.
norm_schema_name	Schema of <i>norm_table_name</i> . If no schema is specified, the current schema is used.

### Usage Notes

See ["Operational Notes"](#) on page 45-6. The following sections are especially relevant:

- ["About Transformation Lists"](#) on page 45-7
- ["About Stacking"](#) on page 45-9
- ["Nested Data Transformations"](#) on page 45-10

### Examples

This example shows how the column `cust_credit_limit` could be normalized in a transformation list called `mining_data_stack`.

---

**Note:** This example invokes the [XFORM\\_STACK Procedure](#) to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See [INSERT\\_BIN\\_NUM\\_EQWIDTH Procedure](#) for an example.

```

## XFORM\_BIN\_CAT Procedure

This procedure creates a view that implements the categorical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    xform_view_name     IN VARCHAR2,
    literal_flag        IN BOOLEAN DEFAULT FALSE,
    bin_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL,
    xform_schema_name   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–41 XFORM\_BIN\_CAT Procedure Parameters**

Parameter	Description
<code>bin_table_name</code>	Name of the transformation definition table for categorical binning. You can use the <a href="#">CREATE_BIN_CAT Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_BIN_CAT</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for categorical binning or you can write your own SQL.  See <a href="#">Table 45–4, "Columns in a Transformation Definition Table for Categorical Binning"</a> .
<code>data_table_name</code>	Name of the table containing the data to be transformed.
<code>xform_view_name</code>	Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>bin_table_name</code> .
<code>literal_flag</code>	Indicates whether the values in the <code>bin</code> column in the transformation definition table are valid SQL literals. When <code>literal_flag</code> is <code>FALSE</code> (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes.  Set <code>literal_flag</code> to <code>TRUE</code> if the bin identifiers are numbers that should have a numeric data type, as is the case for an O-Cluster model.  See <a href="#">"INSERT_BIN_NUM_EQWIDTH Procedure"</a> on page 45-44 for an example.
<code>bin_schema_name</code>	Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>xform_schema_name</code>	Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

See ["Operational Notes"](#) on page 45-6.

## Examples

This example creates a view that bins the `cust_postal_code` column. The data source consists of three columns from `sh.customer`.

```
describe mining_data
```

Name	Null?	Type
CUST_ID	NOT NULL	NUMBER
CUST_POSTAL_CODE	NOT NULL	VARCHAR2(10)
CUST_CREDIT_LIMIT		NUMBER

```
SELECT * FROM mining_data WHERE cust_id between 104066 and 104069;
```

CUST_ID	CUST_POSTAL_CODE	CUST_CREDIT_LIMIT
104066	69776	7000
104067	52602	9000
104068	55787	11000
104069	55977	5000

```
BEGIN
```

```
  dbms_data_mining_transform.create_bin_cat(
    bin_table_name => 'bin_cat_tbl');
  dbms_data_mining_transform.insert_bin_cat_freq(
    bin_table_name => 'bin_cat_tbl',
    data_table_name => 'mining_data',
    bin_num => 10);
  dbms_data_mining_transform.xform_bin_cat(
    bin_table_name => 'bin_cat_tbl',
    data_table_name => 'mining_data',
    xform_view_name => 'bin_cat_view');
```

```
END;
```

```
/
```

```
SELECT * FROM bin_cat_view WHERE cust_id between 104066 and 104069;
```

CUST_ID	CUST_POSTAL_CODE	CUST_CREDIT_LIMIT
104066	6	7000
104067	11	9000
104068	3	11000
104069	11	5000

```
SELECT text FROM user_views WHERE view_name IN 'BIN_CAT_VIEW';
```

```
TEXT
```

```
-----
SELECT "CUST_ID",DECODE("CUST_POSTAL_CODE",'38082','1','45704','9','48346','5','55787','3','63736','2','67843','7','69776','6','72860','10','78558','4','80841','8',NULL,NULL,'11') "CUST_POSTAL_CODE","CUST_CREDIT_LIMIT" FROM mining_data
```

## XFORM\_BIN\_NUM Procedure

This procedure creates a view that implements the numerical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    xform_view_name    IN VARCHAR2,
    literal_flag        IN BOOLEAN DEFAULT FALSE,
    bin_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL,
    xform_schema_name  IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–42 XFORM\_BIN\_NUM Procedure Parameters**

Parameter	Description
<code>bin_table_name</code>	Name of the transformation definition table for numerical binning. You can use the <a href="#">CREATE_BIN_NUM Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_BIN_NUM</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for numerical binning or you can write your own SQL.  See "Columns in a Transformation Definition Table for Numerical Binning" on page 45-21.
<code>data_table_name</code>	Name of the table containing the data to be transformed
<code>xform_view_name</code>	Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>bin_table_name</code> .
<code>literal_flag</code>	Indicates whether the values in the <code>bin</code> column in the transformation definition table are valid SQL literals. When <code>literal_flag</code> is <code>FALSE</code> (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes.  Set <code>literal_flag</code> to <code>TRUE</code> if the bin identifiers are numbers that should have a numeric data type, as is the case for an O-Cluster model.  See " <a href="#">INSERT_BIN_NUM_EQWIDTH Procedure</a> " on page 45-44 for an example.
<code>bin_schema_name</code>	Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>xform_schema_name</code>	Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

See "[Operational Notes](#)" on page 45-6.

## Examples

This example creates a view that bins the `cust_credit_limit` column. The data source consists of three columns from `sh.customer`.

```
describe mining_data
Name                                         Null?    Type
-----
CUST_ID                                     NOT NULL NUMBER
CUST_POSTAL_CODE                           NOT NULL VARCHAR2(10)
CUST_CREDIT_LIMIT                           NUMBER

column cust_credit_limit off
SELECT * FROM mining_data WHERE cust_id between 104066 and 104069;

      CUST_ID CUST_POSTAL_CODE  CUST_CREDIT_LIMIT
-----
104066 69776                    7000
104067 52602                    9000

8' WHEN "CUST_CREDIT_LIMIT"<=13650 THEN '9' WHEN "CUST_CREDIT_LIMIT"<=15000 THEN  
'10' END "CUST_CREDIT_LIMIT" FROM mining_data
```

## XFORM\_CLIP Procedure

This procedure creates a view that implements the clipping transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
  clip_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  clip_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2,DEFAULT NULL,
  xform_schema_name    IN VARCHAR2,DEFAULT NULL);
```

### Parameters

**Table 45–43 XFORM\_CLIP Procedure Parameters**

Parameter	Description
<code>clip_table_name</code>	Name of the transformation definition table for clipping. You can use the <a href="#">CREATE_CLIP Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_CLIP</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for clipping you can write your own SQL.  See <a href="#">Table 45–8, "Columns in a Transformation Definition Table for Clipping or Winsorizing"</a> .
<code>data_table_name</code>	Name of the table containing the data to be transformed
<code>xform_view_name</code>	Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>clip_table_name</code> .
<code>clip_schema_name</code>	Schema of <code>clip_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>xform_schema_name</code>	Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used.

### Examples

This example creates a view that clips the `cust_credit_limit` column. The data source consists of three columns from `sh.customer`.

```
describe mining_data
Name                               Null?    Type
-----
CUST_ID                             NOT NULL NUMBER
CUST_POSTAL_CODE                     NOT NULL VARCHAR2(10)
CUST_CREDIT_LIMIT                     NUMBER

BEGIN
  dbms_data_mining_transform.create_clip(
    clip_table_name => 'clip_tbl');
  dbms_data_mining_transform.insert_clip_trim_tail(
```

```

        clip_table_name => 'clip_tbl',
        data_table_name => 'mining_data',
        tail_frac       => 0.05,
        exclude_list    => dbms_data_mining_transform.COLUMN_LIST('cust_id');
    dbms_data_mining_transform.xform_clip(
        clip_table_name => 'clip_tbl',
        data_table_name => 'mining_data',
        xform_view_name => 'clip_view');
END;
/
describe clip_view
Name                               Null?    Type
-----
CUST_ID                             NOT NULL NUMBER
CUST_POSTAL_CODE                     NOT NULL VARCHAR2(10)
CUST_CREDIT_LIMIT                     NUMBER

SELECT MIN(cust_credit_limit), MAX(cust_credit_limit) FROM mining_data;

MIN(CUST_CREDIT_LIMIT) MAX(CUST_CREDIT_LIMIT)
-----
                1500                15000

SELECT MIN(cust_credit_limit), MAX(cust_credit_limit) FROM clip_view;

MIN(CUST_CREDIT_LIMIT) MAX(CUST_CREDIT_LIMIT)
-----
                1500                11000

set long 2000
SELECT text FROM user_views WHERE view_name IN 'CLIP_VIEW';

TEXT
-----
SELECT "CUST_ID","CUST_POSTAL_CODE",CASE WHEN "CUST_CREDIT_LIMIT" < 1500 THEN NU
LL WHEN "CUST_CREDIT_LIMIT" > 11000 THEN NULL ELSE "CUST_CREDIT_LIMIT" END "CUST
_CREDIT_LIMIT" FROM mining_data

```

## XFORM\_COL\_REM Procedure

This procedure creates a view that implements the column removal transformations specified in a definition table. Only the columns that are specified in the definition table are removed; the remaining columns from the data table are present in the view.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
  rem_table_name      IN      VARCHAR2,
  data_table_name     IN      VARCHAR2,
  xform_view_name     IN      VARCHAR2,
  rem_schema_name     IN      VARCHAR2 DEFAULT NULL,
  data_schema_name    IN      VARCHAR2 DEFAULT NULL,
  xform_schema_name   IN      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–44 XFORM\_COL\_REM Procedure Parameters**

Parameter	Description
rem_table_name	Name of the transformation definition table for column removal. You can use the <a href="#">CREATE_COL_REM Procedure</a> to create the definition table. See <a href="#">Table 45–10, "Columns in a Transformation Definition Table for Column Removal"</a> .  The table must be populated with column names before you call XFORM_COL_REM. The <a href="#">INSERT_BIN_SUPER Procedure</a> and the <a href="#">INSERT_AUTOBIN_NUM_EQWIDTH Procedure</a> can optionally be used to populate the table. You can also use SQL INSERT statements.
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view presents the columns in <i>data_table_name</i> that are not specified in <i>rem_table_name</i> .
rem_schema_name	Schema of <i>rem_table_name</i> . If no schema is specified, the current schema is used.
data_schema_name	Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used.
xform_schema_name	Schema of <i>xform_view_name</i> . If no schema is specified, the current schema is used.

### Usage Notes

See "[Operational Notes](#)" on page 45-6.

### Examples

This example creates a view that includes all but one column from the table *customers* in the current schema.

```
describe customers
Name                                                    Null?    Type
-----
CUST_ID                                                NOT NULL NUMBER
CUST_MARITAL_STATUS                                   VARCHAR2 (20)
OCCUPATION                                             VARCHAR2 (21)
```

```

AGE                                NUMBER
YRS_RESIDENCE                       NUMBER

BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('colrem_xtbl');
END;
/
INSERT INTO colrem_xtbl VALUES('CUST_MARITAL_STATUS', null);

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
    rem_table_name      => 'colrem_xtbl',
    data_table_name     => 'customers',
    xform_view_name     => 'colrem_view');
END;
/
describe colrem_view

```

Name	Null?	Type
-----	-----	-----
CUST_ID	NOT NULL	NUMBER
OCCUPATION		VARCHAR2 (21)
AGE		NUMBER
YRS_RESIDENCE		NUMBER

## XFORM\_EXPR\_NUM Procedure

This procedure creates a view that implements the specified numeric transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM (
  expr_pattern      IN      VARCHAR2,
  data_table_name  IN      VARCHAR2,
  xform_view_name  IN      VARCHAR2,
  exclude_list     IN      COLUMN_LIST DEFAULT NULL,
  include_list     IN      COLUMN_LIST DEFAULT NULL,
  col_pattern      IN      VARCHAR2 DEFAULT ':col',
  data_schema_name IN      VARCHAR2 DEFAULT NULL,
  xform_schema_name IN     VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–45 XFORM\_EXPR\_NUM Procedure Parameters**

Parameter	Description
<code>expr_pattern</code>	A numeric transformation expression
<code>data_table_name</code>	Name of the table containing the data to be transformed
<code>xform_view_name</code>	Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>expr_pattern</code> and <code>col_pattern</code> .
<code>exclude_list</code>	List of numeric columns to exclude. If NULL, no numeric columns are excluded.  The format of <code>exclude_list</code> is:  <code>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')</code>
<code>include_list</code>	List of numeric columns to include. If NULL, all numeric columns are included.  The format of <code>include_list</code> is:  <code>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')</code>
<code>col_pattern</code>	The value within <code>expr_pattern</code> that will be replaced with a column name. The value of <code>col_pattern</code> is case-sensitive.  The default value of <code>col_pattern</code> is <code>:col</code>
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>xform_schema_name</code>	Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

1. The XFORM\_EXPR\_NUM procedure constructs numeric transformation expressions from the specified expression pattern (`expr_pattern`) by replacing every occurrence of the specified column pattern (`col_pattern`) with an actual column name.

XFORM\_EXPR\_NUM uses the SQL REPLACE function to construct the transformation expressions.

```
REPLACE (expr_pattern,col_pattern,'"column_name"' || '"column_name"')
```

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

**See:** *Oracle Database SQL Language Reference* for information about the REPLACE function

2. Because of the include and exclude list parameters, the XFORM\_EXPR\_NUM and XFORM\_EXPR\_STR procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM\_\* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.
3. See "[Operational Notes](#)" on page 45-6

## Examples

This example creates a view that transforms the data type of numeric columns.

```
describe customers
Name                                         Null?   Type
-----
CUST_ID                                     NOT NULL NUMBER
CUST_MARITAL_STATUS                        VARCHAR2(20)
OCCUPATION                                  VARCHAR2(21)
AGE                                          NUMBER
YRS_RESIDENCE                               NUMBER

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM(
    expr_pattern      => 'to_char(:col)',
    data_table_name   => 'customers',
    xform_view_name   => 'cust_nonum_view',
    exclude_list      => dbms_data_mining_transform.COLUMN_LIST('cust_id'),
    include_list      => null,
    col_pattern       => ':col');
END;
/
describe cust_nonum_view
Name                                         Null?   Type
-----
CUST_ID                                     NOT NULL NUMBER
CUST_MARITAL_STATUS                        VARCHAR2(20)
OCCUPATION                                  VARCHAR2(21)
AGE                                          VARCHAR2(40)
YRS_RESIDENCE                               VARCHAR2(40)
```

## XFORM\_EXPR\_STR Procedure

This procedure creates a view that implements the specified categorical transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR (
  expr_pattern      IN      VARCHAR2,
  data_table_name  IN      VARCHAR2,
  xform_view_name  IN      VARCHAR2,
  exclude_list     IN      COLUMN_LIST DEFAULT NULL,
  include_list     IN      COLUMN_LIST DEFAULT NULL,
  col_pattern      IN      VARCHAR2 DEFAULT ':col',
  data_schema_name IN      VARCHAR2 DEFAULT NULL,
  xform_schema_name IN     VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45-46 XFORM\_EXPR\_STR Procedure Parameters**

Parameter	Description
<code>expr_pattern</code>	A character transformation expression
<code>data_table_name</code>	Name of the table containing the data to be transformed
<code>xform_view_name</code>	Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>expr_pattern</code> and <code>col_pattern</code> .
<code>exclude_list</code>	List of character columns to exclude. If NULL, no character columns are excluded.  The format of <code>exclude_list</code> is: <code>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')</code>
<code>include_list</code>	List of character columns to include. If NULL, all character columns are included.  The format of <code>include_list</code> is: <code>dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')</code>
<code>col_pattern</code>	The value within <code>expr_pattern</code> that will be replaced with a column name. The value of <code>col_pattern</code> is case-sensitive.  The default value of <code>col_pattern</code> is <code>:col</code>
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>xform_schema_name</code>	Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

1. The XFORM\_EXPR\_STR procedure constructs character transformation expressions from the specified expression pattern (`expr_pattern`) by replacing every

occurrence of the specified column pattern (*col\_pattern*) with an actual column name.

XFORM\_EXPR\_STR uses the SQL REPLACE function to construct the transformation expressions.

```
REPLACE (expr_pattern,col_pattern,'"column_name"') || '"column_name"'
```

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

**See:** *Oracle Database SQL Language Reference* for information about the REPLACE function

- Because of the include and exclude list parameters, the XFORM\_EXPR\_STR and XFORM\_EXPR\_NUM procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM\_\* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.
- See "[Operational Notes](#)" on page 45-6

## Examples

This example creates a view that transforms character columns to upper case.

```
describe customers
```

Name	Null?	Type
-----		
CUST_ID	NOT NULL	NUMBER
CUST_MARITAL_STATUS		VARCHAR2 (20)
OCCUPATION		VARCHAR2 (21)
AGE		NUMBER
YRS_RESIDENCE		NUMBER

```
SELECT cust_id, cust_marital_status, occupation FROM customers
WHERE cust_id > 102995
ORDER BY cust_id desc;
```

CUST_ID	CUST_MARITAL_STATUS	OCCUPATION
-----		
103000	Divorc.	Cleric.
102999	Married	Cleric.
102998	Married	Exec.
102997	Married	Exec.
102996	NeverM	Other

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR(
    expr_pattern      => 'upper(:col)',
    data_table_name   => 'customers',
    xform_view_name   => 'cust_upcase_view');
END;
```

```
/
describe cust_upcase_view
```

## XFORM\_MISS\_CAT Procedure

This procedure creates a view that implements the categorical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
  miss_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  miss_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL,
  xform_schema_name    IN VARCHAR2 DEFAULT NULL;
```

### Parameters

**Table 45–47 XFORM\_MISS\_CAT Procedure Parameters**

Parameter	Description
<code>miss_table_name</code>	Name of the transformation definition table for categorical missing value treatment. You can use the <a href="#">CREATE_MISS_CAT Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_MISS_CAT</code> . To populate the table, you can use the <a href="#">INSERT_MISS_CAT_MODE Procedure</a> or you can write your own SQL.  See <a href="#">Table 45–12, "Columns in a Transformation Definition Table for Categorical Missing Value Treatment"</a> .
<code>data_table_name</code>	Name of the table containing the data to be transformed
<code>xform_view_name</code>	Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>miss_table_name</code> .
<code>miss_schema_name</code>	Schema of <code>miss_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>xform_schema_name</code>	Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

See ["Operational Notes"](#) on page 45-6.

### Examples

This example creates a view that replaces missing categorical values with the mode.

## XFORM\_MISS\_NUM Procedure

This procedure creates a view that implements the numerical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
  miss_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  miss_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL,
  xform_schema_name    IN VARCHAR2 DEFAULT NULL;
```

### Parameters

**Table 45–48 XFORM\_MISS\_NUM Procedure Parameters**

Parameter	Description
<code>miss_table_name</code>	Name of the transformation definition table for numerical missing value treatment. You can use the <a href="#">CREATE_MISS_NUM Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_MISS_NUM</code> . To populate the table, you can use the <a href="#">INSERT_MISS_NUM_MEAN Procedure</a> or you can write your own SQL.  See Table 45–14, "Columns in a Transformation Definition Table for Numerical Missing Value Treatment".
<code>data_table_name</code>	Name of the table containing the data to be transformed
<code>xform_view_name</code>	Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>miss_table_name</code> .
<code>miss_schema_name</code>	Schema of <code>miss_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>xform_schema_name</code>	Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

See "Operational Notes" on page 45-6.

### Examples

This example creates a view that replaces missing numerical values with the mean.

```
SELECT * FROM items;
```

```
ITEM_ID      QTY
-----
aa           200
bb           200
cc           250
```

```

gg          250
hh          200
ii
jj          200

SELECT AVG(qty) FROM items;

AVG(QTY)
-----
      200

BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('missnum_xtbl');
  DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name      => 'missnum_xtbl',
    data_table_name     => 'items' );
END;
/

SELECT col, val FROM missnum_xtbl;

COL          VAL
-----
QTY          200

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
    miss_table_name      => 'missnum_xtbl',
    data_table_name     => 'items',
    xform_view_name     => 'items_view');
END;
/

SELECT * FROM items_view;

ITEM_ID      QTY
-----
aa           200
bb           200
cc           250
dd           200
ee           200
ff           100
gg           250
hh           200
ii           200
jj           200

```

## XFORM\_NORM\_LIN Procedure

This procedure creates a view that implements the linear normalization transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

### Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
  norm_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  norm_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL,
  xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 45–49 XFORM\_NORM\_LIN Procedure Parameters**

Parameter	Description
<code>norm_table_name</code>	Name of the transformation definition table for linear normalization. You can use the <a href="#">CREATE_NORM_LIN Procedure</a> to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_NORM_LIN</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for normalization or you can write your own SQL.  See <a href="#">Table 45–12, "Columns in a Transformation Definition Table for Categorical Missing Value Treatment"</a> .
<code>data_table_name</code>	Name of the table containing the data to be transformed
<code>xform_view_name</code>	Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>miss_table_name</code> .
<code>norm_schema_name</code>	Schema of <code>miss_table_name</code> . If no schema is specified, the current schema is used.
<code>data_schema_name</code>	Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used.
<code>xform_schema_name</code>	Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used.

### Usage Notes

See ["Operational Notes"](#) on page 45-6.

### Examples

This example creates a view that normalizes the `cust_year_of_birth` and `cust_credit_limit` columns. The data source consists of three columns from `sh.customer`.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_credit_limit
  FROM sh.customers;

describe mining_data
```

Name	Null?	Type
CUST_ID	NOT NULL	NUMBER
CUST_YEAR_OF_BIRTH	NOT NULL	NUMBER(4)
CUST_CREDIT_LIMIT		NUMBER

```
SELECT * FROM mining_data WHERE cust_id > 104495
ORDER BY cust_year_of_birth;
```

CUST_ID	CUST_YEAR_OF_BIRTH	CUST_CREDIT_LIMIT
104496	1947	3000
104498	1954	10000
104500	1962	15000
104499	1970	3000
104497	1976	3000

```
BEGIN
  dbms_data_mining_transform.CREATE_NORM_LIN(
    norm_table_name=> 'normx_tbl');
  dbms_data_mining_transform.INSERT_NORM_LIN_MINMAX(
    norm_table_name => 'normx_tbl',
    data_table_name => 'mining_data',
    exclude_list => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
    round_num => 3);
END;
/
```

```
SELECT col, shift, scale FROM normx_tbl;
```

COL	SHIFT	SCALE
CUST_YEAR_OF_BIRTH	1910	77
CUST_CREDIT_LIMIT	1500	13500

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
    norm_table_name => 'normx_tbl',
    data_table_name => 'mining_data',
    xform_view_name => 'norm_view');
END;
/
```

```
SELECT * FROM norm_view WHERE cust_id > 104495
ORDER BY cust_year_of_birth;
```

CUST_ID	CUST_YEAR_OF_BIRTH	CUST_CREDIT_LIMIT
104496	.4805195	.1111111
104498	.5714286	.6296296
104500	.6753247	1
104499	.7792208	.1111111
104497	.8571429	.1111111

```
set long 2000
```

```
SQL> SELECT text FROM user_views WHERE view_name IN 'NORM_VIEW';
```

```
TEXT
-----
```

```
SELECT "CUST_ID", ("CUST_YEAR_OF_BIRTH"-1910)/77 "CUST_YEAR_OF_BIRTH", ("CUST  
_CREDIT_LIMIT"-1500)/13500 "CUST_CREDIT_LIMIT" FROM mining_data
```

## XFORM\_STACK Procedure

This procedure creates a view that implements the transformations specified by the stack. Only the columns and nested attributes that are specified in the stack are transformed. Any remaining columns and nested attributes from the data table appear in the view without changes.

To create a list of objects that describe the transformed columns, use the [DESCRIBE\\_STACK Procedure](#).

### See Also:

["Overview"](#) on page 45-3

*Oracle Data Mining Application Developer's Guide* for more information about data mining attributes

## Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_STACK (
  xform_list          IN      TRANSFORM_list,
  data_table_name     IN      VARCHAR2,
  xform_view_name     IN      VARCHAR2,
  data_schema_name    IN      VARCHAR2 DEFAULT NULL,
  xform_schema_name   IN      VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 45–50 XFORM\_STACK Procedure Parameters**

Parameter	Description
xform_list	The transformation list. See <a href="#">Table 45–1</a> for a description of the TRANSFORM_LIST object type.
data_table_name	Name of the table containing the data to be transformed
xform_view_name	Name of the view to be created. The view applies the transformations in <i>xform_list</i> to <i>data_table_name</i> .
data_schema_name	Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used.
xform_schema_name	Schema of <i>xform_view_name</i> . If no schema is specified, the current schema is used.

## Usage Notes

See ["Operational Notes"](#) on page 45-6. The following sections are especially relevant:

- ["About Transformation Lists"](#) on page 45-7
- ["About Stacking"](#) on page 45-9
- ["Nested Data Transformations"](#) on page 45-10

## Examples

This example applies a transformation list to the view `dmuser.cust_info` and shows how the data is transformed. The CREATE statement for `cust_info` is shown in ["DESCRIBE\\_STACK Procedure"](#) on page 45-32.

```
BEGIN
  dbms_data_mining_transform.CREATE_BIN_NUM ('birth_yr_bins');
```

```

dbms_data_mining_transform.INSERT_BIN_NUM_QTILE (
    bin_table_name => 'birth_yr_bins',
    data_table_name => 'cust_info',
    bin_num        => 6,
    exclude_list   => dbms_data_mining_transform.column_list(
                        'cust_id','country_id'));

END;
/
SELECT * FROM birth_yr_bins;

COL          ATT          VAL BIN
-----
CUST_YEAR_OF_BIRTH          1922
CUST_YEAR_OF_BIRTH          1951 1
CUST_YEAR_OF_BIRTH          1959 2
CUST_YEAR_OF_BIRTH          1966 3
CUST_YEAR_OF_BIRTH          1973 4
CUST_YEAR_OF_BIRTH          1979 5

## DBMS\_DATAPUMP

The DBMS\_DATAPUMP package is used to move all, or part of, a database between databases, including both data and metadata.

**See Also:** *Oracle Database Utilities* for more information on the concepts behind the DBMS\_DATAPUMP API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

- [Using DBMS\\_DATAPUMP](#)
  - Overview
  - Security Model
  - Constants
- [Data Structures](#)
  - Data Structures - Object Types
- [Summary of DBMS\\_DATAPUMP Subprograms](#)

---

## Using DBMS\_DATAPUMP

This section contains topics that relate to using the DBMS\_DATAPUMP package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)

## Overview

The support and functionality provided by DBMS\_DATAPUMP is as follows:

- The source and target databases can have different hardware, operating systems, character sets, and time zones.
- All object types and data types existing in Oracle Database 11g are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, datafile names, and tablespace names can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.

## Security Model

Security for the DBMS\_DATAPUMP package is implemented through roles.

### Roles

The DATAPUMP\_EXP\_FULL\_DATABASE and DATAPUMP\_IMP\_FULL\_DATABASE roles allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

#### **DATAPUMP\_EXP\_FULL\_DATABASE**

The DATAPUMP\_EXP\_FULL\_DATABASE role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the DATAPUMP\_EXP\_FULL\_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP\_EXP\_FULL\_DATABASE role will also grant access to the SYS schema.

#### **DATAPUMP\_IMP\_FULL\_DATABASE**

The DATAPUMP\_IMP\_FULL\_DATABASE role affects only Import and SQL\_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the DATAPUMP\_IMP\_FULL\_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP\_IMP\_FULL\_DATABASE role will also grant access to the SYS schema.

## Constants

There are several public constants defined for use with the `DBMS_DATAPUMP.GET_STATUS` procedure. All such constants are defined as part of the `DBMS_DATAPUMP` package. Any references to these constants must be prefixed by `DBMS_DATAPUMP.` and followed by the symbols in the following lists:

### Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_STATUS_WIP`                    `CONSTANT BINARY_INTEGER := 1;`
- `KU$_STATUS_JOB_DESC`            `CONSTANT BINARY_INTEGER := 2;`
- `KU$_STATUS_JOB_STATUS`        `CONSTANT BINARY_INTEGER := 4;`
- `KU$_STATUS_JOB_ERROR`        `CONSTANT BINARY_INTEGER := 8;`

### Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_DUMPFILE_TYPE_DISK`            `CONSTANT BINARY_INTEGER := 0;`
- `KU$_DUMPFILE_TYPE_TEMPLATE`        `CONSTANT BINARY_INTEGER := 3;`

## Data Structures

The `DBMS_DATAPUMP` package defines `OBJECT` types. The types described in this section are defined in the `SYS` schema for use by the `GET_STATUS` function. *The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.*

The collection of types defined for use with the `GET_STATUS` procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 10g, release 1 (10.1), there is a `sys.ku$_Status1010` type, and in the next Oracle Database release, there could be a `sys.ku$_Status1110` type defined. Both types could be used with the `GET_STATUS` procedure.

Public synonyms have been defined for each of the types used with the `GET_STATUS` procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym `ku$_Status1010` is defined for the `sys.ku$_Status1010` type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 10g, release 1, the generic synonym `ku$_Status` is defined as `ku$_Status1010`. In a future release, there might be a `ku$_Status1110` synonym for `sys.ku$Status1110`. Because the `ku$_Status` generic synonym always points to the latest definition, it would now point to `ku$_Status1110` rather than to `ku$_Status1010`.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

---

---

**Note:** Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

---

---

**See Also:** [GET\\_STATUS Procedure](#) on page 46-26 for additional information about how types are used

## Data Structures - Object Types

The DBMS\_DATAPUMP package defines the following kinds of OBJECT types:

- [Worker Status Types](#)
- [Log Entry and Error Types](#)
- [Job Status Types](#)
- [Job Description Types](#)
- [Status Types](#)

### Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The `percent_done` refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```
CREATE TYPE sys.ku$WorkerStatus1010 AS OBJECT (
    worker_number    NUMBER,
    process_name     VARCHAR2(30),
    state            VARCHAR2(30),
    schema           VARCHAR2(30),
    name             VARCHAR2(4000),
    object_type      VARCHAR2(200),
    partition        VARCHAR2(30),
    completed_objects NUMBER,
    total_objects    NUMBER,
    completed_rows   NUMBER,
    completed_bytes  NUMBER,
    percent_done     NUMBER)

CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatus1010
FOR sys.ku$WorkerStatus1010;

CREATE TYPE sys.ku$WorkerStatus1020 AS OBJECT (
    worker_number    NUMBER,          -- Worker process identifier
    process_name     VARCHAR2(30),    -- Worker process name
    state            VARCHAR2(30),    -- Worker process state
    schema           VARCHAR2(30),    -- Schema name

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList
  FOR ku$_WorkerStatusList1020;
```

## Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The `ku$LogLine.errorNumber` type is set to NULL for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

```
CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
    logLineNumber    NUMBER,
    errorNumber      NUMBER,
    LogText          VARCHAR2(2000))

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1020 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;
```

## Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (`percent_done` applies to data only):

```
CREATE TYPE sys.ku$_DumpFile1010 IS OBJECT (
    file_name        VARCHAR2(4000), -- Fully-qualified name
    file_type        NUMBER,         -- 0=Disk, 1=Pipe, etc.
    file_size        NUMBER,         -- Its length in bytes
    file_bytes_written NUMBER        -- Bytes written so far)

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1010 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1020 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile FOR ku$_DumpFile1010;

CREATE TYPE sys.ku$_DumpFileSet1010 AS TABLE OF sys.ku$_DumpFile1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1010 FOR
  sys.ku$_DumpFileSet1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1020 FOR
```

```

sys.ku$_DumpFileSet1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet FOR ku$_DumpFileSet1010;

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT (
    job_name          VARCHAR2(30),
    operation          VARCHAR2(30),
    job_mode           VARCHAR2(30),
    bytes_processed    NUMBER,
    percent_done       NUMBER,
    degree             NUMBER,
    error_count        NUMBER,
    state              VARCHAR2(30),
    phase              NUMBER,
    restart_count      NUMBER,
    worker_status_list ku$_WorkerStatusList1010,
    files              ku$_DumpFileSet1010)

CREATE PUBLIC SYNONYM ku$_JobStatus1010 FOR
    sys.ku$_JobStatus1010;

CREATE TYPE sys.ku$_JobStatus1020 IS OBJECT (

    total_bytes        NUMBER,               -- Total bytes for job
    percent_done       NUMBER,               -- Percent done
    degree             NUMBER,               -- Of job parallelism
    error_count        NUMBER,               -- #errors so far
    state              VARCHAR2(30),         -- Current job state
    phase              NUMBER,               -- Job phase
    restart_count      NUMBER,               -- #Job restarts
    worker_status_list ku$_WorkerStatusList1020, -- job worker processes
    files              ku$_DumpFileSet1010  -- Dump file info)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1020 FOR    sys.ku$_JobStatus1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus FOR ku$_JobStatus1020;

```

## Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

```

CREATE TYPE sys.ku$_ParamValue1010 AS OBJECT (
    param_name        VARCHAR2(30),
    param_op          VARCHAR2(30),
    param_type        VARCHAR2(30),
    param_length      NUMBER,
    param_value_n     NUMBER,
    param_value_t     VARCHAR2(4000));

CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1010 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1020 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue FOR ku$_ParamValue1010;

CREATE TYPE sys.ku$_ParamValues1010 AS TABLE OF sys.ku$_ParamValue1010;

```

```

CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1010 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1020 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues FOR ku$_ParamValues1010;

CREATE TYPE sys.ku$_JobDesc1010 AS OBJECT (
  job_name      VARCHAR2(30),
  guid          RAW(16),
  operation     VARCHAR2(30),
  job_mode     VARCHAR2(30),
  remote_link  VARCHAR2(4000),
  owner        VARCHAR2(30),
  instance     VARCHAR2(16),
  db_version   VARCHAR2(30),
  creator_privs VARCHAR2(30),
  start_time   DATE,
  max_degree   NUMBER,
  log_file     VARCHAR2(4000),
  sql_file     VARCHAR2(4000),
  params       ku$_ParamValues1010)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1010 FOR sys.ku$_JobDesc1010;

CREATE TYPE sys.ku$_JobDesc1020 IS OBJECT (
  job_name      VARCHAR2(30),      -- The job name
  guid          RAW(16),          -- The job GUID
  operation     VARCHAR2(30),      -- Current operation
  job_mode     VARCHAR2(30),      -- Current mode
  remote_link  VARCHAR2(4000),    -- DB link, if any
  owner        VARCHAR2(30),      -- Job owner
  platform     VARCHAR2(101),     -- Current job platform
  exp_platform VARCHAR2(101),     -- Export platform
  global_name  VARCHAR2(4000),    -- Global name of DB
  exp_global_name VARCHAR2(4000), -- Export global name
  instance     VARCHAR2(16),      -- The instance name
  db_version   VARCHAR2(30),      -- Version of objects
  exp_db_version VARCHAR2(30),    -- Export version
  scn          NUMBER,           -- Job SCN
  creator_privs VARCHAR2(30),     -- Privs of job
  start_time   DATE,             -- This job start time
  exp_start_time DATE,           -- Export start time
  term_reason  NUMBER,           -- Job termination code
  max_degree   NUMBER,           -- Max. parallelism
  log_file     VARCHAR2(4000),    -- Log file name
  sql_file     VARCHAR2(4000),    -- SQL file name
  params       ku$_ParamValues1010 -- Parameter list)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1020 FOR sys.ku$_JobDesc1020;
CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc FOR ku$_JobDesc1020;

```

## Status Types

The status type is an aggregate of some the previous types defined and is the return value for the GET\_STATUS call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the `ku$_LogEntry` that is returned has already had its log lines ordered for proper output. That is, the original `ku$_LogEntry` objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```
CREATE TYPE sys.ku$_Status1010 AS OBJECT
(
  mask NUMBER,          /* Indicates which status types are present*/
  wip ku$_LogEntry1010, /* Work-In-Progress: std. exp/imp msgs */
  job_description ku$_JobDesc1010, /* Complete job description */
  job_status ku$_JobStatus1010, /* Detailed job status + per-worker sts */
  error ku$_LogEntry1010 /* Multi-level contextual errors */
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;

CREATE TYPE sys.ku$_Status1020 IS OBJECT
(
  mask NUMBER,          -- Status types present
  wip ku$_LogEntry1010, -- Work in progress
  job_description ku$_JobDesc1020, -- Complete job description
  job_status ku$_JobStatus1020, -- Detailed job status
  error ku$_LogEntry1010 -- Multi-level context errors
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1020 FOR sys.ku$_Status1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status FOR ku$_Status1020;
```

---

## Summary of DBMS\_DATAPUMP Subprograms

**Table 46–1 DBMS\_DATAPUMP Package Subprograms**

Subprogram	Description
<a href="#">ADD_FILE Procedure</a> on page 46-13	Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the FILETYPE parameter provided with this procedure.
<a href="#">ATTACH Function</a> on page 46-16	Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state
<a href="#">DATA_FILTER Procedures</a> on page 46-18	Specifies restrictions on the rows that are to be retrieved
<a href="#">DETACH Procedure</a> on page 46-23	Specifies that the user has no further interest in using the handle
<a href="#">GET_DUMPFILE_INFO Procedure</a> on page 46-24	Retrieves information about a specified dump file
<a href="#">GET_STATUS Procedure</a> on page 46-26	Monitors the status of a job or waits for the completion of a job or for more details on API errors
<a href="#">LOG_ENTRY Procedure</a> on page 46-29	Inserts a message into the log file
<a href="#">METADATA_FILTER Procedure</a> on page 46-30	Provides filters that allow you to restrict the items that are included in a job
<a href="#">METADATA_REMAP Procedure</a> on page 46-33	Specifies a remapping to be applied to objects as they are processed in the specified job
<a href="#">METADATA_TRANSFORM Procedure</a> on page 46-36	Specifies transformations to be applied to objects as they are processed in the specified job
<a href="#">OPEN Function</a> on page 46-39	Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures (but not to the ATTACH function)
<a href="#">SET_PARALLEL Procedure</a> on page 46-42	Adjusts the degree of parallelism within a job
<a href="#">SET_PARAMETER Procedures</a> on page 46-44	Specifies job-processing options
<a href="#">START_JOB Procedure</a> on page 46-53	Begins or resumes execution of a job
<a href="#">STOP_JOB Procedure</a> on page 46-55	Terminates a job, but optionally, preserves the state of the job
<a href="#">WAIT_FOR_JOB Procedure</a> on page 46-57	Runs a job until it either completes normally or stops for some other reason

## ADD\_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL\_FILE operation or specifies the log file or the output file for a SQL\_FILE operation.

### Syntax

```
DBMS_DATAPUMP.ADD_FILE (
  handle      IN NUMBER,
  filename    IN VARCHAR2,
  directory   IN VARCHAR2,
  filesize    IN VARCHAR2 DEFAULT NULL,
  filetype    IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE),
  reusefile   IN NUMBER DEFAULT NULL;
```

### Parameters

**Table 46–2 ADD\_FILE Procedure Parameters**

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
filename	The name of the file being added. <code>filename</code> must be a simple filename without any directory path information. For dump files, the <code>filename</code> can include a substitution variable, <code>%U</code> , which indicates that multiple files may be generated with the specified <code>filename</code> as a template. The <code>%U</code> is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of <code>export%U</code> would cause <code>export01</code> , <code>export02</code> , <code>export03</code> , and so on, to be created depending on how many files are needed to perform the export. For filenames containing the <code>%</code> character, the <code>%</code> must be represented as <code>%%</code> to avoid ambiguity. Any <code>%</code> in a filename must be followed by either a <code>%</code> or a <code>U</code> .
directory	The name of a directory object within the database that is used to locate <code>filename</code> . A <code>directory</code> must be specified. See the Data Pump Export chapter in <i>Oracle Database Utilities</i> for information about the DIRECTORY command-line parameter.
filesize	The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M) or number of gigabytes (if followed by G). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, <code>filesize</code> will default to an unlimited size. For Import and SQL_FILE operations, <code>filesize</code> is ignored. The minimum value for <code>filesize</code> is ten times the default Data Pump block size, which is 4 kilobytes. A <code>filesize</code> can only be specified for dump files.
filetype	The type of the file to be added. The legal values are as follows and must be preceded by <code>DBMS_DATAPUMP.:</code> <ul style="list-style-type: none"> <li>▪ <code>KU\$_FILE_TYPE_DUMP_FILE</code> (dump file for a job)</li> <li>▪ <code>KU\$_FILE_TYPE_LOG_FILE</code> (log file for a job)</li> <li>▪ <code>KU\$_FILE_TYPE_SQL_FILE</code> (output for SQL_FILE job)</li> </ul>

**Table 46–2 (Cont.) ADD\_FILE Procedure Parameters**

Parameter	Description
<code>reusefile</code>	If 0, a preexisting file will cause an error. If 1, a preexisting file will be overwritten. If NULL, the default action for the file type will be applied (that is, dump files will not be overwritten). This parameter should only be non-NULL for dump files. The <code>reusefile</code> parameter is restricted to export jobs.

## Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_ARGVAL`. An invalid value was supplied for an input parameter.
- `INVALID_STATE`. The job is completing, or the job is past the defining state for an import or `SQL_FILE` job or is past the defining state for LOG and SQL files.
- `INVALID_OPERATION`. A dump file was specified for a Network Import or `ESTIMATE_ONLY` export operation.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

## Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a `SQL_FILE` operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
- Import and `SQL_FILE` operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation and `reusefile` is not set to 1, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the `SET_PARALLEL` procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.
- If the substitution variable (`%U`) is included in a filename, multiple dump files may be specified through a single call to `ADD_FILE`. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current `SET_PARALLEL` value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple `ADD_FILES` with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if `expa%U`, `expb%U` and `expc%U` were all specified for a job having a parallelism of 6, the initial dump

files created would look like: `expa01`, `expb01`, `expc01`, `expa02`, `expb02`, and `expc02`.

- If presented with dump file specifications, `expa%U`, `expb%U` and `expc%U`, an Import or `SQL_FILE` operation will begin by attempting to open the dump files, `expa01`, `expb01`, and `expc01`. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, `expa02`, `expb02`, and `expc02`). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.

## ATTACH Function

This function gains access to a previously-created job.

### Syntax

```
DBMS_DATAPUMP.ATTACH(
  job_name      IN VARCHAR2 DEFAULT NULL,
  job_owner     IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

### Parameters

**Table 46–3** ATTACH Function Parameters

Parameter	Description
job_name	The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).
job_owner	The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the DATAPUMP_EXP_FULL_DATABASE role (for export operations) or the DATAPUMP_IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.

### Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD\_FILE, DATA\_FILTER, DETACH, GET\_STATUS, LOG\_ENTRY, METADATA\_FILTER, METADATA\_REMAP, METADATA\_TRANSFORM, SET\_PARALLEL, SET\_PARAMETER, START\_JOB, STOP\_JOB, and WAIT\_FOR\_JOB.

### Exceptions

- INVALID\_ARGVAL. An invalid value was supplied for an input parameter.
- OBJECT\_NOT\_FOUND. The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the DATAPUMP\_EXP\_FULL\_DATABASE or DATAPUMP\_IMP\_FULL\_DATABASE role.
- SUCCESS\_WITH\_INFO. The function succeeded, but further information is available through the GET\_STATUS procedure.
- NO\_SUCH\_JOB. The specified job does not exist.

### Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU\$\_STATUS\_WIP and KU\$\_STATUS\_JOB\_ERROR messages returned through the GET\_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.

- If the `ATTACH` fails, use a null handle in a subsequent call to `GET_STATUS` for more information about the failure.

## DATA\_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

### Syntax

```
DBMS_DATAPUMP.DATA_FILTER (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN NUMBER,
    table_name  IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.DATA_FILTER(
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN VARCHAR2,
    table_name  IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.DATA_FILTER(
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN CLOB,
    table_name  IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 46–4 DATA\_FILTER Procedure Parameters**

Parameter	Description
handle	The handle that is returned from the OPEN function
name	The name of the filter
value	The value of the filter
table_name	The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job.
schema_name	The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name.

### Exceptions

- **INVALID\_ARGVAL.** There can be several reasons for this message:
  - A bad filter name is specified
  - The mode is `TRANSPORTABLE`, which does not support data filters
  - The specified table does not exist
  - The filter has already been set for the specified values of `schema_name` and `table_name`
- **INVALID\_STATE.** The user called `DATA_FILTER` when the job was not in the Defining state.

- `INCONSISTENT_ARGS`. The `value` parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- `PRIVILEGE_ERROR`. A schema name was supplied, but the user did not have the `DATAPUMP_EXP_FULL_DATABASE` or `DATAPUMP_IMP_FULL_DATABASE` role.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

## Usage Notes

- Each data filter can only appear once in each table (for example, you cannot supply multiple `SUBQUERY` filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

With the exception of the `INCLUDE_ROWS` filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

The available data filters are described in [Table 46-5](#).

**Table 46-5 Data Filters**

Name	Datatype	Operations that Support Filter	Description
<code>INCLUDE_ROWS</code>	NUMBER	EXPORT, IMPORT	If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.
<code>PARTITION_EXPR</code> <code>PARTITION_LIST</code>	text	EXPORT, IMPORT	For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for <code>PARTITION_EXPR</code> ) or are included in the list (for <code>PARTITION_LIST</code> ). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names.  Double quotation marks around partition names are required only if the partition names contain special characters.  <code>PARTITION_EXPR</code> is not supported on jobs across a network link.  Default=All partitions are processed
<code>SAMPLE</code>	NUMBER	EXPORT, IMPORT	For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.

**Table 46–5 (Cont.) Data Filters**

<b>Name</b>	<b>Datatype</b>	<b>Operations that Support Filter</b>	<b>Description</b>
SUBQUERY	text	EXPORT, IMPORT	Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.

## DATA\_REMAP Procedure

This procedure specifies transformations to be applied to column data as it is exported from, or imported into, a database.

### Syntax

```
DBMS_DATAPUMP.DATA_REMAP (
  handle          IN NUMBER,
  name            IN VARCHAR2,
  table_name      IN VARCHAR2,
  column          IN VARCHAR2,
  remap_function  IN VARCHAR2),
  schema         IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 46–6 DATA\_REMAP Procedure Parameters**

Parameter	Description
handle	The handle of the current job. The current session must have previously attached to the handle through a call to an OPEN function.
name	The name of the remap
table_name	The table containing the column to be remapped
column	The name of the column to be remapped
remap_function	The meaning of remap_function is dependent upon the value of name. See <a href="#">Table 46–7</a> for a list of possible names.
schema	The schema containing the column to be remapped. If NULL, the remapping applies to all schemas moved in the job that contain the specified table.

### Exceptions

- **INVALID\_ARGVAL.** The mode is transportable (which does not support data modifications) or it has specified that no data to be included in the job. An invalid remap name was supplied.
- **INVALID\_OPERATION.** Data remaps are only supported for Export and Import operations.
- **INVALID\_STATE.** The DATA\_REMAP procedure was called after the job started (that is, it was not in the defining state).
- **NO\_SUCH\_JOB.** The job handle is no longer valid.

### Usage Notes

- The DATA\_REMAP procedure is only supported for Export and Import operations. It allows you to manipulate user data being exported or imported. The name of the remap determines the remap operation to be performed.
- For export operations, you might wish to define a data remap to obscure sensitive data such as credit card numbers from a dump file, but leave the remainder of the data so that it can be read. To accomplish this, the remapping should convert each unique source number into a distinct generated number. So that the mapping is

consistent across the dump file set, the same function should be called for every column that contains the credit card number.

- For import operations, you might wish to define a data remap to reset the primary key when data is being merged into an existing table that contains colliding primary keys. A single remapping function should be provided for all columns defining or referencing the primary key to ensure that remapping is consistent.

---

**Note:** If the called function uses package state variables, then to ensure that remapping is performed consistently across all tables, the job should be run with a SET\_PARALLEL value of 1 and no restart operations should be performed.

---

The Data Remap functions are listed in [Table 46–7](#).

**Table 46–7** *Names of Data Remap Functions*

Name	Meaning of remap_ function	Meaning
COLUMN_FUNCTION	String having the format: [schema.]package.func tion	The name parameter references a PL/SQL package function which is called to modify the data for the specified column. The function accepts a single parameter, which has the same datatype as the remapped column, and returns a value having the same datatype as the remapped column. Note that the default for the schema is the schema of the user performing the export.

## DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

### Syntax

```
DBMS_DATAPUMP.DETACH(  
    handle IN NUMBER);
```

### Parameters

**Table 46–8** *DETACH Procedure Parameters*

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through a call to either an <code>OPEN</code> or <code>ATTACH</code> function.

### Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

### Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user's session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a `STOP_JOB` that was applied to the job referenced by the handle. All previously allocated `DBMS_DATAPUMP` handles are released when an instance is restarted.

## GET\_DUMPFILE\_INFO Procedure

This procedure retrieves information about a specified dump file.

### Syntax

```
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
  filename      IN VARCHAR2,
  directory     IN VARCHAR2,
  info_table    OUT ku$_dumpfile_info,
  filetype      OUT NUMBER);
```

### Parameters

**Table 46–9** GET\_DUMPFILE\_INFO Procedure Parameters

Parameter	Description
filename	A simple filename with no directory path information
directory	A directory object that specifies where the file can be found
info_table	A PL/SQL table for storing information about the dump file
filetype	The type of file (Data Pump dump file, original Export dump file, or unknown)

### Exceptions

The GET\_DUMPFILE\_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET\_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

- NO\_DUMPFILE\_INFO. Unable to retrieve dump file information as specified.

### Usage Notes

You can use the GET\_DUMPFILE\_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of zero will be returned and the dump file info\_table will remain empty.

A filetype value of one indicates a Data Pump dump file. A file type value of two indicates an original Export dump file. In both cases, the dump file info\_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (
  item_code    NUMBER,          -- Identifies header item
  value        VARCHAR2(2048)  -- Text string value)
/

GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;

CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item
/
```

```
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;
```

The item codes, which can easily be extended to provide more information as needed, are currently defined as follows (prepended with the package name, DBMS\_DATAPUMP.):

KU\$DFHDR_FILE_VERSION	CONSTANT NUMBER := 1;
KU\$DFHDR_MASTER_PRESENT	CONSTANT NUMBER := 2;
KU\$DFHDR_GUID	CONSTANT NUMBER := 3;
KU\$DFHDR_FILE_NUMBER	CONSTANT NUMBER := 4;
KU\$DFHDR_CHARSET_ID	CONSTANT NUMBER := 5;
KU\$DFHDR_CREATION_DATE	CONSTANT NUMBER := 6;
KU\$DFHDR_FLAGS	CONSTANT NUMBER := 7;
KU\$DFHDR_JOB_NAME	CONSTANT NUMBER := 8;
KU\$DFHDR_PLATFORM	CONSTANT NUMBER := 9;
KU\$DFHDR_INSTANCE	CONSTANT NUMBER := 10;
KU\$DFHDR_LANGUAGE	CONSTANT NUMBER := 11;
KU\$DFHDR_BLOCKSIZE	CONSTANT NUMBER := 12;
KU\$DFHDR_DIRPATH	CONSTANT NUMBER := 13;
KU\$DFHDR_METADATA_COMPRESSED	CONSTANT NUMBER := 14;
KU\$DFHDR_DB_VERSION	CONSTANT NUMBER := 15;
KU\$DFHDR_MAX_ITEM_CODE	CONSTANT NUMBER := 20;
KU\$DFHDR_MASTER_PIECE_COUNT	CONSTANT NUMBER := 16;
KU\$DFHDR_MASTER_PIECE_NUMBER	CONSTANT NUMBER := 17;
KU\$DFHDR_DATA_COMPRESSED	CONSTANT NUMBER := 18;
KU\$DFHDR_METADATA_ENCRYPTED	CONSTANT NUMBER := 19;
KU\$DFHDR_DATA_ENCRYPTED	CONSTANT NUMBER := 20;

## GET\_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

### Syntax

```
DBMS_DATAPUMP.GET_STATUS (
  handle      IN NUMBER,
  mask        IN BINARY_INTEGER,
  timeout     IN NUMBER DEFAULT NULL,
  job_state   OUT VARCHAR2,
  status      OUT ku$_Status1010);
```

### Parameters

**Table 46–10** GET\_STATUS Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the <code>OPEN</code> or <code>ATTACH</code> function. A null handle can be used to retrieve error information after <code>OPEN</code> and <code>ATTACH</code> failures.
mask	A bit mask that indicates which of four types of information to return: <ul style="list-style-type: none"> <li>▪ <code>KU\$_STATUS_WIP</code></li> <li>▪ <code>KU\$_STATUS_JOB_DESC</code></li> <li>▪ <code>KU\$_STATUS_JOB_STATUS</code></li> <li>▪ <code>KU\$_STATUS_JOB_ERROR</code></li> </ul> Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See <a href="#">Data Structures - Object Types</a> on page 46-7.
timeout	Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If <code>KU\$_STATUS_WIP</code> or <code>KU\$_STATUS_JOB_ERROR</code> information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.
job_state	Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full <code>ku\$_Status</code> structure.
status	A <code>ku\$_Status</code> is returned. The <code>ku\$_Status</code> mask indicates what kind of information is included. This could be none if only <code>KU\$_STATUS_WIP</code> or <code>KU\$_STATUS_JOB_ERROR</code> information is requested and the timeout period expires. This can be a <code>ku\$_Status1010</code> or <code>ku\$_Status1020</code> object type.

### Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_VALUE`. The mask or timeout contains an illegal value.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

## Usage Notes

The `GET_STATUS` procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The `KU$STATUS_JOB_DESC` and `KU$STATUS_JOB_STATUS` values are classified as synchronous information because the information resides in the master table. The `KU$STATUS_WIP` and `KU$STATUS_JOB_ERROR` values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information *only* is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a *maximum* of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the `job_state` returned by `GET_STATUS` does not indicate a terminating job, it is possible that the job could still terminate before the next call to `GET_STATUS`. This would result in an `INVALID_HANDLE` exception. Alternatively, the job could terminate during the call to `GET_STATUS`, which would result in a `NO_SUCH_JOB` exception. Callers should be prepared to handle these cases.

## Error Handling

There are two types of error scenarios that need to be handled using the `GET_STATUS` procedure:

- Errors resulting from other procedure calls: For example, the `SET_PARAMETER` procedure may produce an `INCONSISTENT_ARGS` exception. The client should immediately call `GET_STATUS` with `mask=8` (errors) and `timeout=0`. The returned `ku$Status.error` will contain a `ku$LogEntry` that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be `Table already exists` when trying to create a table. The `ku$Status.error` will contain a `ku$LogEntry` with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to `GET_STATUS` with an infinite timeout (-1) "listening" for `KU$STATUS_WIP` and `KU$STATUS_JOB_ERROR` messages. If status was requested, then `JOB_STATUS` information will also be in the request.

When the `ku$Status` is interpreted, the following guidelines should be used:

- `ku$Status.ku$JobStatus.percent_done` refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
  - `EXPORT` or `network IMPORT`--  $(\text{bytes\_processed} / \text{estimated\_bytes}) * 100$
  - `IMPORT`--  $(\text{bytes\_processed} / \text{total\_expected\_bytes}) * 100$
  - `SQL_FILE` or `estimate-only EXPORT`-- 0.00 if not done or 100.00 if done

The effects of the `QUERY` and `PARTITION_EXPR` data filters are not considered in computing `percent_done`.

It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

```
((SYSDATE - start time) / ku$_Status.ku$_JobStatus.percent_done) * 100
```

- The caller should not use `ku$_Status.ku$_JobStatus.percent_done` for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in `job_state`.

## LOG\_ENTRY Procedure

This procedure inserts a message into the log file.

### Syntax

```
DBMS_DATAPUMP.LOG_ENTRY (
    handle          IN NUMBER,
    message         IN VARCHAR2
    log_file_only  IN NUMBER DEFAULT 0);
```

### Parameters

**Table 46–11 LOG\_ENTRY Procedure Parameters**

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
message	A text line to be added to the log file
log_file_only	Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU\$ STATUS_WIP) messages.

### Exceptions

- INVALID\_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS\_WITH\_INFO. The procedure succeeded, but further information is available through the GET\_STATUS procedure.
- NO\_SUCH\_JOB. The specified job does not exist.

### Usage Notes

The message is added to the log file. If `log_file_only` is zero (the default), the message is also broadcast as a `KU$ STATUS_WIP` message through the `GET_STATUS` procedure to all users attached to the job.

The `LOG_ENTRY` procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports `INCLUDE` and `EXCLUDE` parameters defined by the user. Identifying these values as calls to the underlying `METADATA_FILTER` procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the `INCLUDE` and `EXCLUDE` parameters.

Lines entered in the log stream from `LOG_ENTRY` are prefixed by the string, " ; ; ; "

## METADATA\_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

### Syntax

```
DBMS_DATAPUMP.METADATA_FILTER(
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2,
  object_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.METADATA_FILTER(
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN CLOB,
  object_path IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 46–12 METADATA\_FILTER Procedure Parameters**

Parameter	Description
handle	The handle returned from the OPEN function
name	The name of the filter. See <a href="#">Table 46–13</a> for descriptions of the available filters.
value	The value of the filter
object_path	The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.)  For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.

[Table 46–13](#) describes the name, the object type, and the meaning of the filters available with the METADATA\_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

**Table 46–13 Filters Provided by METADATA\_FILTER Procedure**

Name	Object Type	Meaning
NAME_EXPR	Named objects	Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type.
NAME_LIST		For Table mode, identifies which tables are to be processed.

**Table 46–13 (Cont.) Filters Provided by METADATA\_FILTER Procedure**

Name	Object Type	Meaning
SCHEMA_EXPR SCHEMA_LIST	Schema objects	Restricts the job to objects whose owning schema name is satisfied by the expression.  For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN (' SCOTT ' )').  For Schema mode, identifies which users are to be processed.
TABLESPACE_EXPR TABLESPACE_LIST	TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT	Restricts the job to objects stored in a tablespace whose name is satisfied by the expression.  For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job.  For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.
INCLUDE_PATH_EXPR INCLUDE_PATH_LIST EXCLUDE_PATH_EXPR EXCLUDE_PATH_LIST	All	Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_*) or excluded (EXCLUDE_PATH_*) from the operation. The object_path parameter is not supported for these filters.

## Exceptions

- INVALID\_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID\_ARGVAL. This exception can indicate any of the following conditions:
  - An object\_path was specified for an INCLUDE\_PATH\_EXPR or EXCLUDE\_PATH\_EXPR filter.
  - The specified object\_path is not supported for the current mode.
  - The SCHEMA\_EXPR filter specified multiple schemas for a Table mode job.
- INVALID\_STATE. The user called the METADATA\_FILTER procedure after the job left the defining state.
- INCONSISTENT\_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS\_WITH\_INFO. The procedure succeeded but further information is available through the GET\_STATUS procedure.
- NO\_SUCH\_JOB. The specified job does not exist.

## Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE\_PATH\_EXPR and INCLUDE\_PATH\_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter,

grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.

- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:

- NAME\_EXPR
- SCHEMA\_EXPR
- TABLESPACE\_EXPR
- INCLUDE\_PATH\_EXPR
- EXCLUDE\_PATH\_EXPR

The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:

- NAME\_LIST
- SCHEMA\_LIST
- TABLESPACE\_LIST
- INCLUDE\_PATH\_LIST
- EXCLUDE\_PATH\_LIST

- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.
- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).
- The same filter name can be specified multiple times within a job. For example, specifying NAME\_EXPR as '!='EMP'' and NAME\_EXPR as '!='DEPT'' on a Table mode export would produce a file set containing all of the tables except for EMP and DEPT.

## METADATA\_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

### Syntax

```
DBMS_DATAPUMP.METADATA_REMAP (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  old_value   IN VARCHAR2,
  value       IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 46–14** METADATA\_REMAP Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.
name	The name of the remap. See <a href="#">Table 46–15</a> for descriptions of the available remaps.
old_value	Specifies which value in the dump file set should be reset to value
value	The value of the parameter for the remap. This signifies the new value that old_value should be translated into.
object_type	Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views.  By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.

[Table 46–15](#) describes the remaps provided by the METADATA\_REMAP procedure.

**Table 46–15** Remaps Provided by the METADATA\_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_SCHEMA	Text	Schema objects	Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema.  Privileged users can perform unrestricted schema remaps.  Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap.  For example, SCOTT can remap his BLAKE 's objects to SCOTT, but SCOTT cannot remap SCOTT 's objects to BLAKE.

**Table 46–15 (Cont.) Remaps Provided by the METADATA\_REMAP Procedure**

Name	Datatype	Object Type	Meaning
REMAP_ TABLESPACE	Text	TABLE, INDEX, ROLLBACK_ SEGMENT, MATERIALIZED_ VIEW, MATERIALIZED_ VIEW_ LOG, TABLE_ SPACE	Any storage segment in the job that matches the <code>object_type</code> parameter and was located in the <code>old_value</code> tablespace will be relocated to the <code>value</code> tablespace.
REMAP_ DATAFILE	Text	LIBRARY, TABLESPACE, DIRECTORY	Any datafile reference in the job that matches the <code>object_type</code> parameter and referenced the <code>old_value</code> datafile will be redefined to use the <code>value</code> datafile.
REMAP_TABLE	Text	TABLE	Any reference to a table in the job that matches the <code>old_value</code> table name will be replaced with the <code>value</code> table name. The <code>old_value</code> parameter may refer to a partition such as <code>employees.low</code> . This allows names for tables constructed the by <code>PARTITION_OPTIONS=DEPARTITION</code> parameter to be specified by the user.

## Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_ARGVAL`. This message can indicate any of the following:
  - The job's mode does not include the specified `object_type`.
  - The remap has already been specified for the specified `old_value` and `object_type`.
- `INVALID_OPERATION`. Remaps are only supported for `SQL_FILE` and Import operations. The job's operation was Export, which does not support the use of metadata remaps.
- `INVALID_STATE`. The user called `METADATA_REMAP` after the job had started (that is, the job was not in the defining state).
- `INCONSISTENT_ARGS`. There was no `value` supplied or it was of the wrong datatype for the remap.
- `PRIVILEGE_ERROR`. A nonprivileged user attempted to do a `REMAP_SCHEMA` to a different user's schema or a `REMAP_DATAFILE`.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

## Usage Notes

- The `METADATA_REMAP` procedure is only supported for Import and `SQL_FILE` operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary `SQL_FILE` operation to produce a SQL script corresponding to the dump file set. By editing

the DDL directly and then executing it, you can produce any remappings that you need.

- Transforms for the DataPump API are a subset of the remaps implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according to its parameters. That is, two remaps cannot specify conflicting or redundant remaps.

## METADATA\_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

### Syntax

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN NUMBER,
  object_type IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 46–16 METADATA\_TRANSFORM Procedure Parameters**

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.
name	The name of the transformation. See <a href="#">Table 46–17</a> for descriptions of the available transforms.
value	The value of the parameter for the transform
object_type	Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views.  By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.

[Table 46–17](#) describes the transforms provided by the METADATA\_TRANSFORM procedure.

**Table 46–17 Transforms Provided by the METADATA\_TRANSFORM Procedure**

Name	Datatype	Object Type	Meaning
PCTSPACE	NUMBER	TABLE INDEX TABLESPACE	Specifies a percentage multiplier used to alter extent allocations and datafile sizes. Used to shrink large tablespaces for testing purposes.  Defaults to 100.
SEGMENT_ATTRIBUTES	NUMBER	TABLE, INDEX	If nonzero (TRUE), emit storage segment parameters.  Defaults to 1.

**Table 46–17 (Cont.) Transforms Provided by the METADATA\_TRANSFORM Procedure**

Name	Datatype	Object Type	Meaning
STORAGE	NUMBER	TABLE	<p>If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.)</p> <p>Defaults to nonzero (TRUE).</p>
OID	NUMBER	TYPE TABLE	<p>If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned.</p> <p>Use of this transform on Object Tables will cause breakage in REF columns that point to the table.</p> <p>Defaults to 1.</p>
SEGMENT_CREATION	NUMBER	TABLE	<p>If nonzero (TRUE), the SQL SEGMENT CREATION clause is added to the CREATE TABLE statement. That is, the CREATE TABLE statement will explicitly say either SEGMENT CREATION DEFERRED or SEGMENT CREATION IMMEDIATE.</p> <p>If the value is FALSE, then the SEGMENT CREATION clause is omitted from the CREATE TABLE statement. Set this parameter to FALSE to use the default segment creation attributes for the table(s) being loaded.</p> <p>Defaults to nonzero (TRUE).</p> <p>(This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).)</p>

## Exceptions

- INVALID\_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID\_ARGVAL. This message can indicate any of the following:
  - The mode is transportable, which doesn't support transforms.
  - The job's mode does not include the specified object\_type.
  - The transform has already been specified for the specified value and object\_type.
- INVALID\_OPERATION. Transforms are only supported for SQL\_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- INVALID\_STATE. The user called METADATA\_TRANSFORM after the job had started (that is, the job was not in the defining state).
- INCONSISTENT\_ARGS. There was no value supplied or it was of the wrong datatype for the transform.
- PRIVILEGE\_ERROR. A nonprivileged user attempted to do a REMAP\_SCHEMA to a different user's schema or a REMAP\_DATAFILE.
- SUCCESS\_WITH\_INFO. The procedure succeeded, but further information is available through the GET\_STATUS procedure.

- NO\_SUCH\_JOB. The specified job does not exist.

### Usage Notes

- The METADATA\_TRANSFORM procedure is only supported for Import and SQL\_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL\_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS\_METADATA.SET\_TRANSFORM\_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.

## OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures (but not to the `ATTACH` function).

### Syntax

```
DBMS_DATAPUMP.OPEN (
  operation      IN VARCHAR2,
  job_mode       IN VARCHAR2,
  remote_link    IN VARCHAR2 DEFAULT NULL,
  job_name       IN VARCHAR2 DEFAULT NULL,
  version        IN VARCHAR2 DEFAULT 'COMPATIBLE'
)
RETURN NUMBER;
```

### Parameters

**Table 46–18** OPEN Function Parameters

Parameter	Meaning
<code>operation</code>	The type of operation to be performed. <a href="#">Table 46–19</a> contains descriptions of valid operation types.
<code>job_mode</code>	The scope of the operation to be performed. <a href="#">Table 46–20</a> contains descriptions of valid modes. Specifying <code>NULL</code> generates an error.
<code>remote_link</code>	If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.
<code>job_name</code>	<p>The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the <code>OPEN</code> function and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name).</p> <p>The name is used to identify the job both within the API and with other database components such as identifying the job in the <code>DBA_RESUMABLE</code> view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format:  <code>"SYS_&lt;OPERATION&gt;_&lt;MODE&gt;_%N"</code>.</p> <p>The default job name is formed where <code>%N</code> expands to a two-digit incrementing integer starting at '01' (for example, <code>"SYS_IMPORT_FULL_03"</code>). The name supplied for the job will also be used to name the master table and other resources associated with the job.</p>
<code>version</code>	<p>The version of database objects to be extracted. This option is only valid for Export, network Import, and <code>SQL_FILE</code> operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</p> <ul style="list-style-type: none"> <li>▪ <code>COMPATIBLE</code> - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the <code>V\$COMPATIBILITY</code> view). Database compatibility must be set to 9.2 or higher.</li> <li>▪ <code>LATEST</code> - the version of the metadata corresponds to the database version.</li> <li>▪ A specific database version, for example, '10.0.0'. In Oracle Database10g, this value cannot be lower than 10.0.0.</li> </ul>

Table 46–19 describes the valid operation types for the OPEN function.

**Table 46–19 Valid Operation Types for the OPEN Function**

Operation	Description
EXPORT	Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.
IMPORT	Restores data and metadata from a dump file set or across a database link.
SQL_FILE	Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure.

Table 46–20 describes the valid modes for the OPEN function.

**Table 46–20 Valid Modes for the OPEN Function**

Mode	Description
FULL	Operates on the full database or full dump file set except for the SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, and LBACSYS schemas.
SCHEMA	Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. Users cannot specify SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, or LBACSYS schemas for this mode.
TABLE	Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed.
TABLESPACE	Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.
TRANSPORTABLE	Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.

## Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: ADD\_FILE, CREATE\_JOB\_VIEW, DATA\_FILTER, DETACH, GET\_STATUS, LOG\_ENTRY, LOG\_ERROR, METADATA\_FILTER, METADATA\_REMAP, METADATA\_TRANSFORM, SET\_PARALLEL, SET\_PARAMETER, START\_JOB, STOP\_JOB, and WAIT\_FOR\_JOB

## Exceptions

- INVALID\_ARGVAL. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- JOB\_EXISTS. A table already exists with the specified job name.
- PRIVILEGE\_ERROR. The user does not have the necessary privileges or roles to use the specified mode.
- INTERNAL\_ERROR. The job was created under the wrong schema or the master table was of the wrong format.

- `SUCCESS_WITH_INFO`. The function succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

### Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the `ATTACH` function.
- If the call to the `OPEN` function fails, call the `GET_STATUS` procedure with a null handle to retrieve additional information about the failure.

## SET\_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

### Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(
  handle      IN NUMBER,
  degree      IN NUMBER);
```

### Parameters

**Table 46–21** SET\_PARALLEL Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
degree	The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.

### Exceptions

- INVALID\_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID\_OPERATION. The SET\_PARALLEL procedure is only valid for export and import operations.
- INVALID\_ARGVAL. An invalid value was supplied for an input parameter.
- SUCCESS\_WITH\_INFO. The procedure succeeded, but further information is available through the GET\_STATUS procedure.
- NO\_SUCH\_JOB. The specified job does not exist.

### Usage Notes

- The SET\_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET\_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET\_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
- To parallelize an Export job to a degree of *n*, the user should supply *n* files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

- SQL\_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

## SET\_PARAMETER Procedures

This procedure is used to specify job-processing options.

### Syntax

```
DBMS_DATAPUMP.SET_PARAMETER(
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2);
```

```
DBMS_DATAPUMP.SET_PARAMETER (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN NUMBER);
```

### Parameters

**Table 46–22 SET\_PARAMETER Procedure Parameters**

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to the OPEN function.
name	The name of the parameter. <a href="#">Table 46–23</a> describes the valid parameter names.
value	The value for the specified parameter

[Table 46–23](#) describes the valid options for the name parameter of the SET\_PARAMETER procedure.

**Table 46–23 Valid Options for the name Parameter in the SET\_PARAMETER Procedure**

Parameter Name	Datatype	Supported Operations	Meaning
CLIENT_COMMAND	Text	All	An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job.
COMPRESSION	Text	Export	<p>Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations.</p> <p>The DATA_ONLY option compresses only user data in the dump file set.</p> <p>The METADATA_ONLY option compresses only metadata in the dump file set.</p> <p>The ALL option compresses both user data and metadata.</p> <p>The NONE option stores the dump file set in an uncompressed format.</p> <p>The METADATA_ONLY and NONE options require a job version of 10.2 or later. All other options require a job version of 11.1 or later.</p> <p>Default=METADATA_ONLY</p>
DATA_OPTIONS	Number	Export and Import	<p>A bitmask to supply special options for processing the job. The possible values are as follows:</p> <ul style="list-style-type: none"> <li>■ KU\$_DATAOPT_SKIP_CONST_ERR</li> <li>■ KU\$_DATAOPT_XMLTYPE_CLOB</li> <li>■ KU\$_DATAOPT_DISABL_APPEND_HINT</li> </ul> <p>Export supports the value KU\$_DATAOPT_XMLTYPE_CLOB. This option stores compressed XMLType columns in the dump file as CLOBs rather than as XML documents.</p> <p>Import supports the value KU\$_DATAOPT_SKIP_CONST_ERR. This option specifies that if constraint violations occur while data is being imported into user tables, the rows that cause the violations will be rejected and the load will continue. If this option is not set, a constraint error will abort the loading of the entire partition (or table for unpartitioned tables). Setting this option may affect performance, especially for pre-existing tables with unique indexes or constraints.</p> <p>Import also supports the value KU\$_DATAOPT_DISABL_APPEND_HINT. This option prevents the append hint from being applied to the data load. Disabling the APPEND hint can be useful if there is a small set of data objects to load that already exist in the database and some other application may be concurrently accessing one or more of the data objects.</p> <p>Use of this parameter requires that the version on the OPEN function be set to 11.1 or later.</p> <p>Default=0</p>

**Table 46–23 (Cont.) Valid Options for the name Parameter in the SET\_PARAMETER Procedure**

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION	Text	Export	<p>Specifies what to encrypt in the dump file set, as follows:</p> <p>ALL enables encryption for all data and metadata in the export operation.</p> <p>DATA_ONLY specifies that only data is written to the dump file set in encrypted format.</p> <p>ENCRYPTED_COLUMNS_ONLY specifies that only encrypted columns are written to the dump file set in encrypted format.</p> <p>METADATA_ONLY specifies that only metadata is written to the dump file set in encrypted format.</p> <p>NONE specifies that no data is written to the dump file set in encrypted format.</p> <p>This parameter requires a job version of 11.1 or later.</p> <p>The default value depends upon the combination of encryption-related parameters that are used. To enable encryption, either ENCRYPTION or ENCRYPTION_PASSWORD or both, must be specified. If only ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to ALL. If neither ENCRYPTION nor ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to NONE.</p> <p>To specify ALL, DATA_ONLY, or METADATA_ONLY, the COMPATIBLE initialization parameter must be set to at least 11.1.</p> <p><b>NOTE:</b> If the data being exported includes SecureFiles that you want to be encrypted, then you must specify ENCRYPTION=ALL to encrypt the entire dump file set. Encryption of the entire dump file set is the only way to achieve encryption security for SecureFiles during a Data Pump export operation.</p>
ENCRYPTION_ALGORITHM	Text	Export	<p>Identifies which cryptographic algorithm should be used to perform encryption. Possible values are AES128, AES192, and AES256.</p> <p>The ENCRYPTION_ALGORITHM parameter requires that you also specify either ENCRYPTION or ENCRYPTION_PASSWORD; otherwise an error is returned. See <i>Oracle Database Advanced Security Administrator's Guide</i> for information about encryption algorithms.</p> <p>This parameter requires a job version of 11.1 or later.</p> <p>Default=AES128</p>

**Table 46–23 (Cont.) Valid Options for the name Parameter in the SET\_PARAMETER Procedure**

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION_MODE	Text	Export	<p>Identifies the types of security used for encryption and decryption. The values are as follows:</p> <p><b>PASSWORD</b> requires that you provide a password when creating encrypted dump file sets. You will need to provide the same password when you import the dump file set. <b>PASSWORD</b> mode requires that you also specify the <code>ENCRYPTION_PASSWORD</code> parameter. The <b>PASSWORD</b> mode is best suited for cases in which the dump file set will be imported into a different or remote database, but which must remain secure in transit.</p> <p><b>TRANSPARENT</b> allows an encrypted dump file set to be created without any intervention from a database administrator (DBA), provided the required Oracle Encryption Wallet is available. Therefore, the <code>ENCRYPTION_PASSWORD</code> parameter is not required, and will in fact, cause an error if it is used in <b>TRANSPARENT</b> mode. This encryption mode is best suited for cases in which the dump file set will be imported into the same database from which it was exported.</p> <p><b>DUAL</b> creates a dump file set that can later be imported using either the Oracle Encryption Wallet or the password that was specified with the <code>ENCRYPTION_PASSWORD</code> parameter. <b>DUAL</b> mode is best suited for cases in which the dump file set will be imported on-site using the Oracle Encryption Wallet, but which may also need to be imported offsite where the Oracle Encryption Wallet is not available.</p> <p>When you use the <code>ENCRYPTION_MODE</code> parameter, you must also use either the <code>ENCRYPTION</code> or <code>ENCRYPTION_PASSWORD</code> parameter. Otherwise, an error is returned.</p> <p>To use <b>DUAL</b> or <b>TRANSPARENT</b> mode, the <code>COMPATIBLE</code> initialization parameter must be set to at least 11.1.</p> <p>The default mode depends on which other encryption-related parameters are used. If only <code>ENCRYPTION</code> is specified, then the default mode is <b>TRANSPARENT</b>. If <code>ENCRYPTION_PASSWORD</code> is specified and the Oracle Encryption Wallet is open, then the default is <b>DUAL</b>. If <code>ENCRYPTION_PASSWORD</code> is specified and the Oracle Encryption Wallet is closed, then the default is <b>PASSWORD</b>.</p>

**Table 46–23 (Cont.) Valid Options for the name Parameter in the SET\_PARAMETER Procedure**

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION_PASSWORD	Text	Export and Import	<p>Specifies a key for re-encrypting encrypted table columns, metadata, or table data so that they are not written as clear text in the dump file set. If the export operation involves encrypted table columns, but an encryption password is not supplied, then the encrypted columns will be written to the dump file set as clear text and a warning will be issued.</p> <p><b>NOTE:</b> Data Pump encryption functionality has changed as of Oracle Database 11g release 1 (11.1). Prior to release 11.1, the ENCRYPTION_PASSWORD parameter applied only to encrypted columns. However, as of release 11.1, the new ENCRYPTION parameter provides options for encrypting other types of data. This means that if you now specify ENCRYPTION_PASSWORD without also specifying ENCRYPTION and a specific option, then <i>all</i> data written to the dump file will be encrypted (equivalent to specifying ENCRYPTION=ALL). If you want to re-encrypt <i>only</i> encrypted columns, you must now specify ENCRYPTION=ENCRYPTED_COLUMNS_ONLY in addition to ENCRYPTION_PASSWORD.</p> <p>For export operations, this parameter is required if ENCRYPTION_MODE is set to either PASSWORD or DUAL.</p> <p>If ENCRYPTION_PASSWORD is specified but ENCRYPTION_MODE is not specified, then it is not necessary to have Transparent Data Encryption set up since ENCRYPTION_MODE will default to PASSWORD.</p> <p>The ENCRYPTION_PASSWORD parameter is not valid if the requested encryption mode is TRANSPARENT.</p> <p>To use the ENCRYPTION_PASSWORD parameter if ENCRYPTION_MODE is set to DUAL, you must have Transparent Data Encryption set up. See <i>Oracle Database Advanced Security Administrator's Guide</i> for more information about Transparent Data Encryption.</p> <p>For network exports, the ENCRYPTION_PASSWORD parameter in conjunction with ENCRYPTION=ENCRYPTED_COLUMNS_ONLY is not supported with user-defined external tables that have encrypted columns. The table will be skipped and an error message will be displayed, but the job will continue.</p> <p>Encryption attributes for all columns must match between the exported table definition and the target table.</p> <p>This parameter requires a job version of 10.2 or later.</p>
ESTIMATE	Text	Export and Import	<p>Specifies that the estimate method for the size of the tables should be performed before starting the job.</p> <p>If BLOCKS, a size estimate for the user tables is calculated using the count of blocks allocated to the user tables.</p> <p>If STATISTICS, a size estimate for the user tables is calculated using the statistics associated with each table. If no statistics are available for a table, the size of the table is estimated using BLOCKS.</p> <p>The ESTIMATE parameter cannot be used in Transportable Tablespace mode.</p> <p>Default=BLOCKS</p>

**Table 46–23 (Cont.) Valid Options for the name Parameter in the SET\_PARAMETER Procedure**

Parameter Name	Datatype	Supported Operations	Meaning
ESTIMATE_ONLY	Number	Export	Specifies that only the estimation portion of an export job should be performed. This option is useful for estimating the size of dump files when the size of the export is unknown.
FLASHBACK_SCN	NUMBER	Export and network Import	System change number (SCN) to serve as transactionally consistent point for reading user data. If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions, except for logical standby databases and Streams targets. FLASHBACK_SCN is not supported in Transportable mode.
FLASHBACK_TIME	Text	Export and network Import	<p>Either the date and time used to determine a consistent point for reading user data or a string of the form TO_TIMESTAMP ( . . . ).</p> <p>If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions.</p> <p>FLASHBACK_SCN and FLASHBACK_TIME cannot both be specified for the same job. FLASHBACK_TIME is not supported in Transportable mode.</p>
INCLUDE_METADATA	NUMBER	Export and Import	<p>If nonzero, metadata for objects will be moved in addition to user table data.</p> <p>If zero, metadata for objects will not moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data.</p> <p>INCLUDE_METADATA is not supported in Transportable mode.</p> <p>Default=1</p>
PARTITION_OPTIONS	Text	Import	<p>Specifies how partitioned tables should be handled during an import operation. The options are as follows:</p> <p>NONE means that partitioning is reproduced on the target database as it existed in the source database.</p> <p>DEPARTITION means that each partition or subpartition that contains storage in the job is reproduced as a separate unpartitioned table. Intermediate partitions that are subpartitioned are not re-created (although their subpartitions are converted into tables). The names of the resulting tables are system-generated from the original table names and partition names unless the name is overridden by the REMAP_TABLE metadata transform.</p> <p>MERGE means that each partitioned table is re-created in the target database as an unpartitioned table. The data from all of the source partitions is merged into a single storage segment. This option is not supported for transportable jobs or when the TRANSPORTABLE parameter is set to ALWAYS.</p> <p>This parameter requires a job version of 11.1 or later.</p> <p>Default=NONE</p>
SKIP_UNUSABLE_INDEXES	NUMBER	Import	<p>If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode.</p> <p>Default=1</p>

**Table 46–23 (Cont.) Valid Options for the name Parameter in the SET\_PARAMETER Procedure**

Parameter Name	Datatype	Supported Operations	Meaning
SOURCE_EDI TION	Text	Export and network Import	The application edition that will be used for determining the objects that will be unloaded for export and for network import.
TABLE_EXISTS_ ACTION	Text	Import	<p>Specifies the action to be performed when data is loaded into a preexisting table. The possible actions are: TRUNCATE, REPLACE, APPEND, and SKIP.</p> <p>If INCLUDE_METADATA=0, only TRUNCATE and APPEND are supported.</p> <p>If TRUNCATE, rows are removed from a preexisting table before inserting rows from the Import.</p> <p>Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE.</p> <p>If REPLACE, preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped.</p> <p>If APPEND, new rows are added to the existing rows in the table.</p> <p>If SKIP, the preexisting table is left unchanged.</p> <p>TABLE_EXISTS_ACTION is not supported in Transportable mode.</p> <p>The default is SKIP if metadata is included in the import. The default is APPEND if INCLUDE_METADATA is set to 0.</p>
TABLESPACE_ DATAFILE	Text	Import	<p>Specifies the full file specification for a datafile in the transportable tablespace set. TABLESPACE_DATAFILE is only valid for transportable mode imports.</p> <p>TABLESPACE_DATAFILE can be specified multiple times, but the value specified for each occurrence must be different.</p>
TARGET_EDI TION	Text	Import	The application edition that will be used for determining where the objects will be loaded for import and for network import.

**Table 46–23 (Cont.) Valid Options for the name Parameter in the SET\_PARAMETER Procedure**

Parameter Name	Datatype	Supported Operations	Meaning
TRANSPORTABLE	Text	Export	<p>For export operations done in table mode, allows the data to be moved using transportable tablespaces. Storage segments in the moved tablespaces that are not associated with the parent schemas (tables) will be reclaimed at import time. If individual partitions are selected in a table-mode job, only the tablespaces referenced by those partitions will be moved. During import, the moved partitions can only be reconstituted as tables by using the PARTITION_OPTIONS=DEPARTITION parameter.</p> <p>Use of the TRANSPORTABLE parameter prohibits the subsequent import of the dump file into a database at a lower version or using different character sets. Additionally, the data files may need to be converted if the target database is on a different platform. The TRANSPORTABLE parameter is not allowed if a network link is supplied on the OPEN call.</p> <p>The possible values for this parameter are as follows:  ALWAYS - data is always moved by moving data files  NEVER - data files are never used for copying user data</p> <p>This parameter requires a job version of 11.1 or later  Default=NEVER</p>
TTS_FULL_CHECK	NUMBER	Export	<p>If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports.</p> <p>Default=0</p>
USER_METADATA	NUMBER	Export and network Import	<p>For schema-mode operations, specifies that the metadata to re-create the users' schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter.</p> <p>The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode.</p> <p>Default=1 if user has DATAPUMP_EXP_FULL_DATABASE role; 0 otherwise.</p>

## Exceptions

- INVALID\_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID\_ARGVAL. This exception could be due to any of the following causes:
  - An invalid name was supplied for an input parameter
  - The wrong datatype was used for value
  - A value was not supplied
  - The supplied value was not allowed for the specified parameter name
  - A flashback parameter had been established after a different flashback parameter had already been established
  - A parameter was specified that did not support duplicate definitions
- INVALID\_OPERATION. The operation specified is invalid in this context.

- `INVALID_STATE`. The specified job is not in the Defining state.
- `INCONSISTENT_ARGS`. Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- `PRIVILEGE_ERROR`. The user does not have the `DATAPUMP_EXP_FULL_DATABASE` or `DATAPUMP_IMP_FULL_DATABASE` role required for the specified parameter.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

### Usage Notes

- The `SET_PARAMETER` procedure is used to specify optional features for the current job. See [Table 46-23](#) for a list of supported options.

## START\_JOB Procedure

This procedure begins or resumes execution of a job.

### Syntax

```
DBMS_DATAPUMP.START_JOB (
  handle          IN NUMBER,
  skip_current    IN NUMBER DEFAULT 0,
  abort_step      IN NUMBER DEFAULT 0,
  cluster_ok      IN NUMBER DEFAULT 1,
  service_name    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 46–24** START\_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
skip_current	If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index.  A description of the actions skipped is entered into the log file. skip_current is ignored for the initial START_JOB in a job.  If zero, no data or metadata is lost upon a restart.
abort_step	Value must be 0. Inserting values other than 0 into this argument will have unintended consequences.
cluster_ok	If = 0, all workers are started on the current instance. Otherwise, workers are started on instances usable by the job.
service_name	If specified, indicates a service name used to constrain the job to specific instances or to a specific resource group.

### Exceptions

- INVALID\_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID\_STATE. The causes of this exception can be any of the following:
  - No files have been defined for an Export, non-network Import, or SQL\_FILE job
  - An ADD\_FILE procedure has not been called to define the output for a SQL\_FILE job
  - A TABLESPACE\_DATAFILE parameter has not been defined for a Transportable Import job
  - A TABLESPACE\_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
  - The dump file set on an Import or SQL\_FILE job was either incomplete or missing a master table specification

- `INVALID_OPERATION`. Unable to restore master table from a dump file set.
- `INTERNAL_ERROR`. An inconsistency was detected when the job was started. Additional information may be available through the `GET_STATUS` procedure.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

### Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the `SET_PARALLEL` procedure was not called prior to the `START_JOB` procedure, the initial level of parallelism used in the job will be 1. If `SET_PARALLEL` was called prior to the job starting, the `degree` specified by the last `SET_PARALLEL` call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another `SET_PARALLEL` call.
- To restart a stopped job, an `ATTACH` function must be performed prior to executing the `START_JOB` procedure.

## STOP\_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

### Syntax

```
DBMS_DATAPUMP.STOP_JOB (
  handle      IN NUMBER,
  immediate   IN NUMBER DEFAULT 0,
  keep_master IN NUMBER DEFAULT NULL,
  delay       IN NUMBER DEFAULT 60);
```

### Parameters

**Table 46–25 STOP\_JOB Procedure Parameters**

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. At the end of the procedure, the user is detached from the handle.
immediate	If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted.  If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work.
keep_master	If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.
delay	The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.

### Exceptions

- INVALID\_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID\_STATE. The job is already in the process of being stopped or completed.
- SUCCESS\_WITH\_INFO. The procedure succeeded, but further information is available through the GET\_STATUS procedure.
- NO\_SUCH\_JOB. The specified job does not exist.

### Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the DETACH procedure.

- Once a job is stopped, it can be restarted using the `ATTACH` function and `START_JOB` procedures, provided the master table and the dump file set are left intact.
- If the `KEEP_MASTER` parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.

## WAIT\_FOR\_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

### Syntax

```
DBMS_DATAPUMP.WAIT_FOR_JOB (
  handle      IN  NUMBER,
  job_state   OUT VARCHAR2);
```

### Parameters

**Table 46–26** *WAIT\_FOR\_JOB Procedure Parameters*

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through a call to either the <code>OPEN</code> or <code>ATTACH</code> function. At the end of the procedure, the user is detached from the handle.
job_state	The state of the job when it has stopped executing. This will be either <code>Stopped</code> or <code>Completed</code> .

### Exceptions

- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` API.
- `INVALID_HANDLE`. The job handle is no longer valid.

### Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling `WAIT_FOR_JOB`. When `WAIT_FOR_JOB` returns, the job will no longer be executing. If the job completed normally, the final status will be `Completed`. If the job stopped executing because of a `STOP_JOB` request or an internal error, the final status will be `Stopped`.

## Using DBMS\_DBFS\_CONTENT

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)

## Overview

The DBMS\_DBFS\_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers. The "Content" in the DBFS Content interface refers to a file including metadata, and it can map to a BLOB (and other columns) in a table or be dynamically created by user-written plug-ins in Java or PL/SQL that run inside the database. This latter form is referred to as a "Store Provider."

For applications that already use LOBs as columns in their schema, the DBFS Content interface comes with a default implementation to access the BLOB columns. This enables existing applications to easily add PL/SQL provider implementations and provide access through the DBFS Content interface without rewriting their schema or their business logic. Additionally, applications can read and write content that is stored in other (third party) stores through the standard DBFS Content programming interface.

Examples of providers include:

- Content applications like Content DB
- Packaged applications that want to surface data through file
- Custom applications that want to leverage the file system interface -- for example, an application that stores medical image

The DBS\_DBFS\_CONTENT package abstracts out the common features of various stores into a simple and minimalist interface used to build portable client applications while insulated from store-specific libraries and implementation.

The content interface aggregates the path namespace of one or more stores into a single unified namespace, using the first component of the path name as a disambiguator, and presents this namespace to client-applications.

This allows clients to access the underlying documents using either a full-absolute path name as a single string:

```
/store-name/store-specific-path-name
```

or a store-qualified path name as a string 2-tuple:

```
["store-name", "/store-specific-path-name"]
```

The interface then takes care of correctly dispatching various operations on path names to the appropriate stores, and integrating the results back into the client-desired namespace.

Store service providers must conform to the Service Provider Interface (SPI) as declared by the package DBMS\_DBFS\_CONTENT\_SPI - the SPI is not a client-side interface and serves as a private contract between the implementation of the content interface and various stores that wish to be pluggable into it.

The content interface defines client-visible behavior (normal and exceptional) of various store operations, while allowing different stores to implement as rich a set of features as they choose - the interface allows stores to self-describe their capabilities and allows intelligent client applications to tune their behavior based on these capabilities (rather than hard-code logic specific to stores identified by name or by implementation).

## Security Model

The `DBMS_DBFS_CONTENT` package runs under `AUTHID CURRENT_USER`.

## Constants

The DBMS\_DBFS\_CONTENT package uses the constants shown in the following tables:

- [DBMS\\_DBFS\\_CONTENT Constants - Path Names](#)
- [DBMS\\_DBFS\\_CONTENT Constants - ContentID](#)
- [DBMS\\_DBFS\\_CONTENT Constants - Properties](#)
- [DBMS\\_DBFS\\_CONTENT Constants - Path Name Types](#)
- [DBMS\\_DBFS\\_CONTENT Constants - Store Features](#)
- [DBMS\\_DBFS\\_CONTENT Constants - Lock Types](#)
- [DBMS\\_DBFS\\_CONTENT Constants - Standard Properties](#)
- [DBMS\\_DBFS\\_CONTENT Constants - Optional Properties](#)
- [DBMS\\_DBFS\\_CONTENT Constants - Property Access Flags](#)
- [DBMS\\_DBFS\\_CONTENT Constants - Operation Codes](#)

### Path Name Constants and Types

The following constants are useful for declaring paths and item names. Paths are limited to 1024 characters and item names are limited to 256 characters.

**Table 47–1 DBMS\_DBFS\_CONTENT Constants - Path Names**

Constant	Type	Value	Description
NAME_MAX	PLS_INTEGER	256	Maximum length of an absolute path name visible to clients
NAME_T	VARCHAR2 (256)	NAME_MAX	Portable alias for string that can represent component names
PATH_MAX	PLS_INTEGER	1024	Maximum length of any individual component of an absolute path name visible to clients
PATH_T	VARCHAR2 (1024)	PATH_MAX	Portable alias for string that can represent path names

### ContentID Constants

Stores may expose to the user a unique identifier that represents a particular path item in the store. These identifiers are limited to 128 characters.

**Table 47–2 DBMS\_DBFS\_CONTENT Constants - ContentID**

Constant	Type	Value	Description
CONTENT_ID_MAX	PLS_INTEGER	128	Maximum length of a store-specific provider-generated contentID that identifies a file-type content item

**Table 47-2 (Cont.) DBMS\_DBFS\_CONTENT Constants - ContentID**

Constant	Type	Value	Description
CONTENT_ID_T	RAW(128)	CONTENT_ID_MAX	Portable alias for raw buffers that can represent contentID values

**Properties Constants**

Every path name in a store is associated with a set of properties. For simplicity and to provide generic basis, each property is identified by a string "name", has a string "value" (which might be NULL if unset or undefined or unsupported by a specific store implementation) and a value "typecode" (a numeric discriminant for the actual type of value held in the "value" string.)

Coercing property values to strings has the advantage of making the various interfaces uniform and compact (and can even simplify implementation of the underlying stores), but has the disadvantage of the potential for information loss during conversions to and from strings.

It is expected that clients and stores use well-defined database conventions for these conversions, and use the typecode field as appropriate.

A typecode is a numeric value representing the true type of a string-coerced property value. Simple scalar types (numbers, dates, timestamps, etc.) can be depended on by clients and must be implemented by stores.

Since standard RDBMS typecodes are positive integers, the DBMS\_DBFS\_CONTENT interface allows negative integers to represent client-defined types by negative typecodes. These typecodes do not conflict with standard typecodes, are maintained persistently and returned to the client as needed, but need not be interpreted by the DBFS content API or any particular store. Portable client applications should not use user-defined typecodes as a back door way of passing information to specific stores.

**Table 47-3 DBMS\_DBFS\_CONTENT Constants - Properties**

Constant	Type	Value	Description
PROPNAME_MAX	PLS_INTEGER	32	Maximum length of a property name
PROPNAME_T	VARCHAR2(32)	PROPNAME_MAX	Portable alias for string that can represent property names
PROPVAL_MAX	PLS_INTEGER	1024	Maximum length of the string value of a property
PROPVAL_T	VARCHAR2(1024)	PATH_MAX	Portable alias for string that can represent property values

**Path Name Types**

Path items in a store have a item type associated with them. These types represent the kind of entry the item represents in the store.

**Table 47-4 DBMS\_DBFS\_CONTENT Constants - Path Name Types**

Constant	Type	Value	Description
TYPE_FILE	PLS_INTEGER	1	A regular file storing content (a logically linear sequence of bytes accessed as a BLOB)
TYPE_DIRECTORY	PLS_INTEGER	2	A container of other path name types, including file types
TYPE_LINK	PLS_INTEGER	3	A symbolic link (that is, an uninterpreted string value associated with a path name). Since symbolic links may represent path names that fall outside the scope of any given store (or even the entire aggregation of stores managed by the DBMS_DBFS_CONTENT interface), or may not even represent path names, clients must be careful in creating symbolic links, and stores must be careful in trying to resolve these links internally.
TYPE_REFERENCE	PLS_INTEGER	4	A hard link which is always a valid path name alias to content

### Store Features

In order to provide a common programmatic interface to as many different types of stores as possible, the DBFS content API leaves some of the behavior of various operations to individual store providers to define and implement.

However, it is still important to provide client-side programmers with an API that is sufficiently rich and conducive to portable applications.

The DBFS content API achieves this by allowing different store service providers (and different stores) to describe themselves through a "feature set" (a bitmask indicating which features they support and which ones they do not).

Using the feature set, it is possible, albeit tricky, for client applications to compensate for the feature deficiencies of specific stores by implementing additional logic on the client-side, and deferring complex operations to stores capable of supporting them.

**Table 47-5 DBMS\_DBFS\_CONTENT Constants - Store Features**

Constant	Type	Value	Description
FEATURE_FOLDERS	PLS_INTEGER	1	Set if the store supports folders (or directories) as part of hierarchical path names

**Table 47–5 (Cont.) DBMS\_DBFS\_CONTENT Constants - Store Features**

Constant	Type	Value	Description
FEATURE_FOIAT	PLS_INTEGER	2	Set if implicit folder operations within the store (performed as part of a client-requested operation) runs inside autonomous transactions. In general, the use of autonomous transactions is a compromise between (a) simplicity in the implementation and client-controlled transaction scope for all operations, at the cost of greatly reduced concurrency (FEATURE_FOIAT not set), versus (b) more complex implementation and smaller client-controlled transaction scope, at the benefit of greatly increased concurrency (FEATURE_FOIAT set).
FEATURE_NOWAIT	PLS_INTEGER	4	Set if the store allows <code>nowait</code> gets of path elements. The default behavior is to wait for row locks; if <code>nowait</code> gets are implemented, the <code>get</code> operation raises an ORA-54 exception if the path element is already locked by another transaction.
FEATURE_ACLS	PLS_INTEGER	8	Set if the store supports Access Control Lists (ACLs) and internal authorization or checking based on these ACLs. ACLs are standard properties but a store may do nothing more than store and retrieve the ACLs without interpreting them in any way.
FEATURE_LINKS	PLS_INTEGER	16	Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself
FEATURE_LINK_DEREF	PLS_INTEGER	32	Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself
FEATURE_REFERENCES	PLS_INTEGER	64	Set if the store supports hard links

**Table 47-5 (Cont.) DBMS\_DBFS\_CONTENT Constants - Store Features**

Constant	Type	Value	Description
FEATURE_LOCKING	PLS_INTEGER	128	Set if the store supports user-level locks (read-only, write-only, read-write) that can be applied on various items of the store, and if the store uses these lock settings to control various types of access to the locked items. User-level locks are orthogonal to transaction locks and persist beyond the scope of any specific transaction, session, or connection — this implies that the store itself may not be able to clean up after dangling locks, and client-applications need to perform any garbage collection.
FEATURE_LOCK_HIERARCHY	PLS_INTEGER	256	Set if the store allows a user-lock to control access to the entire sub-tree under the locked path name. A simpler locking model would have locking semantics apply only to a specific path name, and depend on the locks placed on its parents or children (unless the requested operation would implicitly need to modify these parents or children).
FEATURE_LOCK_CONVERT	PLS_INTEGER	512	Set if the store supports upgrade or downgrade of locks from one mode to another
FEATURE_VERSIONING	PLS_INTEGER	1024	Set if the store supports at least a linear versioning and version management. Different versions of the same path name are identified by monotonic version numbers, with a version-nonqualified path name representing the latest version.
FEATURE_VERSION_PATH	PLS_INTEGER	2048	Set if the store supports a hierarchical namespace for different versions of a path name
FEATURE_SOFT_DELETES	PLS_INTEGER	4096	Set if the store supports a "soft-delete", that is, the ability to delete a path name and make it invisible to normal operations, but retain the ability to restore the path name later (as long as it has not been overwritten by a new create operation). The store also supports purging soft-deleted path names (making them truly deleted), and navigation modes that show soft-deleted items.
FEATURE_HASHING	PLS_INTEGER	8192	Set if the store automatically computes and maintains some type of a secure hash of the contents of a path name (typically a TYPE_FILE path).

**Table 47-5 (Cont.) DBMS\_DBFS\_CONTENT Constants - Store Features**

Constant	Type	Value	Description
FEATURE_HASH_LOOKUP	PLS_INTEGER	16384	Set if the store allows "content-based addressing", that is, the ability to locate a content item based, not on its path name, but on its content hash.
FEATURE_FILTERING	PLS_INTEGER	32768	<p>Set if the store allows clients to pass a filter function (a PL/SQL function conforming to the signature below) that returns a logical boolean indicating if a given store item satisfies a selection predicate. Stores that support filtering may be able to more efficiently perform item listing, directory navigation, and deletions by embedding the filtering logic inside their implementation. If filtering is not supported, clients can retrieve more items than necessary and perform the filtering checks themselves, albeit less efficiently.</p> <p>A filter predicate is a function with the following signature:</p> <pre>function filterFunction(   path          IN  VARCHAR2,   store_name    IN  VARCHAR2,   opcode        IN  INTEGER,   item_type     IN  INTEGER,   properties    IN  DBMS_DBFS_ CONTENT_PROPERTIES_T,   content       IN  BLOB)   RETURN INTEGER;</pre> <p>Any PL/SQL function conforming to this signature can examine the contents and properties of a store item, and determine if the item satisfies the selection criterion for the current operation. Any nonzero return value results in the DBMS_DBFS_CONTENT interface processing the item as part of the current operation; a return value that is zero or NULL results in the item being skipped from processing.</p>
FEATURE_SEARCHING	PLS_INTEGER	65536	Set if the store allows clients to pass a text-search filter query to locate <code>type_file</code> path names based on their content. Stores that support searching may use indexes to accelerate such searches; otherwise, clients need to build their own indexes, or else search a potentially larger set of items to locate the ones of interest for the current search.

**Table 47-5 (Cont.) DBMS\_DBFS\_CONTENT Constants - Store Features**

Constant	Type	Value	Description
FEATURE_ASOF	PLS_INTEGER	131072	Set if the store allows clients to use a flashback timestamp in query operations (non-mutating <a href="#">GETPATH Procedures</a> , <a href="#">LIST Function</a> , <a href="#">SEARCH Function</a> ).
FEATURE_PROVIDER_PROPS	PLS_INTEGER	262144	Set if the store allows per-operation properties (that control the behavior of the store with regard to the current operation, as opposed to properties associated with individual items).
FEATURE_SNAPSHOTS	PLS_INTEGER	524288	Set if the store allows the use of named, read-only snapshots of its contents. It is up to the provider to implement snapshots using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between snapshots and its parent content view.
FEATURE_CLONES	PLS_INTEGER	1048576	Set if the store allows the use of named, writable clones of its contents. It is up to the provider to implement clones using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between clones and its parent content view.
FEATURE_LOCATOR	PLS_INTEGER	2097152	Set if the store allows direct access to file contents through a LOB locator. Stores that internally manipulate the file contents, perhaps by shredding or reassembling them in separate pieces, performing other transformations, and so on, cannot transparently give out a LOB locator to clients. The file contents of these stores should be accessed using the buffer-based interfaces.
FEATURE_CONTENT_ID	PLS_INTEGER	4194304	Set if the store allows a "pathless", contentID-based access to files (there is no notion of a directory, link, or reference in this model)
FEATURE_LAZY_PATH	PLS_INTEGER	8388608	Set if the store allows a lazy binding of a path name to file content elements that are otherwise identified by a contentID; this feature makes sense only in conjunction with FEATURE_CONTENT_ID

### Lock types

Stores that support locking should implement 3 types of locks: `LOCK_READ_ONLY`, `LOCK_WRITE_ONLY`, and `LOCK_READ_WRITE`.

User-locks (of one of these 3 types) can be associated with a user-supplied `lock_data`. This is not interpreted by the store, but can be used by client applications for their own purposes. For example, the user-data could indicate the time at which the lock was placed, assuming some part of the client application is interested in later using this information to control its actions, such as garbage collect stale locks or explicitly break locks.

In the simplest locking model, a `LOCK_READ_ONLY` prevents all explicit modifications to a path name (but allows implicit modifications, and changes to parent/child path names). A `LOCK_WRITE_ONLY` prevents all explicit reads to the path name (but allows implicit reads, and reads to parent/child path names). A `LOCK_READ_WRITE` allows both.

All locks are associated with a "principal" performing the locking operation; stores that support locking are expected to preserve this information, and use it to perform read or write lock checking (see `opt_locker`).

More complex lock models: multiple read-locks, lock-scoping across path name hierarchies, lock conversions, group-locking, and other strategies, are possible but currently not defined by the content interface.

**Table 47-6 DBMS\_DBFS\_CONTENT Constants - Lock Types**

Constant	Type	Value	Description
<code>LOCK_READ_ONLY</code>	<code>PLS_INTEGER</code>	1	Locks as read-only
<code>LOCK_WRITE_ONLY</code>	<code>PLS_INTEGER</code>	2	Locks as write-only
<code>LOCK_READ_WRITE</code>	<code>PLS_INTEGER</code>	3	Locks as read-write

### Standard properties

Standard properties are well-defined, mandatory properties associated with all content path names that all stores should support (in the manner described by the content interface), with some concessions. For example, a read-only store need not implement a `modification_time` or `creation_time`; stores created against tables with a fixed-schema may choose reasonable defaults for as many of these properties as needed, and so on.

All standard properties informally use the `STD` namespace. Clients and stores should avoid using this namespace to define their own properties since this can cause conflicts in future.

The menu of standard properties is expected to be fairly stable over time.

**Table 47-7 DBMS\_DBFS\_CONTENT Constants - Standard Properties**

Constant	Type	Value	Description
<code>STD_ACCESS_TIME</code>	<code>VARCHAR2(32)</code>	'std:access_time'	<code>TYPECODE_TIMESTAMP</code> in UTC: The time of last access of a path name's contents

**Table 47-7 (Cont.) DBMS\_DBFS\_CONTENT Constants - Standard Properties**

Constant	Type	Value	Description
STD_ACL	VARCHAR2 (32)	'std:acl'	TYPECODE_VARCHAR2: The access control list (in standard ACL syntax) associated with the path name
STD_CANONICAL_PATH	VARCHAR2 (32)	'std:canonical_path'	TYPECODE_VARCHAR2: The canonical store-specific path name of an item, suitably cleaned up (leading or trailing "/" collapsed or trimmed, and so on)
STD_CHANGE_TIME	VARCHAR2 (32)	'std:change_time'	TYPECODE_TIMESTAMP in UTC: The time of last change to the metadata of a path name
STD_CHILDREN	VARCHAR2 (32)	'std:children'	TYPECODE_NUMBER: The number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)
STD_CONTENT_TYPE	VARCHAR2 (32)	'std:content_type'	TYPECODE_NUMBER: The number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)
STD_CREATION_TIME	VARCHAR2 (32)	'std:creation_time'	TYPECODE_TIMESTAMP in UTC: The time at which the item was created (once set, this value never changes for the lifetime of the path name)
STD_DELETED	VARCHAR2 (32)	'std:deleted'	TYPECODE_NUMBER as a BOOLEAN: Set to a nonzero number if the path name has been soft-deleted but not yet purged.
STD_GUID	VARCHAR2 (32)	'std:guid'	TYPECODE_NUMBER: A store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given ( <i>store-name</i> , <i>store-specific-path name</i> ) has a stable and unique GUID for its lifetime.
STD_LENGTH	VARCHAR2 (32)	'std:length'	TYPECODE_NUMBER: The length of the content (BLOB) of a TYPE_FILE/TYPE_REFERENCE path, or the length of the referent of a TYPE_LINK symbolic link. Directories do not have a well-defined length and stores are free to set this property to zero, NULL, or any other value.

**Table 47-7 (Cont.) DBMS\_DBFS\_CONTENT Constants - Standard Properties**

Constant	Type	Value	Description
STD_MODIFICATION_TIME	VARCHAR2 (32)	'std:modification_time'	TYPECODE_TIMESTAMP in UTC: The time of last change to the data associated with a path name. Change to the content of a TYPE_FILE/TYPE_REFERENCE path, the referent of the TYPE_LINK path, and addition or deletion of immediate children in a TYPE_DIRECTORY path, all constitute data changes.
STD_OWNER	VARCHAR2 (32)	'std:owner'	TYPECODE_VARCHAR2: A client-supplied (or implicit) owner name for the path name. The owner name may be used (along with the current "principal") for access checks by stores that support ACLs, locking, or both.
STD_PARENT_GUID	VARCHAR2 (32)	'std:parent_guid'	TYPECODE_NUMBER: A store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given ( <i>store-name, store-specific-path name</i> ) has a stable and unique GUID for its lifetime.  STD_PARENT_GUID(path name) == STD_GUID(parent (path name))
STD_REFERENT	VARCHAR2 (32)	'std:referent'	TYPECODE_VARCHAR2: The content of the symbolic link of a TYPE_LINK path; NULL otherwise. As mentioned, the STD_REFERENT can be an arbitrary string and must not necessarily be interpreted as path name by clients (or such interpretation should be done with great care).

**Optional Properties**

Optional properties are well-defined but non-mandatory properties associated with all content path names that all stores are free to support (but only in the manner described by the DBFS content API). Clients should be prepared to deal with stores that support none of the optional properties.

All optional properties informally use the "opt:" namespace. Clients and stores should avoid using this namespace to define their own properties since this can cause conflicts in the future.

The menu of optional properties is expected to be expand over time.

**Table 47-8 DBMS\_DBFS\_CONTENT Constants - Optional Properties**

Constant	Type	Value	Description
OPT_HASH_TYPE	VARCHAR2 (32)	'opt:hash_type'	TYPECODE_NUMBER: The number of (compatible) locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the <code>opt_locker</code> must specify all lockers (with repeats so that lock counts can be correctly maintained).
OPT_HASH_VALUE	VARCHAR2 (32)	'opt:hash_value'	TYPECODE_NUMBER: The hash value of type <code>OPT_HASH_TYPE</code> describing the content of the path name.
OPT_LOCK_COUNT	VARCHAR2 (32)	'opt:lock_count'	TYPECODE_NUMBER: The number of (compatible) locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the <code>opt_locker</code> must specify all lockers (with repeats so that lock counts can be correctly maintained).
OPT_LOCK_DATA	VARCHAR2 (32)	'opt:lock_data'	TYPECODE_NUMBER: The client-supplied user-data associated with a user-lock, uninterpreted by the store.
OPT_LOCKER	VARCHAR2 (32)	'opt:locker'	TYPECODE_NUMBER: One or more implicit or client-specified principals that applied a user-lock on a path name.
OPT_LOCK_STATUS	VARCHAR2 (32)	'opt:lock_status'	TYPECODE_NUMBER: One of the <code>LOCK_READ_ONLY</code> , <code>LOCK_WRITE_ONLY</code> , <code>LOCK_READ_WRITE</code> values describing the type of lock currently applied on a path name.
OPT_VERSION	VARCHAR2 (32)	'opt:version'	TYPECODE_NUMBER: A sequence number for linear versioning of a path name.
OPT_VERSION_PATH	VARCHAR2 (32)	'opt:version_path'	TYPECODE_NUMBER: A version-path name for hierarchical versioning of a path name.
OPT_CONTENT_ID	VARCHAR2 (32)	'opt:content_id'	TYPECODE_NUMBER: A provider-generated store-specific unique contentID in the form of a string for a file content element (that may optionally not be associated with a path; see <code>FEATURE_CONTENT_ID</code> and <code>FEATURE_LAZY_PATH</code> ).

### Property Access Flags

Content interface methods to get or set properties can use combinations of property access flags to fetch properties from different name spaces in a single interface call.

**Table 47–9 DBMS\_DBFS\_CONTENT Constants - Property Access Flags**

Constant	Type	Value	Description
PROP_NONE	PLS_INTEGER	0	None: used when the client is not interested in any properties, and is invoking the content access method for other reasons (path name existence or lockability validation, data access, and so on)
PROP_STD	PLS_INTEGER	1	Mandatory: used when the client is interested in the standard properties; all standard properties are retrieved if this flag is specified.
PROP_OPT	PLS_INTEGER	2	Optional: used when the client is interested in the optional properties; all optional properties are retrieved if this flag is specified.
PROP_USR	PLS_INTEGER	3	User-defined: used when the client is interested in the user-defined properties; all user-defined properties are retrieved if this flag is specified.
PROP_ALL	PLS_INTEGER	PROP_STD + PROP_OPT + PROP_USR;	All: an alias for the combination of all standard, optional, and user-defined properties
PROP_DATA	PLS_INTEGER	8	Content: used when the client is interested only in data access, and does not care about properties
PROP_SPC	PLS_INTEGER	16	Specific: used when the client is interested in a mix-and-match of different subsets of various property name spaces; the names of the specific properties to fetch are passed into the content interface method call as arguments, and only these property values are fetched and returned to the client. This is useful in cases where there are a very large number of properties potentially accessible, but the client is interested in only a small number of them (and knows the names of these "interesting" properties beforehand).  PROP_SPC is applicable only to the various GETPATH operations. Other operations that specify properties ignore PROP_SPC specifications.

**Operation Codes**

All of the operations in the DBFS content API are represented as abstract opcodes.

Clients can use these opcodes to directly and explicitly by invoking the [CHECKACCESS Function](#) to verify if a particular operation can be invoked by a given principal on a particular path name.

**Table 47-10 DBMS\_DBFS\_CONTENT Constants - Operation Codes**

Constant	Type	Value	Description
OP_CREATE	PLS_INTEGER	1	Create a path item
OP_CREATEFILE	PLS_INTEGER	OP_CREATE	Create a file
OP_CREATELINK	PLS_INTEGER	OP_CREATE	Create a soft link
OP_CREATEREFERENCE	PLS_INTEGER	OP_CREATE	Create a reference (hard link)
OP_DELETE	PLS_INTEGER	2	Soft-deletion, purge, and restore operations are all represented by OP_DELETE
OP_DELETEFILE	PLS_INTEGER	OP_DELETE	Delete a file
OP_DELETEDIRECTORY	PLS_INTEGER	OP_DELETE	Delete a directory
OP_RESTORE	PLS_INTEGER	OP_DELETE	Restore a soft-deleted path item
OP_PURGE	PLS_INTEGER	OP_DELETE	Purge a soft-deleted path item
OP_READ	PLS_INTEGER	3	Read from a path item
OP_GET	PLS_INTEGER	OP_READ	Get a path item for either read or update operations
OP_WRITE	PLS_INTEGER	4	Write a path item
OP_PUT	PLS_INTEGER	OP_WRITE	Put (write) to a path item
OP_RENAME	PLS_INTEGER	5	Rename a path item
OP_RENAMEFROM	PLS_INTEGER	OP_RENAME	Operations performed on the source of a rename
OP_RENAMETO	PLS_INTEGER	OP_RENAME	Operations performed on the destination of a rename
OP_SETPATH	PLS_INTEGER	OP_RENAME	Set a path item name
OP_LIST	PLS_INTEGER	6	Perform a path listing
OP_SEARCH	PLS_INTEGER	7	Perform a search
OP_LOCK	PLS_INTEGER	8	Lock a path item
OP_UNLOCK	PLS_INTEGER	9	Unlock a path item
OP_ACL	PLS_INTEGER	10	An implicit operation invoked during an OP_CREATE or OP_PUT that specifies a STD_ACL property; the operation tests to see if the principal is allowed to set or change the ACL of a store item
OP_STORE	PLS_INTEGER	11	A catch-all category for miscellaneous store operations that do not fall under any of the other operational interfaces

## Exceptions

DBFS content API operations can raise any one of the following top-level exceptions.

Clients can program against these specific exceptions in their error handlers without worrying about the specific store implementations of the underlying error signally code.

Store service providers, for their part, should do their best to trap or wrap any internal exceptions into one of the following exception types, as appropriate

**Table 47-11 DBMS\_DBFS\_CONTENT Exceptions**

<b>Exception</b>	<b>Code</b>	<b>Description</b>
PATH_EXISTS	64000	A specified path name already exists
INVALID_PARENT	64001	Parent of a specified path name does not exist
INVALID_PATH	64002	Specified path name does not exist, or is not valid
UNSUPPORTED_OPERATION	64003	An operation unsupported by a store was invoked
INVALID_ARGUMENTS	64004	An operation was invoked with invalid arguments
INVALID_ACCESS	64005	Access control checks failed for the current operation
LOCK_CONFLICT	64006	Current operation failed lock conflict check
INVALID_STORE	64007	An invalid store name was specified
INVALID_MOUNT	64008	An invalid mount point was specified
INVALID_PROVIDER	64009	An invalid provider-package was specified
READONLY_PATH	64010	A mutating operation was invoked on a read-only mount or store

## Operational Notes

- [Implementation](#)
- [Path Names](#)
- [Creation Operations](#)
- [Deletion Operations](#)
- [Get \(Retrieve\) and Put \(Insert\) Operations](#)
- [Rename and Move Operations](#)
- [Directory Navigation and Search](#)
- [Locking Operations](#)
- [Access Check Operation](#)

### Implementation

Since the interconnection of the [DBMS\\_DBFS\\_CONTENT](#) interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a service provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

### Path Names

All path names used in the provider SPI are store-qualified in pair form (`store_name`, `pathname`) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in [DBMS\\_DBFS\\_CONTENT Constants - Store Features](#)) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a `NULL` path name, and possibly a contentID specified as a parameter or by way of the `OPT_CONTENT_ID` (see [DBMS\\_DBFS\\_CONTENT Constants - Optional Properties](#)) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

### Creation Operations

The provider SPI must allow the DBFS content API to create directory, file, link, and reference elements subject to store feature support.

All of the creation subprograms require a valid path name, but note the special exemption for contentID-based access. Creation subprograms can optionally specify properties to be associated with the path name as it is created. It is also possible for clients to return item properties after the creation completes so that automatically generated properties, such as `STD_CREATION_TIME` (see [DBMS\\_DBFS\\_CONTENT Constants - Standard Properties](#)) are immediately available to clients. The exact set of properties fetched back is controlled by the various `PROP_XXX` bitmasks in the `prop_flags` parameter.

Links and references require an additional path name to associate with the primary path name.

File path names can optionally specify a BLOB value to use to initially populate the underlying file content (the provided BLOB may be any valid LOB). On creation, the underlying LOB is returned to the client, provided that `PROP_DATA` is specified in the `prop_flags` parameter.

Nondirectory path names require that their parent directory be created first. Directory path names themselves can be recursively created with the path name hierarchy leading up to a directory created in one call.

Attempts to create paths that already exist is an error; the sole exception is path names that are "soft-deleted" (as discussed in the context of [Deletion Operations](#)). In these cases, the soft-deleted item is implicitly purged, and the new item creation is attempted.

Stores and their providers that support contentID-based access accept an explicit store name and a `NULL` path to create a new content element. The contentID generated for this element is available by means of the `OPT_CONTENT_ID` property (see [DBMS\\_DBFS\\_CONTENT Constants - Optional Properties](#)), contentID-based creation being automatically implied by `PROP_OPT` property in the `prop_flags` parameter).

The newly created element may also have an internally generated path name if `FEATURE_LAZY_PATH` property is not supported (see [DBMS\\_DBFS\\_CONTENT Constants - Store Features](#)) and this path is available by way of the `STD_CANONICAL_PATH` property (see [DBMS\\_DBFS\\_CONTENT Constants - Standard Properties](#)).

Only file elements are candidates for contentID-based access.

### **Deletion Operations**

The provider SPI must allow the DBFS content API to delete directory, file, link, and reference elements (subject to store feature support).

By default, the deletions are permanent, removing the successfully deleted items on transaction commit, but stores may also support "soft-delete" features. If requested by the client, soft-deleted items are retained by the store, although they are not typically visible in normal listings or searches.

Soft-deleted items can be restored, or explicitly purged.

Directory path names can be recursively deleted, with the path name hierarchy below a directory deleted in one call. Non-recursive deletions can be performed only on empty directories. Recursive soft-deletions apply the soft-delete to all of the items being deleted.

Individual path names, as well as all soft-deleted path names under a directory, can be restored or purged by means of the various restore and purge subprograms.

Providers that support filtering can use the provider filter to identify subsets of items to delete. This makes most sense for bulk operations such as the [DELETEDIRECTORY Procedure](#), [PROPVARCHAR2 Function](#), and [RESTOREALL Procedure](#), but all of the deletion-related operations accept a `filter` argument.

Stores and their providers that support contentID-based access can also allow file items to be deleted by specifying their contentID.

### **Get (Retrieve) and Put (Insert) Operations**

Existing path items can be accessed (for query or for update) and modified using simple get and put subprograms. All path names allow their metadata (properties) to

be read and modified. On completion of the call, the client can request specific properties to be fetched by means of the `prop_flags` parameter.

File path names allow their data (content) to be read and modified. On completion of the call, the client can use the `PROP_DATA` bitmasks in the `prop_flags` parameter to request a new `BLOB` locator to continue data access.

Files can also be read or written without using `BLOB` locators by explicitly specifying logical offsets, buffer amounts, and a suitably sized buffer.

Update accesses must specify the `forUpdate` flag. Access to link path names can be implicitly and internally de-referenced by stores (subject to feature support) if the `deref` flag is specified, however, this may have undetermined outcomes since symbolic links are not always resolvable.

The read methods, such as the [GETPATH Procedures](#) where `forUpdate` is specified as 0, also accepts a valid `asof` timestamp in the `ctx` parameter that can be used by stores to implement "as of" style flashback queries. Mutating versions of the [GETPATH Procedures](#) and the [PUTPATH Procedures](#) methods do not support "as of" modes of operation.

The [GETPATHNOWAIT Procedures](#) implies that the operation is for an update, and, if implemented (see `FEATURE_NOWAIT` in [DBMS\\_DBFS\\_CONTENT Constants - Store Features](#)), this allows providers to return an exception (ORA-00054) rather than wait for row locks.

### Rename and Move Operations

Path names can be renamed or moved, possibly across directory hierarchies and mount-points, but within the same store.

Nondirectory path names previously accessible by way of specifying the `oldPath` parameter are renamed as a single item subsequently accessible by specifying `newPath`, assuming that `newPath` does not already exist.

If `newPath` exists and is not a directory, the action of renaming implicitly deletes the existing item before renaming `oldPath`. If the `newPath` exists and is a directory, `oldPath` is moved into the target directory.

Directory path names previously accessible by way of `oldPath` are renamed by moving the directory and all of its children to `newPath` (if it does not already exist) or as children of `newPath` (if it exists and is a directory).

Stores and their providers that support `contentID`-based access and lazy path name binding also support the [SETPATH Procedures](#) that associates an existing `contentID` with a new "path".

### Directory Navigation and Search

The `DBMS_DBFS_CONTENT` interface can list or search the contents of directory path names, optionally operating recursively into sub-directories, optionally seeing soft-deleted items, optionally using flashback "as of" a provided timestamp, and optionally filtering items in or out within the store based on list or search predicates.

### Locking Operations

Clients of the `DBMS_DBFS_CONTENT` interface can apply user-level locks to any valid path name (subject to store feature support), associate the lock with user-data, and subsequently unlock these path names.

The status of locked items is available using various optional properties (note the previous discussion regarding `opt_lock`).

It is the responsibility of the store (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.

#### **Access Check Operation**

This operation ascertains if a given path name (`store_name`, `path`, `pathtype`) can be manipulated by operation (see the various `DBMS_DBFS_CONTENT.OP_XXX` opcodes in [DBMS\\_DBFS\\_CONTENT Constants - Optional Properties](#)) by the user acting on the store utilizing the `principal` parameter. This is a convenience function for the `DBMS_DBFS_CONTENT` interface; a store that supports access control still internally performs these checks to guarantee security.

---

## Data Structures

The `DBMS_DBFS_CONTENT` package defines `RECORD` types and `TABLE` types.

### RECORD Types

- [FEATURE\\_T Record Type](#)
- [MOUNT\\_T Record Type](#)
- [PATH\\_ITEM\\_T Record Type](#)
- [PROP\\_ITEM\\_T Record Type](#)
- [PROPERTY\\_T Record Type](#)
- [STORE\\_T Record Type](#)

### TABLE Types

- [FEATURES\\_T Table Type](#)
- [MOUNTS\\_T Table Type](#)
- [PATH\\_ITEMS\\_T Table Type](#)
- [PROP\\_ITEMS\\_T Table Type](#)
- [PROPERTIES\\_T Table Type](#)
- [STORES\\_T Table Type](#)

### Usage Notes

There is an approximate correspondence between `DBMS_DBFS_CONTENT_PROPERTY_T` and `PROPERTY_T` — the former is a SQL object type that describes the full property tuple, while the latter is a PL/SQL record type that describes only the property value component.

Likewise, there is an approximate correspondence between `DBMS_DBFS_CONTENT_PROPERTIES_T` and `PROPERTIES_T` — the former is a SQL nested table type, while the latter is a PL/SQL hash table type.

Dynamic SQL calling conventions force the use of SQL types, but PL/SQL code may be implemented more conveniently in terms of the hash-table types.

The `DBMS_DBFS_CONTENT` interface provides convenient utility functions to convert between `DBMS_DBFS_CONTENT_PROPERTIES_T` and `PROPERTIES_T` (see `propertiesT2H` and `propertiesH2T`).

Clients can query the `DBMS_DBFS_CONTENT` interface for the list of available stores, determine which store is to handle access to a given path name, and determine the feature set for the store.

## FEATURE\_T Record Type

This type describes a store mount point and its properties.

### Syntax

```
TYPE feature_t IS RECORD (  
    feature_name    VARCHAR2(32),  
    feature_mask    INTEGER,  
    feature_state   VARCHAR2(3));
```

### Fields

**Table 47–12** MOUNT\_T Fields

Field	Description
feature_name	Name of feature
feature_mask	Value used to mask off all other bits other than this feature in the feature value
feature_state	'YES' or 'NO' depending on whether the feature is supported on this store

## MOUNT\_T Record Type

This type describes a store mount point and its properties.

### Syntax

```
TYPE mount_t IS RECORD (
  store_name      VARCHAR2(32),
  store_id        NUMBER,
  provider_name   VARCHAR2(32),
  provider_pkg    VARCHAR2(32),
  provider_id     NUMBER,
  provider_version VARCHAR2(32),
  store_features  INTEGER,
  store_guid      NUMBER,
  store_mount     NAME_T,
  mount_properties DBMS_DBFS_CONTENT_PROPERTIES_T);
```

### Fields

**Table 47–13** MOUNT\_T Fields

Field	Description
store_name	Name of store
store_id	ID of store
provider_name	Name of the content store
provider_pkg	PL/SQL package name for the content store
provider_id	Unique identifier for the content store
provider_version	Version number for the content store
respos_features	Features supported by this content store
store_guid	Unique ID for this instance of the store
store_mount	Location at which this store instance is mounted
mount_properties	Properties for this mount point (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )

## PATH\_ITEM\_T Record Type

A `PATH_ITEM_T` is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

### Syntax

```
TYPE path_item_t IS RECORD (
    store          NAME_T,
    mount         NAME_T,
    pathname      PATH_T,
    pathtype     VARCHAR2(32),
    filedata     BLOB,
    std_access_time  TIMESTAMP,
    std_acl       VARCHAR2(1024),
    std_change_time  TIMESTAMP,
    std_children  NUMBER,
    std_content_type VARCHAR2(1024),
    std_creation_time  TIMESTAMP,
    std_deleted   INTEGER,
    std_guid     INTEGER,
    std_modification_time  TIMESTAMP,
    std_owner     VARCHAR2(32),
    std_parent_guid  INTEGER,
    std_referent  VARCHAR2(1024),
    opt_hash_type VARCHAR2(32),
    opt_hash_value VARCHAR2(128),
    opt_lock_count  INTEGER,
    opt_lock_data  VARCHAR2(128),
    opt_locker     VARCHAR2(128),
    opt_lock_status  INTEGER,
    opt_version    INTEGER,
    opt_version_path  PATH_T,
    opt_content_id  CONTENT_ID_T);
```

### Fields

**Table 47–14** *PATH\_ITEM\_T Fields*

Field	Description
store	Name of store
mount	Location at which instance of store is mounted
pathname	Name of path to item
pathtype	Type of object path (see <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )
filedata	BLOB locator that can be used to access data in the path item
std_access_time	Time of last access of a pathname's contents
std_acl	Access Control List (in standard ACL syntax)
std_change_time	Time of last change to the metadata of a path name
std_children	Number of child directories or folders a directory or folder path (this property should be available in providers that support the <code>feature_folders</code> feature).

**Table 47-14 (Cont.) PATH\_ITEM\_T Fields**

Field	Description
std_content_type	One or more client-supplied mime-types (in standard RFC syntax) describing the path name which is typically of <code>type_file</code> . The content type s not necessarily interpreted by the store.
std_creation_time	Time at which the item was created. Once set, this value remains the same for the lifetime of the path name.
std_deleted	Set to a nonzero number if the path name has been soft-deleted but not yet purged (see <a href="#">DBMS_DBFS_CONTENT Constants - Store Features</a> )
std_guid	Store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given <i>store-name, store-specific-pathname</i> has a stable and unique GUID for its lifetime.
std_modification_time	Time of last change to the data associated with a path name. Changes to the content of a <code>type_file</code> or <code>type_reference</code> path, the referent of the <code>type_link</code> path, and addition or deletion of immediate children in a <code>type_directory</code> path, all constitute data changes.
std_owner	Client-supplied (or implicit) owner name for the path name
std_parent_guid	Store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given <i>store-name, store-specific-pathname</i> has a stable and unique GUID for its lifetime.  <code>std_parent_guid(pathname) == std_guid(parent(pathname))</code>
std_referent	Content of the symbolic link of a <code>type_link</code> path, otherwise NULL. As mentioned before, the <code>std_referent</code> can be an arbitrary string and must not necessarily be interpreted as pathname by clients (or such interpretation should be done with great care).
opt_hash_type	Type of hash provided in the <code>opt_hash_value</code> property (see <a href="#">DBMS_CRYPT</a> for possible options)
opt_hash_value	Hash value of type <code>opt_hash_type</code> describing the content of the path name
opt_lock_count	Number of compatible locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the <code>opt_locker</code> must specify all lockers with repeats so that lock counts can be correctly maintained.
opt_lock_data	Client-supplied user-data associated with a user-lock, uninterpreted by the store
opt_locker	One or more implicit or client-specified principals that applied a user-lock on a path name
opt_lock_status	One of the <code>lock_read_only</code> , <code>lock_write_only</code> , <code>lock_read_write</code> values describing the type of lock currently applied on a path name
opt_version	Sequence number for linear versioning of a path name
opt_version_path	Version path name for hierarchical versioning of a path name
opt_content_id	Stringified provider-generated store-specific unique contentID for a file element (that may optionally not be associated with a path (see <code>FEATURE_CONTENT_ID</code> and <code>FEATURE_LAZY_PATH</code> in <a href="#">DBMS_DBFS_CONTENT Constants - Store Features</a> ))

## PROP\_ITEM\_T Record Type

A `PROP_ITEM_T` is a tuple describing a (`store`, `mount`) qualified path in a store, with all user-defined properties associated with it, expanded out into individual (`name`, `value`, `type`) tuples.

### Syntax

```
TYPE prop_item_t IS RECORD (  
    store          NAME_T,  
    mount          NAME_T,  
    pathname       PATH_T,  
    property_name  PROPNAME_T,  
    property_value PROPVAL_T,  
    property_type  INTEGER);
```

### Fields

**Table 47–15** *PROP\_ITEM\_T Fields*

Field	Description
<code>store</code>	Name of store
<code>mount</code>	Location at which instance of store is mounted
<code>pathname</code>	Name of path to item
<code>property_name</code>	Name of the property
<code>property_value</code>	Value of the property
<code>property_type</code>	PL/SQL typecode for the property value

## PROPERTY\_T Record Type

This type describes a single (value, typecode) property value tuple; the property name is implied (see [PROPERTIES\\_T Table Type](#)).

### Syntax

```
TYPE property_t IS RECORD (  
    propvalue    PROPVAL_T,  
    typecode     INTEGER);
```

### Fields

**Table 47–16** *PROPERTY\_T Fields*

Field	Description
propvalue	Value of property
typecode	Typecode

## STORE\_T Record Type

This type describes a store registered with and managed by the DBMS\_DBFS\_CONTENT interface.

### Syntax

```
TYPE store_t IS RECORD (  
    store_name          VARCHAR2(32),  
    store_id            NUMBER,  
    provider_name       VARCHAR2(32),  
    provider_pkg        VARCHAR2(32),  
    provider_id         NUMBER,  
    provider_version    VARCHAR2(32),  
    store_features      INTEGER,  
    store_guid          NUMBER);
```

### Fields

**Table 47–17** STORE\_T Fields

Field	Description
store_name	Name of store
store_id	ID of store
provider_name	Name of the content store
provider_pkg	PL/SQL package name for the content store
provider_id	Unique identifier for the content store
provider_version	Version number for the content store
store_features	Features supported by this content store
store_guid	Unique ID for this instance of the store

## FEATURES\_T Table Type

A table type of [FEATURE\\_T Record Type](#).

### Syntax

```
TYPE features_t IS TABLE OF feature_t;
```

## MOUNTS\_T Table Type

A table type of [MOUNT\\_T Record Type](#).

### Syntax

```
TYPE mounts_t IS TABLE OF mount_t;
```

## PATH\_ITEMS\_T Table Type

A table type of [PATH\\_ITEM\\_T Record Type](#)

### Syntax

```
TYPE path_items_t IS TABLE OF path_item_t;
```

## PROP\_ITEMS\_T Table Type

A table type of [PATH\\_ITEM\\_T Record Type](#).

### Syntax

```
TYPE prop_items_t IS TABLE OF prop_item_t;
```

## PROPERTIES\_T Table Type

This is a name-indexed hash table of property tuples. The implicit hash-table association between the index and the value allows the client to build up the full DBMS\_DBFS\_CONTENT\_PROPERTY\_T tuples for a PROPERTIES\_T.

### Syntax

```
TYPE properties_t IS TABLE OF property_t INDEX BY propname_t;
```

## STORES\_T Table Type

This type describes a store registered with and managed by the DBMS\_DBFS\_CONTENT interface.

### Syntax

```
TYPE stores_t IS TABLE OF store_t;
```

---

## Summary of DBMS\_DBFS\_CONTENT Subprograms

**Table 47–18 DBMS\_DBFS\_CONTENT Package Subprograms**

Subprogram	Description
<a href="#">CHECKACCESS Function</a> on page 47-40	Reports if the user ( <code>principal</code> ) can perform the specified operation on the given path
<a href="#">CHECKSPI Functions and Procedures</a> on page 47-41	Checks if a user-provided package implements all of the <code>DBMS_DBFS_CONTENT_SPI</code> subprograms with the proper signatures, and reports on the conformance.
<a href="#">CREATEDIRECTORY Procedures</a> on page 47-42	Creates a directory
<a href="#">CREATEFILE Procedures</a> on page 47-43	Creates a file
<a href="#">CREATELINK Procedures</a> on page 47-44	Creates a new reference to the source file system element
<a href="#">CREATEREFERENCE Procedures</a> on page 47-45	Creates a physical link to an already existing file system element
<a href="#">DECODEFEATURES Function</a> on page 47-46	Given a feature bit set integer value, returns a <code>FEATURES_T</code> table of the feature bits as <code>FEATURE_T</code> records
<a href="#">DELETECONTENT Procedure</a> on page 47-47	Deletes the file specified by the given <code>contentID</code>
<a href="#">DELETEDIRECTORY Procedure</a> on page 47-48	Deletes a directory
<a href="#">DELETEFILE Procedure</a> on page 47-46	Deletes a file
<a href="#">FEATURENAME Function</a> on page 47-50	Given a feature bit, returns a <code>VARCHAR2</code> of that feature's name
<a href="#">FLUSHSTATS Function</a> on page 47-51	Flushes <code>DBMS_DBFS_CONTENT</code> statistics to disk
<a href="#">GETDEFAULTACL Procedure</a> on page 47-52	Returns the <code>ACL</code> parameter of the default context
<a href="#">GETDEFAULTASOF Procedure</a> on page 47-53	Returns the <code>asof</code> parameter of the default context
<a href="#">GETDEFAULTCONTEXT Procedure</a> on page 47-54	Returns the default context
<a href="#">GETDEFAULTOWNER Procedure</a> on page 47-55	Returns the <code>owner</code> parameter of the default context
<a href="#">GETDEFAULTPRINCIPAL Procedure</a> on page 47-56	Returns the <code>principal</code> parameter of the default context
<a href="#">GETFEATURESBYMOUNT Function</a> on page 47-57	Returns features of a store by mount point
<a href="#">GETFEATURESBYNAME Function</a> on page 47-58	Returns features of a store by store name
<a href="#">GETFEATURESBYPATH Function</a> on page 47-59	Returns features of a store by path
<a href="#">GETPATHBYMOUNTID Function</a> on page 47-63	Returns the full absolute path name

**Table 47–18 (Cont.) DBMS\_DBFS\_CONTENT Package Subprograms**

Subprogram	Description
<a href="#">GETPATH Procedures</a> on page 47-63	Returns existing path items (such as files and directories)
<a href="#">GETPATHBYSTOREID Function</a> on page 47-64	If the underlying GUID is found in the underlying store, returns the store-qualified path name
<a href="#">GETPATHNOWAIT Procedures</a> on page 47-65	Implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.
<a href="#">GETSTOREBYMOUNT Function</a> on page 47-67	Returns a store by way of its mount point
<a href="#">GETSTOREBYNAME Function</a> on page 47-68	Returns a store by way of its name
<a href="#">GETSTOREBYPATH Function</a> on page 47-69	Returns a store by way of its path
<a href="#">GETSTATS Procedure</a> on page 47-70	Returns information about DBMS_DBFS_CONTENT statistics collection
<a href="#">GETTRACE Function</a> on page 47-71	Returns whether or not DBMS_DBFS_CONTENT tracing is turned on
<a href="#">GETVERSION Function</a> on page 47-72	Returns the version of the DBMS_DBFS_CONTENT interface in a standardized format associated with a store
<a href="#">LIST Function</a> on page 47-73	Lists the path items in the specified path meeting the specified filter and other criteria
<a href="#">LISTALLCONTENT Function</a> on page 47-75	Lists all path items in all mounts
<a href="#">LISTALLPROPERTIES Function</a> on page 47-74	Returns a table of all properties for all path items in all mounts
<a href="#">LISTMOUNTS Function</a> on page 47-76	Lists all available mount points, their backing stores, and the store features
<a href="#">LISTSTORES Function</a> on page 47-77	Lists all available stores and their features
<a href="#">LOCKPATH Procedure</a> on page 47-78	Applies user-level locks to the given valid path name
<a href="#">MOUNTSTORE Procedure</a> on page 47-79	Mounts a previously registered store and binds it to the mount point
<a href="#">NORMALIZEPATH Functions</a> on page 47-81	Converts a store-specific or full-absolute path name into normalized form
<a href="#">PROPANY Functions</a> on page 47-82	Provides constructors that take one of a variety of types and return a PROPERTY_T
<a href="#">PROPERTIESH2T Function</a> on page 47-83	Converts a PROPERTY_T hash to a DBMS_DBFS_CONTENT_PROPERTIES_T table
<a href="#">PROPERTIEST2H Function</a> on page 47-84	Converts a DBMS_DBFS_CONTENT_PROPERTIES_T table to a PROPERTY_T hash
<a href="#">PROPNUMBER Function</a> on page 47-85	Is a constructor that takes a NUMBER and returns a PROPERTY_T
<a href="#">PROPRAW Function</a> on page 47-86	Is a constructor that takes a RAW and returns a PROPERTY_T
<a href="#">PROPTIMESTAMP Function</a> on page 47-87	Is a constructor that takes a TIMESTAMP and returns a PROPERTY_T

**Table 47-18 (Cont.) DBMS\_DBFS\_CONTENT Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">PROPVARCHAR2 Function</a> on page 47-88	Is a constructor that takes a <code>VARCAHR2</code> and returns a <code>PROPERTY_T</code>
<a href="#">PURGEALL Procedure</a> on page 47-89	Purges all soft-deleted entries matching the path and optional filter criteria
<a href="#">PURGEPATH Procedure</a> on page 47-90	Purges any soft-deleted versions of the given path item
<a href="#">PUTPATH Procedures</a> on page 47-91	Creates a new path item
<a href="#">REGISTERSTORE Procedure</a> on page 47-93	Registers a new store
<a href="#">RENAMEPATH Procedures</a> on page 47-94	Renames or moves a path
<a href="#">RESTOREALL Procedure</a> on page 47-95	Restores all soft-deleted path items meeting the path and filter criteria
<a href="#">RESTOREPATH Procedure</a> on page 47-96	Restores all soft-deleted path items that match the given path and filter criteria
<a href="#">SEARCH Function</a> on page 47-97	Searches for path items matching the given path and filter criteria
<a href="#">SETDEFAULTACL Procedure</a> on page 47-98	Sets the ACL parameter of the default context
<a href="#">SETDEFAULTASOF Procedure</a> on page 47-99	Sets the "as of" parameter of the default context
<a href="#">SETDEFAULTCONTEXT Procedure</a> on page 47-100	Sets the default context
<a href="#">SETDEFAULTOWNER Procedure</a> on page 47-101	Sets the "owner" parameter of the default context
<a href="#">SETDEFAULTPRINCIPAL Procedure</a> on page 47-102	Sets the "principal" parameter of the default context
<a href="#">SETPATH Procedures</a> on page 47-103	Assigns a path name to a path item represented by <code>contentID</code>
<a href="#">SETSTATS Procedure</a> on page 47-104	Enables and disables statistics collection
<a href="#">SETTRACE Procedure</a> on page 47-105	Sets <code>DBMS_DBFS_CONTENT</code> tracing on or off
<a href="#">SPACEUSAGE Procedure</a> on page 47-106	Queries file system space usage statistics
<a href="#">TRACE Procedure</a> on page 47-107	Returns a <code>CLOB</code> that contains the evaluation results
<a href="#">TRACEENABLED Function</a> on page 47-108	Determines if the current trace "severity" set by the <a href="#">SETTRACE Procedure</a> is at least as high as the given trace level
<a href="#">UNLOCKPATH Procedure</a> on page 47-109	Unlocks path items that were previously locked with the <a href="#">LOCKPATH Procedure</a>
<a href="#">UNMOUNTSTORE Procedure</a> on page 47-110	Unmounts a registered store
<a href="#">UNREGISTERSTORE Procedure</a> on page 47-111	Unregisters a store

## CHECKACCESS Function

This function reports if the user (*principal*) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

### Syntax

```
DBMS_DBFS_CONTENT.CHECKACCESS (
  path          IN      VARCHAR2,
  pathtype     IN      INTEGER,
  operation     IN      VARCHAR2,
  principal    IN      VARCHAR2,
  store_name   IN      VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 47–19** *CHECKACCESS Procedure Parameters*

Parameter	Description
<code>path</code>	Name of path to check for access
<code>pathtype</code>	Type of object <code>path</code> represents (see <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )
<code>operation</code>	Operation to be checked (see <a href="#">DBMS_DBFS_CONTENT Constants - Optional Properties</a> )
<code>principal</code>	File system user for whom the access check is made
<code>store_name</code>	Name of store

### Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

## CHECKSPI Functions and Procedures

Given the name of a putative DBMS\_DBFS\_CONTENT\_SPI conforming package, this function or procedure checks whether the package implements all of the provider subprograms with the proper signatures, and reports on the conformance.

### Syntax

```
DBMS_DBFS_CONTENT.CHECKSPI (
  package_name      IN          VARCHAR2)
RETURN CLOB;
```

```
DBMS_DBFS_CONTENT.CHECKSPI (
  schema_name      IN          VARCHAR2,
  package_name     IN          VARCHAR2)
return clob;
```

```
DBMS_DBFS_CONTENT.CHECKSPI (
  package_name     IN          VARCHAR2,
  chk              IN OUT NOCOPY CLOB);
```

```
DBMS_DBFS_CONTENT.CHECKSPI (
  schema_name     in          VARCHAR2,
  package_name    in          VARCHAR2,
  chk             in out nocopy CLOB);
```

### Parameters

**Table 47–20** CHECKSPI Procedure Parameters

Parameter	Description
package_name	Name of package
schema_name	Name of schema
chk	CLOB that contains the evaluation results

### Usage Notes

- The functional form returns a cached temporary LOB of session duration with the results of the analysis. The caller is expected to manage the lifetime of this LOB, as needed.
- The procedural form generates the results of the analysis into the `chk` LOB parameter; if the value passed in is `NULL`, the results are written to the foreground trace file provided that `DBMS_DBFS_CONTENT` interface tracing is enabled. If neither tracing is enabled nor a valid LOB passed in, the checker does not provide any useful indication of the analysis (other than raise exceptions if it encounters a serious error).
- If `schema_name` is `NULL`, standard name resolution rules (current schema, private synonym, public synonym) are used to try and locate a suitable package to analyze.

## CREATEDIRECTORY Procedures

This procedure creates a directory.

### Syntax

```
DBMS_DBFS_CONTENT.CREATEDIRECTORY (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags    IN          INTEGER      DEFAULT PROP_STD,
  recurse       IN          BOOLEAN     DEFAULT FALSE,
  store_name    IN          VARCHAR2    DEFAULT NULL,
  principal     IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.CREATEDIRECTORY (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY PROPERTIES_T,
  prop_flags    IN          INTEGER      DEFAULT PROP_STD,
  recurse       IN          BOOLEAN     DEFAULT FALSE,
  store_name    IN          VARCHAR2    DEFAULT NULL,
  principal     IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 47–21** *CREATEDIRECTORY Procedure Parameters*

Parameter	Description
path	Name of path to the directory
properties	One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
prop_flags	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>PROP_SPC</code> (see <a href="#">DBMS_DBFS_CONTENT Constants - Property Access Flags</a> ), and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
recurse	If 0, do not execute recursively; otherwise, recursively create the directories above the given directory
store_name	Name of store
principal	File system user for whom the access check is made

## CREATEFILE Procedures

This procedure creates a file.

### Syntax

```
DBMS_DBFS_CONTENT.CREATEFILE (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  prop_flags    IN          INTEGER          DEFAULT (PROP_STD + PROP_DATA),
  store_name    IN          VARCHAR2        DEFAULT NULL,
  principal     IN          VARCHAR2        DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.CREATEFILE (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  prop_flags    IN          INTEGER          DEFAULT (PROP_STD + PROP_DATA),
  store_name    IN          VARCHAR2        DEFAULT NULL,
  principal     IN          VARCHAR2        DEFAULT NULL);
```

### Parameters

**Table 47–22 CREATEFILE Procedure Parameters**

Parameter	Description
path	Name of path to the file
properties	One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data with which to populate the file (optional)
prop_flags	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
store_name	Name of store
principal	File system user for whom the access check is made

## CREATELINK Procedures

This procedure creates a new reference to the source file system element (such as a file, or directory). The resulting reference points to the source element but does not directly share metadata with the source element. This is analogous to a UNIX file system symbolic link.

### Syntax

```
DBMS_DBFS_CONTENT.CREATELINK (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags   IN          INTEGER      DEFAULT PROP_STD,
  store_name   IN          VARCHAR2    DEFAULT NULL,
  principal    IN          VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATELINK (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties   IN OUT NOCOPY PROPERTIES_T,
  prop_flags   IN          INTEGER      DEFAULT PROP_STD,
  store_name   IN          VARCHAR2    DEFAULT NULL,
  principal    IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 47–23** CREATELINK Procedure Parameters

Parameter	Description
srcPath	File system entry with which to link
dstPath	Path of the new link element to be created
properties	One or more properties and their values to be set, returned depending, or both, on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
store_name	Name of store
principal	File system user for whom the access check is made

## CREATEREFERENCE Procedures

This procedure creates a physical link to an already existing file system element (such as file or directory). The resulting entry shares the same metadata structures as the value of the `srcPath` parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

### Syntax

```
DBMS_DBFS_CONTENT.CREATEREFERENCE (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags  IN          INTEGER      DEFAULT PROP_STD,
  store_name   IN          VARCHAR2   DEFAULT NULL,
  principal   IN          VARCHAR2   DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.CREATEREFERENCE (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties   IN OUT NOCOPY PROPERTIES_T,
  prop_flags  IN          INTEGER      DEFAULT PROP_STD,
  store_name   IN          VARCHAR2   DEFAULT NULL,
  principal   IN          VARCHAR2   DEFAULT NULL);
```

### Parameters

**Table 47–24** *CREATEREFERENCE Procedure Parameters*

Parameter	Description
<code>srcPath</code>	File system entry with which to link
<code>dstPath</code>	Path of the new link element to be created
<code>properties</code>	One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
<code>prop_flags</code>	Determines which properties are set, returned. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
<code>store_name</code>	Name of store
<code>principal</code>	File system user for whom the access check is made

## DECODEFEATURES Function

Given a feature bit set integer value, this function returns a `FEATURES_T` table of the feature bits as `FEATURE_T` records.

### Syntax

```
DBMS_DBFS_CONTENT.DECODEFEATURES (  
    featureSet      IN      INTEGER)  
    RETURN FEATURES_T DETERMINISTIC PIPELINED;
```

### Parameters

**Table 47–25** *DECODEFEATURES Function Parameters*

Parameter	Description
featureSet	Feature set

### Return Values

[FEATURES\\_T Table Type](#)

## DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

### Syntax

```
DBMS_DBFS_CONTENT.DELETECONTENT (
  store_name    IN    VARCHAR2    DEFAULT NULL,
  contentID    IN    RAW,
  filter        IN    VARCHAR2    DEFAULT NULL,
  soft_delete   IN    BOOLEAN     DEFAULT NULL,
  principal     IN    VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 47–26 DELETECONTENT Procedure Parameters**

Parameter	Description
store_name	Name of store
contentID	Unique identifier for the file to be deleted
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see " <a href="#">Deletion Operations</a> " on page 47-20).
principal	File system user for whom the access check is made

## DELETEDIRECTORY Procedure

This procedure deletes a directory. If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

### Syntax

```
DBMS_DBFS_CONTENT.DELETEDIRECTORY (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2  DEFAULT NULL,
  soft_delete   IN      BOOLEAN    DEFAULT NULL,
  recurse       IN      BOOLEAN    DEFAULT FALSE,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 47–27 DELETEDIRECTORY Procedure Parameters**

Parameter	Description
<code>path</code>	Name of path to the directory
<code>filter</code>	A filter, if any, to be applied
<code>soft_delete</code>	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see <a href="#">"Deletion Operations"</a> on page 47-20).
<code>recurse</code>	If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.
<code>store_name</code>	Name of store
<code>principal</code>	File system user for whom the access check is made

## DELETEFILE Procedure

This procedure deletes the specified file.

### Syntax

```
DBMS_DBFS_CONTENT.DELETEFILE (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2  DEFAULT NULL,
  soft_delete   IN      BOOLEAN    DEFAULT NULL,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 47–28** *DELETEFILE Procedure Parameters*

Parameter	Description
path	Name of path to the file
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see " <a href="#">Deletion Operations</a> " on page 47-20).
store_name	Name of store
principal	File system user for whom the access check is made

## FEATURENAME Function

Given a feature bit, this function returns a VARCHAR2 of that feature's name.

### Syntax

```
DBMS_DBFS_CONTENT.FEATURENAME (  
    featureBit          IN          INTEGER)  
RETURN VARCHAR2 DETERMINISTIC;
```

### Parameters

**Table 47–29** *FEATURENAME Function Parameters*

Parameter	Description
featureBit	Bit representation of the feature (see <a href="#">DBMS_DBFS_CONTENT Constants - Store Features</a> )

### Return Values

Name of the feature

## **FLUSHSTATS Function**

This procedure flushes DBMS\_DBFS\_CONTENT statistics to disk.

### **Syntax**

```
DBMS_DBFS_CONTENT.FLUSHSTATS;
```

## GETDEFAULTACL Procedure

This procedure returns the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTACL (  
    acl    OUT NOCOPY    VARCHAR2);
```

### Parameters

**Table 47–30** *GETDEFAULTACL Procedure Parameters*

Parameter	Description
acl	ACL for all new elements created (implicitly or explicitly) by the current operation

## GETDEFAULTASOF Procedure

This procedure returns the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTASOF (  
    asof    OUT NOCOPY    TIMESTAMP);
```

### Parameters

**Table 47–31** *GETDEFAULTASOF Procedure Parameters*

Parameter	Description
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

## GETTDEFAULTCONTEXT Procedure

This procedure returns the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

### Syntax

```
DBMS_DBFS_CONTENT.GETTDEFAULTCONTEXT (  
  principal    OUT NOCOPY    VARCHAR2,  
  owner        OUT NOCOPY    VARCHAR2,  
  acl          OUT NOCOPY    VARCHAR2,  
  asof         OUT NOCOPY    TIMESTAMP);
```

### Parameters

**Table 47–32** *GETTDEFAULTCONTEXT Procedure Parameters*

Parameter	Description
principal	Agent (principal) invoking the current operation
owner	Owner for new elements created (implicitly or explicitly) by the current operation
acl	ACL for all new elements created (implicitly or explicitly) by the current operation
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

## GETDEFAULTOWNER Procedure

This procedure returns the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTOWNER (  
    principal    IN    VARCHAR2);
```

### Parameters

**Table 47–33** *GETDEFAULTOWNER Procedure Parameters*

Parameter	Description
owner	Owner for new elements created (implicitly or explicitly) by the current operation

## GETDEFAULTPRINCIPAL Procedure

This procedure returns the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTPRINCIPAL (  
    principal    OUT NOCOPY    VARCHAR2);
```

### Parameters

**Table 47–34** *GETDEFAULTPRINCIPAL Procedure Parameters*

Parameter	Description
principal	Agent (principal) invoking the current operation

## GETFEATURESBYMOUNT Function

This function returns features of a store by mount point.

### Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYMOUNT (  
    store_mount    IN    VARCHAR2)  
RETURN INTEGER;
```

### Parameters

**Table 47–35** *GETFEATURESBYMOUNT Function Parameters*

Parameter	Description
store_mount	Mount point

### Return Values

A bit mask of supported features (see [FEATURES\\_T Table Type](#))

## GETFEATURESBYNAME Function

This function returns features of a store by store name.

### Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYNAME (  
    store_name      IN      VARCHAR2)  
RETURN INTEGER;
```

### Parameters

**Table 47–36** *GETFEATURESBYNAME Function Parameters*

Parameter	Description
store_name	Name of store

### Return Values

A bit mask of supported features (see [FEATURES\\_T Table Type](#))

## GETFEATURESBYPATH Function

This function returns features of a store by path.

### Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYPATH (  
    path          IN          PATH_T)  
RETURN INTEGER;
```

### Parameters

**Table 47–37** *GETFEATURESBYPATH Function Parameters*

Parameter	Description
path	PATH_T

### Return Values

A bit mask of supported features (see [FEATURES\\_T Table Type](#))

## GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a BLOB locator using the `prop_data` bitmask in `prop_flags` (see [DBMS\\_DBFS\\_CONTENT Constants - Property Access Flags](#)) or by passing one or more RAW buffers.

When `forUpdate` is 0, this procedure also accepts a valid `asof` timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures do not support these modes of operation.

### Syntax

```
DBMS_DBFS_CONTENT.GETPATH (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    content       OUT NOCOPY  BLOB,
    item_type     OUT          INTEGER,
    prop_flags    IN          INTEGER          DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA) ,

    asof          IN          TIMESTAMP      DEFAULT NULL,
    forUpdate     IN          BOOLEAN        DEFAULT FALSE,
    deref         IN          BOOLEAN        DEFAULT FALSE,
    store_name    IN          VARCHAR2       DEFAULT NULL,
    principal     IN          VARCHAR2       DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.GETPATH (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY PROPERTIES_T,
    content       OUT NOCOPY  BLOB,
    item_type     OUT          INTEGER,
    prop_flags    IN          INTEGER          DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA) ,

    asof          IN          TIMESTAMP      DEFAULT NULL,
    forUpdate     IN          BOOLEAN        DEFAULT FALSE,
    deref         IN          BOOLEAN        DEFAULT FALSE,
    store_name    IN          VARCHAR2       DEFAULT NULL,
    principal     IN          VARCHAR2       DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.GETPATH (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    amount        IN OUT          NUMBER,
    offset        IN          NUMBER,
    buffers       OUT NOCOPY  RAW,
    prop_flags    IN          INTEGER          DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA) ,

    asof          IN          TIMESTAMP      DEFAULT NULL,
    store_name    IN          VARCHAR2       DEFAULT NULL,
    principal     IN          VARCHAR2       DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.GETPATH (
```

```

path          IN          VARCHAR2,
properties    IN OUT NOCOPY  PROPERTIES_T,
amount        IN OUT        NUMBER,
offset        IN          NUMBER,
buffers       OUT          NOCOPY RAW,
prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                PROP_OPT +
                                PROP_DATA),

asof          IN          TIMESTAMP   DEFAULT NULL,
store_name    IN          VARCHAR2    DEFAULT NULL,
principal     IN          VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
path          IN          VARCHAR2,
properties    IN OUT NOCOPY  DBMS_DBFS_CONTENT_PROPERTIES_T,
amount        IN OUT        NUMBER,
offset        IN          NUMBER,
buffers       OUT          NOCOPY  DBMS_DBFS_CONTENT_RAW_T,
prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                PROP_OPT +
                                PROP_DATA),

asof          IN          TIMESTAMP   DEFAULT NULL,
store_name    IN          VARCHAR2    DEFAULT NULL,
principal     IN          VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
path          IN          VARCHAR2,
properties    IN OUT NOCOPY  PROPERTIES_T,
amount        IN OUT        NUMBER,
offset        IN          NUMBER,
buffers       OUT          NOCOPY  DBMS_DBFS_CONTENT_RAW_T,
prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                PROP_OPT +
                                PROP_DATA),

asof          IN          TIMESTAMP   DEFAULT NULL,
store_name    IN          VARCHAR2    DEFAULT NULL,
principal     IN          VARCHAR2    DEFAULT NULL);

```

## Parameters

**Table 47–38** *GETPATH Procedure Parameters*

Parameter	Description
path	Name of path to path items
properties	One or more properties and their values to be returned depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )
amount	On input, number of bytes to be read. On output, number of bytes read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write

**Table 47-38 (Cont.) GETPATH Procedure Parameters**

Parameter	Description
<code>prop_flags</code>	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
<code>asof</code>	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
<code>forUpdate</code>	Specifies that a lock should be taken to signify exclusive write access to the path item
<code>deref</code>	If nonzero, attempts to resolve the given path item to actual data provided it is a reference
<code>store_name</code>	Name of store
<code>principal</code>	Agent (principal) invoking the current operation

## GETPATHBYMOUNTID Function

If the underlying GUID is found in the underlying store, this function returns the full absolute path name.

### Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYMOUNTID (  
    store_mount      IN      VARCHAR2,  
    guid             IN      INTEGER)  
RETURN VARCHAR2;
```

### Parameters

**Table 47–39** *GETPATHBYMOUNTID Function Parameters*

Parameter	Description
store_mount	Mount point in which the path item with guid resides
guid	Unique ID for the path item

### Usage Notes

If the GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

### Return Values

Path of the path item represented by GUID in store\_mount

## GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

### Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYSTOREID (  
    store_name      IN      VARCHAR2,  
    guid            IN      INTEGER)  
RETURN VARCHAR2;
```

### Parameters

**Table 47–40** *GETPATHBYSTOREID Function Parameters*

Parameter	Description
store_name	Name of store
guid	Unique ID representing the desired path item

### Usage Notes

If the GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

### Return Values

Store-qualified path name represented by the GUID

## GETPATHNOWAIT Procedures

This procedure implies that the operation is for an update, and, if implemented (see `FEATURE_NOWAIT` in [DBMS\\_DBFS\\_CONTENT Constants - Store Features](#)), allows providers to return an exception (ORA-00054) rather than wait for row locks.

### Syntax

```
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    content       OUT NOCOPY  BLOB,
    item_type     OUT          INTEGER,
    prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA),
    deref         IN          BOOLEAN     DEFAULT FALSE,
    store_name    IN          VARCHAR2    DEFAULT NULL,
    principal     IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY PROPERTIES_T,
    content       OUT NOCOPY  BLOB,
    item_type     OUT          INTEGER,
    prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA),
    deref         IN          BOOLEAN     DEFAULT FALSE,
    store_name    IN          VARCHAR2    DEFAULT NULL,
    principal     IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 47-41 GETPATHNOWAIT Procedure Parameters**

Parameter	Description
<code>path</code>	Name of path to path items
<code>properties</code>	One or more properties and their values to be returned depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
<code>content</code>	BLOB holding data which populates the file (optional)
<code>item_type</code>	Type of the path item specified (see <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )
<code>prop_flags</code>	Determines which properties are returned. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
<code>asof</code>	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
<code>deref</code>	If nonzero, attempts to resolve the given path item to actual data provided it is a reference
<code>store_name</code>	Name of store

**Table 47–41 (Cont.) GETPATHNOWAIT Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>principal</code>	Agent (principal) invoking the current operation

## GETSTOREBYMOUNT Function

This function returns a store by way of its name.

### Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYMOUNT (  
    store_mount      IN      VARCHAR2)  
    RETURN STORE_T;
```

### Parameters

**Table 47–42** *GETSTOREBYMOUNT Function Parameters*

Parameter	Description
store_mount	Name of store

### Return Values

[STORE\\_T Record Type](#)

## GETSTOREBYNAME Function

This function returns a store by way of its name.

### Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYNAME (  
    store_name      IN      VARCHAR2)  
RETURN STORE_T;
```

### Parameters

**Table 47–43** *GETSTOREBYNAME Function Parameters*

Parameter	Description
store_name	Name of store

### Return Values

[STORE\\_T Record Type](#)

## GETSTOREBYPATH Function

This function returns a store by way of its path.

### Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYPATH (  
    path      IN      PATH_T)  
RETURN STORE_T;
```

### Parameters

**Table 47–44** *GETSTOREBYPATH Function Parameters*

Parameter	Description
path	PATH_T s

### Return Values

[STORE\\_T Record Type](#)

## GETSTATS Procedure

This procedure returns information about DBMS\_DBFS\_CONTENT statistics collection.

### Syntax

```
DBMS_DBFS_CONTENT.GETSTATS (  
    enabled          OUT   BOOLEAN,  
    flush_time      OUT   INTEGER,  
    flush_count     OUT   INTEGER);
```

### Parameters

**Table 47–45** GETSTATS Procedure Parameters

Parameter	Description
enabled	Whether statistics collection is enabled
flush_time	How often to flush the statistics to disk in centiseconds
flush_count	Number of operations to allow between statistics flushes

## GETTRACE Function

This function returns whether DBMS\_DBFS\_CONTENT tracing is turned on or not.

### Syntax

```
DBMS_DBFS_CONTENT.GETTRACE  
RETURN INTEGER.
```

### Return Values

Returns 0 if tracing is off, non-zero if tracing is on.

## GETVERSION Function

This function marks each version of the DBMS\_DBFS\_CONTENT interface.

### Syntax

```
DBMS_DBFS_CONTENT.GETVERSION (  
    RETURN VARCHAR2;
```

### Return Values

A string enumerating the version of the DBMS\_DBFS\_CONTENT interface in standard naming convention: string: *a.b.c* corresponding to *major*, *minor*, and *patch* components.

## LIST Function

This function lists the path items in the specified path meeting the specified filter and other criteria.

### Syntax

```
DBMS_DBFS_CONTENT.LIST (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2  DEFAULT NULL,
  recurse       IN      INTEGER    DEFAULT 0,
  asof          IN      TIMESTAMP  DEFAULT NULL,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL)
RETURN DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

### Parameters

**Table 47–46** LIST Function Parameters

Parameter	Description
path	Name of path to directories
filter	A filter, if any, to be applied
recurse	If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
store_name	Name of respository
principal	Agent (principal) invoking the current operation

### Return Values

[DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T Table Type](#)

## LISTALLPROPERTIES Function

This function returns a table of all properties for all path items in all mounts

### Syntax

```
DBMS_DBFS_CONTENT.LISTALLPROPERTIES  
RETURN PROP_ITEMS_T PIPELINED;
```

### Return Values

[PROP\\_ITEMS\\_T Table Type](#)

## LISTALLCONTENT Function

This function lists all path items in all mounts.

### Syntax

```
DBMS_DBFS_CONTENT.LISTALLCONTENT  
RETURN PATH_ITEMS_T PIPELINED;
```

### Return Values

[PATH\\_ITEMS\\_T Table Type](#)

## LISTMOUNTS Function

This function lists all available mount points, their backing stores, and the store features.

### Syntax

```
DBMS_DBFS_CONTENT.LISTMOUNTS  
  RETURN MOUNTS_T PIPELINED;
```

### Return Values

[MOUNTS\\_T Table Type](#)

### Usage Notes

A single mount results in a single returned row, with its `store_mount` field of the returned records set to NULL.

## LISTSTORES Function

This function lists all available stores and their features.

### Syntax

```
DBMS_DBFS_CONTENT.LISTSTORES  
  RETURN STORES_T PIPELINED;
```

### Return Values

[STORES\\_T Table Type](#)

### Usage Notes

The `store_mount` field of the returned records is set to `NULL` (since mount-points are separate from stores themselves).

## LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

### Syntax

```
DBMS_DBFS_CONTENT.LOCKPATH (  
  path          IN      VARCHAR2,  
  lock_type     IN      INTEGER      DEFAULT LOCK_READ_ONLY,  
  lock_data     IN      VARCHAR2     DEFAULT NULL,  
  store_name    IN      VARCHAR2     DEFAULT NULL,  
  principal     IN      VARCHAR2     DEFAULT NULL);
```

### Parameters

**Table 47-47** LOCKPATH Procedure Parameters

Parameter	Description
path	Name of path to file items
lock_type	One of the available lock types (see <a href="#">DBMS_DBFS_CONTENT Constants - Lock Types</a> )
lock_data	Optional user data to be associated with the lock
store_name	Name of store
principal	Agent (principal) invoking the current operation

## MOUNTSTORE Procedure

This procedure mounts a previously registered store and binds it to the mount point.

### Syntax

```
DBMS_DBFS_CONTENT.MOUNTSTORE (
  store_mount   in   VARCHAR2   DEFAULT NULL,
  singleton     in   BOOLEAN    DEFAULT FALSE,
  principal     in   VARCHAR2   DEFAULT NULL,
  owner         in   VARCHAR2   DEFAULT NULL,
  acl           in   VARCHAR2   DEFAULT NULL,
  asof         in   TIMESTAMP   DEFAULT NULL,
  read_only    in   BOOLEAN    DEFAULT FALSE);
```

### Parameters

**Table 47–48 MOUNTSTORE Procedure Parameters**

Parameter	Description
store_mount	Path name to use to mount this store
singleton	Whether the mount is a single backend store on the system
principal	Agent (principal) invoking the current operation
owner	Owner for new elements created (implicitly or explicitly) by the current operation
acl	ACL for all new elements created (implicitly or explicitly) by the current operation
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
read_only	Whether the mount is read-only

### Usage Notes

- Once mounted, accesses to path names of the form */store\_mount/xyz...* are redirected to *store\_name* and its content provider.
- Store mount points must be unique, and a syntactically valid path name component (specifically, a NAME\_T with no embedded /).
- If a mount point is not specified (NULL), the invoked subprogram attempts to use the store name itself as the mount point name (subject to the uniqueness and syntactic constraints).
- A special empty mount point is available for single stores, specifically a scenario where the content interface manages a single backend store - in such cases, the client can directly deal with full path names of the form */xyz...* since there is no ambiguity in how to redirect these accesses.
- Singleton mount points are indicated by the "singleton" boolean argument, and the *store\_mount* argument is ignored.
- The same store can be mounted multiple times, obviously at different mount points.
- Mount properties can be used to specify the execution environment, specifically, the default values of the principal, owner, ACL, and *asof* for a particular mount

point. Mount properties can also be used to specify a read-only mount. If a flashback mount is specified (through `asof`), it implies a read-only mount.

## NORMALIZEPATH Functions

This function converts a store-specific or full-absolute path name into normalized form:

- verifies that the path name is absolute, and so starts with "/"
- collapses multiple consecutive "/" into a single "/"
- strips trailing "/"
- breaks up a store-specific normalized path name into 2 components - parent pathname, trailing component name
- breaks up a full-absolute normalized path name into 3 components - store name, parent pathname, trailing component name

### Syntax

```
DBMS_DBFS_CONTENT.NORMALIZEPATH (
  path          IN          VARCHAR2,
  parent        OUT NOCOPY  VARCHAR2,
  tpath         OUT NOCOPY  VARCHAR2)
RETURN VARCHAR2;
```

```
DBMS_DBFS_CONTENT.NORMALIZEPATH (
  path          IN          VARCHAR2,
  store_name    OUT NOCOPY  VARCHAR2,
  parent        OUT NOCOPY  VARCHAR2,
  tpath         OUT NOCOPY  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 47–49** *NORMALIZEPATH Function Parameters*

Parameter	Description
path	Name of path to file items
store_name	Name of store
parent	Parent path name
tpath	Name of trailing path item

### Return Values

The completely normalized store-specific or full-absolute path name

## PROPANY Functions

This function provides constructors that take one of a variety of types and return a `PROPERTY_T`.

### Syntax

```
DBMS_DBFS_CONTENT.PROPANY (  
    val      IN      NUMBER)  
RETURN PROPERTY_T;
```

```
DBMS_DBFS_CONTENT.PROPANY (  
    val      IN      VARCHAR2)  
RETURN PROPERTY_T;
```

```
DBMS_DBFS_CONTENT.PROPANY (  
    val      IN      TIMESTAMP)  
RETURN PROPERTY_T;
```

```
DBMS_DBFS_CONTENT.PROPANY (  
    val      IN      RAW)  
RETURN PROPERTY_T;
```

### Parameters

**Table 47–50** *PROPANY Function Parameters*

Parameter	Description
val	Value

### Return Values

[PROPERTY\\_T Record Type](#)

## PROPERTIESH2T Function

This function converts a PROPERTY\_T hash to a DBMS\_DBFS\_CONTENT\_PROPERTIES\_T table.

### Syntax

```
DBMS_DBFS_CONTENT.PROPERTIESH2T (  
    pprops      IN      PROPERTIES_T)  
RETURN DBMS_DBFS_CONTENT_PROPERTIES_T;
```

### Parameters

**Table 47–51** *PROPERTIESH2T Function Parameters*

Parameter	Description
sprops	A PROPERTIES_T hash

### Return Values

[DBMS\\_DBFS\\_CONTENT\\_PROPERTIES\\_T Table Type](#)

## PROPERTIEST2H Function

This function converts a DBMS\_DBFS\_CONTENT\_PROPERTIES\_T table to a PROPERTY\_T hash.

### Syntax

```
DBMS_DBFS_CONTENT.PROPERTIEST2H (
    sprops      IN      DBMS_DBFS_CONTENT_PROPERTIES_T)
RETURN properties_t;
```

### Parameters

**Table 47–52** *PROPERTIEST2H Function Parameters*

Parameter	Description
sprops	A DBMS_DBFS_CONTENT_PROPERTIES_T table

### Return Values

[PROPERTIES\\_T Table Type](#)

## PROPNUMBER Function

This function is a constructor that takes a number and returns a `PROPERTY_T`.

### Syntax

```
DBMS_DBFS_CONTENT.PROPNUMBER (  
    val      IN      NUMBER)  
RETURN PROPERTY_T;
```

### Parameters

**Table 47–53** *PROPNUMBER Function Parameters*

Parameter	Description
val	Value

### Return Values

[PROPERTY\\_T Record Type](#)

## PROPRAW Function

This function is a constructor that takes a RAW and returns a PROPERTY\_T.

### Syntax

```
DBMS_DBFS_CONTENT.PROPRW (
    val      IN      RAW)
RETURN PROPERTY_T;
```

### Parameters

**Table 47–54** PROPRAW Function Parameters

Parameter	Description
val	Value

### Return Values

[PROPERTY\\_T Record Type](#)

## PROPTIMESTAMP Function

This function is a constructor that takes a `TIMESTAMP` and returns a `PROPERTY_T`.

### Syntax

```
DBMS_DBFS_CONTENT.PROPTIMESTAMP (  
    val      IN      TIMESTAMP)  
RETURN PROPERTY_T;
```

### Parameters

**Table 47–55** *PROPTIMESTAMP Function Parameters*

Parameter	Description
val	Value

### Return Values

[PROPERTY\\_T Record Type](#)

## PROPVARCHAR2 Function

This function is a constructor that takes a VARCHAR2 and returns a PROPERTY\_T.

### Syntax

```
DBMS_DBFS_CONTENT.PROPVARCHAR2 (  
    val      IN      VARCHAR2)  
RETURN PROPERTY_T;
```

### Parameters

**Table 47–56** PROPNUMBER Function Parameters

Parameter	Description
val	Value

### Return Values

[PROPERTY\\_T Record Type](#)

## PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT.PURGEALL (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2  DEFAULT NULL,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 47-57** *PURGEALL Procedure Parameters*

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied based on specified criteria
store_name	Name of store
principal	Agent (principal) invoking the current operation

## PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

### Syntax

```
DBMS_DBFS_CONTENT.PURGEPATH (  
    path          IN          VARCHAR2,  
    filter        IN          VARCHAR2  DEFAULT NULL,  
    store_name    IN          VARCHAR2  DEFAULT NULL,  
    principal     IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 47–58** *PURGEPATH Procedure Parameters*

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied
store_name	Name of store
principal	Agent (principal) invoking the current operation

## PUTPATH Procedures

This procedure creates a new path item.

### Syntax

```
DBMS_DBFS_CONTENT.PUTPATH (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  item_type    OUT          INTEGER,
  prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                     PROP_OPT +
                                     PROP_DATA),
  store_name    IN          VARCHAR2    DEFAULT NULL,
  principal     IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.PUTPATH (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  item_type    OUT          INTEGER,
  prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                     PROP_OPT +
                                     PROP_DATA),
  store_name    IN          VARCHAR2    DEFAULT NULL,
  principal     IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.PUTPATH (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  amount        IN          NUMBER,
  offset        IN          NUMBER,
  buffer        IN          RAW,
  prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                     PROP_OPT),
  store_name    IN          VARCHAR2    DEFAULT NULL,
  principal     IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.PUTPATH (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY PROPERTIES_T,
  amount        IN          NUMBER,
  offset        IN          NUMBER,
  buffer        IN          RAW,
  prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                     PROP_OPT),
  store_name    IN          VARCHAR2    DEFAULT NULL,
  principal     IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.PUTPATH (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  written       OUT          NUMBER,
  offset        IN          NUMBER,
  buffers       IN          DBMS_DBFS_CONTENT_RAW_T,
  prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                     PROP_OPT),
  store_name    IN          VARCHAR2    DEFAULT NULL,
```

```

principal IN          VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
  path      IN          VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  written   OUT         NUMBER,
  offset    IN          NUMBER,
  buffers   IN          DBMS_DBFS_CONTENT_RAW_T,
  prop_flags IN        INTEGER     DEFAULT (PROP_STD +
                                         PROP_OPT),

  store_name IN        VARCHAR2    DEFAULT NULL,
  principal IN        VARCHAR2    DEFAULT NULL);

```

## Parameters

**Table 47–59** *PUTPATH Procedure Parameters*

Parameter	Description
path	Name of path to file items
properties	One or more properties and their values to be set depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )
amount	Number of bytes to be read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write
prop_flags	Determines which properties are set. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
store_name	Name of store
principal	Agent (principal) invoking the current operation

## REGISTERSTORE Procedure

This procedure registers a new store backed by a provider that uses a store service provider (conforming to the DBMS\_DBFS\_CONTENT\_SPI package signature). This method is to be used primarily by service providers after they have created a new store.

### Syntax

```
DBMS_DBFS_CONTENT.REGISTERSTORE (  
    store_name          IN      VARCHAR2,  
    provider_name      IN      VARCHAR2,  
    provider_package   IN      VARCHAR2);
```

### Parameters

**Table 47–60 REGISTERSTORE Procedure Parameters**

Parameter	Description
store_name	Name of store, must be unique
provider_name	Name of provider
provider_package	Store service provider

## RENAMEPATH Procedures

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

---

**Note:** See ["Rename and Move Operations"](#) on page 47-21

---

### Syntax

```
DBMS_DBFS_CONTENT.RENAMEPATH (
    oldPath      IN          VARCHAR2,
    newPath      IN          VARCHAR2,
    properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    store_name   IN          VARCHAR2  DEFAULT NULL,
    principal    IN          VARCHAR2  DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.RENAMEPATH (
    oldPath      IN          VARCHAR2,
    newPath      IN          VARCHAR2,
    properties   IN OUT NOCOPY PROPERTIES_T,
    store_name   IN          VARCHAR2  DEFAULT NULL,
    principal    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 47–61** *RENAMEPATH Procedure Parameters*

Parameter	Description
oldPath	Name of path prior to renaming
newPath	Name of path after renaming
properties	One or more properties and their values to be set depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
store_name	Name of store, must be unique
principal	Agent (principal) invoking the current operation

## RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT.RESTOREALL (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2  DEFAULT NULL,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 47-62** *RESTOREALL Procedure Parameters*

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied
store_name	Name of store
principal	Agent (principal) invoking the current operation

## RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT.RESTOREPATH (  
  path          IN          VARCHAR2,  
  filter        IN          VARCHAR2  DEFAULT NULL,  
  store_name    IN          VARCHAR2  DEFAULT NULL,  
  principal     IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 47–63** *RESTOREPATH Procedure Parameters*

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied
store_name	Name of store
principal	Agent (principal) invoking the current operation

## SEARCH Function

This function...

### Syntax

```
DBMS_DBFS_CONTENT.SEARCH (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2  DEFAULT NULL,
  recurse       IN      INTEGER    DEFAULT 0,
  asof          IN      TIMESTAMP  DEFAULT NULL,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL)
RETURN DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

### Parameters

**Table 47–64 LIST Function Parameters**

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied
recurse	If 0, do not execute recursively. Otherwise, recursively search the contents of directories and files below the given directory.
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
store_name	Name of store
principal	Agent (principal) invoking the current operation

### Return Values

DBMS\_DBFS\_CONTENT\_LIST\_ITEMS\_T

## SETDEFAULTACL Procedure

This procedure sets the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTACL (  
    acl    IN    VARCHAR2);
```

### Parameters

**Table 47–65** *SETDEFAULTACL Procedure Parameters*

Parameter	Description
acl	ACL for all new elements created (implicitly or explicitly) by the current operation

### Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

## SETDEFAULTASOF Procedure

This procedure sets the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTASOF (
  asof IN TIMESTAMP);
```

### Parameters

**Table 47–66 SETDEFAULTASOF Procedure Parameters**

Parameter	Description
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

### Usage Notes

- NULL by default, this parameter can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

## SETDEFAULTCONTEXT Procedure

This procedure sets the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

### Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTCONTEXT (
  principal IN VARCHAR2,
  owner     IN VARCHAR2,
  acl       IN VARCHAR2,
  asof      IN  TIMESTAMP);
```

### Parameters

**Table 47-67** *SETDEFAULTCONTEXT Procedure Parameters*

Parameter	Description
principal	Agent (principal) invoking the current operation
owner	Owner for new elements created (implicitly or explicitly) by the current operation
acl	ACL for all new elements created (implicitly or explicitly) by the current operation
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

### Usage Notes

- All of the context parameters are NULL by default, and be can be cleared by setting them to NULL.
- The context parameters, once set, remain as defaults for the duration of the session, and are inherited by all operations for which the defaults are not explicitly overridden.

## SETDEFAULTOWNER Procedure

This procedure sets the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTOWNER (
    principal    IN    VARCHAR2);
```

### Parameters

**Table 47–68** *SETDEFAULTOWNER Procedure Parameters*

Parameter	Description
owner	Owner for new elements created (implicitly or explicitly) by the current operation

### Usage Notes

- NULL by default, this parameter can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

## SETDEFAULTPRINCIPAL Procedure

This procedure sets the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTPRINCIPAL (  
    principal    IN    VARCHAR2);
```

### Parameters

**Table 47–69** *SETDEFAULTPRINCIPAL Procedure Parameters*

Parameter	Description
principal	Agent (principal) invoking the current operation

### Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

## SETPATH Procedures

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the `SETPATH` Procedure that associates an existing contentID with a new path.

---

---

**Note:** See ["Rename and Move Operations"](#) on page 47-21

---

---

### Syntax

```
DBMS_DBFS_CONTENT.SETPATH (
  store_name  IN          VARCHAR2,
  contentID   IN          RAW,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  principal   IN          VARCHAR2  DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.SETPATH (
  store_name  IN          VARCHAR2,
  contentID   IN          RAW,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY PROPERTIES_T,
  principal   IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 47–70** *SETPATH Procedure Parameters*

Parameter	Description
store_name	Name of the store
contentID	Unique identifier for the item to be associated
path	Name of path to path item
properties	One or more properties and their values to be set depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
principal	Agent (principal) invoking the current operation

## SETSTATS Procedure

This procedure enables and disables statistics collection. The client can optionally control the flush settings by specifying non-NULL values for the time, count or both parameters.

### Syntax

```
DBMS_DBFS_CONTENT.SETSTATS (  
  enable          IN    BOOLEAN,  
  flush_time      IN    INTEGER,  
  flush_count     IN    INTEGER);
```

### Parameters

**Table 47-71** SETSTATS Procedure Parameters

Parameter	Description
enable	If TRUE, enable statistics collection. If FALSE, disable statistics collection.
flush_time	How often to flush the statistics to disk in centiseconds
flush_count	Number of operations to allow between statistics flushes

### Usage Notes

The SETSTATS Procedure buffers statistics in-memory for a maximum of `flush_time` centiseconds or a maximum of `flush_count` operations (whichever limit is reached first), or both, at which time the buffers are implicitly flushed to disk.

## SETTRACE Procedure

This procedure sets the DBMS\_DBFS\_CONTENT tracing severity to the given level, 0 being "off".

### Syntax

```
DBMS_DBFS_CONTENT.SETTRACE  
    trclvl      IN      INTEGER);
```

### Parameters

**Table 47–72** SETTRACE Procedure Parameters

Parameter	Description
trclvl	Level of the tracing, higher values implying more tracing

## SPACEUSAGE Procedure

This procedure queries file system space usage statistics. Providers are expected to support this subprogram for their stores (and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on).

### Syntax

```
DBMS_DBFS_CONTENT.SPACEUSAGE (
  path          IN          VARCHAR2,
  blksize      OUT         INTEGER,
  tbytes       OUT         INTEGER,
  fbytes       OUT         INTEGER,
  nfile        OUT         INTEGER,
  ndir         OUT         INTEGER,
  nlink        OUT         INTEGER,
  nref         OUT         INTEGER,
  store_name   IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 47–73 SPACEUSAGE Procedure Parameters**

Parameter	Description
path	Name of path to file items
blksize	Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable.
tbytes	Total size of the store in bytes computed over all segments that comprise the store
fbytes	Free or unused size of the store in bytes computed over all segments that comprise the store
nfile	Number of currently available files in the store
ndir	Number of currently available directories in the store
nlink	Number of currently available links in the store
nref	Number of currently available references in the store
store_name	Name of store

### Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

## TRACE Procedure

This procedure outputs tracing to the current foreground trace file.

### Syntax

```
DBMS_DBFS_CONTENT.TRACE
  sev          IN          INTEGER,
  msg0         IN          VARCHAR2,
  msg1         IN          VARCHAR   DEFAULT '',
  msg2         IN          VARCHAR   DEFAULT '',
  msg3         IN          VARCHAR   DEFAULT '',
  msg4         IN          VARCHAR   DEFAULT '',
  msg5         IN          VARCHAR   DEFAULT '',
  msg6         IN          VARCHAR   DEFAULT '',
  msg7         IN          VARCHAR   DEFAULT '',
  msg8         IN          VARCHAR   DEFAULT '',
  msg9         IN          VARCHAR   DEFAULT '',
  msg10        IN          VARCHAR   DEFAULT '' );
```

### Parameters

**Table 47–74** TRACE Procedure Parameters

Parameter	Description
sev	Severity at which trace message is output
msg*	One or more message strings to be output. If more than one message is specified, all are output.

### Usage Notes

- Trace information is written to the foreground trace file, with varying levels of detail as specified by the trace level arguments.
- The global trace level consists of 2 components: "severity" and "detail". These can be thought of as additive bitmasks.

The "severity" allows the separation of top level as compared to low-level tracing of different components, and allows the amount of tracing to be increased as needed. There are no semantics associated with different levels, and users are free to set trace at any severity they choose, although a good rule of thumb would use severity "1" for top level API entry and exit traces, "2" for internal operations, and "3" or greater for very low-level traces.

The "detail" controls how much additional information: timestamps, short-stack, etc. is dumped along with each trace record.

## TRACEENABLED Function

This function determines if the current trace "severity" set by the [SETTRACE Procedure](#) is at least as high as the given trace level.

### Syntax

```
DBMS_DBFS_CONTENT.TRACEENABLED(  
    sev          IN          INTEGER)  
RETURN INTEGER;
```

### Parameters

**Table 47–75** *TRACEENABLED Procedure Parameters*

Parameter	Description
sev	Severity at which trace message is output

### Return Values

Returns 0 if the requested severity level is lower than the currently set trace severity level; 1 otherwise.

## UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the [LOCKPATH Procedure](#).

### Syntax

```
DBMS_DBFS_CONTENT.UNLOCKPATH (  
    path          IN      VARCHAR2,  
    store_name    IN      VARCHAR2    DEFAULT NULL,  
    principal     IN      VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 47–76 UNLOCKPATH Procedure Parameters**

Parameter	Description
path	Name of path to file items
store_name	Name of store
principal	Agent (principal) invoking the current operation

## UNMOUNTSTORE Procedure

This procedure unmounts a registered store, either by name or by mount point.

### Syntax

```
DBMS_DBFS_CONTENT.UNMOUNTSTORE (  
    store_name      IN      VARCHAR2  DEFAULT NULL,  
    store_mount     IN      VARCHAR2  DEFAULT NULL,  
    ignore_unknown  IN      BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 47-77 UNMOUNTSTORE Procedure Parameters**

Parameter	Description
store_name	Name of store
store_mount	Location at which the store instance is mounted
ignore_unknown	If TRUE, attempts to unregister unknown stores will not raise an exception.

### Usage Notes

- Single stores can be unmounted only by store name (since they have no mount-points).
- Attempting to unmount a store by name unmounts all mount points associated with the store.
- Once unmounted all access to the store (or mount point) are not guaranteed to work.
- If the `ignore_unknown` argument is TRUE, attempts to unregister unknown stores or mounts do not raise an exception.

## UNREGISTERSTORE Procedure

This procedure unregisters a previously registered store (invalidating all mount points associated with it).

### Syntax

```
DBMS_DBFS_CONTENT.UNREGISTERSTORE (
  store_name      IN      VARCHAR2,
  ignore_unknown  IN      BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 47–78 UNREGISTERSTORE Procedure Parameters**

Parameter	Description
store_name	Name of store
ignore_unknown	

### Usage Notes

- Once unregistered all access to the store (and its mount points) are not guaranteed to work
- If the ignore\_unknown argument is TRUE, attempts to unregister unknown stores do not raise an exception.

---

## DBMS\_DBFS\_CONTENT\_SPI

The `DBMS_DBFS_CONTENT_SPI` package provides the Application Programming Interface (API) specification for [DBMS\\_DBFS\\_CONTENT](#) service providers. Application designers can create PL/SQL packages conforming to this API to extend `DBMS_CONTENT` to utilize custom service providers.

**See Also:**

This chapter contains the following topics:

- [Using DBMS\\_DBFS\\_CONTENT\\_SPI](#)
  - Overview
  - Security Model
  - Operational Notes
- [Summary of DBMS\\_DBFS\\_CONTENT\\_SPI Subprograms](#)

---

## Using DBMS\_DBFS\_CONTENT\_SPI

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

## Overview

The `DBMS_DBFS_CONTENT_SPI` package describes an internal contract between the implementation of the `DBMS_DBFS_CONTENT` interface and individual service providers, and whichever package contains their code.

Since PL/SQL does not allow a compile-time, declarative type-conformation between package signatures, store providers should informally conform to the SPI, which is to say, they should implement the SPI by means of a package that contains all of the methods specified in package `DBMS_DBFS_CONTENT_SPI`, with the same method signatures and semantics.

Obviously, these provider packages can implement other methods and expose other interfaces, however, these interfaces are not to be used by the `DBMS_CONTENT` interface itself.

Since the provider SPI is merely a contract specification, there is no package body for `DBMS_DBFS_CONTENT_SPI`, and it is not possible to actually invoke any methods using this package.

The SPI references various elements (constants, types, exceptions) defined by the `DBMS_CONTENT` interface.

Additionally, there is an almost one-to-one correspondence between the client API exported by the `DBMS_CONTENT` interface and the provider interface that the `DBMS_CONTENT` interface itself expects to work against.

The main distinction in the method naming conventions is that all path name references are always store-qualified. That is, the notion of mount-points and full-absolute path names have been normalized and converted to store-qualified path names by the `DBMS_CONTENT` interface before it invokes any of the provider SPI methods.

Since the interconnection of the `DBMS_DBFS_CONTENT` interface and the provider SPI is a 1-to-many pluggable architecture, and the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

## Security Model

Implementations of the `DBMS_DBFS_CONTENT_SPI` package should be created as `AUTHID CURRENT_USER`.

## Operational Notes

- [Implementation](#)
- [Path Names](#)
- [Creation Operations](#)
- [Deletion Operations](#)
- [Get \(Retrieve\) and Put \(Insert\) Operations](#)
- [Rename and Move Operations](#)
- [Directory Navigation and Search](#)
- [Locking Operations](#)
- [Access Check Operation](#)

### Implementation

Since the interconnection of the [DBMS\\_DBFS\\_CONTENT](#) interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a service provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

### Path Names

All path names used in the provider SPI are store-qualified in pair form (`store_name`, `pathname`) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in [DBMS\\_DBFS\\_CONTENT Constants - Store Features](#)) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a `NULL` path name, and possibly a contentID specified as a parameter or by way of the `OPT_CONTENT_ID` (see [DBMS\\_DBFS\\_CONTENT Constants - Optional Properties](#)) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

### Creation Operations

The provider SPI must allow the DBFS content API to create directory, file, link, and reference elements subject to store feature support.

All of the creation subprograms require a valid path name, but note the special exemption for contentID-based access. Creation subprograms can optionally specify properties to be associated with the path name as it is created. It is also possible for clients to return item properties after the creation completes so that automatically generated properties, such as `STD_CREATION_TIME` (see [DBMS\\_DBFS\\_CONTENT Constants - Standard Properties](#)) are immediately available to clients. The exact set of properties fetched back is controlled by the various `PROP_XXX` bitmasks in the `prop_flags` parameter.

Links and references require an additional path name to associate with the primary path name.

File path names can optionally specify a BLOB value to use to initially populate the underlying file content (the provided BLOB may be any valid LOB). On creation, the underlying LOB is returned to the client, provided that `PROP_DATA` is specified in the `prop_flags` parameter.

Non-directory path names require that their parent directory be created first. Directory path names themselves can be recursively created with the path name hierarchy leading up to a directory created in one call.

Attempts to create paths that already exist is an error; the sole exception is path names that are "soft-deleted" (as discussed in the context of [Deletion Operations](#)). In these cases, the soft-deleted item is implicitly purged, and the new item creation is attempted.

Stores and their providers that support contentID-based access accept an explicit store name and a `NULL` path to create a new content element. The contentID generated for this element is available by means of the `OPT_CONTENT_ID` property (see [DBMS\\_DBFS\\_CONTENT Constants - Optional Properties](#)), contentID-based creation being automatically implied by `PROP_OPT` property in the `prop_flags` parameter).

The newly created element may also have an internally generated path name if `FEATURE_LAZY_PATH` property is not supported (see [DBMS\\_DBFS\\_CONTENT Constants - Store Features](#)) and this path is available by way of the `STD_CANONICAL_PATH` property (see [DBMS\\_DBFS\\_CONTENT Constants - Standard Properties](#)).

Only file elements are candidates for contentID-based access.

### Deletion Operations

The provider SPI must allow the DBFS content API to delete directory, file, link, and reference elements (subject to store feature support).

By default, the deletions are permanent, removing the successfully deleted items on transaction commit, but stores may also support "soft-delete" features. If requested by the client, soft-deleted items are retained by the store, although they are not typically visible in normal listings or searches.

Soft-deleted items can be restored, or explicitly purged.

Directory path names can be recursively deleted, with the path name hierarchy below a directory deleted in one call. Non-recursive deletions can be performed only on empty directories. Recursive soft-deletions apply the soft-delete to all of the items being deleted.

Individual path names, as well as all soft-deleted path names under a directory, can be restored or purged by means of the various restore and purge subprograms.

Providers that support filtering can use the provider filter to identify subsets of items to delete. This makes most sense for bulk operations such as the [DELETEDIRECTORY Procedure](#), [PURGEALL Procedure](#), and [RESTOREALL Procedure](#), but all of the deletion-related operations accept a `filter` argument.

Stores and their providers that support contentID-based access can also allow file items to be deleted by specifying their contentID.

### Get (Retrieve) and Put (Insert) Operations

Existing path items can be accessed (for query or for update) and modified using simple get and put subprograms. All path names allow their metadata (properties) to

be read and modified. On completion of the call, the client can request specific properties to be fetched by means of the `prop_flags` parameter.

File path names allow their data (content) to be read and modified. On completion of the call, the client can use the `PROP_DATA` bitmasks in the `prop_flags` parameter to request a new `BLOB` locator to continue data access.

Files can also be read or written without using `BLOB` locators by explicitly specifying logical offsets or buffer-amounts and a suitably sized buffer.

Update accesses must specify the `forUpdate` flag. Access to link path names can be implicitly and internally de-referenced by stores (subject to feature support) if the `deref` flag is specified, however, this may have undetermined outcomes since symbolic links are not always resolvable.

The read methods, such as the [GETPATH Procedures](#) where `forUpdate` is specified as 0, also accepts a valid `asof` timestamp in the `ctx` parameter that can be used by stores to implement "as of" style flashback queries. Mutating versions of the [GETPATH Procedures](#) and the [PUTPATH Procedures](#) methods do not support "as of" modes of operation.

The [GETPATHNOWAIT Procedure](#) implies that the operation is for an update, and, if implemented (see `FEATURE_NOWAIT` in [DBMS\\_DBFS\\_CONTENT Constants - Store Features](#)), this allows providers to return an exception (ORA-00054) rather than wait for row locks.

### Rename and Move Operations

Path names can be renamed or moved, possibly across directory hierarchies and mount-points, but within the same store.

Non-directory path names previously accessible by way of specifying the `oldPath` parameter are renamed as a single item subsequently accessible by specifying `newPath`, assuming that `newPath` does not already exist.

If `newPath` exists and is not a directory, the action of renaming implicitly deletes the existing item before renaming `oldPath`. If the `newPath` exists and is a directory, `oldPath` is moved into the target directory.

Directory path names previously accessible by way of `oldPath` are renamed by moving the directory and all of its children to `newPath` (if it does not already exist) or as children of `newPath` (if it exists and is a directory).

Stores and their providers that support `contentID`-based access and lazy path name binding also support the [SETPATH Procedure](#) that associates an existing `contentID` with a new "path".

### Directory Navigation and Search

The `DBMS_CONTENT` interface can list or search the contents of directory path names, with the option of doing so recursively into sub-directories, optionally seeing soft-deleted items, optionally using flashback "as of" a provided timestamp, and optionally filtering items in or out within the store based on list or search predicates.

### Locking Operations

Clients of the `DBMS_CONTENT` interface can apply user-level locks to any valid path name (subject to store feature support), associate the lock with user-data, and subsequently unlock these path names.

The status of locked items is available using various optional properties (note the previous discussion regarding `opt_lock`).

It is the responsibility of the store (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.

**Access Check Operation**

This operation ascertains if a given path name (`store_name`, `path`, `pathtype`) can be manipulated by operation (see the various `DBMS_CONTENT.OP_XXX` opcodes in [DBMS\\_DBFS\\_CONTENT Constants - Optional Properties](#)) by the user acting on the store utilizing the `principal` parameter. This is a convenience function for the `DBMS_CONTENT` interface; a store that supports access control still internally performs these checks to guarantee security.

---

## Summary of DBMS\_DBFS\_CONTENT\_SPI Subprograms

**Table 48–1 DBMS\_DBFS\_CONTENT\_SPI Package Subprograms**

Subprogram	Description
<a href="#">CHECKACCESS Function</a> on page 48-11	Reports if the user ( <code>principal</code> ) can perform the specified operation on the given path
<a href="#">CREATEDIRECTORY Procedure</a> on page 48-12	Creates a directory
<a href="#">CREATEFILE Procedure</a> on page 48-13	Creates a file
<a href="#">CREATELINK Procedure</a> on page 48-14	Creates a physical link to an already existing file system element
<a href="#">CREATEREFERENCE Procedure</a> on page 48-15	Creates a new reference to the source file system element
<a href="#">DELETECONTENT Procedure</a> on page 48-16	Deletes the file specified by the given <code>contentID</code>
<a href="#">DELETEDIRECTORY Procedure</a> on page 48-17	Deletes a directory
<a href="#">DELETEFILE Procedure</a> on page 48-18	Deletes a file
<a href="#">GETFEATURES Function</a> on page 48-19	Returns the features of a store
<a href="#">GETPATH Procedures</a> on page 48-20	Returns existing path items (such as files and directories)
<a href="#">GETPATHBYSTOREID Function</a> on page 48-22	If the underlying <code>GUID</code> is found in the underlying store, returns the store-qualified path name
<a href="#">GETPATHNOWAIT Procedure</a> on page 48-23	Implies that the operation is for an update, and, if implemented, allows providers to return an exception ( <code>ORA-00054</code> ) rather than wait for row locks.
<a href="#">GETSTOREID Function</a> on page 48-24	Returns the ID of a store
<a href="#">GETVERSION Function</a> on page 48-25	Returns the version associated with a store
<a href="#">LIST Function</a> on page 48-26	Lists the contents of a directory path name
<a href="#">LOCKPATH Procedure</a> on page 48-27	Applies user-level locks to the given valid path name
<a href="#">PURGEALL Procedure</a> on page 48-28	Purges all soft-deleted entries matching the path and optional filter criteria
<a href="#">PURGEPATH Procedure</a> on page 48-29	Purges any soft-deleted versions of the given path item
<a href="#">PUTPATH Procedures</a> on page 48-30	Creates a new path item
<a href="#">RENAMEPATH Procedure</a> on page 48-32	Renames or moves a path
<a href="#">RESTOREALL Procedure</a> on page 48-33	Restores all soft-deleted path items meeting the path and filter criteria

**Table 48-1 (Cont.) DBMS\_DBFS\_CONTENT\_SPI Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">RESTOREPATH Procedure</a> on page 48-34	Restores all soft-deleted path items that match the given path and filter criteria
<a href="#">SEARCH Function</a> on page 48-35	Searches for path items matching the given path and filter criteria
<a href="#">SETPATH Procedure</a> on page 48-36	Assigns a path name to a path item represented by contentID
<a href="#">SPACEUSAGE Procedure</a> on page 48-37	Queries file system space usage statistics
<a href="#">UNLOCKPATH Procedure</a> on page 48-38	Unlocks path items that were previously locked with the <a href="#">LOCKPATH Procedure</a>

## CHECKACCESS Function

This function reports if the user (`principal`) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.CHECKACCESS (
  store_name  IN    VARCHAR2  DEFAULT NULL,
  path        IN    VARCHAR2,
  pathtype    IN    INTEGER,
  operation   IN    VARCHAR2,
  principal   IN    VARCHAR2)
RETURN INTEGER;
```

### Parameters

**Table 48–2** *CHECKACCESS Procedure Parameters*

Parameter	Description
<code>store_name</code>	Name of store
<code>path</code>	Name of path to check for access
<code>pathtype</code>	Type of object <code>path</code> represents (see <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )
<code>operation</code>	Operation to be checked (see <a href="#">DBMS_DBFS_CONTENT Constants - Optional Properties</a> )
<code>principal</code>	File system user for whom the access check is made

### Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

## CREATEDIRECTORY Procedure

This procedure creates a directory.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEDIRECTORY (
  store_name IN          VARCHAR2,
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  prop_flags IN          INTEGER,
  recurse   IN          INTEGER,
  ctx       IN          DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–3** *CREATEDIRECTORY Procedure Parameters*

Parameter	Description
store_name	Name of store
path	Name of path to the directory
properties	One or more properties and their values to be set, returned, or both, depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting PROP_SPC (see <a href="#">DBMS_DBFS_CONTENT Constants - Property Access Flags</a> ), and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
recurse	If 0, do not execute recursively; otherwise, recursively create the directories above the given directory
ctx	Context with which to create the directory (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## CREATEFILE Procedure

This procedure creates a file.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEFILE (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  content     IN OUT NOCOPY BLOB,
  prop_flags  IN          INTEGER,
  ctx         IN          DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–4 CREATEFILE Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to the file
properties	One or more properties and their values to be set, returned or both depending, or both on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data with which to populate the file (optional)
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
ctx	Context with which to create the file (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## CREATELINK Procedure

This procedure creates a physical link to an already existing file system element (such as file or directory). The resulting entry shares the same metadata structures as the value of the `srcPath` parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATELINK (
  store_name      IN          VARCHAR2,
  srcPath         IN          VARCHAR2,
  dstPath        IN          VARCHAR2,
  properties     IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  prop_flags     IN          INTEGER,
  ctx            IN          DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–5** *CREATELINK Procedure Parameters*

Parameter	Description
<code>store_name</code>	Name of store
<code>srcPath</code>	File system entry with which to link
<code>dstPath</code>	Path of the new link element to be created
<code>properties</code>	One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
<code>prop_flags</code>	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
<code>ctx</code>	Context with which to create the link (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## CREATEREFERENCE Procedure

This procedure creates a new reference to the source file system element (such as a file, or directory). The resulting reference points to the source element but does not directly share metadata with the source element. This is analogous to a UNIX file system symbolic link.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEREFERENCE (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties   IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  prop_flags   IN          INTEGER,
  store_name   IN          VARCHAR2,
  ctx          IN          DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–6** *CREATEREFERENCE Procedure Parameters*

Parameter	Description
store_name	Name of store
srcPath	File system entry with which to link
dstPath	Path of the new link element to be created
properties	One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
prop_flags	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
ctx	Context with which to create the reference (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETECONTENT (
  store_name      IN      VARCHAR2,
  contentID       IN      RAW,
  filter          IN      VARCHAR2,
  soft_delete     IN      INTEGER,
  ctx             IN      DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48-7 DELETECONTENT Procedure Parameters**

Parameter	Description
store_name	Name of store
contentID	Unique identifier for the file to be deleted
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see "Deletion Operations" on page 48-6).
ctx	Context with which to delete the file (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## DELETEDIRECTORY Procedure

This procedure deletes a directory. If `recurse` is nonzero, it recursively deletes all elements of the directory. A `filter`, if supplied, determines which elements of the directory are deleted.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETEDIRECTORY (
  store_name  IN   VARCHAR2,
  path        IN   VARCHAR2,
  filter      IN   VARCHAR2,
  soft_delete IN   INTEGER,
  recurse     IN   INTEGER,
  ctx        IN   DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–8 DELETEDIRECTORY Procedure Parameters**

Parameter	Description
<code>store_name</code>	Name of store
<code>path</code>	Name of path to the directory
<code>filter</code>	A filter, if any, to be applied
<code>soft_delete</code>	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see <a href="#">"Deletion Operations"</a> on page 48-6).
<code>recurse</code>	If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.
<code>ctx</code>	Context with which to delete the directory (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## DELETEDFILE Procedure

This procedure deletes the specified file.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETEDFILE (  
  store_name    IN    VARCHAR2,  
  path          IN    VARCHAR2,  
  filter        IN    VARCHAR2,  
  soft_delete   IN    BOOLEAN,  
  ctx           IN    DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–9 DELETEDFILE Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to the file
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see "Deletion Operations" on page 48-6).
ctx	Context with which to delete the file (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T</a> Object Type)

## GETFEATURES Function

This function returns the features of a store.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETFEATURES (  
    store_name      IN      VARCHAR2)  
RETURN INTEGER;
```

### Parameters

**Table 48–10** *GETFEATURES Function Parameters*

Parameter	Description
store_name	Name of store

### Return Values

DBMS\_CONTENT.FEATURE\_\* features supported by the Service Provider

## GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a BLOB locator using the `prop_data` bitmask in `prop_flags` (see [DBMS\\_DBFS\\_CONTENT Constants - Property Access Flags](#)) or by passing one or more RAW buffers.

When `forUpdate` is 0, this procedure also accepts a valid "as of" timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures do not support these modes of operation.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATH (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  content     OUT         NOCOPY BLOB,
  item_type   OUT         INTEGER,
  prop_flags  IN          INTEGER,
  forUpdate   IN          INTEGER,
  deref       IN          INTEGER,
  ctx         IN          DBMS_CONTENT_CONTEXT_T);
```

```
DBMS_DBFS_CONTENT_SPI.GETPATH (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  amount     IN OUT      NUMBER,
  offset      IN          NUMBER,
  buffer      OUT         NOCOPY RAW,
  prop_flags  IN          INTEGER,
  ctx         IN          DBMS_CONTENT_CONTEXT_T);
```

```
DBMS_DBFS_CONTENT_SPI.GETPATH (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  amount     IN OUT      NUMBER,
  offset      IN          NUMBER,
  buffers     OUT         NOCOPY DBMS_CONTENT_RAW_T,
  prop_flags  IN          INTEGER,
  ctx         IN          DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–11** GETPATH Procedure Parameters

Parameter	Description
<code>store_name</code>	Name of store
<code>path</code>	Name of path to path items

**Table 48–11 (Cont.) GETPATH Procedure Parameters**

Parameter	Description
properties	One or more properties and their values to be returned depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )
amount	On input, number of bytes to be read. On output, number of bytes read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write
prop_flags	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
forUpdate	Specifies that a lock should be taken to signify exclusive write access to the path item
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATHBYSTOREID (  
  store_name      IN      VARCHAR2,  
  guid            IN      INTEGER)  
RETURN VARCHAR2;
```

### Parameters

**Table 48–12** *GETPATHBYSTOREID Function Parameters*

Parameter	Description
store_name	Name of store
guid	Unique ID representing the desired path item

### Return Values

Store-qualified path name represented by the GUID

### Usage Notes

If the `STD_GUID` is unknown, a `NULL` value is returned. Clients are expected to handle this as appropriate.

## GETPATHNOWAIT Procedure

This procedure implies that the operation is for an update, and, if implemented (see `FEATURE_NOWAIT` in [DBMS\\_DBFS\\_CONTENT Constants - Store Features](#)), allows providers to return an exception (ORA-00054) rather than wait for row locks.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATHNOWAIT (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  content     OUT         NOCOPY BLOB,
  item_type   OUT         INTEGER,
  prop_flags  IN          INTEGER,
  deref       IN          INTEGER,
  ctx        IN          DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–13** *GETPATHNOWAIT Procedure Parameters*

Parameter	Description
store_name	Name of store
path	Name of path to path items
properties	One or more properties and their values to be returned depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )
prop_flags	Determines which properties are returned. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## GETSTOREID Function

This function returns the ID of a store.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETSTOREID (  
    store_name          IN          VARCHAR2)  
    RETURN NUMBER;
```

### Parameters

**Table 48–14** *GETSTOREID Function Parameters*

Parameter	Description
store_name	Name of store

### Return Values

ID of the Store

### Usage Notes

A store ID identifies a provider-specific store, across registrations and mounts, but independent of changes to the store contents. For this reason, changes to the store table or tables should be reflected in the store ID, but re-initialization of the same store table or tables should preserve the store ID.

## GETVERSION Function

This function returns the version associated with a store.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETVERSION (  
    store_name      IN      VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 48–15** *GETVERSION Function Parameters*

Parameter	Description
store_name	Name of store

### Return Values

A "version" (either specific to a provider package, or to an individual store) based on a standard *a.b.c* naming convention (for *major*, *minor*, and *patch* components)

## LIST Function

This function lists the contents of a directory path name.

The invoker of the subprogram has the option to investigate recursively into sub-directories, to make soft-deleted items visible, to use a flashback "as of" a specified timestamp, and to filter items within the store based on list predicates.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.LIST (
  store_name  IN   VARCHAR2,
  path        IN   VARCHAR2,
  filter      IN   VARCHAR2,
  recurse     IN   INTEGER,
  ctx         IN   DBMS_CONTENT_CONTEXT_T)
RETURN DBMS_CONTENT_LIST_ITEMS_T PIPELINED;
```

### Parameters

**Table 48–16** LIST Function Parameters

Parameter	Description
store_name	Name of respository
path	Name of path to directories
filter	A filter, if any, to be applied
recurse	If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

### Return Values

Path items found that match the path, filter and criteria for executing recursively (see [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T Table Type](#))

### Usage Notes

This function returns only list items; the client is expected to explicitly use one of the [GETPATH Procedures](#) to access the properties or content associated with an item.

## LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.LOCKPATH (
  store_name    IN    VARCHAR2,
  path          IN    VARCHAR2,
  lock_type     IN    INTEGER,
  lock_data     IN    VARCHAR2,
  ctx           IN    DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–17** LOCKPATH Procedure Parameters

Parameter	Description
store_name	Name of store
path	Path name of items to be locked
lock_type	One of the available lock types (see <a href="#">DBMS_DBFS_CONTENT Constants - Lock Types</a> )
lock_data	Optional user data to be associated with the lock
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

### Usage Notes

- It is the responsibility of the store and its providers (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.
- The status of locked items is available by means of various optional properties (see OPT\_LOCK\* in [DBMS\\_DBFS\\_CONTENT Constants - Optional Properties](#)).

## PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEALL (  
  store_name    IN      VARCHAR2,  
  path          IN      VARCHAR2,  
  filter        IN      VARCHAR2,  
  ctx           IN      DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–18** *PURGEALL Procedure Parameters*

Parameter	Description
store_name	Name of store
path	Name of path to file items
filter	A filter, if any, to be applied based on specified criteria
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEPATH (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2,
  store_name    IN      VARCHAR2,
  ctx           IN      DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–19** *PURGEPATH Procedure Parameters*

Parameter	Description
store_name	Name of store
path	Name of path to file items
filter	A filter, if any, to be applied
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## PUTPATH Procedures

This procedure creates a new path item.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.PUTPATH (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  content     IN OUT NOCOPY BLOB,
  item_type   OUT         INTEGER,
  prop_flags  IN          INTEGER,
  ctx        IN          DBMS_CONTENT_CONTEXT_T);
```

```
DBMS_DBFS_CONTENT_SPI.PUTPATH (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  amount     IN          NUMBER,
  offset     IN          NUMBER,
  buffer     IN          RAW,
  prop_flags  IN          INTEGER,
  ctx        IN          DBMS_CONTENT_CONTEXT_T);
```

```
DBMS_DBFS_CONTENT_SPI.PUTPATH (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  written    OUT         NUMBER,
  offset     IN          NUMBER,
  buffers    IN          DBMS_CONTENT_RAW_T,
  prop_flags  IN          INTEGER,
  ctx        IN          DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–20 PUTPATH Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Path name of item to be put
properties	One or more properties and their values to be set depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )
amount	Number of bytes to be read
written	Number of bytes written
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write

**Table 48–20 (Cont.) PUTPATH Procedure Parameters**

Parameter	Description
prop_flags	Determines which properties are set. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## Usage Notes

- All path names allow their metadata (properties) to be read and modified. On completion of the call, the client can access specific properties using prop\_flags (see [DBMS\\_DBFS\\_CONTENT Constants - Property Access Flags](#)).
- On completion of the call, the client can request a new BLOB locator that can be used to continue data access using the prop\_data bitmask in prop\_flags (see [DBMS\\_DBFS\\_CONTENT Constants - Property Access Flags](#)).
- Files can also be written without using BLOB locators, by explicitly specifying logical offsets or buffer-amounts, and a suitably sized buffer.

## RENAMEPATH Procedure

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

---

---

**Note:** See ["Rename and Move Operations"](#) on page 48-7

---

---

### Syntax

```
DBMS_DBFS_CONTENT_SPT.RENAMEPATH (
  store_name      IN          VARCHAR2,
  oldPath         IN          VARCHAR2,
  newPath         IN          VARCHAR2,
  properties      IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  ctx             IN          DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–21** *RENAMEPATH Procedure Parameters*

Parameter	Description
store_name	Name of store, must be unique
oldPath	Name of path prior to renaming
newPath	Name of path after renaming
properties	One or more properties and their values to be set depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.RESTOREALL (
  store_name  IN    VARCHAR2,
  path        IN    VARCHAR2,
  filter      IN    VARCHAR2,
  ctx         IN    DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–22** *RESTOREALL Procedure Parameters*

Parameter	Description
store_name	Name of store
path	Name of path to path items
filter	A filter, if any, to be applied
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.RESTOREPATH (  
  store_name      IN      VARCHAR2,  
  path            IN      VARCHAR2,  
  filter          IN      VARCHAR2,  
  ctx             IN      DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–23** *RESTOREPATH Procedure Parameters*

Parameter	Description
store_name	Name of store
path	Name of path to path items
filter	A filter, if any, to be applied
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## SEARCH Function

This function searches for path items matching the given path and filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.SEARCH (
  store_name  IN    VARCHAR2,
  path        IN    VARCHAR2,
  filter      IN    VARCHAR2,
  recurse     IN    INTEGER,
  ctx         IN    DBMS_CONTENT_CONTEXT_T)
RETURN DBMS_CONTENT_LIST_ITEMS_T PIPELINED;
```

### Parameters

**Table 48–24** LIST Function Parameters

Parameter	Description
store_name	Name of store
path	Name of path to the path items
filter	A filter, if any, to be applied
recurse	If 0, do not execute recursively. Otherwise, recursively search the contents of directories and files below the given directory.
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

### Return Values

Path items matching the given path and filter criteria (see [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T Table Type](#))

## SETPATH Procedure

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the `SETPATH` Procedure that associates an existing contentID with a new path.

---

---

**Note:** See ["Rename and Move Operations"](#) on page 48-7

---

---

### Syntax

```
DBMS_DBFS_CONTENT_SPI.SETPATH (
  store_name    IN          VARCHAR2,
  contentID     IN          RAW,
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_CONTENT_PROPERTIES_T,
  ctx           IN          DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–25** *SETPATH Procedure Parameters*

Parameter	Description
store_name	Name of the store
contentID	Unique identifier for the item to be associated
path	Name of path to path item
properties	One or more properties and their values to be set depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## SPACEUSAGE Procedure

This procedure queries file system space usage statistics. Providers are expected to support this subprogram for their stores and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.SPACEUSAGE (
  store_name  IN      VARCHAR2,
  blksize    OUT     INTEGER,
  tbytes     OUT     INTEGER,
  fbytes     OUT     INTEGER,
  nfile      OUT     INTEGER,
  ndir       OUT     INTEGER,
  nlink      OUT     INTEGER,
  nref       OUT     INTEGER);
```

### Parameters

**Table 48–26** SPACEUSAGE Procedure Parameters

Parameter	Description
store_name	Name of store
blksize	Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable.
tbytes	Total size of the store in bytes computed over all segments that comprise the store
fbytes	Free or unused size of the store in bytes computed over all segments that comprise the store
nfile	Number of currently available files in the store
ndir	Number of currently available directories in the store
nlink	Number of currently available links in the store
nref	Number of currently available references in the store

### Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, it is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

## UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the [LOCKPATH Procedure](#).

### Syntax

```
DBMS_DBFS_CONTENT_SPI.UNLOCKPATH (  
  store_name      IN      VARCHAR2,  
  path            IN      VARCHAR2,  
  ctx             IN      DBMS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 48–27 UNLOCKPATH Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to the path items
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

The Oracle Database File System Hierarchical Store is implemented in the `DBMS_DBFS_HS` package. This package provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables.

## Using DBMS\_DBFS\_HS

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)

## Overview

The DBMS\_DBFS\_HS package is a service provider underneath the DBMS\_DBFS\_CONTENT package that enables use of tape or Amazon S3 Web service as storage for data.

The data on tape or Amazon S3 Web service is part of the Oracle Database and can be accessed through all standard interfaces, but only through the database. The package allows users to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management of their content.

The package initially stores all content files in level-1 cache. As the level-1 cache fills up, content files are moved to level-2 cache and then to an external storage device using bulk writes.

## Security Model

The `DBMS_DBFS_HS` package runs with invoker's rights.

## Constants

The DBMS\_DBFS\_HS package uses the constants shown in following tables:

- [DBMS\\_DBFS\\_HS Constants - Used by the CREATESTORE Procedure](#)
- [DBMS\\_DBFS\\_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function](#)
- [DBMS\\_DBFS\\_HS Constants - Used by the REGISTERSTORECOMMAND Function](#)
- [DBMS\\_DBFS\\_HS Constants - Failure/Success/Error](#)

**Table 49–1 DBMS\_DBFS\_HS Constants - Used by the CREATESTORE Procedure**

Constant	Type	Value	Description
STORETYPE_TAPE	VARCHAR2 (50)	'HS_TAPE'	Use tape as a storage tier
STORETYPE_AMAZONS3	VARCHAR2 (50)	'HS_S3'	Use Amazon S3 Web service as a storage tier

**Table 49–2 DBMS\_DBFS\_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function**

Constant	Type	Value	Description
PROPNAME_BUCKET	VARCHAR2 (50)	'BUCKET'	<p>Specifies the AWS bucket to be used as a storage tier by the Hierarchical Store.</p> <p>Restrictions on bucket name are:</p> <ol style="list-style-type: none"> <li>1) Bucket names can only contain lowercase letters, numbers, periods (.) and dashes(-). Note that underscores ( ) are invalid.</li> <li>2) Bucket names must start with a number or letter.</li> <li>3) Bucket names cannot be in an IP address style (192.168.5.4).</li> <li>4) Bucket names must be between 3 and 63 characters long.</li> <li>5) Bucket names should not end with a dash.</li> <li>6) Dashes cannot appear next to periods. For example, my-.bucket.com is invalid.</li> </ol>
PROPNAME_CACHESIZE	VARCHAR2 (50)	'CACHE_SIZE'	<p>Specifies the cumulative cache size used for the Hierarchical Store. This property is set by the <a href="#">CREATESTORE Procedure</a> and can be modified by the <a href="#">RECONFIGCACHE Procedure</a>. It cannot be modified by the <a href="#">SETSTOREPROPERTY Procedure</a>, though its value can be queried by the <a href="#">GETSTOREPROPERTY Function</a>.</p>

**Table 49–2 (Cont.) DBMS\_DBFS\_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function**

Constant	Type	Value	Description
PROPNAME_ COMPRESSLEVEL	VARCHAR2 (50)	'COMPRESSION _LEVEL'	Use to enable compression of files stored in the DBFS hierarchical store. It specifies the compression level to be used for compressing the files
PROPNAME_ ENABLECLEANUPO NDELETE	VARCHAR2 (50)	'ENABLE_ CLEANUP_ON_ DELETE'	If this property is set to 'TRUE', whenever the user invokes the <a href="#">DELETEFILE Procedure</a> in the <a href="#">DBMS_DBFS_CONTENT</a> interface on a file residing in the DBMS_DBFS_HS store, the DBMS_DBFS_HS removes the file on the external storage that contains this user file provided that the file has no other useful data. By default, the property is set to 'TRUE' for STORETYPE_AMAZONS3 and 'FALSE' for STORETYPE_TAPE.
PROPNAME_ HTTPPROXY	VARCHAR2 (50)	'HTTP_PROXY'	Specifies the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service
PROPNAME_ LICENSEID	VARCHAR2 (50)	'LICENSE_ID'	Specifies the license ID associated with the library libosbws11.so.
PROPNAME_ LOBCACHE_QUOTA	VARCHAR2 (50)	'LOBCACHE_ QUOTA'	Specifies fraction of the cache_size which is allocated for level 1 cache. The default value of this parameter is NULL which means that 0.8 (= 80%) of the cache_size is used for level 1 cache.  This property cannot be modified by the <a href="#">SETSTOREPROPERTY Procedure</a> though its value can be queried by the <a href="#">GETSTOREPROPERTY Function</a> . Its value is set by <a href="#">CREATESTORE Procedure</a> and can be modified by the <a href="#">RECONFIGCACHE Procedure</a> .
PROPNAME_ MEDIAPOOL	VARCHAR2 (50)	'MEDIA_POOL'	Specifies the media pool number to use for storing the content
PROPVAL_ COMPLVL_NONE	VARCHAR2 (50)	'NONE'	Indicates no compression
PROPVAL_ COMPLVL_LOW	VARCHAR2 (50)	'LOW'	Use to set the compression level to LOW. This is expected to have the best performance while still providing a good compression ratio.
PROPVAL_ COMPLVL_MEDIUM	VARCHAR2 (50)	'MEDIUM'	Use to set the compression level to MEDIUM. This compression level is expected to provide better compression ratio than LOW but the time required for compression will be higher than compression level LOW.

**Table 49–2 (Cont.) DBMS\_DBFS\_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function**

Constant	Type	Value	Description
PROPVAL_ COMPLVL_HIGH	VARCHAR2 (50)	'HIGH'	Use to set the compression level to HIGH. This compression level is expected to provide the best compression ratio but compression time will in general be highest among the 3 compression levels.
PROPNAME_ OPTTARBALLSIZE	VARCHAR2 (50)	'OPTIMAL_ TARBALL_ SIZE'	Specifies <code>optimal_tarball_size</code> as the maximum possible size of an archive file.  Multiple content files are bundled together into one archive file and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation.  This property cannot be modified by the <a href="#">SETSTOREPROPERTY Procedure</a> though its value can be queried by the <a href="#">GETSTOREPROPERTY Function</a> . Its value is set by <a href="#">CREATESTORE Procedure</a> and can be modified by the <a href="#">RECONFIGCACHE Procedure</a> .
PROPNAME_ READCHUNKSIZE	VARCHAR2 (50)	'READ_CHUNK_ SIZE'	Specifies the size used by the SBT protocol to transfer data from tape or S3. This chunk is allocated in memory per transaction for retrieval of content files from an archive store, so the value of this property should be conservative. The default size of 1MB is typically good for most users.
PROPNAME_ S3HOST	VARCHAR2 (50)	'S3_HOST'	Specifies the HOST name of the Amazon S3 storage service. It must be <code>s3.amazonaws.com</code> .
PROPNAME_ SBT_ LIBRARY	VARCHAR2 (50)	'SBT_ LIBRARY'	Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named <code>libosbws11.so</code> and is available in <code>rdbms/lib</code> directory.
PROPNAME_ STREAMABLE	VARCHAR2 (50)	'STREAMABLE'	Indicates whether buffer-based PUT or GET should be done on this store. Valid values for are TRUE and FALSE. The default value of this property is TRUE.

**Table 49–2 (Cont.) DBMS\_DBFS\_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function**

Constant	Type	Value	Description
PROPNAME_ WALLET	VARCHAR2 (50)	'WALLET'	<p>The value of this property should be of the form:</p> <p>LOCATION=file:filename CREDENTIAL_ ALIAS=access/secret_alias PROXY_AUTH_ ALIAS=proxyusername/password alias</p> <p>Defines the Oracle Wallet which contains the credentials of the Amazon S3 account associated with the store under consideration.</p> <p>LOCATION: The directory path that contains the Oracle wallet. The format is file:directory-path The format of wallet_path in Windows is, for example: file:c:\WINNT\Profiles\username\WALLETS In UNIX or Linux it is, for example: file:/home/username/wallets</p> <p>When the package is executed in the Oracle database server, the wallet is accessed from the database server.</p> <p>PASSWORD: Defines the wallet password. If auto-login is enabled in wallet (this can be changed using the OWM utility), this parameter does not have to be specified. By default, the mkstore utility enables auto-login.</p> <p>CREDENTIAL_ALIAS: Defines the credential alias for ACCESS_KEY and SECRET_KEY</p>
PROPNAME_ WRITECHUNKSIZ	VARCHAR2 (50)	'WRITE_ CHUNK_SIZE'	<p>Specifies the size used by the SBT protocol to transfer data to tape or S3.</p> <p>This chunk is allocated in memory per transaction for PUT of Content Files to an archive store so the value should be conservative.</p> <p>The default size of 1MB is typically good for most users.</p>

**Table 49–3 DBMS\_DBFS\_HS Constants - Used by the REGISTERSTORECOMMAND Function**

Constant	Type	Value	Description
BEFORE_PUT	NUMBER	'1'	Specified operation must be performed before writing a SECUREFILE to the remote store

**Table 49–3 (Cont.) DBMS\_DBFS\_HS Constants - Used by the REGISTERSTORECOMMAND Function**

Constant	Type	Value	Description
BEFORE_GET	NUMBER	'2'	Specified operation must be performed before a retrieval operation such as reading a SECUREFILE from the remote device

**Table 49–4 DBMS\_DBFS\_HS Constants - Failure/Success/Error**

Constant	Type	Value	Description
FAIL	NUMBER	'0'	Procedure or function did not execute successfully
SUCCESS	NUMBER	'1'	Procedure or function completed successfully
ERROR	NUMBER	'2'	Procedure or function returned an error

## Operational Notes

When the `DBMS_DBFS_HS` package is executed in the Oracle database server, the wallet is accessed from the database server.

---

## Summary of DBMS\_DBFS\_HS Subprograms

**Table 49–5 DBMS\_DBFS\_HS Package Subprograms**

Subprogram	Description
<a href="#">CLEANUPUNUSEDBACKUPFILES Procedure</a> on page 49-12	Removes files created on the external storage device that hold no currently used data
<a href="#">CREATEBUCKET Procedure</a> on page 49-13	Creates an AWS bucket, associated with a store of type <code>STORETYPE_AMAZONS3</code> into which the Hierarchical Store can then move data
<a href="#">CREATESTORE Procedure</a> on page 49-14	Creates a new hierarchical store
<a href="#">DEREGSTORECOMMAND Function</a> on page 49-16	Removes a command that had been previously associated with a store through the <a href="#">RECONFIGCACHE Procedure</a>
<a href="#">DROPSTORE Procedure</a> on page 49-16	Deletes a previously created hierarchical store
<a href="#">FLUSHCACHE Procedure</a> on page 49-18	Flushes (writes out) dirty contents from the level-1 cache.
<a href="#">GETSTOREPROPERTY Function</a> on page 49-19	Retrieves the values of a property of a store
<a href="#">RECONFIGCACHE Procedure</a> on page 49-20	Reconfigures the parameters of the database cache used by the store
<a href="#">REGISTERSTORECOMMAND Procedure</a> on page 49-21	Registers commands for a store with the Hierarchical Store to be sent to the Media Manager for the external storage device associated with the store
<a href="#">SENDCOMMAND Procedures</a> on page 49-22	Sends a command to be executed on the external storage device's Media Manager
<a href="#">SETSTOREPROPERTY Procedure</a> on page 49-23	Stores properties of a store in the database
<a href="#">STOREPUSH Procedure</a> on page 49-26	Pushes locally staged data to the remote storage

## CLEANUPUNUSEDBACKUPFILES Procedure

This procedure removes files created on the external storage device that hold no currently used data in them.

### Syntax

```
DBMS_DBFS_HS.CLEANUPUNUSEDBACKUPFILES (  
    store_name    IN    VARCHAR2);
```

### Parameters

**Table 49–6** *CLEANUPUNUSEDBACKUPFILES Procedure Parameters*

Parameter	Description
store_name	Name of store

### Usage Notes

- The action of removing files from external storage device can not be rolled back.
- This method can be executed periodically to clear space on the external storage device. Asynchronously deleting content from the external storage device is useful because it has minimal impact on the OLTP performance. The periodic scheduling can be accomplished using the DBMS\_SCHEDULER package.

## CREATEBUCKET Procedure

This procedure creates an AWS bucket, associated with a store of type `STORETYPE_AMAZONS3` into which the Hierarchical Store can then move data.

### Syntax

```
DBMS_DBFS_HS.CREATEBUCKET (  
    store_name    IN    VARCHAR2);
```

### Parameters

**Table 49–7** *CREATEBUCKET Procedure Parameters*

Parameter	Description
store_name	Name of store

### Usage Notes

- The `PROPNAME_BUCKET` property of the store should be set before this subprogram is called.
- Once this procedure has successfully created a bucket in Amazon S3, the bucket can only be deleted using out-of-band methods, such as logging-in to S3 and deleting data (directories, files, and other items) for the bucket.

## CREATESTORE Procedure

This procedure creates a new hierarchical store `store_name` of type `STORE_TYPE` (`STORETYPE_TAPE` or `STORETYPE_AMAZONS3`) in schema `schema_name` (defaulting to current schema) under the ownership of the invoking session user.

### Syntax

```
DBMS_DBFS_HS.CREATESTORE (
  store_name          IN    VARCHAR2,
  store_type          IN    VARCHAR2,
  tbl_name            IN    VARCHAR2,
  tbs_name            IN    VARCHAR2,
  cache_size          IN    NUMBER,
  lob_cache_quota     IN    NUMBER DEFAULT NULL,
  optimal_tarball_size IN    NUMBER DEFAULT NULL,
  schema_name         IN    VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 49–8 CREATESTORE Procedure Parameters**

Parameter	Description
<code>store_name</code>	Name of store
<code>store_type</code>	<code>STORETYPE_TAPE</code> or <code>STORETYPE_AMAZONS3</code>
<code>tbl_name</code>	Table for store entries
<code>tbs_name</code>	Tablespace for the store
<code>cache_size</code>	Amount of space used by the store to cache content in given tablespace
<code>lob_cache_quota</code>	Fraction of the <code>cache_size</code> which is allocated for level 1 cache. The default value of this parameter is <code>NULL</code> which means that 0.8 (= 80%) of the <code>cache_size</code> is used for level 1 cache.
<code>optimal_tarball_size</code>	Maximum possible size of the archive file.  Multiple content files are bundled together into one archive file, and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation.  The value of is set by default to 10GB for tape and to 100MB for Amazon S3.
<code>schema_name</code>	Schema for the store

### Usage Notes

- Store names must be unique for an owner. The same store names can be used for different stores owned by different owners.
- Once a table space has been specified to store the store's content in a database, it cannot be changed later.
- This subprogram will execute like a DDL statement, performing an automatic `COMMIT` before and after execution.
- Stores using `DBMS_DBFS_HS` must not use singleton mount. This means that the singleton parameter should be `FALSE` and the `store_mount` parameter should

have a non-NULL value in a call to the DBMS\_DBFS\_CONTENT.MOUNTSTORE Procedure.

## DEREGSTORECOMMAND Function

This procedure removes a command that had been previously associated with a store through the [RECONFIGCACHE Procedure](#).

### Syntax

```
DBMS_DBFS_HS.DEREGSTORECOMMAND (  
    store_name      IN      VARCHAR2,  
    message         IN      VARCHAR2);
```

### Parameters

**Table 49–9** *DEREGSTORECOMMAND Procedure Parameters*

Parameter	Description
store_name	Name of store
message	Message to be deregistered

### Usage Notes

If this subprogram successfully executes, its actions cannot be rolled back by the user. If the user wants to restore the previous state, the user must call the [REGISTERSTORECOMMAND Procedure](#).

## DROPSTORE Procedure

This procedure deletes a previously created hierarchical store specified by name and owned by the invoking session user.

### Syntax

```
DBMS_DBFS_HS.DROPSTORE (
  store_name  IN  VARCHAR2,
  opt_flags   IN  INTEGER DEFAULT 0);
```

### Parameters

**Table 49–10** *DROPSTORE Procedure Parameters*

Parameter	Description
store_name	Name of store owned by the invoking session user
opt_flags	User can specify optional flags. If <code>DISABLE_CLEANUPBACKUPFILES</code> is specified as one of the optional flags, the call to the <a href="#">CLEANUPUNUSEDBACKUPFILES Procedure</a> is not issued. By default, when this flag is not set, the procedure implicitly cleans-up all unused backup files.

### Usage Notes

- The procedure executes like a DDL in that it auto-commits before and after its execution.
- If `CLEANUPBACKUPFILES` is disabled during the procedure, the user must resort to out-of-band techniques to cleanup unused backup files. No further invocations of `CLEANUPBACKFILES` for a dropped store are possible through hierarchical store.
- This subprogram will un-register the store from `DBMS_DBFS_CONTENT` package. All files in the given store are deleted from the store (Tape or Amazon S3 Web service). The database table holding the store's entries in the database, is also dropped by this subprogram.

## FLUSHCACHE Procedure

This procedure flushes out dirty contents from level-1 cache, which can be locked, to level-2 cache, thereby freeing-up space in level 1 cache.

### Syntax

```
DBMS_DBFS_HS.FLUSHCACHE (  
    store_name    IN    VARCHAR2);
```

### Parameters

**Table 49–11** *FLUSHCACHE Procedure Parameters*

Parameter	Description
store_name	Name of store

## GETSTOREPROPERTY Function

This function retrieves the values of a property.

### Syntax

```
DBMS_DBFS_HS.GETSTOREPROPERTY (
  store_name      IN      VARCHAR2,
  property_name   IN      VARCHAR2,
  noexcp          IN      BOOLEAN DEFAULT FALSE) RETURN VARCHAR2;
```

### Parameters

**Table 49–12** *GETSTOREPROPERTY Function Parameters*

Parameter	Description
store_name	Name of store
property_name	Name of property
noexcp	If set to FALSE, raises an exception if the property does not exist in the database. If noexcp is set to TRUE, returns NULL if the property does not exist.

### Return Values

The values of a property.

### Usage Notes

The specified store must already have been created.

## RECONFIGCACHE Procedure

This procedure reconfigures the parameters of the database cache being used by the store.

### Syntax

```
DBMS_DBFS_HS.RECONFIGCACHE (
  store_name          IN    VARCHAR2,
  cache_size         IN    NUMBER DEFAULT NULL,
  lobcache_quota     IN    NUMBER DEFAULT NULL,
  optimal_tarball_size IN  NUMBER DEFAULT NULL);
```

### Parameters

**Table 49–13 RECONFIGCACHE Procedure Parameters**

Parameter	Description
store_name	Name of store
cache_size	Cumulative cache size used for the Hierarchical Store
lobcache_quota	Fraction of the cache size that are assigned to level 1 cache
optimal_tarball_size	Maximum possible size of an archive file. Since creating one file for every content file in the store is a prohibitively expensive operation, multiple content files are bundled together into one archive file for transfer to tape or Amazon S3.

### Usage Notes

- The specified store must already have been created before reconfiguration.
- The Hierarchical Store uses a level 1 cache and a level 2 cache. The level 1 cache subsumes most of the working set and the level 2 cache is used to perform bulk writes to the backend device.
- If any of the last 3 parameters is NULL, its value specified during store creation is used. If the parameter was NULL when the call to the [CREATESTORE Procedure](#) was issued, the DBMS\_DBFS\_HS package assigns a default value.

The DBMS\_DBFS\_HS package optimistically tries to allocate more than 1 tarball's worth of size for level 2 cache to facilitate concurrency, though a minimum of 1 tarball size is necessary for level 2 cache.

The values for cumulative cache size and LOB cache quota decide allocation of space for the two caches. If values are not provided, a user might see an `INSUFFICIENT_CACHE` exception. In that case, it is better to revise the cache parameters in order to have a working store.

- If this subprogram successfully executes, its actions cannot be rolled back by the user. In that case, the user should call RECONFIGCACHE again with new or modified parameters.

## REGISTERSTORECOMMAND Procedure

This procedure registers commands for a store with the Hierarchical Store. These commands are sent to the Media Manager for the external storage device associated with the store.

### Syntax

```
DBMS_DBFS_HS.REGISTERSTORECOMMAND (
  store_name      IN      VARCHAR2,
  message         IN      VARCHAR2,
  flags           IN      NUMBER);
```

### Parameters

**Table 49–14 REGISTERSTORECOMMAND Procedure Parameters**

Parameter	Description
store_name	Name of store
message	Message to be sent to the Media Manager of the external store
flags	Valid values: <ul style="list-style-type: none"> <li>▪ BEFORE_PUT CONSTANT NUMBER := 1;</li> <li>▪ BEFORE_GET CONSTANT NUMBER := 2;</li> </ul>

### Usage Notes

- These commands are sent before the next read or write of content. When the Hierarchical Store wants to push (or get) data to (or from) the storage device, it begins a session (to communicate with the device). After beginning the session, it sends all registered commands for the to the relevant device before writing (or getting) any data.
- If this method successfully executes, its actions cannot be rolled back by the user. To restore the previous state the user must call the [DEREGSTORECOMMAND Function](#).

## SENDERCOMMAND Procedures

This procedure sends a command to be executed on the external storage device's Media Manager.

### Syntax

```
DBMS_DBFS_HS.SENDERCOMMAND (  
  store_name  IN    VARCHAR2,  
  message     IN    VARCHAR2);
```

### Parameters

**Table 49–15** *SENDERCOMMAND Procedure Parameters*

Parameter	Description
store_name	Name of store
message	Message string to be executed

## SETSTOREPROPERTY Procedure

This procedure stores properties of a store in the database as name-value pairs.

### Syntax

```
DBMS_DBFS_HS.SETSTOREPROPERTY (
  store_name      IN   VARCHAR2,
  property_name   IN   VARCHAR2,
  property_value  IN   VARCHAR2);
```

### Parameters

**Table 49–16 SETSTOREPROPERTY Procedure Parameters**

Parameter	Description
store_name	Name of store
property_name	For a store using Tape device, there are three properties whose values must be set by the user, and four properties that have default values. Stores of type STORETYPE_AMAZONS3 have properties with default values. The various options for both types of stores are detailed under property_value.
property_value	<p><b>Stores using a Tape Device</b></p> <p>The values for the following properties must be set by the user:</p> <ul style="list-style-type: none"> <li>■ PROPNAME_SBTLIBRARY - This should point to the shared library used by RMAN to communicate with the external tape device. It is usually named libobk.so.</li> <li>■ PROPNAME_MEDIAPool - Media pool number for storing content</li> <li>■ PROPNAME_CACHE_SIZE - Amount of space, in bytes, used for the cache of this store</li> </ul> <p>The following properties, which have default values assigned to them when a store is created, benefit from tuning:</p> <ul style="list-style-type: none"> <li>■ PROPNAME_READCHUNKSIZE and PROPNAME_WRITECHUNKSIZE - These are the sizes used by the SBT protocol to transfer data to and from the tapes. These chunks are allocated in memory per transaction, so the values should be conservative. The default size is 1MB.</li> <li>■ PROPNAME_STREAMABLE - Indicates whether DBFS_LINKS can perform read operations (for example SELECT or DBMS_LOB.READ) directly from the store, or if the data must be copied back into the database before it can be read</li> <li>■ PROPNAME_ENABLECLEANUPONDELETE - Indicates if unused files on the external storage device should be deleted by DBMS_DBFS_HS. Valid values for this property are 'FALSE' for STORETYPE_TAPE.</li> <li>■ PROPNAME_COMPRESSLEVEL - Describes how files written to Tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.</li> </ul>

**Table 49–16 (Cont.) SETSTOREPROPERTY Procedure Parameters**

Parameter	Description
(cont) property_ value	<p><b>Stores of type STORETYPE_AMAZONS3</b></p> <p>It is mandatory that the following properties have assigned values, and default values are provided:</p> <ul style="list-style-type: none"> <li>■ PROPNAME_SBTLIBRARY - Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named <code>libosbws11.so</code> and is available in <code>rdbms/lib</code> directory.</li> <li>■ PROPNAME_S3HOST - Defines the HOST name of the Amazon S3 storage service. It must be <code>s3.amazonaws.com</code>.</li> <li>■ PROPNAME_BUCKET - Defines the AWS bucket used as a storage tier by the Hierarchical Store. Restrictions on bucket names are: <ul style="list-style-type: none"> <li>-- Bucket names can only contain lowercase letters, numbers, periods (.) and dashes (-). Use of an underscore (_) is invalid.</li> <li>-- Bucket names must start with a number or letter</li> <li>-- Bucket names cannot be in an IP address style ("192.168.5.4")</li> <li>-- Bucket names must be between 3 and 63 characters in length</li> <li>-- Bucket names should not end with a dash</li> <li>-- Dashes cannot appear next to periods. For example, "my-.bucket.com" is invalid.</li> </ul> </li> <li>■ PROPNAME_LICENSEID - Specifies the license ID associated with the library <code>libosbws11.so</code>.</li> <li>■ PROPNAME_WALLET - Has the form: <pre>'LOCATION=file:&lt;filename&gt; CREDENTIAL_ ALIAS=&lt;access/secret_alias&gt; PROXY_AUTH_ ALIAS=&lt;proxyusername/password alias&gt;'</pre> <ul style="list-style-type: none"> <li>-- LOCATION - Directory path that contains the Oracle wallet. The format is <code>file:directory-path</code>. See <a href="#">Examples</a> for variations in format.</li> <li>-- PASSWORD - Defines the wallet password. If auto-login is enabled in the wallet (this can be changed using the user's own utility), and does not have to be specified. By default, the <code>mkstore</code> utility enables auto-login.</li> <li>-- CREDENTIAL_ALIAS - Defines the credential alias for ACCESS_KEY and SECRET_KEY</li> <li>-- PROXY_AUTH_ALIAS - Defines authentication credentials for the proxy server, if applicable.</li> </ul> </li> </ul>

**Table 49–16 (Cont.) SETSTOREPROPERTY Procedure Parameters**

Parameter	Description
(property_value (contd.))	<p>The following properties are optional:</p> <ul style="list-style-type: none"> <li>■ PROPNAME_HTTPPROXY - Defines the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service.</li> <li>■ PROPNAME_STREAMABLE – Indicates whether buffer-based PUT or GET operation should be done on this store. Valid values for this property are TRUE (default) and FALSE.</li> <li>■ PROPNAME_ENABLECLEANUPONDELETE - Indicates if unused files on the external storage device should be deleted by DBMS_DBFS_HS. Valid values for this property are 'FALSE' for STORETYPE_TAPE.</li> <li>■ PROPNAME_COMPRESSLEVEL - Describes how files written to Tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.</li> </ul>

## Usage Notes

- The specified store must already have been created.
- If this subprogram successfully executes, its actions cannot be rolled back by the user.
- The same property can be set multiple times to the same or different values using this subprogram

## Examples

### Format

The format of `wallet_path` in Windows is, for example:

```
file:c:\WINNT\Profiles\\WALLETS
```

The format of `wallet_path` in UNIX or Linux is, for example:

```
file:/home/username/wallets
```

## STOREPUSH Procedure

This procedure pushes locally staged data to the remote storage.

### Syntax

```
DBMS_DBFS_HS.STOREPUSH (
  store_name  IN      VARCHAR2,
  path        IN      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 49–17 STOREPUSH Procedure Parameters**

Parameter	Description
store_name	Name of store whose content the client writes from local cache to the external store
path	A non-mount qualified (without mount point) path within the store. By default, its value is NULL which corresponds to the root path of the store.

### Usage Notes

- The Hierarchical Store caches the content files locally in database tables. When enough content is amassed in the cache to make it efficient to write to the external storage device (or the cache is completely filled), the Hierarchical Store creates a tarball out of the local content and writes these tarballs as files on the external device. The size of the tarball created by the Hierarchical Store is controlled by the store property `PROPNAME_OPTTARBALLSIZE`.
- When the amount of free space in the cache is such that the caching of a content file will push the space used above `cache_size`, the Hierarchical Store will internally call `STOREPUSH`. The `STOREPUSH` Procedure creates tarball(s) out of the existing dirty or modified content files in the cache and writes them out to the external device. A `STOREPUSH` call is not guaranteed to write all the dirty content from local cache to the external storage, since some files may be locked by other sessions.
- `STOREPUSH` has a built-in ability feature allowing it to automatically resume operation. If a `STOREPUSH` call is interrupted (say by a network outage) after it has transferred some tarballs to the external device, it can be restarted after the outage and will then resume transferring data from the point it was interrupted. In other words, work done before the outage is not lost. `STOREPUSH` can safely be restarted and the effect is such as if the outage never occurred.
- If this method successfully executes, its actions cannot be rolled back by the user.
- By default, when `path` is NULL, all files in the store are candidates for `STOREPUSH`. If `path` has a valid input value, all files which are under the namespace of given path are written from the local cache to the external store. If a given path is an existing file, it is pushed out again to the remote store.

---

---

## DBMS\_DBFS\_SFS

The DBMS\_DBFS\_SFS package provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS\_DBFS\_CONTENT package.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

This chapter contains the following topics:

- [Using DBMS\\_DBFS\\_SFS](#)
  - Overview
  - Security Model
  - Constants
- [Summary of DBMS\\_DBFS\\_SFS Subprograms](#)

## Using DBMS\_DBFS\_SFS

- [Overview](#)
- [Security Model](#)
- [Constants](#)

## Overview

The DBMS\_DBFS\_SFS package is a sample implementation of a package that implements and extends the DBMS\_DBFS\_CONTENT\_SFI interface. It provides a POSIX-compliant file system stored in the RDBMS.

## Security Model

The `DBMS_DBFS_SFS` package runs with `AUTHID CURRENT_USER`.

## Constants

The DBMS\_DBFS\_SFS package uses the constants shown in following tables:

- [DBMS\\_DBFS\\_SFS Constants - Compression Levels](#)
- [DBMS\\_DBFS\\_SFS Constants - Used by the encryption Parameter](#)
- [DBMS\\_DBFS\\_SFS Constants - Used by the npartitions Parameter](#)
- [DBMS\\_DBFS\\_SFS Constants - Used by the partition\\_key Parameter](#)

**Table 50–1 DBMS\_DBFS\_SFS Constants - Compression Levels**

Constant	Type	Value	Description
COMPRESSION_ DEFAULT	VARCHAR2 (32)	' '	Use the default SecureFile compression level
COMPRESSION_LOW	VARCHAR2 (32)	'LOW'	Use compression level 'LOW'
COMPRESSION_ MEDIUM	VARCHAR2 (32)	'MEDIUM'	Use compression level 'MEDIUM'
COMPRESSION_HIGH	VARCHAR2 (32)	'HIGH'	Use compression level 'HIGH'

**Table 50–2 DBMS\_DBFS\_SFS Constants - Used by the encryption Parameter**

Constant	Type	Value	Description
ENCRYPTION_ DEFAULT	VARCHAR2 (32)	' '	Use the default SecureFile encryption algorithm
ENCRYPTION_ 3DES168	VARCHAR2 (32)	'3DES168'	Use encryption 3DES 168 bit
ENCRYPTION_ AES128	VARCHAR2 (32)	'AES128'	Use encryption AES 128 bit
ENCRYPTION_ AES192	VARCHAR2 (32)	'AES192'	Use encryption AES 192 bit
ENCRYPTION_ AES256	VARCHAR2 (32)	'AES256'	Use encryption AES 256 bit

**Table 50–3 DBMS\_DBFS\_SFS Constants - Used by the npartitions Parameter**

Constant	Type	Value	Description
DEFAULT_ PARTITIONS	INTEGER	16	Default to 16 partitions

**Table 50–4 DBMS\_DBFS\_SFS Constants - Used by the partition\_key Parameter**

Constant	Type	Value	Description
PARTITION_BY_ ITEM	INTEGER	1	Use a hash of the item name for the partition key
PARTITION_BY_ PATH	INTEGER	2	Use a hash of the path name for the partition key
PARTITION_BY_ GUID	INTEGER	3	Use a hash of the GUID as the partition key

## Summary of DBMS\_DBFS\_SFS Subprograms

**Table 50–5** *DBMS\_DBFS\_SFS Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">CREATEFILESYSTEM Procedure</a> on page 50-7	Creates a file system store
<a href="#">CREATESTORE Procedure</a> on page 50-9	Creates a new DBFS SFS store
<a href="#">DROPFILESYSTEM Procedures</a> on page 50-10	Drops the DBFS SFS store
<a href="#">INITFS Procedure</a> on page 50-11	Initializes a POSIX file system store

## CREATEFILESYSTEM Procedure

This procedure creates a file system store.

### Syntax

```
DBMS_DBFS_SFS.CREATEFILESYSTEM (
  store_name          IN      VARCHAR2,
  schema_name        IN      VARCHAR2  DEFAULT NULL,
  tbl_name           IN      VARCHAR2  DEFAULT NULL,
  tbl_tbs           IN      VARCHAR2  DEFAULT NULL,
  lob_tbs           IN      VARCHAR2  DEFAULT NULL,
  use_bf            IN      BOOLEAN   DEFAULT FALSE,
  properties         IN      DBMS_DBFS_CONTENT_PROPERTIES_T DEFAULT NULL,
  create_only       IN      BOOLEAN   FALSE,
  use_objects       IN      BOOLEAN   DEFAULT FALSE,
  with_grants      IN      BOOLEAN   DEFAULT FALSE,
  do_dedup         IN      BOOLEAN   DEFAULT FALSE,
  do_compress      IN      BOOLEAN   DEFAULT FALSE,
  compression      IN      VARCHAR2  DEFAULT COMPRESSION_DEFAULT,
  do_encrypt       IN      BOOLEAN   DEFAULT FALSE,
  encryption       IN      VARCHAR2  DEFAULT ENCRYPTION_DEFAULT,
  do_partition     IN      BOOLEAN   DEFAULT FALSE,
  npartitions      IN      NUMBER     DEFAULT DEFAULT_PARTITIONS,
  partition_key    IN      NUMBER     DEFAULT PARTITION_BY_ITEM,
  partition_guidi  IN      BOOLEAN   DEFAULT FALSE,
  partition_pathi  IN      BOOLEAN   DEFAULT FALSE,
  partition_prop   IN      BOOLEAN   DEFAULT TRUE);
```

### Parameters

**Table 50-6 CREATEFILESYSTEM Procedure Parameters**

Parameter	Description
store_name	Name of store
schema_name	Schema for the store, defaulting to the current schema
tbl_name	Table for store entries. If not specified, an internally generated name is used.
tbl_tbs	Tablespace for the store, defaulting to the schema's default tablespace
lob_tbs	Tablespace in which to create the LOB segment. It defaults to the user's default tablespace.
use_bf	If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used.
properties	Table of (name, value, typecode) tuples used to configure the store properties. Currently no such properties are defined or used.
create_only	If TRUE, the file system is created, but not registered with the current user
use_objects	If TRUE, a single base-table with an object-type column (using a nested table) is created to backup the new file system. Otherwise, a pair of (parent, child) tables is used to backup the file system. In both cases, the object type nested table or the child table is used only for user-defined properties.

**Table 50–6 (Cont.) CREATEFILESYSTEM Procedure Parameters**

Parameter	Description
with_grants	If TRUE, DML and query access permissions are granted to the DBFS_ROLE as part of creating the file system. Otherwise, explicit grants (or existing permissions) are required to access the file system.
do_dedup	If TRUE, do deduplication the underlying SecureFile column
do_compress	If TRUE, do compression the underlying SecureFile column
compression	Compression algorithm to use (see <a href="#">DBMS_DBFS_SFS Constants - Compression Levels</a> )
do_encrypt	If TRUE, encrypt the underlying SecureFile column
encryption	encryption algorithm to use (see <a href="#">DBMS_DBFS_SFS Constants - Used by the encryption Parameter</a> )
do_partition	If TRUE, partition the table used for storage
npartitions	Number of partitions to create for the table (see <a href="#">DBMS_DBFS_SFS Constants - Used by the npartitions Parameter</a> ).
partition_key	How to partition the table: by item name, by path name, or by GUID (see <a href="#">DBMS_DBFS_SFS Constants - Used by the partition_key Parameter</a> ).
partition_guidi	If TRUE, build an index on GUID
partition_pathi	If TRUE, build an index on path name
partition_prop	If TRUE, partition the properties table

## Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

## CREATESTORE Procedure

This procedure creates a new DBFS SFS store owned by the invoking session user.

### Syntax

```
DBMS_DBFS_SFS.CREATESTORE (
  store_name      IN      VARCHAR2,
  tbl_name       IN      VARCHAR2 DEFAULT NULL,
  tbs_name       in      VARCHAR2 DEFAULT NULL,
  use_bf        in      BOOLEAN  DEFAULT FALSE,
  stgopts       in      VARCHAR2 DEFAULT '');
```

### Parameters

**Table 50–7 CREATESTORE Procedure Parameters**

Parameter	Description
store_name	Name of store
store_type	STORETYPE_TAPE or STORETYPE_AMAZONS3
tbl_name	Placeholder for the store content cached in database
tbs_name	Named tablespace
use_bf	If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used.
stgopts	Currently non-operational, reserved for future use

## DROPFILESYSTEM Procedures

This procedure drops the DBFS SFS store, purging all dictionary information associated with the store, and dropping the underlying file system table.

### Syntax

```
DBMS_DBFS_SFS.DROPFILESYSTEM (
  schema_name  IN      VARCHAR2 DEFAULT NULL,
  tbl_name     IN      INTEGER);

DBMS_DBFS_SFS.DROPFILESYSTEM (
  store_name   IN      VARCHAR2);
```

### Parameters

**Table 50–8** *DROPFILESYSTEM Procedure Parameters*

Parameter	Description
schema_name	Name of schema
tbl_name	Name of tablespace
store_name	Name of store path

### Usage Notes

- If the specified store table is registered by the current user, it will be unregistered from the content interface described in the `DBMS_DBFS_CONTENT` package and the POSIX metadata tables.
- Subsequent to unregistration, an attempt will be made to store table(s). This operation may fail if other users are currently using this store table.
- The user attempting a drop of the tables underlying the store must actually have the privileges to complete the drop operation (either as the owner of the tables, or as a sufficiently privileged user for cross-schema operations).
- The procedure executes like a DDL in that it auto-commits before and after its execution.

## INITFS Procedure

This procedure initialize a POSIX file system store. The table associated with the POSIX file system store `store_name` is truncated and reinitialized with a single "root" directory entry.

### Syntax

```
DBMS_DBFS_SFS.INITFS (  
    store_name      IN      VARCHAR2);
```

### Parameters

**Table 50–9** *INITFS Procedure Parameters*

Parameter	Description
<code>store_name</code>	Name of store

### Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

---

---

## DBMS\_DB\_VERSION

The DBMS\_DB\_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

**See Also:** *PL/SQL Users Guide and Reference* regarding conditional compilation

This package contains the following topics

- [Using DBMS\\_DB\\_VERSION](#)
  - Overview
  - Constants
  - Examples

## Using DBMS\_DB\_VERSION

- [Overview](#)
- [Constants](#)

## Overview

The DBMS\_DB\_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The package for the Oracle Database 11g Release 1 version is shown below.

```
PACKAGE DBMS_DB_VERSION IS
  VERSION CONSTANT PLS_INTEGER := 11; -- RDBMS version number
  RELEASE CONSTANT PLS_INTEGER := 1; -- RDBMS release number
  ver_le_9_1    CONSTANT BOOLEAN := FALSE;
  ver_le_9_2    CONSTANT BOOLEAN := FALSE;
  ver_le_9      CONSTANT BOOLEAN := FALSE;
  ver_le_10_1   CONSTANT BOOLEAN := FALSE;
  ver_le_10_2   CONSTANT BOOLEAN := FALSE;
  ver_le_10     CONSTANT BOOLEAN := FALSE;
  ver_le_11_1   CONSTANT BOOLEAN := TRUE;
  ver_le_11     CONSTANT BOOLEAN := TRUE;
END DBMS_DB_VERSION;
```

The boolean constants follow a naming convention. Each constant gives a name for a boolean expression. For example:

- VER\_LE\_9\_1 represents version <= 9 and release <= 1
- VER\_LE\_10\_2 represents version <= 10 and release <= 2
- VER\_LE\_10 represents version <= 10

A typical usage of these boolean constants is:

```
$IF DBMS_DB_VERSION.VER_LE_10 $THEN
  version 10 and earlier code
$ELSIF DBMS_DB_VERSION.VER_LE_11 $THEN
  version 11 code
$ELSE
  version 12 and later code
$END
```

This code structure will protect any reference to the code for hypothetical version 12. It also prevents the controlling package constant DBMS\_DB\_VERSION.VER\_LE\_11 from being referenced when the program is compiled under version 10. A similar observation applies to version 11. This scheme works even though the static constant VER\_LE\_11 is not defined in version 10 database because conditional compilation protects the \$ELSIF from evaluation if DBMS\_DB\_VERSION.VER\_LE\_10 is TRUE.

## Constants

The `DBMS_DB_VERSION` package contains different constants for different Oracle Database releases. The Oracle Database 11g Release 1 version of the `DBMS_DB_VERSION` package uses the constants shown in [Table 51-1](#).

**Table 51-1** *DBMS\_DB\_VERSION Constants*

Name	Type	Value	Description
<code>VERSION</code>	<code>PLS_INTEGER</code>	10	Current version
<code>RELEASE</code>	<code>PLS_INTEGER</code>	2	Current release
<code>VER_LE_9</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 9
<code>VER_LE_9_1</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 9 and release <= 1
<code>VER_LE_9_2</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 9 and release <= 2
<code>VER_LE_10</code>	<code>BOOLEAN</code>	<code>TRUE</code>	Version <= 10
<code>VER_LE_10_1</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 10 and release <= 1
<code>VER_LE_10_2</code>	<code>BOOLEAN</code>	<code>TRUE</code>	Version <=10 and release <= 2
<code>VER_LE_11</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 11
<code>VER_LE_11_1</code>	<code>BOOLEAN</code>	<code>TRUE</code>	Version <=11 and release <= 1

## Examples

This example uses conditional compilation to guard new features.

```

CREATE OR REPLACE PROCEDURE whetstone IS

  -- Notice that conditional compilation constructs
  -- can interrupt a regular PL/SQL statement.
  -- You can locate a conditional compilation directive anywhere
  -- there is whitespace in the regular statement.

  SUBTYPE my_real IS
    $IF DBMS_DB_VERSION.VER_LE_9 $THEN NUMBER
                                $ELSE BINARY_DOUBLE
    $END;

  t  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 0.499975
                                $ELSE 0.499975d
    $END;

  t2 CONSTANT my_real := $if DBMS_DB_VERSION.VER_LE_9 $THEN 2.0
                                $ELSE 2.0d
    $END;

  x  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                $ELSE 1.0d
    $END;

  y  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                $ELSE 1.0d
    $END;

  z  MY_REAL;

  PROCEDURE P(x IN my_real, y IN my_real, z OUT NOCOPY my_real) IS
    x1 my_real;
    y1 my_real;
  BEGIN
    x1 := x;
    y1 := y;
    x1 := t * (x1 + y1);
    y1 := t * (x1 + y1);
    z := (x1 + y1)/t2;
  END P;
BEGIN
  P(x, y, z);
  DBMS_OUTPUT.PUT_LINE ('z = ' || z);
END whetstone;
/

```

DBMS\_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This API is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

---

---

**Note:** The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

---

---

This chapter contains the following topics:

- [Using DBMS\\_DEBUG](#)
  - Overview
  - Constants
  - Variables
  - Exceptions
  - Operational Notes
- [Data Structures](#)
  - RECORD Types
  - TABLE Types
- [Summary of DBMS\\_DEBUG Subprograms](#)

## Using DBMS\_DEBUG

- [Overview](#)
- [Constants](#)
- [Variables](#)
- [Exceptions](#)
- [Operational Notes](#)

## Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with `DBMS_DEBUG`. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using `DBMS_DEBUG`: This tells it which target session to supervise. The debug session may then call entry points in `DBMS_DEBUG` to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- [SYNCHRONIZE Function](#)
- [DEBUG\\_ON Procedure](#)
- [DEBUG\\_OFF Procedure](#)

`DBMS_DEBUG` does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

## Constants

A breakpoint status may have the following value:

- `breakpoint_status_unused`—breakpoint is not in use

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

## Variables

The DBMS\_DEBUG uses the variables shown in [Table 52-1](#).

**Table 52-1 DBMS\_DEBUG Variables**

Variable	Description
default_timeout	The timeout value (used by both sessions).The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.

## Exceptions

These values are returned by the various functions called in the debug session (SYNCHRONIZE, CONTINUE, SET\_BREAKPOINT, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

Value	Description
success	Normal termination

Statuses returned by GET\_VALUE and SET\_VALUE:

Status	Description
error_bogus_frame	No such entypoint on the stack
error_no_debug_info	Program was compiled without debug symbols
error_no_such_object	No such variable or parameter
error_unknown_type	Debug information is unreadable
error_indexed_table	Returned by GET_VALUE if the object is a table, but no index was provided
error_illegal_index	No such element exists in the collection
error_nullcollection	Table is atomically NULL
error_nullvalue	Value is NULL

Statuses returned by SET\_VALUE:

Status	Description
error_illegal_value	Constraint violation
error_illegal_null	Constraint violation
error_value_malformed	Unable to decipher the given value
error_other	Some other error
error_name_incomplete	Name did not resolve to a scalar

Statuses returned by the breakpoint functions:

Status	Description
error_no_such_breakpt	No such breakpoint
error_idle_breakpt	Cannot enable or disable an unused breakpoint
error_bad_handle	Unable to set breakpoint in given program (nonexistent or security violation)

General error codes (returned by many of the DBMS\_DEBUG subprograms):

<b>Status</b>	<b>Description</b>
error_unimplemented	Functionality is not yet implemented
error_deferred	No program running; operation deferred
error_exception	An exception was raised in the DBMS_DEBUG or Probe packages on the server
error_communication	Some error other than a timeout occurred
error_timeout	Timeout occurred

<b>Exception</b>	<b>Description</b>
illegal_init	DEBUG_ON was called prior to INITIALIZE

The following exceptions are raised by procedure SELF\_CHECK:

<b>Exception</b>	<b>Description</b>
pipe_creation_failure	Could not create a pipe
pipe_send_failure	Could not write data to the pipe
pipe_receive_failure	Could not read data from the pipe
pipe_datatype_mismatch	Datatype in the pipe was wrong
pipe_data_error	Data got garbled in the pipe

## Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

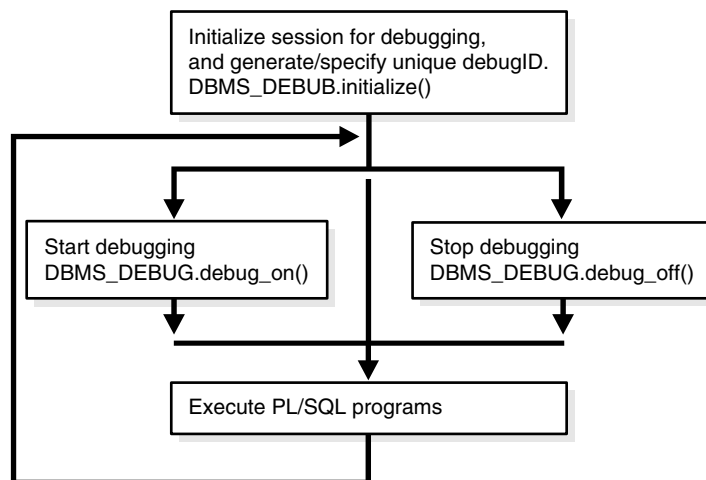

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

Figure 52–1 and Figure 52–2 illustrate the flow of operations in the session to be debugged and in the debugging session.

**Figure 52–1 Target Session**

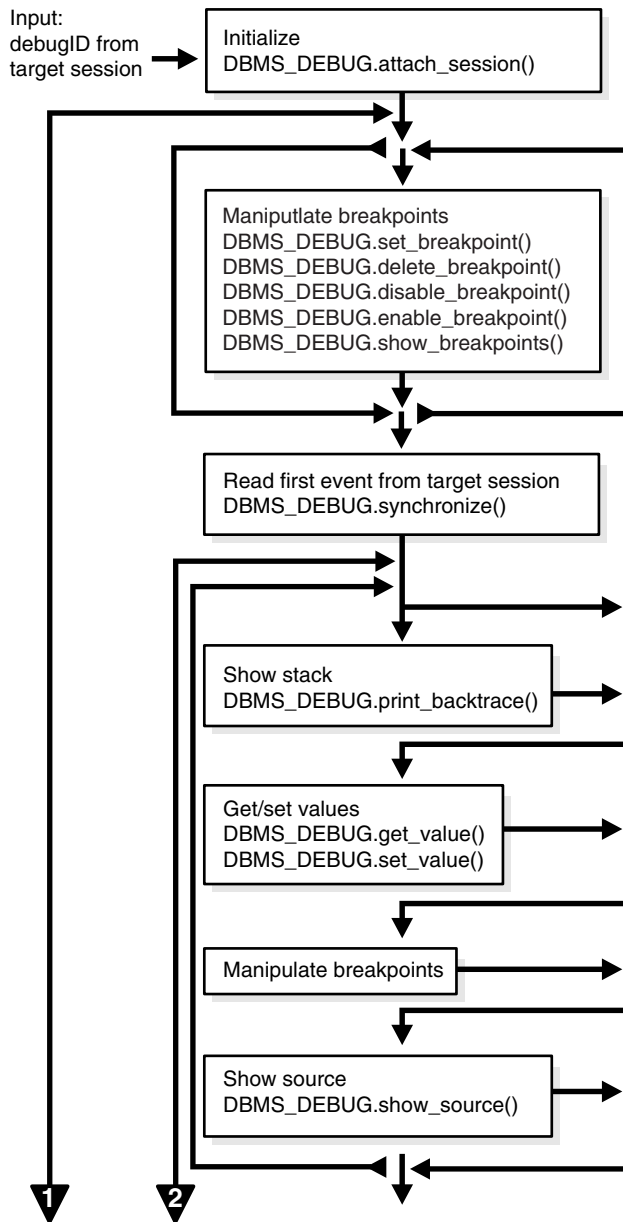

This illustration shows the first steps in the target session:

First, initialize the session for debugging, and generate or specify the unique debugID. `DBMS_DEBUG.initialize()`

Then, start debugging using `DBMS_DEBUG.debug_on()` or stop debugging using `DBMS_DEBUG.debug_off()`. Then, execute the PL/SQL program.

\*\*\*\*\*

**Figure 52-2 Debug Session**

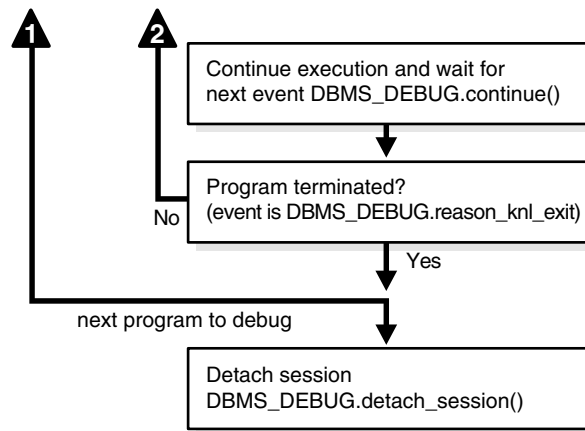

This illustration shows the continuation of steps in the target session:

- Initialize using `DBMS_DEBUG.attach_session()`
- Manipulate the breakpoints using:
  - `DBMS_DEBUG.set_breakpoint()`
  - `DBMS_DEBUG.delete_breakpoint()`
  - `DBMS_DEBUG.disable_breakpoint()`
  - `DBMS_DEBUG.enable_breakpoint()`
  - `DBMS_DEBUG.show_breakpoint()`
- Read first event from the target session using `DBMS_DEBUG.synchronize()`
- Show the stack using `DBMS_DEBUG.print_backtrace()`

- Get/set values using:
  - DBMS\_DEBUG.get\_value()
  - 
  - DBMS\_DEBUG.set\_value()
- Manipulate the breakpoints
- Show the source by using DBMS\_DEBUG.show\_source().

\*\*\*\*\*

**Figure 52–3 Debug Session (Cont.)**

This illustration shows the final steps in the target session:

- Continue execution and wait for the next event DBMS\_DEBUG.continue()
- If the program terminated, detach the session using DBMS\_DEBUG.detach\_session()
- If it did not terminate, resume the process by showing the stack.

\*\*\*\*\*

## Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an *interesting* event occurs. The set of interesting events is specified by the flags passed to DBMS\_DEBUG.CONTINUE in the *breakflags* parameter.

## Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to DBMS\_DEBUG.SYNCHRONIZE after the target session has ended causes the debug session to hang until it times out.

## Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- SET\_BREAKPOINT does not set the breakpoint number (it can be obtained later from SHOW\_BREAKPOINTS if necessary).
- SET\_BREAKPOINT does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

## Diagnostic Output

To debug Probe, there are *diagnostics* parameters to some of the calls in DBMS\_DEBUG. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

## Common and Debug Session Sections

- [Common Section](#)
- [Target Session](#)
- [Debug Session Section](#)

### Common Section

The following subprograms may be called in either the target or the debug session:

- [PROBE\\_VERSION Procedure](#)
- [SELF\\_CHECK Procedure](#)
- [SET\\_TIMEOUT Function](#)

### Target Session

The following subprograms may be called only in the target session:

- [INITIALIZE Function](#)
- [DEBUG\\_ON Procedure](#)
- [SET\\_TIMEOUT\\_BEHAVIOUR Procedure](#)
- [GET\\_TIMEOUT\\_BEHAVIOUR Function](#)

### Debug Session Section

The following subprograms should be run in the debug session only:

- [ATTACH\\_SESSION Procedure](#)
- [SYNCHRONIZE Function](#)
- [SHOW\\_FRAME\\_SOURCE Procedure](#)
- [SHOW\\_SOURCE Procedures](#)
- [GET\\_MORE\\_SOURCE Procedure](#)
- [PRINT\\_BACKTRACE Procedure](#)
- [CONTINUE Function](#)
- [SET\\_BREAKPOINT Function](#)

- [DELETE\\_BREAKPOINT Function](#)
- [SET\\_OER\\_BREAKPOINT Function](#)
- [DELETE\\_OER\\_BREAKPOINT Function](#)
- [ENABLE\\_BREAKPOINT Function](#)
- [DISABLE\\_BREAKPOINT Function](#)
- [SHOW\\_BREAKPOINTS Procedures](#)
- [SET\\_VALUE Functionn](#)
- [GET\\_VALUE Function](#)
- [TARGET\\_PROGRAM\\_RUNNING Procedure](#)
- [DETACH\\_SESSION Procedure](#)
- [GET\\_RUNTIME\\_INFO Function](#)
- [PRINT\\_INSTANTIATIONS Procedure](#)
- [PING Procedure](#)
- [GET\\_LINE\\_MAP Function](#)
- [GET\\_RUNTIME\\_INFO Function](#)
- [GET\\_INDEXES Function](#)
- [EXECUTE Procedure](#)

## OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are `exception_init'd` to the same OER, they are indistinguishable.

## Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
  - Package specifications.
  - Procedures and functions that are not nested inside other packages, procedures, or functions.
  - Object types.
3. `Namespace_pkg_body` contains package bodies and type bodies.
4. `Namespace_trigger` contains triggers.

## Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in PROGRAM\_INFO when Probe is giving a stack backtrace.

- LibunitType\_cursor
- LibunitType\_procedure
- LibunitType\_function
- LibunitType\_package
- LibunitType\_package\_body
- LibunitType\_trigger
- LibunitType\_Unknown

## Breakflags

These are values to use for the breakflags parameter to CONTINUE, in order to tell Probe what events are of interest to the client. These flags may be combined.

Value	Description
break_next_line	Break at next source line (step over calls)
break_any_call	Break at next source line (step into calls)
break_any_return	Break after returning from current entrypoint (skip over any entrypoints called from the current routine)
break_return	Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running Proc1, which calls Proc2, then break_return stops at the end of Proc2.)
break_exception	Break when an exception is raised
break_handler	Break when an exception handler is executed
abort_execution	Stop execution and force an 'exit' event as soon as DBMS_DEBUG.CONTINUE is called.

## Information Flags

These are flags which may be passed as the info\_requested parameter to SYNCHRONIZE, CONTINUE, and GET\_RUNTIME\_INFO.

Flag	Description
info_getStackDepth	Get the current depth of the stack
info_getBreakpoint	Get the breakpoint number
info_getLineinfo	Get program unit information

## Reasons for Suspension

After CONTINUE is run, the program either runs to completion or breaks on some line.

Reason	Description
reason_none	-

<b>Reason</b>	<b>Description</b>
reason_interpreter_starting	Interpreter is starting
reason_breakpoint	Hit a breakpoint
reason_enter	Procedure entry
reason_return	Procedure is about to return
reason_finish	Procedure is finished
reason_line	Reached a new line
reason_interrupt	An interrupt occurred
reason_exception	An exception was raised
reason_exit	Interpreter is exiting (old form)
reason_knl_exit	Kernel is exiting
reason_handler	Start exception-handler
reason_timeout	A timeout occurred
reason_instantiate	Instantiation block
reason_abort	Interpreter is aborting

## Data Structures

The DBMS\_DEBUG package defines RECORD types and TABLE types.

### RECORD Types

- [BREAKPOINT\\_INFO](#) Record Type
- [PROGRAM\\_INFO](#) Record Type
- [RUNTIME\\_INFO](#) Record Type

### TABLE Types

- [BACKTRACE\\_TABLE](#) Table Type
- [BREAKPOINT\\_TABLE](#) Table Type
- [INDEX\\_TABLE](#) Table Type
- [VC2\\_TABLE](#) Table Type

## BREAKPOINT\_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

### Syntax

```
TYPE breakpoint_info IS RECORD (  
    name          VARCHAR2(30),  
    owner         VARCHAR2(30),  
    dblink        VARCHAR2(30),  
    line#         BINARY_INTEGER,  
    libunittype   BINARY_INTEGER,  
    status        BINARY_INTEGER);
```

### Fields

**Table 52–2** BREAKPOINT\_INFO Fields

Field	Description
name	Name of the program unit
owner	Owner of the program unit
dblink	Database link, if remote
line#	Line number
libunittype	NULL, unless this is a nested procedure or function
status	See <a href="#">Constants</a> on page 52-4 for values of breakpoint_status_*

## PROGRAM\_INFO Record Type

This type specifies a program location. It is a line number in a program unit. This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

### Syntax

```
TYPE program_info IS RECORD(
  -- The following fields are used when setting a breakpoint
  namespace      BINARY_INTEGER,
  name            VARCHAR2(30),
  owner          VARCHAR2(30),
  dblink         VARCHAR2(30),
  line#          BINARY_INTEGER,
  -- Read-only fields (set by Probe when doing a stack backtrace)
  libunittype    BINARY_INTEGER,
  entrypointname VARCHAR2(30));
```

### Fields

**Table 52-3 PROGRAM\_INFO Fields**

Field	Description
namespace	See <a href="#">Namespaces</a> on page 52-12
name	Name of the program unit
owner	Owner of the program unit
dblink	Database link, if remote
line#	Line number
libunittype	A read-only field, NULL, unless this is a nested procedure or function
entrypointname	A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications). See the <a href="#">Libunit Types</a> on page 52-13 for more information.

## RUNTIME\_INFO Record Type

This type gives context information about the running program.

### Syntax

```
TYPE runtime_info IS RECORD(  
    line#           BINARY_INTEGER,  
    terminated     binary_integer,  
    breakpoint     binary_integer,  
    stackdepth    BINARY_INTEGER,  
    interpreterdepth BINARY_INTEGER,  
    reason        BINARY_INTEGER,  
    program       program_info);
```

### Fields

**Table 52–4** *RUNTIME\_INFO Fields*

Field	Description
line#	Duplicate of program.line#
terminated	Whether the program has terminated
breakpoint	Breakpoint number
stackdepth	Number of frames on the stack
interpreterdepth	[A reserved field]
reason	Reason for suspension
program	Source location

## **BACKTRACE\_TABLE Table Type**

This type is used by PRINT\_BACKTRACE.

### **Syntax**

```
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```

## **BREAKPOINT\_TABLE Table Type**

This type is used by SHOW\_BREAKPOINTS.

### **Syntax**

```
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

## INDEX\_TABLE Table Type

This type is used by `GET_INDEXES` to return the available indexes for an indexed table.

### Syntax

```
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

## VC2\_TABLE Table Type

This type is used by SHOW\_SOURCE.

### Syntax

```
TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;
```

## Summary of DBMS\_DEBUG Subprograms

**Table 52–5 DBMS\_DEBUG Package Subprograms**

Subprogram	Description
<a href="#">ATTACH_SESSION Procedure</a> on page 52-25	Notifies the debug session about the target debugID
<a href="#">CONTINUE Function</a> on page 52-26	Continues execution of the target program
<a href="#">DEBUG_OFF Procedure</a> on page 27	Turns debug-mode off
<a href="#">DEBUG_ON Procedure</a> on page 52-28	Turns debug-mode on
<a href="#">DELETE_BREAKPOINT Function</a> on page 52-29	Deletes a breakpoint
<a href="#">DELETE_OER_BREAKPOINT Function</a> on page 52-30	Deletes an OER breakpoint
<a href="#">DETACH_SESSION Procedure</a> on page 52-31	Stops debugging the target program
<a href="#">DISABLE_BREAKPOINT Function</a> on page 52-32	Disables a breakpoint
<a href="#">ENABLE_BREAKPOINT Function</a> on page 52-33	Activates an existing breakpoint
<a href="#">EXECUTE Procedure</a> on page 52-34	Executes SQL or PL/SQL in the target session
<a href="#">GET_INDEXES Function</a> on page 52-36	Returns the set of indexes for an indexed table
<a href="#">GET_MORE_SOURCE Procedure</a> on page 52-37	Provides additional source in the event of buffer overflow when using SHOW_SOURCE
<a href="#">GET_LINE_MAP Function</a> on page 52-38	Returns information about line numbers in a program unit
<a href="#">GET_RUNTIME_INFO Function</a> on page 52-39	Returns information about the current program
<a href="#">GET_TIMEOUT_BEHAVIOUR Function</a> on page 52-40	Returns the current timeout behavior
<a href="#">GET_VALUE Function</a> on page 52-41	Gets a value from the currently-running program
<a href="#">INITIALIZE Function</a> on page 52-43	Sets debugID in target session
<a href="#">PING Procedure</a> on page 52-45	Pings the target session to prevent it from timing out
<a href="#">PRINT_BACKTRACE Procedure</a> on page 52-46	Prints a stack backtrace
<a href="#">PRINT_INSTANTIATIONS Procedure</a> on page 52-47	Prints a stack backtrace
<a href="#">PROBE_VERSION Procedure</a> on page 52-48	Returns the version number of DBMS_DEBUG on the server

**Table 52–5 (Cont.) DBMS\_DEBUG Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">SELF_CHECK Procedure</a> on page 52-49	Performs an internal consistency check
<a href="#">SET_BREAKPOINT Function</a> on page 52-50	Sets a breakpoint in a program unit
<a href="#">SET_OER_BREAKPOINT Function</a> on page 52-51	Sets an OER breakpoint
<a href="#">SET_TIMEOUT Function</a> on page 52-52	Sets the timeout value
<a href="#">SET_TIMEOUT_BEHAVIOUR Procedure</a> on page 52-53	Tells Probe what to do with the target session when a timeout occurs
<a href="#">SET_VALUE Function</a> on page 52-54	Sets a value in the currently-running program
<a href="#">SHOW_BREAKPOINTS Procedures</a> on page 52-56	Returns a listing of the current breakpoints
<a href="#">SHOW_FRAME_SOURCE Procedure</a> on page 52-57	Fetches the frame source
<a href="#">SHOW_SOURCE Procedures</a> on page 52-58	Fetches program source
<a href="#">SYNCHRONIZE Function</a> on page 52-60	Waits for program to start running
<a href="#">TARGET_PROGRAM_RUNNING Procedure</a> on page 52-61	Returns TRUE if the target session is currently executing a stored procedure, or FALSE if it is not

## ATTACH\_SESSION Procedure

This procedure notifies the debug session about the target program.

### Syntax

```
DBMS_DEBUG.ATTACH_SESSION (  
    debug_session_id IN VARCHAR2,  
    diagnostics      IN BINARY_INTEGER := 0);
```

### Parameters

**Table 52–6** *ATTACH\_SESSION Procedure Parameters*

Parameter	Description
debug_session_id	Debug ID from a call to INITIALIZE in target session
diagnostics	Generate diagnostic output if nonzero

## CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If `info_requested` is not `NULL`, then calls `GET_RUNTIME_INFO`.

### Syntax

```
DBMS_DEBUG.CONTINUE (
    run_info      IN OUT runtime_info,
    breakflags   IN      BINARY_INTEGER,
    info_requested IN      BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–7** CONTINUE Function Parameters

Parameter	Description
<code>run_info</code>	Information about the state of the program
<code>breakflags</code>	Mask of events that are of interest (see " <a href="#">Breakflags</a> " on page 52-13)
<code>info_requested</code>	Which information should be returned in <code>run_info</code> when the program stops (see " <a href="#">Information Flags</a> " on page 52-13)

### Return Values

**Table 52–8** CONTINUE Function Return Values

Return	Description
<code>success</code>	
<code>error_timeout</code>	Timed out before the program started running
<code>error_communication</code>	Other communication error

## DEBUG\_OFF Procedure

---

---

**Caution:** There must be a debug session waiting if immediate is TRUE.

---

---

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

### Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

### Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

## DEBUG\_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

### Syntax

```
DBMS_DEBUG.DEBUG_ON (  
    no_client_side_plsql_engine BOOLEAN := TRUE,  
    immediate                   BOOLEAN := FALSE);
```

### Parameters

**Table 52–9** *DEBUG\_ON Procedure Parameters*

Parameter	Description
<code>no_client_side_plsql_engine</code>	Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine
<code>immediate</code>	If this is <code>TRUE</code> , then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.

## DELETE\_BREAKPOINT Function

This function deletes a breakpoint.

### Syntax

```
DBMS_DEBUG.DELETE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–10** *DELETE\_BREAKPOINT Function Parameters*

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

### Return Values

**Table 52–11** *DELETE\_BREAKPOINT Function Return Values*

Return	Description
success	
error_no_such_breakpt	No such breakpoint exists
error_idle_breakpt	Cannot delete an unused breakpoint
error_stale_breakpt	The program unit was redefined since the breakpoint was set

## DELETE\_OER\_BREAKPOINT Function

This function deletes an OER breakpoint.

### Syntax

```
DBMS_DEBUG.DELETE_OER_BREAKPOINT (  
    oer IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 52–12** *DELETE\_OER\_BREAKPOINT Function Parameters*

Parameter	Description
oer	The OER (positive 4-byte number) to delete

## **DETACH\_SESSION Procedure**

This procedure stops debugging the target program. This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

### **Syntax**

```
DBMS_DEBUG.DETACH_SESSION;
```

## DISABLE\_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

### Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (  
    breakpoint IN BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–13** *DISABLE\_BREAKPOINT Function Parameters*

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

### Return Values

**Table 52–14** *DISABLE\_BREAKPOINT Function Return Values*

Returns	Description
success	
error_no_such_ breakpt	No such breakpoint exists
error_idle_breakpt	Cannot disable an unused breakpoint

## ENABLE\_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

### Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–15** *ENABLE\_BREAKPOINT Function Parameters*

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

### Return Values

**Table 52–16** *ENABLE\_BREAKPOINT Function Return Values*

Return	Description
success	Success
error_no_such_breakpt	No such breakpoint exists
error_idle_breakpt	Cannot enable an unused breakpoint

## EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to `DBMS_DEBUG.EXECUTE` occurs in the debug session, which then asks the target session to execute the code.

### Syntax

```
DBMS_DEBUG.EXECUTE (
  what          IN VARCHAR2,
  frame#        IN BINARY_INTEGER,
  bind_results  IN BINARY_INTEGER,
  results       IN OUT NOCOPY dbms_debug_vc2coll,
  errm          IN OUT NOCOPY VARCHAR2);
```

### Parameters

**Table 52–17 EXECUTE Procedure Parameters**

Parameter	Description
<code>what</code>	SQL or PL/SQL source to execute
<code>frame#</code>	The context in which to execute the code. Only -1 (global context) is supported at this time.
<code>bind_results</code>	Whether the source wants to bind to <code>results</code> in order to return values from the target session: 0 = No 1 = Yes
<code>results</code>	Collection in which to place results, if <code>bind_results</code> is not 0
<code>errm</code>	Error message, if an error occurred; otherwise, NULL

### Examples

#### Example 1

This example executes a SQL statement. It returns no results.

```
DECLARE
  coll sys.dbms_debug_vc2coll; -- results (unused)
  errm VARCHAR2(100);
BEGIN
  dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
                    'values(''LJE'', 1, 1)',
                    -1, 0, coll, errm);
END;
```

#### Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```
DECLARE
  coll sys.dbms_debug_vc2coll;
  errm VARCHAR2(100);
BEGIN
```

```

dbms_debug.execute(
  'DECLARE PRAGMA autonomous_transaction; ' ||
  'BEGIN ' ||
  '  insert into emp(ename, empno, deptno) ' ||
  '  values(''LJE'', 1, 1); ' ||
  ' COMMIT; ' ||
  'END;',
  -1, 0, coll, errm);
END;

```

### Example 3

This example executes a PL/SQL block, and it returns some results.

```

DECLARE
  coll sys.dbms_debug_vc2coll;
  errm VARCHAR2(100);
BEGIN
  dbms_debug.execute(
    'DECLARE ' ||
    '  pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
    '  x PLS_INTEGER; ' ||
    '  i PLS_INTEGER := 1; ' ||
    'BEGIN ' ||
    '  SELECT COUNT(*) INTO x FROM emp; ' ||
    '  pp.EXTEND(x * 6); ' ||
    '  FOR c IN (SELECT * FROM emp) LOOP ' ||
    '    pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
    '    pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
    '    pp(i) := ''Job:   '' || c.job;   i := i+1; ' ||
    '    pp(i) := ''Mgr:   '' || c.mgr;   i := i+1; ' ||
    '    pp(i) := ''Sal:   '' || c.sal;   i := i+1; ' ||
    '    pp(i) := null;          i := i+1; ' ||
    '  END LOOP; ' ||
    '  :1 := pp; ' ||
    'END;',
    -1, 1, coll, errm);
  each := coll.FIRST;
  WHILE (each IS NOT NULL) LOOP
    dosomething(coll(each));
    each := coll.NEXT(each);
  END LOOP;
END;

```

## GET\_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

### Syntax

```
DBMS_DEBUG.GET_INDEXES (
    varname   IN  VARCHAR2,
    frame#    IN  BINARY_INTEGER,
    handle    IN  program_info,
    entries   OUT index_table)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–18** GET\_INDEXES Function Parameters

Parameter	Description
varname	Name of the variable to get index information about
frame#	Number of frame in which the variable or parameter resides; NULL for a package variable
handle	Package description, if object is a package variable
entries	1-based table of the indexes: if non-NULL, then entries(1) contains the first index of the table, entries(2) contains the second index, and so on.

### Return Values

**Table 52–19** GET\_INDEXES Function Return Values

Return	Description
error_no_such_object	One of the following: <ul style="list-style-type: none"> <li>- The package does not exist</li> <li>- The package is not instantiated</li> <li>- The user does not have privileges to debug the package</li> <li>- The object does not exist in the package</li> </ul>

## GET\_MORE\_SOURCE Procedure

When source does not fit in the buffer provided by that version of the [SHOW\\_SOURCE Procedures](#) which produce a formatted buffer, this procedure provides additional source.

### Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (
  buffer          IN OUT VARCHAR2,
  buflen         IN BINARY_INTEGER,
  piece#         IN BINARY_INTEGER);
```

### Parameters

**Table 52–20** *GET\_MORE\_SOURCE Procedure Parameters*

Parameter	Description
buffer	The buffer
buflen	The length of the buffer
piece#	A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the <a href="#">SHOW_SOURCE Procedures</a>

### Usage Notes

This procedure should be called only after the version of SHOW\_SOURCE that returns a formatted buffer.

## GET\_LINE\_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

### Syntax

```
DBMS_DEBUG.GET_LINE_MAP (
  program          IN  program_info,
  maxline          OUT BINARY_INTEGER,
  number_of_entry_points OUT BINARY_INTEGER,
  linemap         OUT  RAW)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–21** GET\_LINE\_MAP Function Parameters

Parameter	Description
program	A top-level program unit (procedure / package / function / package body, and so on). Its Namespace, Name, and Owner fields must be initialized, the remaining fields are ignored.
maxline	The largest source code line number in 'program'
number_of_entry_points	The number of subprograms in 'program'
linemap	A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either maxline divided by 8 (plus one if maxline MOD 8 is not zero) or 32767 in the unlikely case of maxline being larger than 32767 * 8.

### Return Values

**Table 52–22** GET\_LINE\_MAP Function Return Values

Return	Description
success	A successful completion
error_no_debug_info	The program unit exists, but has no debug info
error_bad_handle	No such program unit exists

## GET\_RUNTIME\_INFO Function

This function returns information about the current program. It is only needed if the `info_requested` parameter to `SYNCHRONIZE` or `CONTINUE` was set to 0.

---

---

**Note:** This is currently only used by client-side PL/SQL.

---

---

### Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (
  info_requested IN BINARY_INTEGER,
  run_info      OUT runtime_info)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–23** *GET\_RUNTIME\_INFO Function Parameters*

Parameter	Description
<code>info_requested</code>	Which information should be returned in <code>run_info</code> when the program stops (see " <a href="#">Information Flags</a> " on page 52-13)
<code>run_info</code>	Information about the state of the program

## GET\_TIMEOUT\_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

### Syntax

```
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–24** GET\_TIMEOUT\_BEHAVIOUR Function Parameters

Parameter	Description
oer	The OER (a 4-byte positive number)

### Return Values

**Table 52–25** GET\_TIMEOUT\_BEHAVIOUR Function Return Values

Return	Description
success	A successful completion

### Information Flags

```
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

### Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`.

## GET\_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET\_VALUE functions.

### Syntax

```
DBMS_DEBUG.GET_VALUE (
  variable_name IN VARCHAR2,
  frame#       IN BINARY_INTEGER,
  scalar_value OUT VARCHAR2,
  format      IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–26** GET\_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter
frame#	Frame in which it lives; 0 means the current procedure
scalar_value	Value
format	Optional date format to use, if meaningful

### Return Values

**Table 52–27** GET\_VALUE Function Return Values

Return	Description
success	A successful completion
error_bogus_frame	Frame does not exist
error_no_debug_info	Entrypoint has no debug information
error_no_such_object	variable_name does not exist in frame#
error_unknown_type	The type information in the debug information is illegible
error_nullvalue	Value is NULL
error_indexed_table	The object is a table, but no index was provided

This form of GET\_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

### Syntax

```
DBMS_DEBUG.GET_VALUE (
  variable_name IN VARCHAR2,
  handle       IN program_info,
  scalar_value OUT VARCHAR2,
  format      IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

## Parameters

**Table 52–28** GET\_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter
handle	Description of the package containing the variable
scalar_value	Value
format	Optional date format to use, if meaningful

## Return Values

**Table 52–29** GET\_VALUE Function Return Values

Return	Description
error_no_such_object	One of the following: <ul style="list-style-type: none"> <li>- Package does not exist</li> <li>- Package is not instantiated</li> <li>- User does not have privileges to debug the package</li> <li>- Object does not exist in the package</li> </ul>
error_indexed_table	The object is a table, but no index was provided

## Examples

This example illustrates how to get the value with a given package PACK in schema SCOTT, containing variable VAR:

```

DECLARE
    handle    dbms_debug.program_info;
    resultbuf VARCHAR2(500);
    retval    BINARY_INTEGER;
BEGIN
    handle.Owner      := 'SCOTT';
    handle.Name       := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
```

## INITIALIZE Function

This function initializes the target session for debugging.

### Syntax

```
DBMS_DEBUG.INITIALIZE (
  debug_session_id IN VARCHAR2      := NULL,
  diagnostics      IN BINARY_INTEGER := 0)
RETURN VARCHAR2;
```

### Parameters

**Table 52–30 INITIALIZE Function Parameters**

Parameter	Description
debug_session_id	Name of session ID. If NULL, then a unique ID is generated.
diagnostics	Indicates whether to dump diagnostic output to the tracefile: 0 = (default) no diagnostics 1 = print diagnostics

### Return Values

The newly-registered debug session ID (debugID)

### Usage Notes

You cannot use DBMS\_DEBUG and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to DBMS\_DEBUG will succeed only if either the caller or the specified debug role carries the DEBUG CONNECT SESSION privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The CREATE ANY PROCEDURE privilege does not affect the visibility of routines through the debugger. A privilege DEBUG for each object has been introduced with a corresponding DEBUG ANY PROCEDURE variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for DEBUG CONNECT SESSION privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or PUBLIC will be used to check for DEBUG CONNECT SESSION. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the DEBUG privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made

(even if those roles were not available within a definer's rights environment of the call), and the debug role.

## PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the `timeout_behaviour` is set to `retry_on_timeout` then this procedure is not necessary.

### Syntax

```
DBMS_DEBUG.PING;
```

### Exceptions

Oracle will display the `no_target_program` exception if there is no target program or if the target session is not currently waiting for input from the debug session.

### Usage Notes

Timeout options for the target session are registered with the target session by calling `set_timeout_behaviour`:

- `retry_on_timeout` - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- `continue_on_timeout` - Continue execution, using same event flags.
- `nodebug_on_timeout` - Turn debug-mode OFF (in other words, call `debug_off`) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling `debug_on`.
- `abort_on_timeout` - Continue execution, using the `abort_execution` flag, which should cause the program to terminate immediately. The session remains in debug-mode.

```
retry_on_timeout CONSTANT BINARY_INTEGER:= 0;  
continue_on_timeout CONSTANT BINARY_INTEGER:= 1;  
nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;  
abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
```

## PRINT\_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded PRINT\_BACKTRACE procedures.

### Syntax

```
DBMS_DEBUG.PRINT_BACKTRACE (  
    listing IN OUT VARCHAR2);  
  
DBMS_DEBUG.PRINT_BACKTRACE (  
    backtrace OUT backtrace_table);
```

### Parameters

**Table 52–31 PRINT\_BACKTRACE Procedure Parameters**

Parameter	Description
listing	A formatted character buffer with embedded newlines
backtrace	1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.

## PRINT\_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

### Syntax

```
DBMS_DEBUG.PRINT_INSTANTIATIONS (
  pkgs   IN OUT NOCOPY backtrace_table,
  flags  IN BINARY_INTEGER);
```

### Parameters

**Table 52–32 PRINT\_INSTANTIATIONS Procedure Parameters**

Parameter	Description
pkgs	The instantiated packages
flags	Bitmask of options: <ul style="list-style-type: none"> <li>■ 1 - show specs</li> <li>■ 2 - show bodies</li> <li>■ 4 - show local instantiations</li> <li>■ 8 - show remote instantiations (NYI)</li> <li>■ 16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.</li> </ul>

### Exceptions

`no_target_program` - target session is not currently executing

### Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: `Namespace`, `Name`, `Owner`, and `LibunitType`.

In addition, `Line#` contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped

## PROBE\_VERSION Procedure

This procedure returns the version number of DBMS\_DEBUG on the server.

### Syntax

```
DBMS_DEBUG.PROBE_VERSION (
    major out BINARY_INTEGER,
    minor out BINARY_INTEGER);
```

### Parameters

**Table 52-33** *PROBE\_VERSION Procedure Parameters*

Parameter	Description
major	Major version number
minor	Minor version number: increments as functionality is added

## SELF\_CHECK Procedure

This procedure performs an internal consistency check. SELF\_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF\_CHECK does not return successfully, then an incorrect version of DBMS\_DEBUG was probably installed on this server. The solution is to install the correct version (pblload.sql loads DBMS\_DEBUG and the other relevant packages).

### Syntax

```
DBMS_DEBUG.SELF_CHECK (
    timeout IN binary_integer := 60);
```

### Parameters

**Table 52–34 SELF\_CHECK Procedure Parameters**

Parameter	Description
timeout	The timeout to use for the communication test. Default is 60 seconds.

### Exceptions

**Table 52–35 SELF\_CHECK Procedure Exceptions**

Exception	Description
OER-6516	Probe version is inconsistent
pipe_creation_failure	Could not create a pipe
pipe_send_failure	Could not write data to the pipe
pipe_receive_failure	Could not read data from the pipe
pipe_datatype_mismatch	Datatype in the pipe was wrong
pipe_data_error	Data got garbled in the pipe

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

## SET\_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session. Execution pauses if the target program reaches the breakpoint.

### Syntax

```
DBMS_DEBUG.SET_BREAKPOINT (
  program      IN program_info,
  line#        IN BINARY_INTEGER,
  breakpoint#  OUT BINARY_INTEGER,
  fuzzy        IN BINARY_INTEGER := 0,
  iterations   IN BINARY_INTEGER := 0)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–36** SET\_BREAKPOINT Function Parameters

Parameter	Description
program	Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.)
line#	Line at which the breakpoint is to be set
breakpoint#	On successful completion, contains the unique breakpoint number by which to refer to the breakpoint
fuzzy	Only applicable if there is no executable code at the specified line: 0 means return <code>error_illegal_line</code> 1 means search forward for an adjacent line at which to place the breakpoint -1 means search backward for an adjacent line at which to place the breakpoint
iterations	Number of times to wait before signalling this breakpoint

### Return Values

---

---

**Note:** The `fuzzy` and `iterations` parameters are not yet implemented

---

---

**Table 52–37** SET\_BREAKPOINT Function Return Values

Return	Description
success	A successful completion
error_illegal_line	Cannot set a breakpoint at that line
error_bad_handle	No such program unit exists

## SET\_OER\_BREAKPOINT Function

This function sets an OER breakpoint.

### Syntax

```
DBMS_DEBUG.SET_OER_BREAKPOINT (
    oer IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 52–38 SET\_OER\_BREAKPOINT Function Parameters**

Parameter	Description
oer	The OER (positive 4-byte number) to set

### Return Values

**Table 52–39 SET\_OER\_BREAKPOINT Function Return Values**

Return	Description
success	A successful completion
error_no_such_breakpt	No such OER breakpoint exists

## SET\_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

### Syntax

```
DBMS_DEBUG.SET_TIMEOUT (  
    timeout BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–40** *SET\_TIMEOUT Function Parameters*

Parameter	Description
timeout	The timeout to use for communication between the target and debug sessions

## SET\_TIMEOUT\_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

### Syntax

```
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
    behaviour IN PLS_INTEGER);
```

### Parameters

**Table 52–41 SET\_TIMEOUT\_BEHAVIOUR Procedure Parameters**

Parameter	Description
behaviour	One of the following:
retry_on_timeout	Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
continue_on_timeout	Continue execution, using same event flags
nodebug_on_timeout	Turn debug-mode OFF (in other words, call <code>debug_off</code> ) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling <code>debug_on</code> .
abort_on_timeout	Continue execution, using the <code>abort_execution</code> flag, which should cause the program to terminate immediately. The session remains in debug-mode.

### Exceptions

unimplemented - the requested behavior is not recognized

### Usage Notes

The default behavior (if this procedure is not called) is `continue_on_timeout`, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.

## SET\_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET\_VALUE functions.

### Syntax

```
DBMS_DEBUG.SET_VALUE (
    frame#           IN binary_integer,
    assignment_statement IN varchar2)
RETURN BINARY_INTEGER;
```

```
DBMS_DEBUG.SET_VALUE (
    handle           IN program_info,
    assignment_statement IN VARCHAR2)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–42 SET\_VALUE Function Parameters**

Parameter	Description
frame#	Frame in which the value is to be set; 0 means the currently executing frame.
handle	Description of the package containing the variable
assignment_statement	An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3;'. Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.

### Return Values

**Table 52–43 SET\_VALUE Function Return Values**

Return	Description
success	-
error_illegal_value	Not possible to set it to that value
error_illegal_null	Cannot set to NULL because object type specifies it as 'not NULL'
error_value_malformed	Value is not a scalar
error_name_incomplete	The assignment statement does not resolve to a scalar. For example, 'x := 3;', if x is a record.
error_no_such_object	One of the following: <ul style="list-style-type: none"> <li>- Package does not exist</li> <li>- Package is not instantiated</li> <li>- User does not have privileges to debug the package</li> <li>- Object does not exist in the package</li> </ul>

## Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that modification to a package variable using `SET_VALUE` might not take effect for a line or two.

## Examples

To set the value of `SCOTT.PACK.var` to 6:

```
DECLARE
    handle dbms_debug.program_info;
    retval BINARY_INTEGER;
BEGIN
    handle.Owner      := 'SCOTT';
    handle.Name       := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval            := dbms_debug.set_value(handle, 'var := 6;');
END;
```

## SHOW\_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW\_BREAKPOINTS procedures.

### Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
    listing    IN OUT VARCHAR2);
```

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
    listing    OUT breakpoint_table);
```

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
    code_breakpoints OUT breakpoint_table,
    oer_breakpoints  OUT oer_table);
```

### Parameters

**Table 52-44** *SHOW\_BREAKPOINTS Procedure Parameters*

Parameter	Description
listing	A formatted buffer (including newlines) of the breakpoints.
	Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.
code_breakpoints	The indexed table of breakpoint entries, indexed by breakpoint number
oer_breakpoints	The indexed table of OER breakpoints, indexed by OER

## SHOW\_FRAME\_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW\_SOURCE procedures.

### Syntax

```
DBMS_DEBUG.SHOW_FRAME_SOURCE (
  first_line IN          BINARY_INTEGER,
  last_line  IN          BINARY_INTEGER,
  source     IN OUT NOCOPY vc2_table,
  frame_num  IN          BINARY_INTEGER);
```

### Parameters

**Table 52–45** SHOW\_FRAME\_SOURCE Procedure Parameters

Parameter	Description
first_line	Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#
frame_num	1-based frame number

### Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source in order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then SHOW\_SOURCE can also be used.
- If it's a stored PLSQL package/function/procedure then use SQL as described in the [Usage Notes](#) to [SHOW\\_SOURCE Procedures](#).

## SHOW\_SOURCE Procedures

The procedure gets the source code. There are two overloaded SHOW\_SOURCE procedures.

### Syntax

```
DBMS_DEBUG.SHOW_SOURCE (
    first_line IN BINARY_INTEGER,
    last_line  IN BINARY_INTEGER,
    source     OUT vc2_table);

DBMS_DEBUG.SHOW_SOURCE (
    first_line IN BINARY_INTEGER,
    last_line  IN BINARY_INTEGER,
    window     IN BINARY_INTEGER,
    print_arrow IN BINARY_INTEGER,
    buffer     IN OUT VARCHAR2,
    buflen     IN BINARY_INTEGER,
    pieces     OUT BINARY_INTEGER);
```

### Parameters

**Table 52–46** SHOW\_SOURCE Procedure Parameters

Parameter	Description
first_line	Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#
window	'Window' of lines (the number of lines around the current source line)
print_arrow	Nonzero means to print an arrow before the current line
buffer	Buffer in which to place the source listing
buflen	Length of buffer
pieces	Set to nonzero if not all the source could be placed into the given buffer

### Return Values

An indexed table of source-lines. The source lines are stored starting at first\_line. If any error occurs, then the table is empty.

### Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```
DECLARE
    info DBMS_DEBUG.runtime_info;
BEGIN
    -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
    -- or GET_RUNTIME_INFO to fill in 'info'
    SELECT text INTO <buffer> FROM all_source
```

```
WHERE owner = info.Program.Owner
      AND name = info.Program.Name
      AND line = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in `bufferlength (bufLen)`, then additional pieces can be retrieved using the `GET_MORE_SOURCE` procedure (`pieces` returns the number of additional pieces that need to be retrieved).

## SYNCHRONIZE Function

This function waits until the target program signals an event. If `info_requested` is not NULL, then it calls `GET_RUNTIME_INFO`.

### Syntax

```
DBMS_DEBUG.SYNCHRONIZE (
  run_info          OUT runtime_info,
  info_requested IN  BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 52–47 SYNCHRONIZE Function Parameters**

Parameter	Description
<code>run_info</code>	Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.
<code>info_requested</code>	Optional bit-field in which to request information other than the default (which is <code>info_getStackDepth + info_getLineInfo</code> ). 0 means that no information is requested at all (see "Information Flags" on page 52-13).

### Return Values

**Table 52–48 SYNCHRONIZE Function Return Values**

Return	Description
<code>success</code>	A successful completion
<code>error_timeout</code>	Timed out before the program started execution
<code>error_communication</code>	Other communication error

## TARGET\_PROGRAM\_RUNNING Procedure

This procedure returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not.

### Syntax

```
DBMS_DEBUG.TARGET_PROGRAM_RUNNING  
RETURN BOOLEAN;
```

This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

- [Using DBMS\\_DDL](#)
  - Deprecated Subprograms
  - Security Model
  - Operational Notes
- [Summary of DBMS\\_DDL Subprograms](#)

## Using DBMS\_DDL

This section contains topics which relate to using the DBMS\_DDL package.

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)

## Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Release 10gR2:

- [ALTER\\_COMPILE Procedure](#)

## Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

## Operational Notes

The `ALTER_COMPILE` procedure commits the current transaction, performs the operation, and then commits again.

---

## Summary of DBMS\_DDL Subprograms

**Table 53–1 DBMS\_DDL Package Subprograms**

Subprogram	Description
<a href="#">ALTER_COMPILE Procedure</a> on page 53-7	Compiles the PL/SQL object
<a href="#">ALTER_TABLE_NOT_REFERENCEABLE Procedure</a> on page 53-8	Reorganizes object tables
<a href="#">ALTER_TABLE_REFERENCEABLE Procedure</a> on page 53-9	Reorganizes object tables
<a href="#">CREATE_WRAPPED Procedures</a> on page 53-10	Takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement
<a href="#">IS_TRIGGER_FIRE_ONCE Function</a> on page 53-12	Returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, returns FALSE
<a href="#">SET_TRIGGER_FIRING_PROPERTY Procedures</a> on page 53-13	Sets the specified DML or DDL trigger's firing property
<a href="#">WRAP Functions</a> on page 53-15	Takes as input a CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated

## ALTER\_COMPILE Procedure

This procedure is equivalent to the following SQL statement:

```
ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]
```

---

**Note:** This procedure is deprecated in Release 10gR2. While the procedure remains available in the package, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

---

### Syntax

```
DBMS_DDL.ALTER_COMPILE (
    type          VARCHAR2,
    schema        VARCHAR2,
    name          VARCHAR2
    reuse_settings BOOLEAN := FALSE);
```

### Parameters

**Table 53–2 ALTER\_COMPILE Procedure Parameters**

Parameter	Description
type	Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER
schema	Schema name If NULL, then use current schema (case-sensitive)
name	Name of the object (case-sensitive)
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

### Exceptions

**Table 53–3 ALTER\_COMPILE Procedure Exceptions**

Exception	Description
ORA-20000:	Insufficient privileges or object does not exist
ORA-20001:	Remote object, cannot compile
ORA-20002:	Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER

## ALTER\_TABLE\_NOT\_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.<table_name> NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

### Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (
    table_name      IN          VARCHAR2,
    table_schema    IN  DEFAULT NULL,
    affected_schema IN  DEFAULT NULL);
```

### Parameters

**Table 53–4 ALTER\_TABLE\_NOT\_REFERENCEABLE Procedure Parameters**

Parameter	Description
<code>table_name</code>	Name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.
<code>table_schema</code>	Name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.
<code>affected_schema</code>	Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

### Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for PUBLIC; that is, it simply undoes the previous `ALTER_TABLE_REFERENCEABLE` call for this specific schema. The affected schema must a particular schema (cannot be PUBLIC).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has `ALTER ANY TABLE` and `SELECT ANY TABLE` and `DROP ANY TABLE` privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

## ALTER\_TABLE\_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes the referenceable table for the given schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.<table_name>] REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

### Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
  table_name      IN  VARCHAR2,
  table_schema    IN  DEFAULT NULL,
  affected_schema IN  DEFAULT NULL);
```

### Parameters

**Table 53–5 ALTER\_TABLE\_REFERENCEABLE Procedure Parameters**

Parameter	Description
<code>table_name</code>	Name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.
<code>table_schema</code>	Name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.
<code>affected_schema</code>	Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

### Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same EOID; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it makes the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.

## CREATE\_WRAPPED Procedures

The procedure takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body. It then generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement. In effect, this procedure bundles together the operations of wrapping the text and creating the PL/SQL unit.

**See Also:** [WRAP Functions](#) on page 53-15

This procedure has 3 overloads. Each of the three functions provides better performance than using a combination of individual [WRAP Functions](#) and DBMS\_SQL.PARSE (or EXECUTE IMMEDIATE) calls. The different functionality of each form of syntax is presented with the definition.

### Syntax

Is a shortcut for EXECUTE IMMEDIATE SYS.DBMS\_DDL.WRAP(*ddl*):

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    VARCHAR2);
```

Is a shortcut for DBMS\_SQL.PARSE(cursor, SYS.DBMS\_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    DBMS_SQL.VARCHAR2A,
    lb     PLS_INTEGER,
    ub     PLS_INTEGER);
```

Is a shortcut for DBMS\_SQL.PARSE(cursor, SYS.DBMS\_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    DBMS_SQL.VARCHAR2S,
    lb     PLS_INTEGER,
    ub     PLS_INTEGER);
```

### Parameters

**Table 53–6 CREATE\_WRAPPED Procedure Parameters**

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

### Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS\_DDL.CREATE\_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS\_DDL to avoid the possibility that the name

DBMS\_DDL is captured by a locally-defined unit or by redefining the DBMS\_DDL public synonym.

- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL `wrap` utility accepts a entire SQL\*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (`EXECUTE IMMEDIATE` and `DBMS_SQL.PARSE`). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL\*Plus `"/"` termination character), both the [CREATE\\_WRAPPED Procedures](#) and the [WRAP Functions](#) require input to be a single unit.

## Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception `DBMS_DDL.MALFORMED_WRAP_INPUT` is raised.

## Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    SYS.DBMS_DDL.CREATE_WRAPPED(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

## IS\_TRIGGER\_FIRE\_ONCE Function

This function returns `TRUE` if the specified DML or DDL trigger is set to fire once. Otherwise, it returns `FALSE`.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the `EXECUTE_ERROR` or `EXECUTE_ALL_ERRORS` procedure in the `DBMS_APPLY_ADM` package
- For changes made by a Logical Standby apply process

---

---

**Note:** Only DML and DDL triggers can be fire once. All other types of triggers always fire.

---

---

**See Also:** ["SET\\_TRIGGER\\_FIRING\\_PROPERTY Procedures"](#) on page 53-13

### Syntax

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
  trig_owner      IN VARCHAR2,
  trig_name       IN VARCHAR2)
RETURN BOOLEAN;
```

### Parameters

**Table 53–7 IS\_TRIGGER\_FIRE\_ONCE Function Parameters**

Parameter	Description
<code>trig_owner</code>	Schema of trigger
<code>trig_name</code>	Name of trigger

## SET\_TRIGGER\_FIRING\_PROPERTY Procedures

This procedure sets the specified DML or DDL trigger's firing property whether or not the property is set for the trigger. Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the EXECUTE\_ERROR or EXECUTE\_ALL\_ERRORS procedure in the DBMS\_APPLY\_ADM package.
- Applied by a Logical Standby apply process

### Syntax

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
    trig_owner      IN  VARCHAR2,
    trig_name       IN  VARCHAR2,
    fire_once       IN  BOOLEAN);
```

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
    trig_owner      IN  VARCHAR2,
    trig_name       IN  VARCHAR2,
    property        IN  INTEGER,
    setting         IN  BOOLEAN);
```

### Parameters

**Table 53–8 SET\_TRIGGER\_FIRING\_PROPERTY Procedure Parameters**

Parameter	Description
trig_owner	Schema of the trigger to set
trig_name	Name of the trigger to set
fire_once	<ul style="list-style-type: none"> <li>■ If TRUE, the trigger is set to fire once. By default, the fire_once parameter is set to TRUE for DML and DDL triggers.</li> <li>■ If FALSE, the trigger is set to always fire unless apply_server_only property is set to TRUE, which overrides fire_once property setting.</li> </ul>
property	<ul style="list-style-type: none"> <li>■ DBMS_DDL.fire_once to set the fire_once property of the trigger</li> <li>■ DBMS_DDL.apply_server_only to indicate whether trigger fires only in the context of SQL apply processes maintaining a logical standby database or Streams apply processes</li> </ul>
setting	Value of property being set

### Usage Notes

DML triggers created on a table have their fire-once property set to TRUE. In this case, the triggers only fire when the table is modified by an user process, and they are automatically disabled inside Oracle processes maintaining either a logical standby database (SQL Apply) or Oracle processes doing replication (Streams Apply) processes, and thus do not fire when a SQL Apply or a Streams Apply process modifies the table. There are two ways for a user to fire a trigger as a result of SQL Apply or a Streams Apply process making a change to a maintained table: (a) setting the fire-once property of a trigger to FALSE, which allows it fire both in the context of a user process or a SQL or Streams Apply process, or (b) by setting the

apply-server-only property to TRUE and thus making the trigger fire only in the context of a SQL Apply or a Streams Apply process and not in the context of a user process.

- FIRE\_ONCE=TRUE, APPLY\_SERVER\_ONLY=FALSE

This is the default property setting for a DML trigger. The trigger only fires when user process modifies the base table.

- FIRE\_ONCE=TRUE or FALSE, APPLY\_SERVER\_ONLY=TRUE

The trigger only fires when SQL Apply or Streams Apply process modifies the base table. The trigger does not fire when a user process modifies the base table. Thus the apply-server-only property overrides the fire-once property of a trigger.

---

---

**Note:**

- If you dequeue an error transaction from the error queue and execute it without using the DBMS\_APPLY\_ADM package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.
  - Only DML and DDL triggers can be fire once. All other types of triggers always fire.
- 
- 

**See Also:** *Oracle Streams Concepts and Administration* for more information about the apply process and controlling a trigger's firing property

## WRAP Functions

This function takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to DBMS\_SQL or EXECUTE IMMEDIATE. The different functionality of each form of syntax is presented with the definition.

**See Also:** [CREATE\\_WRAPPED Procedures](#) on page 53-10

### Syntax

Provides basic functionality:

```
DBMS_DDL.WRAP (
    ddl      VARCHAR2)
RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the [PARSE Procedures](#) in the [DBMS\\_SQL](#) package and its argument list follows the convention of DBMS\_SQL.PARSE:

```
DBMS_DDL.WRAP (
    ddl      DBMS_SQL.VARCHAR2S,
    lb       PLS_INTEGER,
    ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2S;
```

Provides the same functionality as the second form and is provided for compatibility with multiple forms of the [PARSE Procedures](#) in the [DBMS\\_SQL](#) package:

```
DBMS_DDL.WRAP (
    ddl      DBMS_SQL.VARCHAR2A,
    lb       PLS_INTEGER,
    ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2A;
```

### Parameters

**Table 53–9 WRAP Function Parameters**

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

### Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

## Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name `SYS.DBMS_DDL` to avoid the possibility that the name `DBMS_DDL` is captured by a locally-defined unit or by redefining the `DBMS_DDL` public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL `wrap` utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (`EXECUTE IMMEDIATE` and `DBMS_SQL.PARSE`). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL\*Plus `"/` termination character), both the [CREATE\\_WRAPPED Procedures](#) and the [WRAP Functions](#) require input to be a single unit.

## Exceptions

ORA-24230: If the input is not a `CREATE OR REPLACE` statement specifying a PL/SQL unit, exception `DBMS_DDL.MALFORMED_WRAP_INPUT` is raised.

## Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

---

---

## DBMS\_DEFER

DBMS\_DEFER is the user interface to a replicated transactional deferred remote procedure call facility. Replicated applications use the calls in this interface to queue procedure calls for later transactional execution at remote nodes.

These procedures are typically called from either after row triggers or application specified update procedures.

- [Documentation of DBMS\\_DEFER](#)

---

## Documentation of DBMS\_DEFER

For a complete description of this package within the context of Replication, see DBMS\_DEFER in the *Oracle Database Advanced Replication Management API Reference*.

---

---

## DBMS\_DEFER\_QUERY

DBMS\_DEFER\_QUERY enables you to query the deferred transactions queue data that is not exposed through views.

- [Documentation of DBMS\\_DEFER\\_QUERY](#)

---

## Documentation of DBMS\_DEFER\_QUERY

For a complete description of this package within the context of Replication, see DBMS\_DEFER\_QUERY in the *Oracle Database Advanced Replication Management API Reference*.

---

---

## DBMS\_DEFER\_SYS

DBMS\_DEFER\_SYS subprograms manage default replication node lists. This package is the system administrator interface to a replicated transactional deferred remote procedure call facility. Administrators and replication daemons can execute transactions queued for remote nodes using this facility, and administrators can control the nodes to which remote calls are destined.

- [Documentation of DBMS\\_DEFER\\_SYS](#)

---

## Documentation of DBMS\_DEFER\_SYS

For a complete description of this package within the context of Replication, see DBMS\_DEFER\_SYS in the *Oracle Database Advanced Replication Management API Reference*.

You can use the `DBMS_DESCRIBE` package to get information about a PL/SQL object. When you specify an object name, `DBMS_DESCRIBE` returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

- [Using DBMS\\_DESCRIBE](#)
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Examples
- [Summary of DBMS\\_DESCRIBE Subprograms](#)

## Using DBMS\_DESCRIBE

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Examples](#)

## Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

**See Also:** *Oracle Call Interface Programmer's Guide*

## Security Model

This package is available to `PUBLIC` and performs its own security checking based on the schema object being described.

## Types

The DBMS\_DESCRIBE package declares two PL/SQL table types, which are used to hold data returned by DESCRIBE\_PROCEDURE in its OUT parameters. The types are:

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
    INDEX BY BINARY_INTEGER;
```

```
TYPE NUMBER_TABLE IS TABLE OF NUMBER
    INDEX BY BINARY_INTEGER;
```

## Exceptions

DBMS\_DESCRIBE can raise application errors in the range -20000 to -20004.

**Table 57-1 DBMS\_DESCRIBE Errors**

<b>Error</b>	<b>Description</b>
ORA-20000	ORU-10035: cannot describe a package ('X') only a procedure within a package.
ORA-20001	ORU-10032: procedure 'X' within package 'Y' does not exist.
ORA-20002	ORU-10033: object 'X' is remote, cannot describe; expanded name 'Y'.
ORA-20003	ORU-10036: object 'X' is invalid and cannot be described.
ORA-20004	Syntax error attempting to parse 'X'.

## Examples

One use of the DESCRIBE\_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT\_NAME of SCOTT.ACCOUNT\_UPDATE, where ACCOUNT\_UPDATE is an overloaded function with specification:

```
TABLE account (account_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person  (person_id number(4), person_nm varchar2(10))

FUNCTION ACCOUNT_UPDATE (account_no  NUMBER,
                         person       person%rowtype,
                         amounts      DBMS_DESCRIBE.NUMBER_TABLE,
                         trans_date   DATE)
return account.balance%type;

FUNCTION ACCOUNT_UPDATE (account_no  NUMBER,
                         person       person%rowtype,
                         amounts      DBMS_DESCRIBE.NUMBER_TABLE,
                         trans_no     NUMBER)
return account.balance%type;
```

This procedure might look similar to the following output:

overload	position	argument	level	datatype	length	prec	scale	rad
1	0		0		2	22	7	2 10
1	1	ACCOUNT	0		2	0	0	0 0
1	2	PERSON	0		250	0	0	0 0
1	1	PERSON_ID	1		2	22	4	0 10
1	2	PERSON_NM	1		1	10	0	0 0
1	3	AMOUNTS	0		251	0	0	0 0
1	1		1		2	22	0	0 0
1	4	TRANS_DATE	0		12	0	0	0 0
2	0		0		2	22	7	2 10
2	1	ACCOUNT_NO	0		2	22	0	0 0
2	2	PERSON	0		2	22	4	0 10
2	3	AMOUNTS	0		251	22	4	0 10
2	1		1		2	0	0	0 0
2	4	TRANS_NO	0		2	0	0	0 0

The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```
CREATE OR REPLACE PROCEDURE p1 (
  pvc2   IN   VARCHAR2,
  pvc    OUT  VARCHAR,
  pstr   IN OUT STRING,
  plong  IN   LONG,
  prowid IN   ROWID,
  pchara IN   CHARACTER,
  pchar  IN   CHAR,
  praw  IN   RAW,
  plraw  IN   LONG RAW,
  pbinnt IN   BINARY_INTEGER,
  pplsint IN  PLS_INTEGER,
  pbool  IN   BOOLEAN,
  pnat   IN   NATURAL,
  ppos   IN   POSITIVE,
  pposn  IN   POSITIVEN,
```

```

    pnatn  IN    NATURALN,
    pnum   IN    NUMBER,
    pintgr IN    INTEGER,
    pint   IN    INT,
    psmall IN    SMALLINT,
    pdec   IN    DECIMAL,
    preal  IN    REAL,
    pfloat IN    FLOAT,
    pnumer IN    NUMERIC,
    pdp    IN    DOUBLE PRECISION,
    pdate  IN    DATE,
    pmls   IN    MLSLABEL) AS

```

```

BEGIN
    NULL;
END;

```

If you describe this procedure using the following:

```

CREATE OR REPLACE PACKAGE describe_it AS

    PROCEDURE desc_proc (name VARCHAR2);

END describe_it;

CREATE OR REPLACE PACKAGE BODY describe_it AS

    PROCEDURE prt_value(val VARCHAR2, isize INTEGER) IS
        n INTEGER;
    BEGIN
        n := isize - LENGTHB(val);
        IF n < 0 THEN
            n := 0;
        END IF;
        DBMS_OUTPUT.PUT(val);
        FOR i in 1..n LOOP
            DBMS_OUTPUT.PUT(' ');
        END LOOP;
    END prt_value;

    PROCEDURE desc_proc (name VARCHAR2) IS

        overload    DBMS_DESCRIBE.NUMBER_TABLE;
        position     DBMS_DESCRIBE.NUMBER_TABLE;
        c_level      DBMS_DESCRIBE.NUMBER_TABLE;
        arg_name     DBMS_DESCRIBE.VARCHAR2_TABLE;
        dtv          DBMS_DESCRIBE.NUMBER_TABLE;
        def_val      DBMS_DESCRIBE.NUMBER_TABLE;
        p_mode       DBMS_DESCRIBE.NUMBER_TABLE;
        length       DBMS_DESCRIBE.NUMBER_TABLE;
        precision    DBMS_DESCRIBE.NUMBER_TABLE;
        scale        DBMS_DESCRIBE.NUMBER_TABLE;
        radix        DBMS_DESCRIBE.NUMBER_TABLE;
        spare        DBMS_DESCRIBE.NUMBER_TABLE;
        idx          INTEGER := 0;

    BEGIN
        DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
            name,
            null,
            null,

```

```

        overload,
        position,
        c_level,
        arg_name,
        dty,
        def_val,
        p_mode,
        length,
        precision,
        scale,
        radix,
        spare);

DBMS_OUTPUT.PUT_LINE('Position      Name          DTY  Mode');
LOOP
    idx := idx + 1;
    prt_value(TO_CHAR(position(idx)), 12);
    prt_value(arg_name(idx), 12);
    prt_value(TO_CHAR(dty(idx)), 5);
    prt_value(TO_CHAR(p_mode(idx)), 5);
    DBMS_OUTPUT.NEW_LINE;
END LOOP;
EXCEPTION
    WHEN NO_DATA_FOUND THEN
        DBMS_OUTPUT.NEW_LINE;
        DBMS_OUTPUT.NEW_LINE;

END desc_proc;
END describe_it;

```

Then the results list all the numeric codes for the PL/SQL datatypes:

Position	Name	Datatype_Code	Mode
1	PVC2	1	0
2	PVC	1	1
3	PSTR	1	2
4	PLONG	8	0

## Summary of DBMS\_DESCRIBE Subprograms

**Table 57–2 DBMS\_DESCRIBE Package Subprograms**

Subprogram	Description
<a href="#">DESCRIBE_PROCEDURE</a> Procedure on page 57-11	Provides a brief description of a PL/SQL stored procedure

## DESCRIBE\_PROCEDURE Procedure

The procedure `DESCRIBE_PROCEDURE` provides a brief description of a PL/SQL stored procedure. It takes the name of a stored procedure and returns information about each parameter of that procedure.

### Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE (
  object_name          IN  VARCHAR2,
  reserved1            IN  VARCHAR2,
  reserved2            IN  VARCHAR2,
  overload             OUT NUMBER_TABLE,
  position             OUT NUMBER_TABLE,
  level                OUT NUMBER_TABLE,
  argument_name        OUT VARCHAR2_TABLE,
  datatype             OUT NUMBER_TABLE,
  default_value        OUT NUMBER_TABLE,
  in_out               OUT NUMBER_TABLE,
  length               OUT NUMBER_TABLE,
  precision            OUT NUMBER_TABLE,
  scale                OUT NUMBER_TABLE,
  radix                OUT NUMBER_TABLE,
  spare                OUT NUMBER_TABLE,
  include_string_constraints OUT BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 57-3 DBMS\_DESCRIBE.DESCRIBE\_PROCEDURE Parameters**

Parameter	Description
<code>object_name</code>	<p>Name of the procedure being described.</p> <p>The syntax for this parameter follows the rules used for identifiers in SQL. The name can be a synonym. This parameter is required and may not be null. The total length of the name cannot exceed 197 bytes. An incorrectly specified <code>OBJECT_NAME</code> can result in one of the following exceptions:</p> <p>ORA-20000 - A package was specified. You can only specify a stored procedure, stored function, packaged procedure, or packaged function.</p> <p>ORA-20001 - The procedure or function that you specified does not exist within the given package.</p> <p>ORA-20002 - The object that you specified is a remote object. This procedure cannot currently describe remote objects.</p> <p>ORA-20003 - The object that you specified is invalid and cannot be described.</p> <p>ORA-20004 - The object was specified with a syntax error.</p>
<code>reserved1</code> <code>reserved2</code>	Reserved for future use -- must be set to <code>NULL</code> or the empty string.
<code>overload</code>	<p>A unique number assigned to the procedure's signature.</p> <p>If a procedure is overloaded, then this field holds a different value for each version of the procedure.</p>
<code>position</code>	<p>Position of the argument in the parameter list.</p> <p>Position 0 returns the values for the return type of a function.</p>

**Table 57-3 (Cont.) DBMS\_DESCRIBE.DESCRIBE\_PROCEDURE Parameters**

Parameter	Description
level	If the argument is a composite type, such as record, then this parameter returns the level of the datatype. See the <i>Oracle Call Interface Programmer's Guide</i> for a description of the ODESSP call for an example.
argument_name	Name of the argument associated with the procedure that you are describing.
datatype	Oracle datatype of the argument being described. The datatypes and their numeric type codes are: 0 placeholder for procedures with no arguments 1 VARCHAR, VARCHAR2, STRING 2 NUMBER, INTEGER, SMALLINT, REAL, FLOAT, DECIMAL 3 BINARY_INTEGER, PLS_INTEGER, POSITIVE, NATURAL 8 LONG 11 ROWID 12 DATE 23 RAW 24 LONG RAW 58 OPAQUE TYPE 96 CHAR (ANSI FIXED CHAR), CHARACTER 106 MLSLABEL 121 OBJECT 122 NESTED TABLE 123 VARRAY 178 TIME 179 TIME WITH TIME ZONE 180 TIMESTAMP 181 TIMESTAMP WITH TIME ZONE 231 TIMESTAMP WITH LOCAL TIME ZONE 250 PL/SQL RECORD 251 PL/SQL TABLE 252 PL/SQL BOOLEAN
default_value	1 if the argument being described has a default value; otherwise, the value is 0.
in_out	Describes the mode of the parameter: 0 IN 1 OUT 2 IN OUT
length	For %rowtype formal arguments, the length constraint is returned, otherwise 0 is returned. If the include_string_constraints parameter is set to TRUE, the argument's formal length constraint is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96
precision	If the argument being described is of datatype 2 (NUMBER), then this parameter is the precision of that number.
scale	If the argument being described is of datatype 2 (NUMBER), then this parameter is the scale of that number.
radix	If the argument being described is of datatype 2 (NUMBER), then this parameter is the radix of that number.
spare	Reserved for future functionality.
include_string_constraints	The default is FALSE. If the parameter is set to TRUE, the arguments' formal type constraints is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96

**Return Values**

All values from DESCRIBE\_PROCEDURE are returned in its OUT parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.

The DBMS\_DG package allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover.

**See Also:** *Oracle Data Guard Broker* for more information about performing a fast-start failover in a broker configuration

This chapter contains the following topics:

- [Using DBMS\\_DG](#)
  - [Security Model](#)
- [Summary of the DBMS\\_DG Subprogram](#)

## Using DBMS\_DG

There are conditions detectable by applications running outside of the Oracle database that may warrant the Oracle Data Guard broker to perform a fast-start failover. Because the range of possible conditions is virtually unlimited, it is left to the applications to determine which conditions warrant a fast-start failover.

When such conditions occur, the application calls the `DBMS_DG.INITIATE_FS_FAILOVER` procedure to alert the primary database that the application wants a fast-start failover to occur immediately. The primary database then notifies the observer, which immediately initiates a fast-start failover as long as the standby database is in a valid fast-start failover state ("observed" and either "synchronized" or "within lag") to accept a failover.

If the configuration is not in a valid fast-start failover state, the `INITIATE_FS_FAILOVER` subprogram returns an ORA error message (it will not signal an exception) to inform the calling application that a fast-start failover could not be performed.

## Security Model

The DBMS\_DG package runs with invoker's rights and requires the SYSDBA privilege.

---

## Summary of the DBMS\_DG Subprogram

**Table 58–1 DBMS\_DG Package Subprogram**

Subprogram	Description
<a href="#">INITIATE_FS_FAILOVER Procedure</a> on page 58-5	Enables an application to notify the primary database that a fast-start failover is necessary when the application encounters conditions that warrant a failover.

## INITIATE\_FS\_FAILOVER Procedure

Use this procedure to specify a condition string that, when encountered by an application, allows the application to request the primary database to immediately invoke a fast-start failover.

### Syntax

```
DBMS_DG.INITIATE_FS_FAILOVER (
    condstr          IN VARCHAR2)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 58–2** *INITIATE\_FS\_FAILOVER Procedure Parameters*

Parameter	Description
condstr	Specifies the condition string for which a fast-start failover should be requested. If no condition string argument is supplied, the default string of "Application Failover Requested" will be logged in the broker log file and in the database alert log of the primary database.

### Usage Notes

- This procedure returns a binary integer.
- Query the V\$FS\_FAILOVER\_STATS view to see the time of the last fast-start failover and the reason it was performed.

### Errors

**Table 58–3** *INITIATE\_FS\_FAILOVER Procedure Errors*

Error	Description
ORA-00000: normal, successful completion	The request to initiate a fast-start failover has been posted to the observer.
ORA-16646: fast-start failover is disabled	Either a broker configuration does not exist or fast-start failover has not been enabled.
ORA-16666: unable to initiate fast-start failover on a standby database	DBMS_DG.INITIATE_FS_FAILOVER was invoked on a standby site.
ORA-16817: unsynchronized fast-start failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum available fast-start failover configuration when the configuration was not synchronized.
ORA-16819: fast-start failover observer not started	DBMS_DG.INITIATE_FS_FAILOVER was invoked but an observer had not yet been started.
ORA-16820: fast-start failover observer is no longer observing this database	DBMS_DG.INITIATE_FS_FAILOVER was invoked but the configuration detects that the observer may not be running.
ORA-16829: lagging fast-start failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum performance fast-start failover configuration when the configuration was not in the user-specified redo lag limit.

**Example**

In this example, the program attempts to initiate a fast-start failover when fast-start failover is disabled. To use this example, connect as user `SYS` with `SYDDBA` privileges.

```
set serveroutput on

declare
status integer;

begin
status := dbms_dg.initiate_fs_failover('Failover Requested');

dbms_output.put_line('Fast-Start Failover is disabled: Expected status =
ORA-16646');
dbms_output.put_line('                Actual Status = ORA-' || status);

end;
/
exit;
```

---

---

## DBMS\_DIMENSION

DBMS\_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

**See Also:** *Oracle Database Data Warehousing Guide* for detailed conceptual and usage information about the DBMS\_DIMENSION package

This chapter contains the following topics:

- [Using DBMS\\_DIMENSION](#)
  - Security Model
- [Summary of DBMS\\_DIMENSION Subprograms](#)

---

## Using DBMS\_DIMENSION

This section contains topics which relate to using the DBMS\_DIMENSION package.

- [Security Model](#)

## Security Model

Security on this package can be controlled by granting `EXECUTE` to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: `CREATE ANY DIMENSION`, `ALTER ANY DIMENSION`, and `DROP ANY DIMENSION`.

## Summary of DBMS\_DIMENSION Subprograms

**Table 59–1** *DBMS\_DIMENSION Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">DESCRIBE_DIMENSION Procedure</a> on page 59-5	Prints out the definition of the input dimension, including dimension owner and name, levels, hierarchies, and attributes
<a href="#">VALIDATE_DIMENSION Procedure</a> on page 59-6	Verifies that the relationships specified in a dimension are correct

## DESCRIBE\_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS\_OUTPUT package.

### Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (  
    dimension IN VARCHAR2);
```

### Parameters

**Table 59–2** DESCRIBE\_DIMENSION Procedure Parameter

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.

## VALIDATE\_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table `DIMENSION_EXCEPTIONS` in the user's schema.

### Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
    dimension          IN VARCHAR2,
    incremental        IN BOOLEAN := TRUE,
    check_nulls        IN BOOLEAN := FALSE,
    statement_id       IN VARCHAR2 := NULL );
```

### Parameters

**Table 59–3** *VALIDATE\_DIMENSION Procedure Parameters*

Parameter	Description
<code>dimension</code>	The owner and name of the dimension in the format of <code>owner.name</code> .
<code>incremental</code>	If <code>TRUE</code> , check only the new rows for tables of this dimension. If <code>FALSE</code> , check all the rows.
<code>check_nulls</code>	If <code>TRUE</code> , then all level columns are verified to be non-null. If <code>FALSE</code> , this check is omitted. Specify <code>FALSE</code> when non-NULLness is guaranteed by other means, such as <code>NOT NULL</code> constraints.
<code>statement_id</code>	A client-supplied unique identifier to associate output rows with specific invocations of the procedure.

The DBMS\_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone data type.

**See Also:**

- *Oracle Database Globalization Support Guide*
- *Oracle Database Reference*

This chapter contains the following topics:

- [Using DBMS\\_DST](#)
  - Overview
  - Security Model
  - Views
- [Summary of DBMS\\_DST Subprograms](#)

## Using DBMS\_DST

- [Overview](#)
- [Security Model](#)
- [Views](#)

## Overview

The transition period during which Daylight Saving Time comes into effect, or stops being in effect, has the potential for problems, such as data loss, when handling timestamps with time zone data. The `DBMS_DST` package enables working with these transitions in the context of a set of rules.

## Security Model

The DBMS\_DST package is an invoker's rights package.

**See Also:** *Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

The execute privilege on the package is granted to the EXECUTE\_CATALOG\_ROLE role. This role is normally granted to selected users to allow EXECUTE privileges for packages and procedures in the data dictionary.

The user that invokes the package must have the following privileges:

- CREATE ANY TABLE
- ALTER ANY TABLE
- DROP ANY TABLE
- SELECT ANY TABLE
- LOCK ANY TABLE
- ALTER ANY INDEX
- ALTER ANY TRIGGER
- UPDATE ANY TABLE
- EXECUTE ANY TYPE

## Views

The DBMS\_DST package uses the views shown in [Table 60–1, "Views used by DBMS\\_DST"](#), further described in the *Oracle Database Reference*:

**Table 60–1 Views used by DBMS\_DST**

View	Description
DBA_TSTZ_TABLES	Displays information about all tables in the database, which have columns defined on <code>TIMESTAMP WITH TIME ZONE</code> data types or object types containing attributes of <code>TIMESTAMP WITH TIME ZONE</code> data types. Its columns are the same as those in <code>ALL_TSTZ_TABLES</code> .
USER_TSTZ_TABLES	Displays information about the tables owned by the current user, which have columns defined on <code>TIMESTAMP WITH TIME ZONE</code> data types or object types containing attributes of <code>TIMESTAMP WITH TIME ZONE</code> data types. Its columns (except for <code>OWNER</code> ) are the same as those in <code>ALL_TSTZ_TABLES</code> .
ALL_TSTZ_TABLES	Displays information about the tables accessible to the current user, which have columns defined on <code>TIMESTAMP WITH TIME ZONE</code> data types or object types containing attributes of <code>TIMESTAMP WITH TIME ZONE</code> data types.

---

## Summary of DBMS\_DST Subprograms

**Table 60–2 DBMS\_DST Package Subprograms**

Subprogram	Description
<a href="#">BEGIN_PREPARE Procedure</a> on page 60-7	Starts a prepare window
<a href="#">BEGIN_UPGRADE Procedure</a> on page 60-8	Starts an upgrade window
<a href="#">CREATE_AFFECTED_TABLE Procedure</a> on page 60-9	Creates a table that has the schema shown in the comments for the <a href="#">FIND_AFFECTED_TABLES Procedure</a>
<a href="#">CREATE_ERROR_TABLE Procedure</a> on page 60-10	Creates a log error table
<a href="#">CREATE_TRIGGER_TABLE Procedure</a> on page 60-11	Creates a table that is used to record active triggers disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process
<a href="#">END_PREPARE Procedure</a> on page 60-12	Ends a prepare window
<a href="#">END_UPGRADE Procedure</a> on page 60-13	Ends an upgrade window
<a href="#">FIND_AFFECTED_TABLES Procedure</a> on page 60-14	Finds all the tables that have affected TSTZ data due to the new timezone version
<a href="#">UPGRADE_DATABASE Procedure</a> on page 60-15	Upgrades all tables in the database that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type
<a href="#">UPGRADE_SCHEMA Procedure</a> on page 60-17	Upgrades tables in a specified list of schemas that has one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type
<a href="#">UPGRADE_TABLE Procedure</a> on page 60-19	Upgrades a specified list of tables that has one or more columns defined on the TSTZ type or an ADT containing the TSTZ type

## BEGIN\_PREPARE Procedure

This procedure starts a prepare window. Once a prepare window is started successfully, the database property 'DST\_UPGRADE\_STATE' is set to 'PREPARE', and the database property 'SECONDARY\_TT\_VERSION' is set to a new timezone version.

The prepare window lets a DBA investigate data affected by the upgrade, and so judge when it is optimal to perform the upgrade. The prepare window can overlap normal database operation.

### Syntax

```
DBMS_DST.BEGIN_PREPARE (  
    new_version                IN BINARY_INTEGER);
```

### Parameters

**Table 60–3** *BEGIN\_PREPARE Procedure Parameters*

Parameter	Description
new_version	New timezone version to which the database is to be prepared to upgrade

## BEGIN\_UPGRADE Procedure

This procedure starts an upgrade window. When an upgraded window is started successfully, the TSTZ data in the dictionary tables is upgraded to reflect the new timezone version, and the database property 'DST\_UPGRADE\_STATE' is set to 'UPGRADE'. Once BEGIN\_UPGRADE has been performed successfully, the user must re-start the database. After a successful restart, the database property 'PRIMARY\_TT\_VERSION' is the new timezone version, and 'SECONDARY\_TT\_VERSION' is the old timezone version.

The procedure operates atomically, and upgrades all or none of the dictionary tables and the database properties. It must be called in the database in OPEN MIGRATE mode.

### Syntax

```
DBMS_DST.BEGIN_UPGRADE (
    new_version          IN BINARY_INTEGER,
