## ACCEPT\_SQL\_PROFILE Procedure and Function

This procedure creates a SQL profile recommended by the SQL Tuning Advisor. The SQL text is normalized for matching purposes though it is stored in the data dictionary in de-normalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement doesn't exist, an error is reported.

**See Also:** [SQL Profile Subprograms](#) on page 139-12 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER      := NULL,
  name           IN  VARCHAR2    := NULL,
  description    IN  VARCHAR2    := NULL,
  category       IN  VARCHAR2    := NULL);
task_owner      IN  VARCHAR2    := NULL,
replace         IN  BOOLEAN      := FALSE,
force_match     IN  BOOLEAN      := FALSE,
profile_type    IN  VARCHAR2    := REGULAR_PROFILE);
```

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER      := NULL,
  name           IN  VARCHAR2    := NULL,
  description    IN  VARCHAR2    := NULL,
  category       IN  VARCHAR2    := NULL;
  task_owner     IN  VARCHAR2    := NULL,
  replace        IN  BOOLEAN      := FALSE,
  force_match    IN  BOOLEAN      := FALSE,
  profile_type   IN  VARCHAR2    := REGULAR_PROFILE)
RETURN VARCHAR2;
```

### Parameters

**Table 139–8** *ACCEPT\_SQL\_PROFILE Procedure and Function Parameters*

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
object_id	The identifier of the advisor framework object representing the SQL statement associated with the tuning task
name	The name of the SQL profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL profile.
description	A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.

**Table 139–8 (Cont.) ACCEPT\_SQL\_PROFILE Procedure and Function Parameters**

Parameter	Description
category	This is the category name which must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated.
task_owner	Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.
replace	If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .
force_match	If <code>TRUE</code> this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>cursor_sharing</code> parameter.  If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>cursor_sharing</code> parameter.
profile_type	Options: <ul style="list-style-type: none"> <li>▪ <code>REGULAR_PROFILE</code> - profile without a change to parallel execution (Default, equivalent to <code>NULL</code>). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.</li> <li>▪ <code>PX_PROFILE</code> - regular profile with a change to parallel execution</li> </ul>

## Return Values

The name of the SQL profile.

## Usage Notes

The `CREATE ANY SQL PROFILE` privilege is required.

## Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement from the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);

-- create a tuning task tune the statement
```

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK (
  begin_snap => 1, -
  end_snap   => 2, -
  sql_id     => 'ay1m3ssvtrh24');
```

```
-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, `object_id`) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, `TEST`), so that it is not used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
  task_name => :stmt_task, -
  category  => 'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -
                                       force_match => TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to '5'. Please notice that you must pass an object id to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object id is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -
  sqlset_name => 'my_workload', -
  rank1       => 'ELAPSED_TIME', -
  time_limit  => 3600,          -
  description => 'my workload ordered by elapsed time');
```

```
-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

```
-- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
  task_name => :sts_task, -
  object_id => 5);
```

## ADD\_SQLSET\_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
    sqlset_name IN VARCHAR2,
    description IN VARCHAR2 := NULL)
RETURN NUMBER;
```

### Parameters

**Table 139–9 ADD\_SQLSET\_REFERENCE Function Parameters**

Parameter	Description
sqlset_name	The SQL tuning set name
description	The description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.

### Return Values

The identifier of the added reference.

### Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only.

The function returns a reference ID that is used to remove it later. You use the `REMOVE_SQLSET_REFERENCE` Procedure to delete references to a SQL tuning set.

```
variable rid number;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
    sqlset_name => 'my_workload', -
    description => 'my sts reference');
```

You can use the views `USER/DBA_SQLSET_REFERENCES` to find all references on a given SQL tuning set.

## ALTER\_SQL\_PROFILE Procedure

This procedure alters specific attributes of an existing SQL profile object. The following attributes can be altered (using these attribute names):

- "STATUS" can be set to "ENABLED" or "DISABLED"
- "NAME" can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- "DESCRIPTION" can be set to any string of size no more than 500 characters
- "CATEGORY" can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text)

**See Also:** [SQL Profile Subprograms](#) on page 139-12 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
  name           IN  VARCHAR2,
  attribute_name IN  VARCHAR2,
  value          IN  VARCHAR2);
```

### Parameters

**Table 139–10 ALTER\_SQL\_PROFILE Procedure Parameters**

Parameter	Description
name	The (mandatory) name of the existing SQL profile to alter
attribute_name	The (mandatory) attribute name to alter (case insensitive) using valid attribute names
value	The (mandatory) new value of the attribute using valid attribute values

### Usage Notes

Requires the ALTER ANY SQL PROFILE privilege.

### Examples

```
-- Disable a profile, so it is not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                     attribute_name => 'STATUS', -
                                     value          => 'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                     attribute_name => 'STATUS', -
                                     value          => 'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                     attribute_name => 'CATEGORY', -
                                     value          => 'TEST');
```

```
-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name      => :pname, -
                                     attribute_name => 'CATEGORY', -
                                     value         => 'DEFAULT');
```

## CANCEL\_TUNING\_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK(  
  task_name          IN VARCHAR2);
```

### Parameters

**Table 139-11** CANCEL\_TUNING\_TASK Procedure Parameters

Parameter	Description
task_name	The name of the task to cancel

### Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

## CAPTURE\_CURSOR\_CACHE\_SQLSET Procedure

Over a specified time interval this procedure incrementally captures a workload from the cursor cache into a SQL tuning set. The procedure captures a workload from the cursor cache into a SQL tuning set, polling the cache multiple times over a time period and updating the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (
  sqlset_name          IN VARCHAR2,
  time_limit           IN POSITIVE := 1800,
  repeat_interval      IN POSITIVE := 300,
  capture_option       IN VARCHAR2 := 'MERGE',
  capture_mode         IN NUMBER   := MODE_REPLACE_OLD_STATS,
  basic_filter         IN VARCHAR2 := NULL,
  sqlset_owner        IN VARCHAR2 := NULL,
  recursive_sql        IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

### Parameters

**Table 139–12** CAPTURE\_CURSOR\_CACHE\_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
time_limit	The total amount of time, in seconds, to execute
repeat_interval	The amount of time, in seconds, to pause between sampling
capture_option	During capture, either insert new statements, update existing statements, or both. 'INSERT', 'UPDATE', or 'MERGE' just like load_option in load_sqlset
capture_mode	Capture mode (UPDATE and MERGE capture options). Possible values: <ul style="list-style-type: none"> <li>■ MODE_REPLACE_OLD_STATS - Replace statistics when the number of executions seen is greater than that stored in the SQL tuning set</li> <li>■ MODE_ACCUMULATE_STATS - Add new values to current values for SQL we already store. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.</li> </ul>
basic_filter	Filter to apply to cursor cache on each sampling (see SELECT_XXX subprograms). If basic_filter is not set by the caller, the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
sqlset_owner	The owner of the SQL tuning set or NULL for current schema owner
recursive_sql	Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

## Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and cursor cache turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name      => 'my_workload', -
    time_limit       => 30, -
    repeat_interval  => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name      => 'my_workload', -
    time_limit       => 30, -
    repeat_interval  => 5, -
    capture_mode     => dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name      => 'my_workload', -
    time_limit       => 30, -
    repeat_interval  => 5, -
    capture_option   => 'INSERT');
```

## CREATE\_SQL\_PLAN\_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by the SQL Tuning Advisor.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (  
    task_name          IN VARCHAR2,  
    object_id          IN NUMBER := NULL,  
    plan_hash_value    IN NUMBER,  
    owner_name         IN VARCHAR2 := NULL);
```

### Parameters

**Table 139–13** CREATE\_SQL\_PLAN\_BASELINE Procedure Parameters

Parameter	Description
task_name	Name of the task for which to get a script
object_id	Object ID to which the SQL corresponds
plan_hash_value	Plan to create plan baseline
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.

## CREATE\_SQLSET Procedure and Function

The procedure creates a SQL tuning set object in the database.

The function causes the system to generate a name for the SQL tuning set.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2,
  description IN VARCHAR2 := NULL,
  sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2 := NULL,
  description IN VARCHAR2 := NULL,
  sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 139–14** CREATE\_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
description	The description of the SQL tuning set
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

### Examples

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
  sqlset_name => 'my_workload', -
  description => 'complete application workload');
```

## CREATE\_STGTAB\_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

**See Also:** [SQL Profile Subprograms](#) on page 139-12 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (
  table_name          IN VARCHAR2,
  schema_name        IN VARCHAR2 := NULL,
  tablespace_name     IN VARCHAR2 := NULL);
```

### Parameters

**Table 139–15** CREATE\_STGTAB\_SQLPROF Procedure Parameters

Parameter	Description
table_name	The name of the table to create (case-insensitive unless double quoted). Required.
schema_name	The schema to create the table in, or NULL for current schema (case-insensitive unless double quoted)
tablespace_name	The tablespace to store the staging table within, or NULL for current user's default tablespace (case-insensitive unless double quoted)

### Usage Notes

- Call this procedure once before issuing a call to the [PACK\\_STGTAB\\_SQLPROF Procedure](#).
- This procedure can be called multiple times if you would like to have different SQL profiles in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.

### Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name => 'PROFILE_STGTAB');
```

## CREATE\_STGTAB\_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
  table_name          IN VARCHAR2,
  schema_name        IN VARCHAR2 := NULL,
  tablespace_name    IN VARCHAR2 := NULL,
  db_version         IN NUMBER   := NULL);
```

### Parameters

**Table 139–16** CREATE\_STGTAB\_SQLSET Procedure Parameters

Parameter	Description
table_name	Name of the table to create (case-sensitive)
schema_name	Schema in which to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	Tablespace in which to store the staging table, or NULL for current user's default tablespace (case-sensitive)
db_version	Database (DB) version determining the format of the staging table. User can also create an older DB version staging table to export STS to an older DB version. One of the following values: <ul style="list-style-type: none"> <li>■ NULL (default) — current DB version</li> <li>■ STS_STGTAB_10_2_VERSION — 10.2 DB version</li> <li>■ STS_STGTAB_11_1_VERSION — 11.1 DB version</li> <li>■ STS_STGTAB_11_2_VERSION — 11.2 DB version</li> </ul>

### Usage Notes

- Call this procedure once before issuing a call to the [PACK\\_STGTAB\\_SQLSET Procedure](#).
- This procedure can be called multiple times if you would like to have different tuning sets in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.
- Users issuing the call must have permission to CREATE TABLE in the schema provided and the relevant tablespace.
- Please note that the staging table contains nested table columns and indexes, so it should not be renamed.

### Examples

**Create a staging table for packing and eventually exporting a SQL tuning sets**

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

**Create a staging table to pack a SQL tuning set in Oracle Database 10g Release 2 (10.2) format**

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(  
    table_name => 'STGTAB_SQLSET',  
    db_version => DBMS_SQLTUNE.STS_STGTAB_10_2_VERSION)
```

**Create a staging table to pack a SQL tuning set in Oracle Database 11g Release 1 (11.1) format**

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(  
    table_name => 'STGTAB_SQLSET',  
    db_version => DBMS_SQLTUNE.STS_STGTAB_11_1_VERSION)
```

## CREATE\_TUNING\_TASK Functions

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the Cursor Cache given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create tuning task for a SQL Performance Analyzer

In all cases, the function mainly creates an advisor task and sets its parameters.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

SQL text format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  user_name         IN VARCHAR2 := NULL,
  scope             IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2 := NULL,
  description       IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL ID format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER    := NULL,
  scope           IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2 := NULL,
  description     IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Workload Repository format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER    := NULL,
  scope          IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit     IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name      IN VARCHAR2 := NULL,
  description    IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQLSET format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sqlset_name     IN VARCHAR2,
```

```

basic_filter      IN VARCHAR2 := NULL,
object_filter     IN VARCHAR2 := NULL,
rank1            IN VARCHAR2 := NULL,
rank2            IN VARCHAR2 := NULL,
rank3            IN VARCHAR2 := NULL,
result_percentage IN NUMBER   := NULL,
result_limit     IN NUMBER   := NULL,
scope            IN VARCHAR2 := SCOPE_COMPREHENSIVE,
time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
task_name        IN VARCHAR2 := NULL,
description      IN VARCHAR2 := NULL
plan_filter      IN VARCHAR2 := 'MAX_ELAPSED_TIME',
sqlset_owner     IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

#### SQL Performance Analyzer format:

```

DBMS_SQLTUNE.CREATE_TUNING_TASK(
spa_task_name     IN VARCHAR2,
spa_task_owner   IN VARCHAR2 := NULL,
spa_compare_exec IN VARCHAR2 := NULL,
basic_filter      IN VARCHAR2 := NULL,
time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
task_name        IN VARCHAR2 := NULL,
description      IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

## Parameters

**Table 139–17 CREATE\_TUNING\_TASK Function Parameters**

Parameter	Description
sql_text	Text of a SQL statement
begin_snap	Begin snapshot identifier
end_snap	End snapshot identifier
sql_id	Identifier of a SQL statement
bind_list	An ordered list of bind values in ANYDATA type
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from the (filtered/ranked) SQL
user_name	Username for whom the statement is to be tuned
scope	Tuning scope (limited/comprehensive)
time_limit	The maximum duration in seconds for the tuning session
task_name	Optional tuning task name
description	Description of the SQL tuning session to a maximum of 256 characters

**Table 139–17 (Cont.) CREATE\_TUNING\_TASK Function Parameters**

Parameter	Description
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value) associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> <li>■ LAST_GENERATED: plan with the most recent timestamp</li> <li>■ FIRST_GENERATED: plan with the earliest timestamp, the opposite to LAST_GENERATED</li> <li>■ LAST_LOADED: plan with the most recent first_load_time statistics information</li> <li>■ FIRST_LOADED: plan with the earliest first_load_time statistics information, the opposite to LAST_LOADED</li> <li>■ MAX_ELAPSED_TIME: plan with the maximum elapsed time</li> <li>■ MAX_BUFFER_GETS: plan with the maximum buffer gets</li> <li>■ MAX_DISK_READS: plan with the maximum disk reads</li> <li>■ MAX_DIRECT_WRITES: plan with the maximum direct writes</li> <li>■ MAX_OPTIMIZER_COST: plan with the maximum optimizer cost</li> </ul>
sqlset_owner	Owner of the SQL tuning set, or NULL for the current schema owner
spa_task_name	Name of the SQL Performance Analyzer task whose regressions are to be tuned
spa_task_owner	Owner of specified SQL Performance Analyzer task or NULL for current user
spa_compare_exec	Execution name of Compare Performance trial of SQL Performance Analyzer task. If NULL, we use the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE

## Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

## Usage Notes

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

## Examples

```
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);
variable spa_tune_task VARCHAR2(64);
```

### Create Tuning Task with SQL Text format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
```

```
sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');
```

### Create Tuning Task with SQL ID format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24');

-- tune in limited scope
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', -
scope => 'LIMITED');

-- only give 10 minutes for tuning statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', -
time_limit => 600);
```

### Create Tuning Task with AWR Snapshot format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
end_snap => 2, sql_id => 'ay1m3ssvtrh24');
```

### Create Tuning Task with SQL Tuning Set format

```
-- First we need to load an STS, then tune it
-- Tune our statements in order by buffer gets, time limit of one hour
-- the default ranking measure is elapsed time.
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
sqlset_name => 'my_workload', -
rank1 => 'BUFFER_GETS', -
time_limit => 3600, -
description => 'tune my workload ordered by buffer gets');
```

### Create Tuning Task with SPA Task format

```
-- Tune the SQLs that were reported as having regressed from the compare
-- performance execution of the SPA task named task_123
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
spa_task_name => 'task_123',
spa_task_owner => 'SCOTT',
spa_compare_exec => 'exec1');
```

## DELETE\_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
  sqlset_name  IN  VARCHAR2,
  basic_filter IN  VARCHAR2 := NULL,
  sqlset_owner IN  VARCHAR2 := NULL);
```

### Parameters

**Table 139–18** *DELETE\_SQLSET Procedure Parameters*

Parameter	Description
sqlset_name	The SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the Tuning Set.
sqlset_owner	The owner of the SQL tuning set, or NULL for current schema owner

### Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload', -
                                basic_filter => 'elapsed_time < 1000000');
```

## DROP\_SQL\_PROFILE Procedure

This procedure drops the named SQL profile from the database.

**See Also:** [SQL Profile Subprograms](#) on page 139-12 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (  
    name          IN VARCHAR2,  
    ignore       IN BOOLEAN := FALSE);
```

### Parameters

**Table 139–19** *DROP\_SQL\_PROFILE Procedure Parameters*

Parameter	Description
name	The (mandatory) name of SQL profile to be dropped. The name is case sensitive.
ignore	Ignores errors due to object not existing

### Usage Notes

Requires the "DROP ANY SQL PROFILE" privilege.

### Examples

```
-- Drop the profile:  
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

## DROP\_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (  
    sqlset_name    IN  VARCHAR2,  
    sqlset_owner   IN  VARCHAR2 := NULL);
```

### Parameters

**Table 139–20** *DROP\_SQLSET Procedure Parameters*

Parameter	Description
sqlset_name	The SQL tuning set name
sqlset_owner	The owner of the SQL tuning set, or NULL for current schema owner

### Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

### Examples

```
-- Drop the sqlset.  
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

## DROP\_TUNING\_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK(  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 139-21** *DROP\_TUNING\_TASK Procedure Parameters*

Parameter	Description
task_name	The name of the tuning task to drop

## EXECUTE\_TUNING\_TASK Function & Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
    task_name          IN VARCHAR2,
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL)
RETURN VARCHAR2;

DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
    task_name          IN VARCHAR2,
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL);
```

### Parameters

**Table 139–22 EXECUTE\_TUNING\_TASK Function & Procedure Parameters**

Parameter	Description
task_name	Name of the tuning task to execute
execution_name	A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the <a href="#">SET_TUNING_TASK_PARAMETER Procedures</a> ).
execution_desc	A 256-length string describing the execution

### Usage Notes

A tuning task can be executed multiples times without having to reset it.

### Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK (:stmt_task);
```

## IMPLEMENT\_TUNING\_TASK Function

This function implements a set of SQL profile recommendations made by the SQL Tuning Advisor. Call this subprogram is equivalent to calling the [SCRIPT\\_TUNING\\_TASK Function](#) and then running the script.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
    task_name      IN VARCHAR2,
    rec_type       IN VARCHAR2 := REC_TYPE_SQL_PROFILES,
    owner_name     IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL);
```

### Parameters

**Table 139–23** *IMPLEMENT\_TUNING\_TASK Function Parameters*

Parameter	Description
task_name	Name of the tuning task for which to implement recommendations
rec_type	Filter the types of recommendations to implement. Only 'PROFILES' is supported.
owner_name	Owner of the relevant tuning task or NULL for the current user.
execution_name	name of the task execution to use. If NULL, recommendations from the last task execution are implemented.

## INTERRUPT\_TUNING\_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(  
  task_name          IN VARCHAR2);
```

### Parameters

**Table 139-24** *INTERRUPT\_TUNING\_TASK Procedure Parameters*

Parameter	Description
task_name	Name of the tuning task to interrupt

### Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

## LOAD\_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (
  sqlset_name      IN  VARCHAR2,
  populate_cursor  IN  sqlset_cursor,
  load_option      IN  VARCHAR2 := 'INSERT',
  update_option    IN  VARCHAR2 := 'REPLACE',
  update_condition IN  VARCHAR2 := NULL,
  update_attributes IN VARCHAR2 := NULL,
  ignore_null      IN  BOOLEAN  := TRUE,
  commit_rows      IN  POSITIVE := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL);
```

### Parameters

**Table 139–25** *LOAD\_SQLSET Procedure Parameters*

Parameter	Description
sqlset_name	The SQL tuning set name to populate
populate_cursor	The cursor reference from which to populate
load_option	Specifies how the statements are loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"> <li>■ INSERT (default) - add only new statements</li> <li>■ UPDATE - update existing the SQL statements and ignores any new statements</li> <li>■ MERGE - this is a combination of the two other options. This option inserts new statements and updates the information of the existing ones.</li> </ul>
update_option	Specifies how the existing statements are updated. This parameter is considered only if load_option is specified with 'UPDATE'/'MERGE' as an option. The possible values are: <ul style="list-style-type: none"> <li>■ REPLACE (default) - update the statement using the new statistics, bind list, object list, and so on.</li> <li>■ ACCUMULATE - when possible combine attributes (for example, statistics like elapsed_time, and so on) otherwise just replace the old values (for example, module, action, and so on) by the new provided ones. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.</li> </ul>

**Table 139–25 (Cont.) LOAD\_SQLSET Procedure Parameters**

Parameter	Description
update_condition	Specifies a where clause to execute the update operation. The update is performed only if the specified condition is true. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: <ul style="list-style-type: none"> <li>■ OLD - to refer to statement attributes from the SQL tuning set (destination)</li> <li>■ NEW - to refer to statements attributes from the input statements (source)</li> </ul>
update_attributes	Specifies the list of a SQL statement attributes to update during a merge or update operation. The possible values are: <ul style="list-style-type: none"> <li>■ NULL (default) - the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution context like module, action, and so on.</li> <li>■ BASIC - statistics and binds only</li> <li>■ TYPICAL - BASIC + SQL plans (without row source statistics) and without object reference list</li> <li>■ ALL - all attributes including the execution context attributes like module, action, and so on.</li> <li>■ List of comma separated attribute names to update - EXECUTION_CONTEXT, EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)</li> </ul>
ignore_null	If TRUE do not update an attribute if the new value is NULL. That is, do not override with NULL values unless intentional.
commit_rows	If a value is provided, the load commits after each set of that many statements is inserted. If NULL is provided, the load commits only once, at the end of the operation. Providing a value for this argument allows you to monitor the progress of a SQL tuning set load operation in the DBA_/USER_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded.
sqlset_owner	The owner of the SQL tuning set, or the current schema owner or NULL for current owner

## Exceptions

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

## Usage Notes

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

## Examples

In this example, you create and populate a SQL tuning set with all cursor cache statements with an elapsed time of 5 seconds or more excluding statements that

belong to `SYS` schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the cursor cache
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                           populate_cursor => cur);

END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with `'ACCUMULATE'` as your `update_option` because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the `SYS`-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
          'parsing_schema_name <> ''SYS''',
          NULL, NULL, NULL, NULL,
          1,
          NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                           populate_cursor => cur,
                           Using DBMS_SQLTUNE
                           load_option => 'MERGE',
                           update_option => 'ACCUMULATE');

END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that `'INSERT'` is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
```

```
OPEN cur FOR
SELECT VALUE(P)
FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
populate_cursor => cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                           populate_cursor => cur,
                           load_option => 'UPDATE');
END;
/
```

## PACK\_STGTAB\_SQLPROF Procedure

This procedure copies profile data from the SYS. schema into the staging table.

**See Also:** [SQL Profile Subprograms](#) on page 139-12 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
  profile_name      IN VARCHAR2 := '%',
  profile_category  IN VARCHAR2 := 'DEFAULT',
  staging_table_name IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 139–26** *PACK\_STGTAB\_SQLPROF Procedure Parameters*

Parameter	Description
profile_name	The name of the profile to pack (% wildcards acceptable, case-sensitive)
profile_category	The category to pack profiles from (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

### Usage Notes

- This procedure requires ADMINISTER SQL MANAGEMENT OBJECT privilege and INSERT privilege on the staging table.
- Note that this function issues a COMMIT after packing each SQL profile, so if an error is raised mid-execution, clear the staging table by deleting its rows.

### Examples

Put only those profiles in the DEFAULT category into the staging table. This corresponds to all profiles used by default on this system.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name => 'PROFILE_STGTAB');
```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
                                         staging_table_name => 'PROFILE_STGTAB');
```

## PACK\_STGTAB\_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the [CREATE\\_STGTAB\\_SQLSET Procedure](#).

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
  sqlset_name          IN VARCHAR2,
  sqlset_owner         IN VARCHAR2 := NULL,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  db_version           IN NUMBER := NULL);
```

### Parameters

**Table 139–27** *PACK\_STGTAB\_SQLSET Procedure Parameters*

Parameter	Description
sqlset_name	The name of the SQL tuning set to pack (% wildcards acceptable, case-sensitive)
sqlset_owner	The category from which to pack SQL tuning sets (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-sensitive)
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-sensitive)
db_version	Database (DB) version determining the format of the staging table. User can also create an older DB version staging table to export STS to an older DB version. One of the following values: <ul style="list-style-type: none"> <li>■ NULL (default) — current DB version</li> <li>■ STS_STGTAB_10_2_VERSION — 10.2 DB version</li> <li>■ STS_STGTAB_11_1_VERSION — 11.1 DB version</li> <li>■ STS_STGTAB_11_2_VERSION — 11.2 DB version</li> </ul>

### Usage Notes

- This procedure can be called several times to move more than one SQL tuning set. Users can then move the populated staging table to another system using any method, such as database link or datapump. Users can then call the [UNPACK\\_STGTAB\\_SQLSET Procedure](#) create the SQL tuning set on the other system.
- Note that this function issues a COMMIT after packing each SQL tuning set, so if an error is raised mid-execution, clear the staging table by deleting its rows.

### Examples

#### Put all SQL tuning sets on the system in the staging table

-- to create a staging table, see the [CREATE\\_STGTAB\\_SQLSET Procedure](#)

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name => '%', -
```

```
sqlset_owner      => '%', -  
staging_table_name => 'STGTAB_SQLSET');
```

**Put only those SQL tuning sets owned by the current user in the staging table**

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(  
  sqlset_name      => '%',  
  staging_table_name => 'STGTAB_SQLSET');
```

**Pack a specific SQL tuning set**

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(  
  sqlset_name      => 'my_workload', -  
  staging_table_name => 'STGTAB_SQLSET');
```

**Pack a second SQL tuning set**

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(  
  sqlset_name      => 'workload_subset', -  
  staging_table_name => 'STGTAB_SQLSET');
```

**Pack the STS my\_workload to a staging table STGTAB\_SQLSET created for Oracle Database 10g Release 2 (10.2)**

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(  
  sqlset_name      => 'workload_subset',  
  staging_table_name => 'STGTAB_SQLSET',  
  db_version       => DBMS_SQLTUNE.STS_STGTAB_10_2_VERSION);
```

**Pack the STS my\_workload to a staging table STGTAB\_SQLSET created for Oracle Database 11g Release 1 (11.1)**

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(  
  sqlset_name      => 'workload_subset',  
  staging_table_name => 'STGTAB_SQLSET',  
  db_version       => DBMS_SQLTUNE.STS_STGTAB_11_1_VERSION);
```

## REMAP\_STGTAB\_SQLPROF Procedure

This procedure allows DBAs to change the profile data values kept in the staging table prior to performing an unpack operation. The procedure can be used to change the category of a profile. It can be used to change the name of a profile if one already exists on the system with the same name.

**See Also:** [SQL Profile Subprograms](#) on page 139-12 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name     IN VARCHAR2 := NULL,
  new_profile_category IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

### Parameters

**Table 139–28** REMAP\_STGTAB\_SQLPROF Procedure Parameters

Parameter	Description
old_profile_name	The name of the profile to target for a remap operation (case-sensitive)
new_profile_name	The new name of the profile, or NULL to remain the same (case-sensitive)
new_profile_category	The new category for the profile, or NULL to remain the same (case-sensitive)
staging_table_name	The name of the table on which to perform the remap operation (case-sensitive). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-sensitive)

### Usage Notes

Using this procedure requires the UPDATE privilege on the staging table.

### Examples

Change the name of a profile before we unpack, to avoid conflicts

```
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name => :pname,      -
                                         new_profile_name => 'IMP' || :pname, -
                                         staging_table_name => 'PROFILE_STGTAB');
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name => :pname,      -
                                         new_profile_category => 'TEST',    -
                                         staging_table_name => 'PROFILE_STGTAB');
```

## REMAP\_STGTAB\_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system.

**See Also:** [SQL Profile Subprograms](#) on page 139-12 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
  old_sqlset_name      IN VARCHAR2,
  old_sqlset_owner     IN VARCHAR2 := NULL,
  new_sqlset_name      IN VARCHAR2 := NULL,
  new_sqlset_owner     IN VARCHAR2 := NULL,
  staging_table_name   IN VARCHAR2,
  tagging_schema_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 139–29** REMAP\_STGTAB\_SQLSET Procedure Parameters

Parameter	Description
old_sqlset_name	The name of the tuning set to target for a remap operation. Wildcards are not supported.
old_sqlset_owner	The new name of the tuning set owner to target for a remap operation. NULL for current schema owner
new_sqlset_name	The new name for the tuning set, or NULL to keep the same tuning set name.
new_sqlset_owner	The new owner for the tuning set, or NULL to remain the same owner name.
staging_table_name	The name of the table on which to perform the remap operation (case-sensitive)
staging_schema_owner	The name of staging table owner, or NULL for current schema owner (case-sensitive)

### Usage Notes

You can call this procedure multiple times to remap more than one tuning set name or owner. Note that this procedure only handles one tuning set per call.

### Examples

```
-- Change the name of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name => 'my_workload', -
                                       old_sqlset_owner => 'SH', -
                                       new_sqlset_name => 'imp_workload', -
                                       staging_table_name => 'STGTAB_SQLSET');
```

```
-- Change the owner of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name => 'imp_workload', -
                                       old_sqlset_owner => 'SH', -
                                       new_sqlset_owner => 'SYS', -
                                       staging_table_name => 'STGTAB_SQLSET');
```

## REMOVE\_SQLSET\_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate it is no longer used by the client.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
  sqlset_name  IN  VARCHAR2,
  reference_id IN  NUMBER);
```

### Parameters

**Table 139–30 REMOVE\_SQLSET\_REFERENCE Procedure Parameters**

Parameter	Description
sqlset_name	The SQL tuning set name
reference_id	The identifier of the reference to remove

### Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again.

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
      sqlset_name => 'my_workload', -
      reference_id => :rid);
```

Use views USER/DBA\_SQLSET\_REFERENCES to find all references on a given SQL tuning set.

## REPORT\_AUTO\_TUNING\_TASK Function

This function displays a report from the automatic tuning task. This function reports on a range of task executions, whereas the [REPORT\\_TUNING\\_TASK Function](#) reports on a single execution. Note that this function is deprecated in Oracle Database 11g Release 2 (11.2) in favor of `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK`.

### See Also:

- [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group
- [REPORT\\_AUTO\\_TUNING\\_TASK Function](#) on page 28-7

### Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK (
  begin_exec      IN VARCHAR2 := NULL,
  end_exec        IN VARCHAR2 := NULL,
  type            IN VARCHAR2 := TYPE_TEXT,
  level           IN VARCHAR2 := LEVEL_TYPICAL,
  section         IN VARCHAR2 := SECTION_ALL,
  object_id       IN NUMBER   := NULL,
  result_limit    IN NUMBER   := NULL)
RETURN CLOB;
```

### Parameters

**Table 139-31** *REPORT\_AUTO\_TUNING\_TASK Function Parameters*

Parameter	Description
<code>begin_exec</code>	Name of execution from which to begin the report. NULL retrieves a report on the most recent run
<code>end_exec</code>	Name of execution at which to end the report. NULL retrieves a report on the most recent run.
<code>type</code>	Type of the report to produce. Possible values are <code>TYPE_TEXT</code> which produces a text report
<code>level</code>	Level of detail in the report: <ul style="list-style-type: none"> <li>■ <code>LEVEL_BASIC</code>: simple version of the report. Just show info about the actions taken by the advisor.</li> <li>■ <code>LEVEL_TYPICAL</code>: show information about every statement analyzed, including requests not implemented.</li> <li>■ <code>LEVEL_ALL</code>: highly detailed report level, also provides annotations about statements skipped over.</li> </ul>
<code>section</code>	Optionally limit the report to a single section ( <code>ALL</code> for all sections): <ul style="list-style-type: none"> <li>■ <code>SECTION_SUMMARY</code> - summary information</li> <li>■ <code>SECTION_FINDINGS</code> - tuning findings</li> <li>■ <code>SECTION_PLAN</code> - explain plans</li> <li>■ <code>SECTION_INFORMATION</code> - general information</li> <li>■ <code>SECTION_ERROR</code> - statements with errors</li> <li>■ <code>SECTION_ALL</code> - all statements</li> </ul>

**Table 139-31 (Cont.) REPORT\_AUTO\_TUNING\_TASK Function Parameters**

<b>Parameter</b>	<b>Description</b>
<code>object_id</code>	Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
<code>result_limit</code>	Maximum number of SQL statements to show in the report

**Return Values**

A CLOB containing the desired report.

## REPORT\_SQL\_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the V\$ views and AWR.

**See Also:** [SQL Performance Reporting Subprograms](#) on page 139-15 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REPORT_SQL_DETAIL (
  sql_id          IN VARCHAR2  DEFAULT NULL,
  sql_plan_hash_value IN NUMBER  DEFAULT NULL,
  start_time      IN DATE      DEFAULT NULL,
  duration        IN NUMBER    DEFAULT NULL,
  inst_id         IN NUMBER    DEFAULT NULL,
  dbid            IN NUMBER    DEFAULT NULL,
  event_detail    IN VARCHAR2  DEFAULT 'YES',
  bucket_max_count IN NUMBER   DEFAULT 128,
  bucket_interval IN NUMBER    DEFAULT NULL,
  top_n           IN NUMBER    DEFAULT 10,
  report_level    IN VARCHAR2  DEFAULT 'TYPICAL',
  type            IN VARCHAR2  DEFAULT 'ACTIVE')
RETURN CLOB;
```

### Parameters

**Table 139-32** REPORT\_SQL\_DETAIL Function Parameters

Parameter	Description
sql_id	SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.
sql_plan_hash_value	Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.
start_time	If specified, shows SQL activity (from gv\$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time.
duration	Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.
inst_id	Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.
dbid	DBID from which to get SQL details. If NULL, uses current DBID.
event_detail	When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name).
bucket_max_count	If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.

**Table 139-32 (Cont.) REPORT\_SQL\_DETAIL Function Parameters**

Parameter	Description
bucket_interval	If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
top_n	Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.
report_level	<p>Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> <li>▪ 'TOP' - Show top values for the ASH dimensions for a SQL statement; ON by default</li> <li>▪ 'SPM' - Show existing plan baselines for a SQL statement; OFF by default</li> <li>▪ 'MISMATCH' - Show reasons for creating new child cursors (sharing criteria violations); OFF by default.</li> <li>▪ 'STATS' - Show SQL execution statistics per plan from GV\$SQLAREA_PLAN_HASH; ON by default</li> <li>▪ 'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default</li> <li>▪ 'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default</li> <li>▪ 'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan timeline histogram); ON by default</li> <li>▪ 'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default</li> <li>▪ 'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default</li> <li>▪ 'XPLAN' - Show execution plans; ON by default</li> <li>▪ 'BINDS' - show captured bind data; ON by default</li> </ul> <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> <li>▪ -SQL_TEXT - No SQL text in report</li> <li>▪ +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR</li> <li>▪ -SQL_FULLTEXT - No full SQL text (+SQL_TEXT)</li> <li>▪ +SQL_FULLTEXT - Show full SQL text (default value)</li> </ul> <p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> <li>▪ NONE - minimum possible</li> <li>▪ BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM</li> <li>▪ TYPICAL - SQL_FULLTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+XPLAN+MONITOR</li> <li>▪ ALL - everything</li> </ul> <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p>
type	Report format: 'ACTIVE' by default. Can also be 'XML' (see Usage Notes).

## Return Values

A CLOB containing the desired report.

## Usage Notes

- ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.
- The invoker needs the SELECT privilege on the following views:
  - V\$SESSION
  - DBA\_ADVISOR\_FINDINGS
  - V\$DATABASE
  - GV\$ASH\_INFO
  - GV\$ACTIVE\_SESSION\_HISTORY
  - GV\$SQLAREA\_PLAN\_HASH
  - GV\$SQL
  - DBA\_HIST\_SNAPSHOT
  - DBA\_HIST\_WR\_CONTROL
  - DBA\_HIST\_ACTIVE\_SESS\_HISTORY
  - DBA\_HIST\_SQLSTAT
  - DBA\_HIST\_SQL\_BIND\_METADATA
  - DBA\_HIST\_SQLTEXT
  - DBA\_SQL\_PLAN\_BASELINES
  - DBA\_SQL\_PROFILES
  - DBA\_ADVISOR\_TASKS
  - DBA\_SERVICES
  - DBA\_USERS
  - DBA\_OBJECTS
  - DBA\_PROCEDURES
- The invoker needs the EXECUTE privilege on the [DBMS\\_XPLAN](#) package.
- Finally, the invoker requires all privileges required by `DBMS_SQLTUNE.REPORT_SQL_MONITOR` and `DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST` as it calls these functions.

## REPORT\_SQL\_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

**See Also:** [Real-time SQL Monitoring Subprograms](#) on page 139-14 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR(
  sql_id              IN VARCHAR2  DEFAULT NULL,
  session_id         IN NUMBER    DEFAULT NULL,
  session_serial     IN NUMBER    DEFAULT NULL,
  sql_exec_start     IN DATE      DEFAULT NULL,
  sql_exec_id        IN NUMBER    DEFAULT NULL,
  inst_id            IN NUMBER    DEFAULT NULL,
  start_time_filter  IN DATE      DEFAULT NULL,
  end_time_filter    IN DATE      DEFAULT NULL,
  instance_id_filter IN NUMBER    DEFAULT NULL,
  parallel_filter    IN VARCHAR2  DEFAULT NULL,
  plan_line_filter   IN NUMBER    DEFAULT NULL,
  event_detail       IN VARCHAR2  DEFAULT 'YES',
  bucket_max_count  IN NUMBER    DEFAULT 128,
  bucket_interval   IN NUMBER    DEFAULT NULL,
  base_path          IN VARCHAR2  DEFAULT NULL,
  last_refresh_time  IN DATE      DEFAULT NULL,
  report_level       IN VARCHAR2  DEFAULT 'TYPICAL',
  type              IN VARCHAR2  DEFAULT 'TEXT',
  sql_plan_hash_value IN NUMBER    DEFAULT NULL)
RETURN CLOB;
```

### Parameters

**Table 139–33** *REPORT\_SQL\_MONITOR Function Parameters*

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
session_id	If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
sql_exec_start	This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.

**Table 139-33 (Cont.) REPORT\_SQL\_MONITOR Function Parameters**

Parameter	Description
<code>sql_exec_id</code>	This parameter, along with <code>sql_exec_start</code> , is only applicable when <code>sql_id</code> is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by <code>sql_id</code> , assuming that this statement was monitored. When <code>NULL</code> (the default), the last monitored execution of SQL <code>sql_id</code> is shown.
<code>inst_id</code>	Only considers statements started on the specified instance. Use <code>-1</code> to target the login instance. <code>NULL</code> (default) targets all instances.
<code>start_time_filter</code>	If not <code>NULL</code> , the report considers only the activity (from <code>GV\$ACTIVE_SESSION_HISTORY</code> ) recorded after the specified date. If <code>NULL</code> , the reported activity starts when the execution of the targeted SQL statement has started.
<code>end_time_filter</code>	If not <code>NULL</code> , the report shows only the activity (from <code>GV\$ACTIVE_SESSION_HISTORY</code> ) collected before the date <code>end_time_filter</code> . If <code>NULL</code> , the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.
<code>instance_id_filter</code>	Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a <code>NULL</code> value (the default) to include the activity on all instances where the parallel query was executed.
<code>parallel_filter</code>	Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be: <ul style="list-style-type: none"> <li>▪ <code>NULL</code> to target all processes</li> <li>▪ <code>[qc] [servers (&lt;svr_grp&gt;[ , ] &lt;svr_set&gt;[ , ] &lt;srv_num&gt;)]</code>: 'qc' stands for query coordinator and <code>servers()</code> stipulate which PX servers to consider.</li> </ul> <p>The following examples show how to target a subset of the parallel processes:</p> <ul style="list-style-type: none"> <li>▪ <code>qc</code>: targets only the query coordinator</li> <li>▪ <code>servers(1)</code>: targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel.</li> <li>▪ <code>servers(, 2)</code>: targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers)</li> <li>▪ <code>servers(1, 1)</code>: consider only group 1, set 1</li> <li>▪ <code>servers(1, 2, 4)</code>: consider only group 1, set 2, server number 4. This reports for a single parallel server process</li> <li>▪ <code>qc servers(1, 2, 4)</code>: same as above by also including the query coordinator</li> </ul>
<code>event_detail</code>	When value is 'YES' (the default), reported activity from <code>GV\$ACTIVE_SESSION_HISTORY</code> is aggregated by ( <code>wait_class</code> , <code>event_name</code> ). Use 'NO' to only aggregate by <code>wait_class</code> .
<code>bucket_max_count</code>	If specified, this should be the maximum number of histogram buckets created in the report

**Table 139-33 (Cont.) REPORT\_SQL\_MONITOR Function Parameters**

Parameter	Description
bucket_interval	If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
base_path	URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)
last_refresh_time	If not NULL (default is NULL), the time when the report was last retrieved (see SYSDATE attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized: <ul style="list-style-type: none"> <li>■ SQL text is not returned when this option is specified</li> <li>■ activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket</li> </ul>
report_level	Level of detail for the report, either 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below.  In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i> . Several sections are defined: <ul style="list-style-type: none"> <li>■ 'XPLAN' - Show explain plan; ON by default</li> <li>■ 'PLAN' - Show plan monitoring statistics; ON by default</li> <li>■ 'SESSIONS' - Show session details. Applies only to parallel queries; ON by default</li> <li>■ 'INSTANCE' - Show instance details. Applies only to parallel and cross instance; ON by default</li> <li>■ 'PARALLEL' - An umbrella parameter for specifying sessions+instance details</li> <li>■ 'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default</li> <li>■ 'BINDS' - Show bind information when available; ON by default</li> <li>■ 'METRICS' - Show metric data (CPU, IOs, ...) over time; ON by default</li> <li>■ 'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default</li> <li>■ 'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default</li> <li>■ 'OTHER' - Other info; ON by default</li> </ul> In addition, SQL text can be specified at different levels: <ul style="list-style-type: none"> <li>■ SQL_TEXT - No SQL text in report</li> <li>■ +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR</li> <li>■ -SQL_FULLTEXT - No full SQL text (+SQL_TEXT)</li> <li>■ +SQL_FULLTEXT - Show full SQL text (default value)</li> </ul>

**Table 139-33 (Cont.) REPORT\_SQL\_MONITOR Function Parameters**

Parameter	Description
report_level (contd.)	<p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> <li>■ NONE - minimum possible</li> <li>■ +BASIC - SQL_TEXT-PLAN-XPLAN-SESSIONS-INSTANCE-ACTIVITY_HISTOGRAM-PLAN_HISTOGRAM-METRICS</li> <li>■ TYPICAL - everything but PLAN_HISTOGRAM</li> <li>■ ALL - everything</li> </ul> <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p>
type	Report format, 'TEXT' by default. Can be 'TEXT', 'HTML', 'XML' or 'ACTIVE' (see Usage Notes).
sql_plan_hash_value	Target only those SQL executions with the specified plan_hash_value. Default is NULL.

## Return Values

A CLOB containing the desired report.

## Usage Notes

- The target SQL statement for this report can be:
  - The last SQL monitored by Oracle (this is the default behavior, so there is no need to specify any parameter)
  - The last SQL executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally its serial number. For example, use `session_id => USERENV ('SID')` for the current session or `session_id=>20, session_serial=>103` for session ID 20, serial number 103.
  - The last execution of a specific statement identified by its `sql_id`.
  - A specific execution of a SQL statement identified by its execution key (`sql_id, sql_exec_start` and `sql_exec_id`).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
  - `GV$SQL_MONITOR`
  - `GV$SQL_PLAN_MONITOR`
  - `GV$SQL_PLAN`
  - `GV$ACTIVE_SESSION_HISTORY`
  - `GV$SESSION_LONGOPS`
  - `GV$SQL`
- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram. By default, the maximum number of buckets is set to 128 and the RDBMS derives the `bucket_interval` based on this. The `bucket_interval` (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1s) without exceeding the maximum number of buckets. For example, if the query has executed for 600s, the RDBMS selects a `bucket_interval` of 8s

(a power of two) given that  $600/8 = 74$  which is less than 128 buckets maximum. Smaller than 8s would be 4s which would lead to more buckets than the 128 maximum. If `bucket_interval` is specified, the RDBMS uses that value instead of deriving it from `bucket_max_count`.

- ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

**See Also:** *Oracle Database Performance Tuning Guide* for more information about SQL real-time monitoring.

## REPORT\_SQL\_MONITOR\_LIST Function

This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics.

Use the [REPORT\\_SQL\\_MONITOR\\_LIST Function](#) to get detail monitoring information for a single SQL statement

**See Also:** [SQL Performance Reporting Subprograms](#) on page 139-15 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST (
  sql_id           IN VARCHAR2  DEFAULT NULL,
  session_id      IN NUMBER     DEFAULT NULL,
  session_serial  IN NUMBER     DEFAULT NULL,
  inst_id         IN NUMBER     DEFAULT NULL,
  active_since_date IN DATE      DEFAULT NULL,
  active_since_sec IN NUMBER     DEFAULT NULL,
  last_refresh_time IN DATE      DEFAULT NULL,
  report_level    IN VARCHAR2   DEFAULT 'TYPICAL',
  auto_refresh    IN NUMBER     DEFAULT NULL,
  base_path       IN VARCHAR2   DEFAULT NULL,
  type            IN VARCHAR2   DEFAULT 'TEXT')
RETURN CLOB;
```

### Parameters

**Table 139-34** REPORT\_SQL\_MONITOR\_LIST Function Parameters

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
session_id	If not NULL, this parameter targets only the sub-set of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
inst_id	Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.
active_since_date	If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.
active_since_sec	Same as active_since_date but with the date specified relative to the current sysdate minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.

**Table 139-34 (Cont.) REPORT\_SQL\_MONITOR\_LIST Function Parameters**

Parameter	Description
last_refresh_time	If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, sql_exec_id). For queries with a first refresh time after the specified date, only the SQL execution key and statistics are returned.
report_level	Level of detail for the report. The level can be either: <ul style="list-style-type: none"> <li>■ BASIC - SQL text up to 200 characters</li> <li>■ TYPICAL - include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters</li> <li>■ ALL - currently the same as TYPICAL</li> </ul>
auto_refresh	Currently non-operational, reserved for future use
base_path	URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)
type	Report format, 'TEXT' by default. Can be 'TEXT', 'HTML' or 'XML'.

## Return Values

A report (XML, text, HTML) for the list of SQL statements that have been monitored.

## Usage Notes

The user tuning this function needs to have privilege to access the following fixed views: GV\$SQL\_MONITOR and GV\$SQL.

**See Also:** *Oracle Database Performance Tuning Guide* for more information about SQL real-time monitoring.

## REPORT\_TUNING\_TASK Function

This procedure displays the results of a tuning task.

**See Also:** [SQL Performance Reporting Subprograms](#) on page 139-15 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK (
  task_name      IN   VARCHAR2,
  type           IN   VARCHAR2  := 'TEXT',
  level         IN   VARCHAR2  := 'TYPICAL',
  section       IN   VARCHAR2  := ALL,
  object_id     IN   NUMBER     := NULL,
  result_limit  IN   NUMBER     := NULL,
  owner_name    IN   VARCHAR2  := NULL,
  execution_name IN  VARCHAR2  := NULL)
RETURN CLOB;
```

### Parameters

**Table 139–35** REPORT\_TUNING\_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task to report
type	Type of the report to produce. Possible values are TEXT which produces a text report.
level	Level of detail in the report: <ul style="list-style-type: none"> <li>■ BASIC: simple version of the report. Just show info about the actions taken by the advisor.</li> <li>■ TYPICAL: show information about every statement analyzed, including requests not implemented.</li> <li>■ ALL: highly detailed report level, also provides annotations about statements skipped over.</li> </ul>
section	Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"> <li>■ SUMMARY - summary information</li> <li>■ FINDINGS - tuning findings</li> <li>■ PLAN - explain plans</li> <li>■ INFORMATION - general information</li> <li>■ ERROR - statements with errors</li> <li>■ ALL - all statements</li> </ul>
object_id	Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.
execution_name	Name of the task execution to use. If NULL, the report is generated for the last task execution.

## Return Values

A CLOB containing the desired report.

## Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'FINDINGS',
5) from dual;
```

## RESET\_TUNING\_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(  
  task_name          IN VARCHAR2);
```

### Parameters

**Table 139–36** RESET\_TUNING\_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to reset

### Examples

```
-- reset and re-execute a task  
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);  
  
-- re-execute the task  
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

## RESUME\_TUNING\_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
  task_name          IN VARCHAR2,
  basic_filter       IN VARCHAR2 := NULL);
```

### Parameters

**Table 139–37 RESUME\_TUNING\_TASK Procedure Parameters**

Parameter	Description
task_name	The name of the tuning task to resume
basic_filter	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter is applied in conjunction with the basic filter (i.e., parameter <code>basic_filter</code> ) when calling <a href="#">CREATE_TUNING_TASK Functions</a> .

### Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

### Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

## SCRIPT\_TUNING\_TASK Function

This function creates a SQL\*PLUS script which can then be executed to implement a set of Advisor recommendations.

**See Also:** [SQL Tuning Advisor Subprograms](#) on page 139-11 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
  task_name          IN VARCHAR2,
  rec_type           IN VARCHAR2  := REC_TYPE_ALL,
  object_id          IN NUMBER    := NULL,
  result_limit       IN NUMBER    := NULL,
  owner_name         IN VARCHAR2  := NULL,
  execution_name     IN VARCHAR2  := NULL)
RETURN CLOB;
```

### Parameters

**Table 139–38** *SCRIPT\_TUNING\_TASK Function Parameters*

Parameter	Description
task_name	Name of the tuning task for which to apply a script
rec_type	Filter the script by types of recommendations to include. Any subset of the following separated by commas: or 'ALL: 'PROFILES' 'STATISTICS' 'INDEXES'. For example, a script with profiles and statistics: 'PROFILES, STATISTICS'
object_id	Optionally filters by a single object ID
result_limit	Optionally shows commands for only top N SQL (ordered by object_id and ignored if an object_id is also specified)
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner
excution_name	Name of the task execution to use. If NULL, the script is generated for the last task execution.

### Return Values

Returns a script in the form of a CLOB.

### Usage Notes

- Once the script is returned, it should then be checked by the DBA and executed.
- Wrap with a call to `DBMS_ADVISOR.CREATE_FILE` to put it into a file.

### Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of just the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;
```

```
-- get a script of just stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about just one SQL statement when we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

## SELECT\_CURSOR\_CACHE Function

This function collects SQL statements from the SQL Cursor Cache.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter      IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN  NUMBER := NULL,
  attribute_list   IN  VARCHAR2 := NULL,
  recursive_sql    IN  VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 139–39** *SELECT\_CURSOR\_CACHE Function Parameters*

Parameter	Description
<code>basic_filter</code>	The SQL predicate to filter the SQL from the cursor cache defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, the subprogram captures only statements of the type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .
<code>object_filter</code>	Currently not supported.
<code>ranking_measure (n)</code>	An order-by clause on the selected SQL.
<code>result_percentage</code>	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
<code>result_limit</code>	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
<code>attribute_list</code>	List of SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <li>■ <code>TYPICAL - BASIC + SQL plan</code> (without row source statistics) and without object reference list (default)</li> <li>■ <code>BASIC</code> - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</li> <li>■ <code>ALL</code> - return all attributes</li> <li>■ Comma separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>BIND_LIST</code>, <code>OBJECT_LIST</code>, <code>SQL_PLAN</code>, <code>SQL_PLAN_STATISTICS</code>: similar to <code>SQL_PLAN + row source statistics</code></li> </ul>
<code>recursive_sql</code>	Filter that includes recursive SQL in the SQL tuning set ( <code>HAS_RECURSIVE_SQL</code> ) or excludes it ( <code>NO_RECURSIVE_SQL</code> ).

## Return Values

This function returns a one SQLSET\_ROW per SQL\_ID or PLAN\_HASH\_VALUE pair found in each data source.

## Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the cursor cache views.

## Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j''));

-- Notice that some statements can have multiple plans. The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value). This is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''ay1m3ssvtrh24''))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor, along the
-- lines given below

-- Select all statements in the cursor cache.
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT value(P)
        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

    -- Process each statement (or pass cursor to load_sqlset).

    CLOSE cur;
END;
/

-- Look for statements not parsed by SYS.
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur for
        SELECT VALUE(P)
        FROM table(
            DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS''')) P;

    -- Process each statement (or pass cursor to load_sqlset).

    CLOSE cur;
```

```
end;
/

-- All statements from a particular module/action.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'module = 'MY_APPLICATION' and action = 'MY_ACTION') P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/

-- all statements that ran for at least five seconds
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'buffer_gets > 100 and parsing_schema_name = 'APPS')P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of sqlset_row
-- is NULL)
DECLARE
  cur sys_refcursor;
```

```

BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(dbms_sqлтune.select_cursor_cache(
      'elapsed_time > 5000000', NULL, NULL, NULL, NULL, 1, NULL,
      'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/

-- Select the top 100 statements in the cursor cache ordering by elapsed_time.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
      NULL,
      'ELAPSED_TIME', NULL, NULL,
      1,
      100)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- Select the set of statements which cumulatively account for 90% of the
-- buffer gets in the cursor cache. This means that the buffer gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
      NULL,
      'BUFFER_GETS', NULL, NULL,
      .9)) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/

```

## SELECT\_SQL\_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SELECT_SQL_TRACE (
  directory          IN VARCHAR2,
  file_name         IN VARCHAR2 := NULL,
  mapping_table_name IN VARCHAR2 := NULL,
  mapping_table_owner IN VARCHAR2 := NULL, ,
  select_mode       IN POSITIVE := SINGLE_EXECUTION,
  options           IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start     IN VARCHAR2 := NULL,
  pattern_end       IN VARCHAR2 := NULL,
  result_limit      IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 139–40** *SELECT\_SQL\_TRACE Function Parameters*

Parameter	Description
<code>directory</code>	The directory object containing the trace file(s). This field is mandatory.
<code>file_name</code>	All or part of name of the trace file(s) to process. If <code>NULL</code> then the current or most recent file in the specified location or path is used. '%' wildcards are supported for matching trace file names.
<code>mapping_table_name</code>	The mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is <code>NULL</code> , the mappings in the current database is used.
<code>mapping_table_owner</code>	the mapping table owner. If it is <code>NULL</code> , the current user is used.
<code>select_mode</code>	the mode for selecting SQL from the trace. By default, it is <code>SINGLE_EXECUTION</code> . <ul style="list-style-type: none"> <li>■ <code>SINGLE_EXECUTION</code> - return one execution of a SQL.(default).</li> <li>■ <code>ALL_EXECUTIONS</code> - return all executions.</li> </ul>
<code>options</code>	The options. By default, it is <code>LIMITED_COMMAND_TYPE</code> which can be specified to include SQL statements from all Oracle command types. <ul style="list-style-type: none"> <li>■ <code>LIMITED_COMMAND_TYPE</code> - returns the SQL statements with the command types <code>CREATE</code>, <code>INSERT</code>, <code>SELECT</code>, <code>UPDATE</code>, <code>DELETE</code>, <code>UPSERT</code>. It is the default.</li> <li>■ <code>ALL_COMMAND_TYPE</code> - returns the SQL statements with all command types.</li> </ul>
<code>pattern_start</code>	Opening delimiting pattern of the trace file section(s) to consider. CURRENTLY INOPERABLE.
<code>pattern_end</code>	closing delimiting pattern of the trace file section(s) to process. CURRENTLY INOPERABLE.

**Table 139-40 (Cont.) SELECT\_SQL\_TRACE Function Parameters**

Parameter	Description
result_limit	Top SQL from the (filtered) source. Default to MAXSB4 if NULL.

## Return Values

This function returns a SQLSET\_ROW object.

## Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT value(p)
     FROM TABLE(
       DBMS_SQLTUNE.SELECT_SQL_TRACE(
         directory=>'SQL_TRACE_DIR',
         file_name=>'%trc',
         mapping_table_name=>'mapping')) p;
  DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/
```

## SELECT\_SQLPA\_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

### See Also:

- [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group
- *Oracle Database Real Application Testing User's Guide*

### Syntax

```
DBMS_SQLTUNE.SELECT_SQLPA_TASK(
    task_name          IN VARCHAR2,
    task_owner        IN VARCHAR2 := NULL,
    execution_name    IN VARCHAR2 := NULL,
    level_filter      IN VARCHAR2 := 'REGRESSED',
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    attribute_list    IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 139–41** SELECT\_SQLPA\_TASK Function Parameters

Parameter	Description
task_name	Name of the SQL Performance Analyzer task
task_owner	Owner of the SQL Performance Analyzer task. If NULL, then assume the current user.
execution_name	Name of the SQL Performance Analyzer task execution (type COMPARE PERFORMANCE) from which the provided filters will be applied. If NULL, then assume the most recent COMPARE PERFORMANCE execution.
level_filter	Filter to specify which subset of SQLs to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed. <ul style="list-style-type: none"> <li>■ IMPROVED includes only improved SQL.</li> <li>■ REGRESSED includes only regressed SQL (default).</li> <li>■ CHANGED includes only SQL with changed performance.</li> <li>■ UNCHANGED includes only SQL with unchanged performance.</li> <li>■ CHANGED_PLANS includes only SQL with plan changes.</li> <li>■ UNCHANGED_PLANS includes only SQL with unchanged plans.</li> <li>■ ERRORS includes only SQL with errors only.</li> <li>■ MISSING_SQL includes only missing SQL statements (across STS).</li> <li>■ NEW_SQL includes only new SQL statements (across STS).</li> </ul>
basic filter	SQL predicate to filter the SQL in addition to the level filters.
object_filter	Currently not supported.

**Table 139-41 (Cont.) SELECT\_SQLPA\_TASK Function Parameters**

Parameter	Description
<code>attribute_list</code>	<p>List of SQL statement attributes to return in the result. The possible values are:</p> <ul style="list-style-type: none"> <li>▪ <code>TYPICAL - BASIC</code> + SQL plan (without row source statistics) and without object reference list (default)</li> <li>▪ <code>BASIC</code> - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</li> <li>▪ <code>ALL</code> - return all attributes</li> <li>▪ Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> + row source statistics).</li> </ul>

### Return Values

This function returns a SQL tuning set object.

### Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

## SELECT\_SQLSET Function

This function reads SQLSET contents.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SELECT_SQLSET (
  sqlset_name      IN  VARCHAR2,
  basic_filter     IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN  NUMBER := NULL,
  attribute_list   IN  VARCHAR2 := NULL,
  plan_filter      IN  VARCHAR2 := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL,
  recursive_sql    IN  VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 139-42** *SELECT\_SQLSET Function Parameters*

Parameter	Description
sqlset_name	The SQL tuning set name
basic_filter	The SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the SQLSET_ROW
object_filter	Currently not supported.
ranking_measure (n)	An order-by clause on the selected SQL
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <li>■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default)</li> <li>■ BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</li> <li>■ ALL - return all attributes</li> <li>■ Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).</li> </ul>
plan_filter	The plan filter

**Table 139-42 (Cont.) SELECT\_SQLSET Function Parameters**

Parameter	Description
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner
recursive_sql	Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

**Return Values**

This function returns a one SQLSET\_ROW per SQL\_ID or PLAN\_HASH\_VALUE pair found in each data source.

**Usage Notes**

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

**Examples**

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

## SELECT\_WORKLOAD\_REPOSITORY Functions

This function collects SQL statements from the workload repository. The overloaded forms let you:

- Collect SQL statements from all snapshots between `begin_snap` and `end_snap`.
- Collect SQL statements from a workload repository baseline.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  basic_filter    IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit    IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL,
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  baseline_name  IN VARCHAR2,
  basic_filter    IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit    IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL,
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 139–43** *SELECT\_WORKLOAD\_REPOSITORY Function Parameters*

Parameter	Description
<code>begin_snap</code>	Begin snapshot (non-inclusive).
<code>end_snap</code>	End snapshot (inclusive).
<code>baseline_name</code>	The name of the baseline period.
<code>basic_filter</code>	The SQL predicate to filter the SQL from the workload repository defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, the subprogram captures only statements of the type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .
<code>object_filter</code>	Currently not supported.
<code>ranking_measure (n)</code>	An order-by clause on the selected SQL.

**Table 139-43 (Cont.) SELECT\_WORKLOAD\_REPOSITORY Function Parameters**

Parameter	Description
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure.
attribute_list	List of SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <li>■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default)</li> <li>■ BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</li> <li>■ ALL - return all attributes</li> <li>■ Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).</li> </ul>
recursive_sql	Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

## Return Values

This function returns a one SQLSET\_ROW per SQL\_ID or PLAN\_HASH\_VALUE pair found in each data source.

## Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

## Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

## SET\_TUNING\_TASK\_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER(  
    task_name    IN  VARCHAR2,  
    parameter    IN  VARCHAR2,  
    value        IN  VARCHAR2);
```

```
DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER(  
    task_name    IN  VARCHAR2,  
    parameter    IN  VARCHAR2,  
    value        IN  NUMBER);
```

### Parameters

**Table 139–44** SET\_TUNING\_TASK\_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute

**Table 139–44 (Cont.) SET\_TUNING\_TASK\_PARAMETER Procedure Parameters**

Parameter	Description
parameter	<p>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</p> <ul style="list-style-type: none"> <li>▪ APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</li> <li>▪ BASIC_FILTER: basic filter for SQL tuning set</li> <li>▪ DAYS_TO_EXPIRE: number of days until the task is deleted</li> <li>▪ DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the <a href="#">EXECUTE_TUNING_TASK Function &amp; Procedure</a></li> <li>▪ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task)</li> <li>▪ LOCAL_TIME_LIMIT: per-statement time out (seconds)</li> <li>▪ MODE: tuning scope (comprehensive, limited)</li> <li>▪ OBJECT_FILTER: object filter for SQL tuning set</li> <li>▪ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</li> <li>▪ RANK_MEASURE1: first ranking measure for SQL tuning set</li> <li>▪ RANK_MEASURE2: second possible ranking measure for SQL tuning set</li> <li>▪ RANK_MEASURE3: third possible ranking measure for SQL tuning set</li> <li>▪ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</li> <li>▪ SQL_LIMIT: maximum number of SQL statements to tune</li> <li>▪ SQL_PERCENTAGE: percentage filter of SQL tuning set statements</li> <li>▪ TEST_EXECUTE: FULL/AUTO/OFF. <ul style="list-style-type: none"> <li>* FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</li> <li>* AUTO - test-execute for an automatically-chosen time proportional to the tuning time</li> <li>* OFF - do not test-execute</li> </ul> </li> <li>▪ TIME_LIMIT: global time out (seconds)</li> <li>▪ USERNAME: username under which the statement is parsed</li> </ul>
value	New value of the specified parameter

## Usage Notes

When setting automatic tuning task parameters, use the [SET\\_AUTO\\_TUNING\\_TASK\\_PARAMETER Procedures](#) in the [DBMS\\_AUTO\\_SQLTUNE](#) package.

## SQLTEXT\_TO\_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in `dba_sql_profiles`.

**See Also:** [SQL Profile Subprograms](#) on page 139-12 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (  
  sql_text      IN CLOB,  
  force_match  IN BOOLEAN := FALSE)  
RETURN NUMBER;
```

### Parameters

**Table 139–45** *SQLTEXT\_TO\_SIGNATURE Function Parameters*

Parameter	Description
<code>sql_text</code>	SQL text whose signature is required. Required.
<code>force_match</code>	If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed

### Return Values

This function returns the signature of the specified SQL text.

## UNPACK\_STGTAB\_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

**See Also:** [SQL Profile Subprograms](#) on page 139-12 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
  profile_name      IN VARCHAR2 := '%',
  profile_category IN VARCHAR2 := 'DEFAULT',
  replace           IN BOOLEAN,
  staging_table_name IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 139-46 UNPACK\_STGTAB\_SQLPROF Procedure Parameters**

Parameter	Description
profile_name	The name of the profile to unpack (% wildcards acceptable, case-sensitive)
profile_category	The category from which to unpack profiles (% wildcards acceptable, case-sensitive)
replace	The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists
staging_table_name	The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

### Usage Notes

Using this procedure requires the CREATE ANY SQL PROFILE privilege and the SELECT privilege on staging table.

### Examples

```
-- Unpack all profiles stored in a staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace           => FALSE, -
                                         staging_table_name => 'PROFILE_STGTAB');
```

-- If there is a failure during the unpack operation, users can find the profile  
-- we failed on and perform a remap\_stgtab\_sqlprof operation targeting it. Then  
-- they can resume the unpack operation by setting replace to TRUE so that  
-- the profiles that were already created are replaced

```
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace           => TRUE, -
                                         staging_table_name => 'PROFILE_STGTAB');
```

## UNPACK\_STGTAB\_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
  sqlset_name          IN VARCHAR2 := '%',
  sqlset_owner        IN VARCHAR2 := NULL,
  replace              IN BOOLEAN,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 139-47 UNPACK\_STGTAB\_SQLSET Procedure Parameters**

Parameter	Description
sqlset_name	The name of the tuning set to unpack (not NULL). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, just specify '%' to unpack all tuning sets from the staging table.
sqlset_owner	The name of tuning set owner, or NULL for current schema owner. Wildcards supported.
replace	Replaces tuning set if they already exist. If FALSE, raises errors if you try to create a tuning set that already exists
staging_table_name	The name of the staging table, moved after a call to the <a href="#">PACK_STGTAB_SQLSET Procedure</a> (case-sensitive)
staging_schema_owner	The name of staging table owner, or NULL for current schema owner (case-sensitive)

### Usage Notes

- Users can drop the staging table after this procedure completes successfully.
- The unpack procedure commits after successfully loading each SQL tuning set. If it fails with one tuning set, no part of that tuning set will have been unpacked, but those which the subprogram had already apprehended continue to exist.
- When failures occur due to SQL tuning set name or owner conflicts, users should use the [REMAP\\_STGTAB\\_SQLSET Procedure](#) to patch the staging table, and then call this procedure again to unpack those tuning sets that remain.

### Examples

```
-- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name    => '%', -
                                       sqlset_owner    => '%', -
                                       replace         => FALSE, -
                                       staging_table_name => 'STGTAB_SQLSET');
```

-- errors can arise during STS unpack when a STS in the staging table has the  
-- same name/owner as STS on the system. In this case, users should call

```
-- remap_stgtab_sqlset to patch the staging table and with which to call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -
                                       sqlset_owner     => '%', -
                                       replace           => TRUE, -
                                       staging_table_name => 'STGTAB_SQLSET');
```

## UPDATE\_SQLSET Procedures

This procedure updates selected fields for SQL statement in a SQL tuning set.

**See Also:** [SQL Tuning Set Subprograms](#) on page 139-13 for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  NUMBER := NULL);
```

### Parameters

**Table 139–48** UPDATE\_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
sql_id	The identifier of the statement to update
attribute_name	The name of the attribute to modify
attribute_value	The new value of the attribute

---

---

## DBMS\_STAT\_FUNCS

The DBMS\_STAT\_FUNCS package provides statistical functions.

This chapter contains the following topic:

- [Summary of DBMS\\_STAT\\_FUNCS Subprograms](#)

## Summary of DBMS\_STAT\_FUNCS Subprograms

**Table 140–1** *DBMS\_STAT\_FUNCS Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">EXPONENTIAL_DIST_FIT Procedure</a> on page 140-3	Tests how well a sample of values fits an exponential distribution
<a href="#">NORMAL_DIST_FIT Procedure</a> on page 140-4	Tests how well a sample of values fits a normal distribution
<a href="#">POISSON_DIST_FIT Procedure</a> on page 140-5	Tests how well a sample of values fits a Poisson distribution
<a href="#">SUMMARY Procedure</a> on page 140-6	Summarizes a numerical column of a table
<a href="#">UNIFORM_DIST_FIT Procedure</a> on page 140-7	Tests how well a sample of values fits a uniform distribution
<a href="#">WEIBULL_DIST_FIT Procedure</a> on page 140-8	Tests how well a sample of values fits a Weibull distribution

## EXPONENTIAL\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

### Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda      IN   NUMBER,
  mu          IN   NUMBER,
  sig         OUT  NUMBER);
```

### Parameters

**Table 140–2 EXPONENTIAL\_DIST\_FIT Procedure Parameters**

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The scale parameter.
mu	The location parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.

## NORMAL\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

### Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (  
    ownername    IN    VARCHAR2,  
    tablename    IN    VARCHAR2,  
    columnname   IN    VARCHAR2,  
    test_type    IN    VARCHAR2 DEFAULT 'SHAPIRO_WILKS',  
    mean         IN    NUMBER,  
    stdev        IN    NUMBER,  
    sig          OUT   NUMBER);
```

### Parameters

**Table 140–3** *NORMAL\_DIST\_FIT Procedure Parameters*

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.
mean	The mean of the distribution against which to compare.
stdev	The standard deviation of the distribution against which to compare.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.

## POISSON\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

### Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda      IN   NUMBER,
  sig         OUT  NUMBER);
```

### Parameters

**Table 140–4 POISSON\_DIST\_FIT Procedure Parameters**

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The lambda parameter is the shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.

## SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`. The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

### Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  sigma_value IN   NUMBER DEFAULT 3,
  s           OUT  SummaryType);
```

### Parameters

**Table 140–5** *SUMMARY Procedure Parameters*

Parameter	Description
<code>ownername</code>	The schema where the table resides.
<code>tablename</code>	The table where the column resides.
<code>columnname</code>	The column of the table to be summarized.
<code>sigma_value</code>	The number of sigmas for the set of extreme values, defaults to 3.
<code>s</code>	The Record containing summary information about given column.

### Definition of SummaryType

```
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
  count          NUMBER,
  min            NUMBER,
  max           NUMBER,
  range         NUMBER,
  mean         NUMBER,
  cmode       num_table,
  variance    NUMBER,
  stddev     NUMBER,
  quantile_5  NUMBER,
  quantile_25 NUMBER,
  median     NUMBER,
  quantile_75 NUMBER,
  quantile_95 NUMBER,
  plus_x_sigma NUMBER,
  minus_x_sigma NUMBER,
  extreme_values num_table,
  top_5_values  n_arr,
  bottom_5_values n_arr);
```

## UNIFORM\_DIST\_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

### Syntax

```
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  var_type    IN   VARCHAR2 DEFAULT 'CONTINUOUS',
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  paramA      IN   NUMBER,
  paramB      IN   NUMBER,
  sig         OUT  NUMBER);
```

### Parameters

**Table 140–6 UNIFORM\_DIST\_FIT Procedure Parameters**

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
var_type	The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
paramA	Parameter A estimated from the sample (the location parameter).
paramB	Parameter B estimated from the sample (the scale parameter).
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.

## WEIBULL\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

### Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  alpha       IN   NUMBER,
  mu          IN   NUMBER,
  beta        IN   NUMBER,
  sig         OUT  NUMBER);
```

### Parameters

**Table 140–7 WEIBULL\_DIST\_FIT Procedure Parameters**

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
alpha	The scale parameter.
mu	The location parameter.
beta	The slope/shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.

With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

**See Also:** *Oracle Database Performance Tuning Guide*

This chapter contains the following topics:

## Using DBMS\_STATS

This section contains topics which relate to using the DBMS\_STATS package.

- [Overview](#)
- [Types](#)
- [Constants](#)
- [Operational Notes](#)
- [Deprecated Subprograms](#)
- [Examples](#)

## Overview

The Oracle RDBMS allows you to collect statistics of many different kinds as an aid to improving performance. This package is concerned with optimizer statistics only. Given that Oracle sets automatic statistics collection of this kind on by default, this package is intended for only specialized cases.

The statistics of interest to be viewed or modified can reside in the dictionary or in a table created in the user's schema for this purpose. You can also collect and manage user-defined statistics for tables and domain indexes using this package.

For example, if the `DELETE_COLUMN_STATS` procedure is invoked on a column for which an association is defined, user-defined statistics for that column are deleted in addition to deletion of the standard statistics.

Only statistics stored in the dictionary have an impact on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel

**See Also:** *Oracle Database Performance Tuning Guide* for more information about "Managing Optimizer Statistics".

## Types

Types for the minimum and maximum values and histogram endpoints include:

```
TYPE numarray IS VARRAY(256) OF NUMBER;
TYPE datearray IS VARRAY(256) OF DATE;
TYPE chararray IS VARRAY(256) OF VARCHAR2(4000);
TYPE rawarray IS VARRAY(256) OF RAW(2000);
TYPE fltarray IS VARRAY(256) OF BINARY_FLOAT;
TYPE dblarray IS VARRAY(256) OF BINARY_DOUBLE;
```

```
TYPE StatRec IS RECORD (
    epc NUMBER,
    minval RAW(2000),
    maxval RAW(2000),
    bkvals NUMARRAY,
    novals NUMARRAY,
    chvals CHARARRAY,
    eavs NUMBER);
```

Types for listing stale tables include:

```
TYPE ObjectElem IS RECORD (
    ownname VARCHAR2(30), -- owner
    objtype VARCHAR2(6), -- 'TABLE' or 'INDEX'
    objname VARCHAR2(30), -- table/index
    partname VARCHAR2(30), -- partition
    subpartname VARCHAR2(30)); -- subpartition
type ObjectTab is TABLE of ObjectElem;
```

Type for displaying statistics difference report:

```
TYPE DiffRepElem IS RECORD (
    report CLOB, -- stats difference report
    maxdiffpct number); -- max stats difference (percentage)
type DiffRepTab is table of DiffRepElem;
```

## Constants

The DBMS\_STATS package uses the constants shown in [Table 141-1](#):

**Table 141-1 DBMS\_STATS Constants**

Name	Type	Value	Description
AUTO_CASCADE	BOOLEAN	NULL	Lets Oracle decide whether to collect statistics for indexes or not
AUTO_DEGREE	NUMBER	32768	Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters. For definition of default parallel degree, see "Degree of Parallelism" in <i>Oracle Database VLDB and Partitioning Guide</i> .
AUTO_INVALIDATE	BOOLEAN	NULL	Lets Oracle decide when to invalidate dependent cursors
AUTO_SAMPLE_SIZE	NUMBER	0	Indicates that auto-sample size algorithms should be used

## Operational Notes

The `DBMS_STATS` subprograms perform the following general operations:

- [Gathering Optimizer Statistics](#)
- [Setting or Getting Statistics](#)
- [Deleting Statistics](#)
- [Transferring Statistics](#)
- [Locking or Unlocking Statistics](#)
- [Restoring and Purging Statistics History](#)
- [User-Defined Statistics](#)
- [Pending Statistics](#)
- [Comparing Statistics](#)
- [Extended Statistics](#)

Most of the `DBMS_STATS` procedures include the three parameters `statown`, `stattab`, and `statid`. These parameters allow you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with *sets* of statistics.

The `stattab` parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the `statown` parameter is specified). You can create multiple tables with different `stattab` identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single `stattab` by using the `statid` parameter, which avoids cluttering the user's schema.

For the `SET` and `GET` procedures, if `stattab` is not provided (that is, `NULL`), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if `stattab` is not `NULL`, then the `SET` or `GET` operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of `DBMS_STATS` procedures using the [SET\\_DATABASE\\_PREFS Procedure](#), [SET\\_GLOBAL\\_PREFS Procedure](#), [SET\\_SCHEMA\\_PREFS Procedure](#) and [SET\\_TABLE\\_PREFS Procedure](#).

Most of the procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a parameter, `force` which allows you to override any lock on statistics.

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

### Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the `ANALYZE` command:

[GATHER\\_DATABASE\\_STATS Procedures](#)  
[GATHER\\_DICTIONARY\\_STATS Procedure](#)  
[GATHER\\_FIXED\\_OBJECTS\\_STATS Procedure](#)

[GATHER\\_INDEX\\_STATS Procedure](#)  
[GATHER\\_SCHEMA\\_STATS Procedures](#)  
[GATHER\\_SYSTEM\\_STATS Procedure](#)  
[GATHER\\_TABLE\\_STATS Procedure](#)

The `GATHER_*` procedures also collect user-defined statistics for columns and domain indexes.

The `statown`, `stattab`, and `statid` parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

[GENERATE\\_STATS Procedure](#)

## Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

[PREPARE\\_COLUMN\\_VALUES Procedures](#)  
[PREPARE\\_COLUMN\\_VALUES\\_NVARCHAR2 Procedure](#)  
[PREPARE\\_COLUMN\\_VALUES\\_ROWID Procedure](#)

[SEED\\_COL\\_USAGE Procedure](#)  
[SET\\_INDEX\\_STATS Procedures](#)  
[SET\\_SYSTEM\\_STATS Procedure](#)  
[SET\\_TABLE\\_STATS Procedure](#)

[GET\\_COLUMN\\_STATS Procedures](#)  
[GET\\_INDEX\\_STATS Procedures](#)  
[GET\\_SYSTEM\\_STATS Procedure](#)  
[GET\\_TABLE\\_STATS Procedure](#)

In the special versions of the `SET_*_STATS` procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or external statistics table:

- User-defined statistics (`extstats`)
- The statistics type schema name (`statsschema`)
- The statistics type name (`statsname`)

The user-defined statistics and the corresponding statistics type are inserted into the `USTATS$` dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the `GET_*_STATS` procedures return user-defined statistics and the statistics type owner and name as `OUT` arguments corresponding to the schema object specified. If user-defined statistics are not collected, `NULL` values are returned.

## Deleting Statistics

The `DELETE_*` procedures delete both user-defined statistics and the standard statistics for the given schema object.

[DELETE\\_COLUMN\\_STATS Procedure](#)  
[DELETE\\_DATABASE\\_STATS Procedure](#)

[DELETE\\_DICTIONARY\\_STATS Procedure](#)  
[DELETE\\_FIXED\\_OBJECTS\\_STATS Procedure](#)  
[DELETE\\_INDEX\\_STATS Procedure](#)  
[DELETE\\_SCHEMA\\_STATS Procedure](#)  
[DELETE\\_SYSTEM\\_STATS Procedure](#)  
[DELETE\\_TABLE\\_STATS Procedure](#)

## Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

[CREATE\\_STAT\\_TABLE Procedure](#)  
[DROP\\_STAT\\_TABLE Procedure](#)

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table ([EXPORT\\_\\*](#))
- from a user statistics table to the dictionary ([IMPORT\\_\\*](#))

[EXPORT\\_COLUMN\\_STATS Procedure](#)  
[EXPORT\\_DATABASE\\_STATS Procedure](#)  
[EXPORT\\_DICTIONARY\\_STATS Procedure](#)  
[EXPORT\\_FIXED\\_OBJECTS\\_STATS Procedure](#)  
[EXPORT\\_INDEX\\_STATS Procedure](#)  
[EXPORT\\_SCHEMA\\_STATS Procedure](#)  
[EXPORT\\_SYSTEM\\_STATS Procedure](#)  
[EXPORT\\_TABLE\\_STATS Procedure](#)

[IMPORT\\_COLUMN\\_STATS Procedure](#)  
[IMPORT\\_DATABASE\\_STATS Procedure](#)  
[IMPORT\\_DICTIONARY\\_STATS Procedure](#)  
[IMPORT\\_FIXED\\_OBJECTS\\_STATS Procedure](#)  
[IMPORT\\_INDEX\\_STATS Procedure](#)  
[IMPORT\\_SCHEMA\\_STATS Procedure](#)  
[IMPORT\\_SYSTEM\\_STATS Procedure](#)  
[IMPORT\\_TABLE\\_STATS Procedure](#)

---

---

**Note:** Oracle does not support export or import of statistics across databases of different character sets.

---

---

## Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

[LOCK\\_SCHEMA\\_STATS Procedure](#)  
[LOCK\\_TABLE\\_STATS Procedure](#)

[UNLOCK\\_SCHEMA\\_STATS Procedure](#)  
[UNLOCK\\_TABLE\\_STATS Procedure](#)

The [LOCK\\_\\*](#) procedures either freeze the current set of the statistics or to keep the statistics empty (uncollected). When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

## Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

[RESET\\_GLOBAL\\_PREF\\_DEFAULTS Procedure](#)

[RESTORE\\_DICTIONARY\\_STATS Procedure](#)

[RESTORE\\_FIXED\\_OBJECTS\\_STATS Procedure](#)

[RESTORE\\_SCHEMA\\_STATS Procedure](#)

[RESTORE\\_SYSTEM\\_STATS Procedure](#)

[RESTORE\\_TABLE\\_STATS Procedure](#)

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the [ALTER\\_STATS\\_HISTORY\\_RETENTION Procedure](#).

The other DBMS\_STATS procedures related to restoring statistics are:

- [PURGE\\_STATS Procedure](#): This procedure lets you manually purge old versions beyond a time stamp.
- [GET\\_STATS\\_HISTORY\\_RETENTION Function](#): This function gets the current statistics history retention value.
- [GET\\_STATS\\_HISTORY\\_AVAILABILITY Function](#): This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

RESTORE\_\* operations are not supported for user defined statistics.

## User-Defined Statistics

The DBMS\_STATS package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the [GET\\_INDEX\\_STATS Procedures](#) invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

SET\_\* and GET\_\* operations for user-defined statistics are also supported using a special version of the SET and GET interfaces for columns and indexes.

EXPORT\_\*, IMPORT\_\* and RESTORE\_\* operations are not supported for user defined statistics.

## Pending Statistics

The package gather statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the PUBLISH option to FALSE using the SET\*PREFS procedures. The default value for PUBLISH is TRUE. The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_pending_statistics` is set to TRUE. The default value of this parameter is FALSE and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the [EXPORT\\_PENDING\\_STATS Procedure](#)) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

Once the performance or query plans have been verified, the pending statistics can be published (run the [PUBLISH\\_PENDING\\_STATS Procedure](#)) if the performance is acceptable or delete (run the [DELETE\\_PENDING\\_STATS Procedure](#)) if not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- [DELETE\\_PENDING\\_STATS Procedure](#)
- [EXPORT\\_PENDING\\_STATS Procedure](#)
- [PUBLISH\\_PENDING\\_STATS Procedure](#)

## Comparing Statistics

The `DIFF_TABLE_STATS_*` statistics can be used to compare statistics for a table from two different sources. The statistics can be from:

- two different user statistics tables
- a single user statistics table containing two sets of statistics that can be identified using `stats`
- a user statistics table and dictionary history
- pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function, with a default of 10%. The statistics corresponding to the first source (`stattab1` or `time1`) will be used as basis for computing the differential percentage.

## Extended Statistics

This package allows you to collect statistics for column groups and expressions (known as "statistics extensions"). The statistics collected for column groups and expressions are called "extended statistics".

Statistics on Column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates `c1=1` and `c2=1` and if there are statistics on (c1, c2), the optimizer will use this statistics for estimating the combined selectivity of the predicates. The expression statistics are used by optimizer for estimating selectivity of predicates on those expressions. The extended statistics are similar to column statistics and the procedures that take columns names will accept extension names in place of column names.

Related subprograms:

- [CREATE\\_EXTENDED\\_STATS Function](#)
- [DROP\\_EXTENDED\\_STATS Procedure](#)

- [SHOW\\_EXTENDED\\_STATS\\_NAME](#) Function

## Deprecated Subprograms

The following subprograms are obsolete with Release 11g:

- [GET\\_PARAM](#) Function  
Instead, use [GET\\_PREFS](#) Function
- [SET\\_PARAM](#) Procedure  
Instead, use [SET\\_GLOBAL\\_PREFS](#) Procedure
- [RESET\\_PARAM\\_DEFAULTS](#) Procedure  
Instead use [RESET\\_GLOBAL\\_PREF\\_DEFAULTS](#) Procedure

## Examples

- [Using Pending Statistics](#)
- [Gathering Daytime System Statistics](#)

### Using Pending Statistics

Assume many modifications have been made to the `employees` table since the last time statistics were gathered. To ensure that the cost-based optimizer is still picking the best plan, statistics should be gathered once again; however, the user is concerned that new statistics will cause the optimizer to choose bad plans when the current ones are acceptable. The user can do the following:

```
EXEC DBMS_STATS.SET_TABLE_PREFS('hr', 'employees', 'PUBLISH', 'false');
```

By setting the `employees` tables publish preference to `FALSE`, any statistics gather from now on will not be automatically published. The newly gathered statistics will be marked as pending.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS ('hr', 'employees');
```

To test the newly gathered statistics, set `optimizer_pending_statistics` to `TRUE` in a session and run sample queries.

```
ALTER SESSION SET optimizer_use_pending_statistics = TRUE;
```

If the pending statistics generate sound execution plans, they can be published:

```
EXEC DBMS_STATS.PUBLISH_PENDING_STATS('hr', 'employees');
EXEC DBMS_STATS.SET_TABLE_PREF('hr', 'employees', 'PUBLISH', 'true');
```

### Gathering Daytime System Statistics

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the `MYSTATS` table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    stattab  => 'mystats',
    statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the `MYSTATS` table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    stattab  => 'mystats',
    statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE jobno number;
BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
```

```
        ('mystats','OLTP');'  
        sysdate, 'sysdate + 1');  
        COMMIT;  
    END;  
  
    BEGIN  
        DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS  
        ('mystats','OLAP');'  
        sysdate + 0.5, 'sysdate + 1');  
        COMMIT;  
    END;
```

---

## Summary of DBMS\_STATS Subprograms

**Table 141–2 DBMS\_STATS Package Subprograms**

Subprogram	Description
<a href="#">ALTER_STATS_HISTORY_RETENTION Procedure</a> on page 141-20	Changes the statistics history retention value
<a href="#">CONVERT_RAW_VALUE Procedures</a> on page 141-21	Convert the internal representation of a minimum or maximum value into a datatype-specific value
<a href="#">CONVERT_RAW_VALUE_NVARCHAR Procedure</a> on page 141-22	Convert the internal representation of a minimum or maximum value into a datatype-specific value
<a href="#">CONVERT_RAW_VALUE_ROWID Procedure</a> on page 141-23	Convert the internal representation of a minimum or maximum value into a datatype-specific value
<a href="#">COPY_TABLE_STATS Procedure</a> on page 141-24	Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling
<a href="#">CREATE_EXTENDED_STATS Function</a> on page 141-26	Creates a virtual column for a user specified column group or an expression in a table
<a href="#">CREATE_STAT_TABLE Procedure</a> on page 141-28	Creates a table with name <code>stattab</code> in ownname's schema which is capable of holding statistics
<a href="#">DELETE_COLUMN_STATS Procedure</a> on page 141-29	Deletes column-related statistics
<a href="#">DELETE_DATABASE_PREFS Procedure</a> on page 141-31	Deletes the statistics preferences of all the tables, excluding the tables owned by Oracle
<a href="#">DELETE_DATABASE_STATS Procedure</a> on page 141-34	Deletes statistics for the entire database
<a href="#">DELETE_DICTIONARY_STATS Procedure</a> on page 141-35	Deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas)
<a href="#">DELETE_FIXED_OBJECTS_STATS Procedure</a> on page 141-34	Deletes statistics of all fixed tables
<a href="#">DELETE_INDEX_STATS Procedure</a> on page 141-37	Deletes index-related statistics
<a href="#">DELETE_PENDING_STATS Procedure</a> on page 141-38	Deletes the private statistics that have been collected but have not been published
<a href="#">DELETE_SCHEMA_PREFS Procedure</a> on page 141-39	Deletes the statistics preferences of all the tables owned by the specified owner name
<a href="#">DELETE_SCHEMA_STATS Procedure</a> on page 141-42	Deletes schema-related statistics
<a href="#">DELETE_SYSTEM_STATS Procedure</a> on page 141-43	Deletes system statistics
<a href="#">DELETE_TABLE_PREFS Procedure</a> on page 141-44	Deletes statistics preferences of the specified table in the specified schema
<a href="#">DELETE_TABLE_STATS Procedure</a> on page 141-47	Deletes table-related statistics
<a href="#">DIFF_TABLE_STATS_IN_HISTORY Function</a> on page 141-49	Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps

**Table 141–2 (Cont.) DBMS\_STATS Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">DIFF_TABLE_STATS_IN_PENDING Function</a> on page 141-50	Compares pending statistics and statistics as of a timestamp or statistics from dictionary
<a href="#">DIFF_TABLE_STATS_IN_STATTAB Function</a> on page 141-51	Compares statistics for a table from two different sources
<a href="#">DROP_EXTENDED_STATS Procedure</a> on page 141-52	Drops the statistics entry that is created for the user specified extension
<a href="#">DROP_STAT_TABLE Procedure</a> on page 141-53	Drops a user statistics table created by CREATE_STAT_TABLE
<a href="#">EXPORT_COLUMN_STATS Procedure</a> on page 141-54	Retrieves statistics for a particular column and stores them in the user statistics table identified by <code>stattab</code>
<a href="#">EXPORT_DATABASE_PREFS Procedure</a> on page 141-55	Exports the statistics preferences of all the tables, excluding the tables owned by Oracle
<a href="#">EXPORT_DATABASE_STATS Procedure</a> on page 141-56	Retrieves statistics for all objects in the database and stores them in the user statistics table identified by <code>statown.stattab</code>
<a href="#">EXPORT_DICTIONARY_STATS Procedure</a> on page 141-57	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by <code>stattab</code>
<a href="#">EXPORT_FIXED_OBJECTS_STATS Procedure</a> on page 141-58	Retrieves statistics for fixed tables and stores them in the user statistics table identified by <code>stattab</code>
<a href="#">EXPORT_INDEX_STATS Procedure</a> on page 141-59	Retrieves statistics for a particular index and stores them in the user statistics table identified by <code>stattab</code>
<a href="#">EXPORT_PENDING_STATS Procedure</a> on page 141-60	Exports the statistics gathered and stored as pending
<a href="#">EXPORT_SCHEMA_PREFS Procedure</a> on page 141-61	Exports the statistics preferences of all the tables owned by the specified owner name
<a href="#">EXPORT_SCHEMA_STATS Procedure</a> on page 141-62	Retrieves statistics for all objects in the schema identified by <code>ownname</code> and stores them in the user statistics table identified by <code>stattab</code>
<a href="#">EXPORT_SYSTEM_STATS Procedure</a> on page 141-63	Retrieves system statistics and stores them in the user statistics table
<a href="#">EXPORT_TABLE_PREFS Procedure</a> on page 141-64	Exports statistics preferences of the specified table in the specified schema into the specified statistics table
<a href="#">EXPORT_TABLE_STATS Procedure</a> on page 141-65	Retrieves statistics for a particular table and stores them in the user statistics table
<a href="#">FLUSH_DATABASE_MONITORING_INFO Procedure</a> on page 141-66	Flushes in-memory monitoring information for all the tables to the dictionary
<a href="#">GATHER_DATABASE_STATS Procedures</a> on page 141-67	Gathers statistics for all objects in the database
<a href="#">GATHER_DICTIONARY_STATS Procedure</a> on page 141-67	Gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components
<a href="#">GATHER_FIXED_OBJECTS_STATS Procedure</a> on page 141-75	Gathers statistics of fixed objects
<a href="#">GATHER_INDEX_STATS Procedure</a> on page 141-76	Gathers index statistics

**Table 141-2 (Cont.) DBMS\_STATS Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">GATHER_SCHEMA_STATS Procedures</a> on page 141-78	Gathers statistics for all objects in a schema
<a href="#">GATHER_SYSTEM_STATS Procedure</a> on page 141-82	Gathers system statistics
<a href="#">GATHER_TABLE_STATS Procedure</a> on page 141-84	Gathers table and column (and index) statistics
<a href="#">GENERATE_STATS Procedure</a> on page 141-88	Generates object statistics from previously collected statistics of related objects
<a href="#">GET_COLUMN_STATS Procedures</a> on page 141-89	Gets all column-related information
<a href="#">GET_INDEX_STATS Procedures</a> on page 141-91	Gets all index-related information
<a href="#">GET_PARAM Function</a> on page 141-94	Gets the default value of parameters of DBMS_STATS procedures [see <a href="#">Deprecated Subprograms</a> on page 141-12]
<a href="#">GET_PREFS Function</a> on page 141-95	Gets the default value of the specified preference
<a href="#">GET_STATS_HISTORY_AVAILABILITY Function</a> on page 141-98	Gets the oldest timestamp where statistics history is available
<a href="#">GET_STATS_HISTORY_RETENTION Function</a> on page 141-99	Returns the current retention value
<a href="#">GET_SYSTEM_STATS Procedure</a> on page 141-100	Gets system statistics from stattab, or from the dictionary if stattab is NULL
<a href="#">GET_TABLE_STATS Procedure</a> on page 141-102	Gets all table-related information
<a href="#">IMPORT_COLUMN_STATS Procedure</a> on page 141-104	Retrieves statistics for a particular column from the user statistics table identified by stattab and stores them in the dictionary
<a href="#">IMPORT_DATABASE_PREFS Procedure</a> on page 141-106	Imports the statistics preferences of all the tables, excluding the tables owned by Oracle
<a href="#">IMPORT_DATABASE_STATS Procedure</a> on page 141-107	Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary
<a href="#">IMPORT_DICTIONARY_STATS Procedure</a> on page 141-108	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary
<a href="#">IMPORT_FIXED_OBJECTS_STATS Procedure</a> on page 141-110	Retrieves statistics for fixed tables from the user statistics table identified by stattab and stores them in the dictionary
<a href="#">IMPORT_INDEX_STATS Procedure</a> on page 141-111	Retrieves statistics for a particular index from the user statistics table identified by stattab and stores them in the dictionary
<a href="#">IMPORT_SCHEMA_PREFS Procedure</a> on page 141-112	Imports the statistics preferences of all the tables owned by the specified owner name
<a href="#">IMPORT_SCHEMA_STATS Procedure</a> on page 141-113	Retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary

**Table 141–2 (Cont.) DBMS\_STATS Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">IMPORT_SYSTEM_STATS Procedure</a> on page 141-115	Retrieves system statistics from the user statistics table and stores them in the dictionary
<a href="#">IMPORT_TABLE_PREFS Procedure</a> on page 141-116	Sets the statistics preferences of the specified table in the specified schema
<a href="#">IMPORT_TABLE_STATS Procedure</a> on page 141-117	Retrieves statistics for a particular table from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
<a href="#">LOCK_PARTITION_STATS Procedure</a> on page 141-119	Locks statistics for a partition
<a href="#">LOCK_SCHEMA_STATS Procedure</a> on page 141-120	Locks the statistics of all tables of a schema
<a href="#">LOCK_TABLE_STATS Procedure</a> on page 141-121	Locks the statistics on the table
<a href="#">MERGE_COL_USAGE Procedure</a> on page 141-122	Merges column usage information from a source database, by means of a <code>dblink</code> , into the local database
<a href="#">PREPARE_COLUMN_VALUES Procedures</a> on page 141-123	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the <a href="#">SEED_COL_USAGE Procedure</a>
<a href="#">PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure</a> on page 141-125	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the <a href="#">SEED_COL_USAGE Procedure</a>
<a href="#">PREPARE_COLUMN_VALUES_ROWID Procedure</a> on page 141-127	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the <a href="#">SEED_COL_USAGE Procedure</a>
<a href="#">PUBLISH_PENDING_STATS Procedure</a> on page 141-129	Publishes the statistics gathered and stored as pending
<a href="#">PURGE_STATS Procedure</a> on page 141-130	Purges old versions of statistics saved in the dictionary
<a href="#">RESET_GLOBAL_PREF_DEFAULTS Procedure</a> on page 141-131	Resets the default values of all parameters to Oracle recommended values
<a href="#">RESET_PARAM_DEFAULTS Procedure</a> on page 141-132	Resets global preferences to default values [see <a href="#">Deprecated Subprograms</a> on page 141-12]
<a href="#">RESTORE_DICTIONARY_STATS Procedure</a> on page 141-134	Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp
<a href="#">RESTORE_FIXED_OBJECTS_STATS Procedure</a> on page 141-135	Restores statistics of all fixed tables as of a specified timestamp
<a href="#">RESTORE_SCHEMA_STATS Procedure</a> on page 141-136	Restores statistics of all tables of a schema as of a specified timestamp
<a href="#">RESTORE_SYSTEM_STATS Procedure</a> on page 141-137	Restores statistics of all tables of a schema as of a specified timestamp
<a href="#">RESTORE_TABLE_STATS Procedure</a> on page 141-138	Restores statistics of a table as of a specified timestamp ( <code>as_of_timestamp</code> ), as well as statistics of associated indexes and columns

**Table 141–2 (Cont.) DBMS\_STATS Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">SEED_COL_USAGE Procedure</a> on page 141-139	Iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements
<a href="#">SET_COLUMN_STATS Procedures</a> on page 141-140	Sets column-related information
<a href="#">SET_DATABASE_PREFS Procedure</a> on page 141-142	Sets the statistics preferences of all the tables, excluding the tables owned by Oracle
<a href="#">SET_GLOBAL_PREFS Procedure</a> on page 141-139	Sets the global statistics preferences
<a href="#">SET_INDEX_STATS Procedures</a> on page 141-148	Sets index-related information
<a href="#">SET_PARAM Procedure</a> on page 141-151	Sets default values for parameters of DBMS_STATS procedures [see <a href="#">Deprecated Subprograms</a> on page 141-12]
<a href="#">SET_SCHEMA_PREFS Procedure</a> on page 141-153	Sets the statistics preferences of all the tables owned by the specified owner name
<a href="#">SET_SYSTEM_STATS Procedure</a> on page 141-154	Sets system statistics

## ALTER\_STATS\_HISTORY\_RETENTION Procedure

This procedure changes the statistics history retention value. Statistics history retention is used by both the automatic purge and [PURGE\\_STATS Procedure](#).

### Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (  
    retention          IN          NUMBER);
```

### Parameters

**Table 141–3 ALTER\_STATS\_HISTORY\_RETENTION Procedure Parameters**

Parameter	Description
retention	<p>The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes:</p> <ul style="list-style-type: none"><li>▪ -1 :Statistics history is never purged by automatic purge</li><li>▪ 0 : Old statistics are never saved. The automatic purge will delete all statistics history</li><li>▪ NULL : Change statistics history retention to default value</li></ul>

### Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

### Exceptions

ORA-20000: Insufficient privileges

## CONVERT\_RAW\_VALUE Procedures

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The `minval` and `maxval` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

### Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval     RAW,
    resval OUT BINARY_FLOAT);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval     RAW,
    resval OUT BINARY_DOUBLE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval     RAW,
    resval OUT DATE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval     RAW,
    resval OUT NUMBER);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval     RAW,
    resval OUT VARCHAR2);
```

### Pragmas

```
pragma restrict_references(convert_raw_value, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 141–4** *CONVERT\_RAW\_VALUE Procedure Parameters*

Parameter	Description
<code>rawval</code>	The raw representation of a column minimum or maximum datatype-specific output parameters
<code>resval</code>	The converted, type-specific value

## CONVERT\_RAW\_VALUE\_NVARCHAR Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The `minval` and `maxval` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

### Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
    rawval      RAW,
    resval OUT NVARCHAR2);
```

### Pragmas

```
pragma restrict_references(convert_raw_value_nvarchar, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 141–5** *CONVERT\_RAW\_VALUE\_NVARCHAR Procedure Parameters*

Parameter	Description
<code>rawval</code>	The raw representation of a column minimum or maximum datatype-specific output parameters
<code>resval</code>	The converted, type-specific value

## CONVERT\_RAW\_VALUE\_ROWID Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the StatRec structure as filled in by GET\_COLUMN\_STATS or PREPARE\_COLUMN\_VALUES are appropriate values for input.

### Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
    rawval      RAW,
    resval OUT ROWID);
```

### Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 141–6** *CONVERT\_RAW\_VALUE\_ROWID Procedure Parameters*

Parameter	Description
rawval	The raw representation of a column minimum or maximum datatype-specific output parameters
resval	The converted, type-specific value

## COPY\_TABLE\_STATS Procedure

This procedure copies the statistics of the source [sub] partition to the destination [sub] partition. It also copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of blks, or number of rows) based on the given `scale_factor`.

### Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  srcpartname      VARCHAR2,
  dstpartname      VARCHAR2,
  scale_factor     VARCHAR2 DEFAULT 1,
  flags            NUMBER DEFAULT,
  force            BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–7 COPY\_TABLE\_STATS Procedure Parameters**

Parameter	Description
<code>ownname</code>	Schema of the table of source and destination [sub] partitions
<code>tablename</code>	Table name of source and destination [sub] partitions
<code>srcpartname</code>	Source [sub] partition
<code>dstpartname</code>	Destination [sub] partition
<code>scale_factor</code>	Scale factor to scale <code>nblks</code> , <code>nrows</code> etc. in <code>dstpartname</code>
<code>flags</code>	For internal Oracle use (should be left as <code>NULL</code> )
<code>force</code>	When value of this argument is <code>TRUE</code> , copy statistics even if locked

### Exceptions

ORA-20000: Invalid partition name

ORA-20001: Bad input value

### Usage Notes

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:

- If the partitioning type is `HASH` the minimum and maximum values of the destination partition are same as that of the source partition.
- If the partitioning type is `LIST` then
  - if the destination partition is a `NOT DEFAULT` partition then
    - \* the minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition
    - \* the maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition

- alternatively, if the destination partition is a `DEFAULT` partition, then
  - \* the minimum value of the destination partition is set to the minimum value of the source partition
  - \* the maximum value of the destination partition is set to the maximum value of the source partition
- If the partitioning type is `RANGE` then
  - the minimum value of the destination partition is set to the high bound of previous partition
  - the maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is `MAXVALUE`, in which case the maximum value of the destination partition is set to the high bound of the previous partition

Note that if the destination partition is the first partition then minimum values are equal to maximum values.

The procedure is extended to handle the second and subsequent key columns with two additional rules (which do not apply to the first key column) :

- If the source partition column's minimum value is equal to its maximum value, and both are equal to the source partition's lower bound, and it has a single distinct value, then the destination partition column's minimum and maximum values are both set to the destination partition's lower bound.
- If the above condition does not apply, the destination partition column's maximum value is set to the greater of the destination partition upper bound and the source partition column's maximum value, with the following exception: if the destination partition is `D` and its preceding partition is `D-1` and the key column to be adjusted is `Cn`, the maximum value for `Cn` is set to the upper bound of `D` (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column `Cn-1` are the same in partitions `D` and `D-1`.

## CREATE\_EXTENDED\_STATS Function

This function creates a column statistics entry in the system for a user specified column group or an expression in a table. Statistics for this extension will be gathered when user or auto statistics gathering job gathers statistics for the table. We call statistics for such an extension, "extended statistics". This function returns the name of this newly created entry for the extension.

### Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    extension  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 141–8 CREATE\_EXTENDED\_STATS Function Parameters**

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column <i>c1</i> , <i>c2</i> . An example column group can be "( <i>c1</i> , <i>c2</i> )" and an example expression can be "( <i>c1</i> + <i>c2</i> )".

### Return Values

This function returns the name of this newly created entry for the extension.

### Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

### Usage Notes

There are nine restrictions on the extension:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by *SYS*.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables or external tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column can not appear more than once in a column group.
- A column group can not contain expressions.

- An expression must contain at least one column.
- An expression can not contain a subquery.
- The COMPATIBLE parameter needs to be 11.0.0.0 or greater

## CREATE\_STAT\_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

### Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (  
    ownname VARCHAR2,  
    stattab VARCHAR2,  
    tblspace VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–9 CREATE\_STAT\_TABLE Procedure Parameters**

Parameter	Description
<code>ownname</code>	Name of the schema
<code>stattab</code>	Name of the table to create. This value should be passed as the <code>stattab</code> parameter to other procedures when the user does not want to modify the dictionary statistics directly.
<code>tblspace</code>	Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.

### Exceptions

ORA-20000: Table already exists or insufficient privileges

ORA-20001: Tablespace does not exist

## DELETE\_COLUMN\_STATS Procedure

This procedure deletes column-related statistics.

### Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  colname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  statab       VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  cascade_parts BOOLEAN DEFAULT TRUE,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  force        BOOLEAN DEFAULT FALSE,
  col_stat_type VARCHAR2 DEFAULT 'ALL');
```

### Parameters

**Table 141–10** *DELETE\_COLUMN\_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition for which to delete the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global column statistics are deleted.
statab	User statistics table identifier describing from where to delete the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code> ).
cascade_parts	If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then setting this to <code>true</code> causes the deletion of statistics for this column for all underlying partitions as well.
statown	Schema containing <code>statab</code> (if different than <code>ownname</code> )
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	When value of this argument is <code>TRUE</code> , deletes column statistics even if locked

**Table 141–10 (Cont.) DELETE\_COLUMN\_STATS Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
col_stat_type	Type of column statistics to be deleted. This argument takes the following values: <ul style="list-style-type: none"><li>■ HISTOGRAM - delete column histogram only</li><li>■ ALL - delete base column statistics and histogram</li></ul>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

## DELETE\_DATABASE\_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
  pname          IN   VARCHAR2,
  add_sys        IN   BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–11** *DELETE\_DATABASE\_PREFS Procedure Parameters*

Parameter	Description
<code>pname</code>	<p>Preference name. The default value for following parameters can be deleted:</p> <ul style="list-style-type: none"> <li>■ CASCADE</li> <li>■ DEGREE</li> <li>■ ESTIMATE_PERCENT</li> <li>■ METHOD_OPT</li> <li>■ NO_INVALIDATE</li> <li>■ GRANULARITY</li> <li>■ PUBLISH</li> <li>■ INCREMENTAL</li> <li>■ STALE_PERCENT</li> </ul> <p>· CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics</p> <p>· DEGREE - The value determines degree of parallelism used for gathering statistics</p> <p>· ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>

**Table 141–11 (Cont.) DELETE\_DATABASE\_PREFS Procedure Parameters**

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns</li> <li>- SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns</li> <li>- column_name : name of a column</li> <li>- extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned)</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics</p>

**Table 141-11 (Cont.) DELETE\_DATABASE\_PREFS Procedure Parameters**

Parameter	Description
.	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>■ the INCREMENTAL value for the partitioned table is set to TRUE;</li> <li>■ the PUBLISH value for the partitioned table is set to TRUE;</li> <li>■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>
.	<p>STALE_PERCENT - Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%. Note that if you set stale_percent to zero the AUTO STATS gathering job will gather statistics for this table every time a row in the table is modified.</p>
add_sys	Value TRUE will include the Oracle-owned tables

## Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

## Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS ('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS ('ESTIMATE_PERCENT', TRUE);
```

## DELETE\_DATABASE\_STATS Procedure

This procedure deletes statistics for all the tables in a database.

### Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  force           BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 141–12** *DELETE\_DATABASE\_STATS Procedure Parameters*

Parameter	Description
statab	User statistics table identifier describing from where to delete the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code> )
statown	Schema containing <code>statab</code> (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	When the value of this argument is <code>TRUE</code> , deletes statistics of tables in a database even if they are locked

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

## DELETE\_DICTIONARY\_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

### Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN   DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force           BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 141–13** DELETE\_DICTIONARY\_STATS Procedure Parameters

Parameter	Description
statab	User statistics table identifier describing from where to delete the statistics. If statab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)
statown	Schema containing statab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked

### Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## DELETE\_FIXED\_OBJECTS\_STATS Procedure

This procedure deletes statistics of all fixed tables.

### Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
  statab      VARCHAR2 DEFAULT NULL,
  statid      VARCHAR2 DEFAULT NULL,
  statown     VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force       BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–14** *DELETE\_FIXED\_OBJECTS\_STATS Procedure Parameters*

Parameter	Description
statab	The user statistics table identifier describing from where to delete the current statistics. If <code>statab</code> is <code>NULL</code> , the statistics will be deleted directly in the dictionary.
statid	The (optional) identifier to associate with these statistics within <code>statab</code> . This only applies if <code>statab</code> is not <code>NULL</code> .
statown	Schema containing <code>statab</code> (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>
force	Ignores the statistics lock on objects and deletes the statistics if set to <code>TRUE</code>

### Usage Notes

You must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege to execute this procedure.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## DELETE\_INDEX\_STATS Procedure

This procedure deletes index-related statistics.

### Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  cascade_parts   BOOLEAN  DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  force           BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 141–15** *DELETE\_INDEX\_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.
statab	User statistics table identifier describing from where to delete the statistics. If statab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)
cascade_parts	If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well
statown	Schema containing statab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	When value of this argument is TRUE, deletes index statistics even if locked

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

## DELETE\_PENDING\_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

### Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (  
    ownname    IN  VARCHAR2  DEFAULT USER,  
    tabname    IN  VARCHAR2);
```

### Parameters

**Table 141–16** *DELETE\_PENDING\_STATS Procedure Parameters*

Parameter	Description
ownname	Owner name
tabname	Table name

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

- If the parameter `tabname` is `NULL` delete applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

### Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

## DELETE\_SCHEMA\_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

### Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
  ownname  IN  VARCHAR2,
  pname    IN  VARCHAR2);
```

### Parameters

**Table 141–17** *DELETE\_SCHEMA\_PREFS Procedure Parameters*

Parameter	Description
ownname	Owner name
pname	Preference name. The default value for following parameters can be deleted: <ul style="list-style-type: none"> <li>▪ CASCADE</li> <li>▪ DEGREE</li> <li>▪ ESTIMATE_PERCENT</li> <li>▪ METHOD_OPT</li> <li>▪ NO_INVALIDATE</li> <li>▪ GRANULARITY</li> <li>▪ PUBLISH</li> <li>▪ INCREMENTAL</li> <li>▪ STALE_PERCENT</li> </ul>
.	CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics
.	DEGREE - Determines degree of parallelism used for gathering statistics
.	ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

**Table 141–17 (Cont.) DELETE\_SCHEMA\_PREFS Procedure Parameters**

Parameter	Description
.	<p>METHOD_OPT - Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns</li> <li>- column_name : name of a column</li> <li>- extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
.	<p>GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

**Table 141-17 (Cont.) DELETE\_SCHEMA\_PREFS Procedure Parameters**

Parameter	Description
PUBLISH	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
INCREMENTAL	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>■ the INCREMENTAL value for the partitioned table is set to TRUE</li> <li>■ the PUBLISH value for the partitioned table is set to TRUE</li> <li>■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>
STALE_PERCENT	<p>STALE_PERCENT - Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%. Note that if you set stale_percent to zero the AUTO_STATS gathering job will gather statistics for this table every time a row in the table is modified.</p>

## Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

## Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

## DELETE\_SCHEMA\_STATS Procedure

This procedure deletes statistics for an entire schema.

### Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
  ownname          VARCHAR2,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force            BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–18** *DELETE\_SCHEMA\_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
statab	User statistics table identifier describing from where to delete the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code> )
statown	Schema containing <code>statab</code> (if different than <code>ownname</code> )
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	When value of this argument is <code>TRUE</code> , deletes statistics of tables in a schema even if locked

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

## DELETE\_SYSTEM\_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option) if `stattab` is not specified. If `stattab` is specified, the subprogram deletes all system statistics with the associated `statid` from the `stattab`.

### Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–19** *DELETE\_SYSTEM\_STATS Procedure Parameters*

Parameter	Description
<code>stattab</code>	Identifier of the user statistics table where the statistics will be saved
<code>statid</code>	Optional identifier associated with the statistics saved in the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

## DELETE\_TABLE\_PREFS Procedure

This procedure is used to delete the statistics preferences of the specified table in the specified schema.

### Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tablename  IN  VARCHAR2,
    pname      IN  VARCHAR2);
```

### Parameters

**Table 141–20** *DELETE\_TABLE\_PREFS Procedure Parameters*

Parameter	Description
ownname	Owner name
tablename	Table name
pname	Preference name. The default value for following preferences can be deleted: <ul style="list-style-type: none"> <li>▪ CASCADE</li> <li>▪ DEGREE</li> <li>▪ ESTIMATE_PERCENT</li> <li>▪ METHOD_OPT</li> <li>▪ NO_INVALIDATE</li> <li>▪ GRANULARITY</li> <li>▪ PUBLISH</li> <li>▪ INCREMENTAL</li> <li>▪ STALE_PERCENT</li> </ul>
.	CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics
.	DEGREE - Determines degree of parallelism used for gathering statistics
.	ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

**Table 141–20 (Cont.) DELETE\_TABLE\_PREFS Procedure Parameters**

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms.</li> <li>- AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns.</li> <li>- column_name : name of a column</li> <li>- extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>

**Table 141–20 (Cont.) DELETE\_TABLE\_PREFS Procedure Parameters**

Parameter	Description
.	<p>PUBLISH - Determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>■ INCREMENTAL value for the partitioned table is set to TRUE</li> <li>■ PUBLISH value for the partitioned table is set to TRUE;</li> <li>■ User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>
.	<p>STALE_PERCENT - Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%.</p>
pvalue	<p>Preference value. If NULL is specified, it will set the Oracle default value.</p>

## Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

## Usage Notes

- To run this procedure, you need to connect as owner of the table, be granted ANALYZE privilege on the table, or ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

## DELETE\_TABLE\_STATS Procedure

This procedure deletes table-related statistics.

### Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    statab          VARCHAR2 DEFAULT NULL,
    statid          VARCHAR2 DEFAULT NULL,
    cascade_parts    BOOLEAN  DEFAULT TRUE,
    cascade_columns  BOOLEAN  DEFAULT TRUE,
    cascade_indexes  BOOLEAN  DEFAULT TRUE,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    force           BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 141–21** *DELETE\_TABLE\_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved from the global table level.
statab	User statistics table identifier describing from where to retrieve the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code> )
cascade_parts	If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then setting this to <code>TRUE</code> causes the deletion of statistics for this table for all underlying partitions as well
cascade_columns	Indicates that <code>DELETE_COLUMN_STATS</code> should be called for all underlying columns (passing the <code>cascade_parts</code> parameter)
cascade_indexes	Indicates that <code>DELETE_INDEX_STATS</code> should be called for all underlying indexes (passing the <code>cascade_parts</code> parameter)
statown	Schema containing <code>statab</code> (if different than <code>ownname</code> )
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	When value of this argument is <code>TRUE</code> , deletes table statistics even if locked

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

## DIFF\_TABLE\_STATS\_IN\_HISTORY Function

This function can be used to compare statistics for a table from two timestamps in past and compare the statistics as of that timestamps.

### Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
  ownname      IN VARCHAR2,
  tablename    IN VARCHAR2,
  time1        IN TIMESTAMP WITH TIME ZONE,
  time2        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  pctthreshold IN NUMBER DEFAULT 10)
RETURN DiffRepTab pipelined;
```

### Parameters

**Table 141–22** *DIFF\_TABLE\_STATS\_IN\_HISTORY Function Parameters*

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tablename	Table for which statistics are to be compared
time1	First timestamp 1
time2	Second timestamp 2
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

### Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

## DIFF\_TABLE\_STATS\_IN\_PENDING Function

This function compares pending statistics and statistics as of a timestamp or statistics from dictionary.

### Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(  
    ownname      IN VARCHAR2,  
    tabname      IN VARCHAR2,  
    timestamp    IN TIMESTAMP WITH TIME ZONE,  
    pctthreshold IN NUMBER DEFAULT 10)  
RETURN DiffRepTab pipelined;
```

### Parameters

**Table 141–23** DIFF\_TABLE\_STATS\_IN\_PENDING Function Parameters

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tabname	Table for which statistics are to be compared
timestamp	Time stamp to get statistics from the history
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

### Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

## DIFF\_TABLE\_STATS\_IN\_STATTAB Function

This function can be used to compare statistics for a table from two different sources. The statistics can be drawn from

- two different user statistics tables
- a single user statistics table containing 2 sets of statistics that can be identified using `statids`
- a user statistics table and dictionary

The function also compares the statistics of the dependent objects (indexes, columns, partitions) as well. It displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function. The statistics corresponding to the first source (`stattab1` or `time1`) will be used as basis for computing the difference percentage.

### Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
    ownname          IN VARCHAR2,
    tabname          IN VARCHAR2,
    stattab1         IN VARCHAR2,
    stattab2         IN VARCHAR2 DEFAULT NULL,
    pctthreshold     IN NUMBER   DEFAULT 10,
    statid1          IN VARCHAR2 DEFAULT NULL,
    statid2          IN VARCHAR2 DEFAULT NULL,
    stattab1own      IN VARCHAR2 DEFAULT NULL,
    stattab2own      IN VARCHAR2 DEFAULT NULL)
RETURN DiffRepTab pipelined;
```

### Parameters

**Table 141–24** *DIFF\_TABLE\_STATS\_IN\_STATTAB Function Parameters*

Parameter	Description
<code>ownname</code>	Owner of the table. Specify NULL for current schema.
<code>tabname</code>	Table for which statistics are to be compared
<code>stattab1</code>	User statistics table 1
<code>stattab2</code>	User statistics table 2. If NULL, statistics in <code>stattab1</code> is compared with current statistics in dictionary. This is the default. Specify same table as <code>stattab1</code> to compare two sets within the statistics table (see <code>statid</code> below).
<code>pctthreshold</code>	The function reports difference in statistics only if it exceeds this limit. The default value is 10.
<code>statid1</code>	(optional) Identifies statistics set within <code>stattab1</code> .
<code>statid2</code>	(optional) Identifies statistics set within <code>stattab2</code>
<code>stattab1own</code>	Schema containing <code>stattab1</code> (if other than <code>ownname</code> )
<code>stattab2own</code>	Schema containing <code>stattab2</code> (if other than <code>ownname</code> )

## DROP\_EXTENDED\_STATS Procedure

This function drops the statistics entry that is created for the user specified extension. This cancels the effects of the [CREATE\\_EXTENDED\\_STATS Function](#).

### Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    extension  VARCHAR2);
```

### Parameters

**Table 141–25 DROP\_EXTENDED\_STATS Procedure Parameters**

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

### Usage Notes

If no extended statistics set is created for the extension, this function throws an error.

### Exceptions

- ORA-20000: Insufficient privileges or extension does not exist
- ORA-20001: Error when processing extension

## DROP\_STAT\_TABLE Procedure

This procedure drops a user statistics table.

### Syntax

```
DBMS_STATS.DROP_STAT_TABLE (  
    ownname VARCHAR2,  
    stattab VARCHAR2);
```

### Parameters

**Table 141-26** *DROP\_STAT\_TABLE Procedure Parameters*

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier

### Exceptions

ORA-20000: Table does not exists or insufficient privileges.

## EXPORT\_COLUMN\_STATS Procedure

This procedure retrieves statistics for a particular column and stores them in the user statistics table identified by *stattab*.

### Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
  ownname  VARCHAR2,
  tabname  VARCHAR2,
  colname  VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab  VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  statown  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–27 EXPORT\_COLUMN\_STATS Procedure Parameters**

Parameter	Description
<i>ownname</i>	Name of the schema
<i>tabname</i>	Name of the table to which this column belongs
<i>colname</i>	Name of the column or extension
<i>partname</i>	Name of the table partition. If the table is partitioned and if <i>partname</i> is <i>NULL</i> , then global and partition column statistics are exported.
<i>stattab</i>	User statistics table identifier describing where to store the statistics
<i>statid</i>	Identifier (optional) to associate with these statistics within <i>stattab</i>
<i>statown</i>	Schema containing <i>stattab</i> (if different than <i>ownname</i> )

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## EXPORT\_DATABASE\_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
  stattab   IN  VARCHAR2,
  statid    IN  VARCHAR2 DEFAULT NULL,
  statown   IN  VARCHAR2 DEFAULT NULL,
  add_sys   IN  BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 141–28 EXPORT\_DATABASE\_PREFS Procedure Parameters**

Parameter	Description
<code>stattab</code>	Statistics table name to where statistics should be exported
<code>statid</code>	(Optional) Identifier to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if other than <code>ownname</code> )
<code>add_sys</code>	Value <code>TRUE</code> will include the Oracle-owned tables

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

## EXPORT\_DATABASE\_STATS Procedure

This procedure retrieves statistics for all objects in the database and stores them in the user statistics tables identified by `statown.stattab`.

### Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 141–29 EXPORT\_DATABASE\_STATS Procedure Parameters**

Parameter	Description
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)
<code>stat_category</code>	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>▪ 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</li> <li>▪ 'SYNOPSSES' - auxiliary statistics information gathered on a partitioned table when <code>incremental</code> is <code>TRUE</code></li> </ul>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## EXPORT\_DICTIONARY\_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 141–30 EXPORT\_DICTIONARY\_STATS Procedure Parameters**

Parameter	Description
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)
<code>stat_category</code>	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>▪ 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</li> <li>▪ 'SYNOPSISSES' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</li> </ul>

### Usage Notes

- You must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` and `ANALYZE ANY SYSTEM` privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## EXPORT\_FIXED\_OBJECTS\_STATS Procedure

This procedure retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (  
    stattab VARCHAR2,  
    statid  VARCHAR2 DEFAULT NULL,  
    statown VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–31 EXPORT\_FIXED\_OBJECTS\_STATS Procedure Parameters**

Parameter	Description
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## EXPORT\_INDEX\_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
  ownname  VARCHAR2,
  indname  VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab  VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  statown  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–32** EXPORT\_INDEX\_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>indname</code>	Name of the index
<code>partname</code>	Name of the index partition. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition index statistics are exported.
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code> )

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## EXPORT\_PENDING\_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

### Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (
  ownname      IN VARCHAR2 DEFAULT USER,
  tablename    IN VARCHAR2,
  stattab      IN VARCHAR2,
  statid       IN VARCHAR2 DEFAULT NULL,
  statown      IN VARCHAR2 DEFAULT USER);
```

### Parameters

**Table 141–33 EXPORT\_PENDING\_STATS Procedure Parameters**

Parameter	Description
ownname	Owner name
tablename	Table name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within <i>stattab</i>
statown	Schema containing <i>stattab</i> (if other than <i>ownname</i> )

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

- If the parameter *tablename* is `NULL` then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

## EXPORT\_SCHEMA\_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

### Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
  ownname   IN  VARCHAR2,
  statab    IN  VARCHAR2,
  statid    IN  VARCHAR2 DEFAULT NULL,
  statown   IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141-34 EXPORT\_SCHEMA\_PREFS Procedure Parameters**

Parameter	Description
ownname	Owner name
statab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within statab
statown	Schema containing statab (if different than ownname)

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

## EXPORT\_SCHEMA\_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by `ownname` and stores them in the user statistics tables identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
  ownname          VARCHAR2,
  stattab          VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 141–35 EXPORT\_SCHEMA\_STATS Procedure Parameters**

Parameter	Description
<code>ownname</code>	Name of the schema
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code> )
<code>stat_category</code>	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>▪ 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</li> <li>▪ 'SYNOPSISSES' - auxiliary statistics information gathered on a partitioned table when <code>incremental</code> is <code>TRUE</code></li> </ul>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## EXPORT\_SYSTEM\_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–36 EXPORT\_SYSTEM\_STATS Procedure Parameters**

Parameter	Description
<code>stattab</code>	Identifier of the user statistics table that describes where the statistics will be stored
<code>statid</code>	Optional identifier associated with the statistics stored from the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to export system statistics

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## EXPORT\_TABLE\_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

### Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
  ownname      IN  VARCHAR2,
  tablename    IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–37 EXPORT\_TABLE\_PREFS Procedure Parameters**

Parameter	Description
ownname	Owner name
tablename	Table name
stattab	Statistics table name where to export the statistics
statid	Optional identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

## EXPORT\_TABLE\_STATS Procedure

This procedure retrieves statistics for a particular table and stores them in the user statistics table. Cascade results in all index statistics associated with the specified table being exported as well.

### Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab          VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  cascade         BOOLEAN DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 141–38 EXPORT\_TABLE\_STATS Procedure Parameters**

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are exported.
statab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within statab
cascade	If true, then column and index statistics for this table are also exported
statown	Schema containing statab (if different than ownname)
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>▪ 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</li> <li>▪ 'SYNOPSISSES' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</li> </ul>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## FLUSH\_DATABASE\_MONITORING\_INFO Procedure

This procedure flushes in-memory monitoring information for all tables in the dictionary. Corresponding entries in the \*\_TAB\_MODIFICATIONS, \*\_TAB\_STATISTICS and \*\_IND\_STATISTICS views are updated immediately, without waiting for the Oracle database to flush them periodically. This procedure is useful when you need up-to-date information in those views. Because the GATHER\_\*\_STATS procedures internally flush monitoring information, it is not necessary to run this procedure before gathering the statistics.

### Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

The ANALYZE\_ANY system privilege is required to run this procedure.

## GATHER\_DATABASE\_STATS Procedures

This procedure gathers statistics for all objects in the database.

### Syntax

```
DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER      DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
  block_sample      BOOLEAN    DEFAULT FALSE,
  method_opt       VARCHAR2   DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER     DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN    DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab         VARCHAR2   DEFAULT NULL,
  statid          VARCHAR2   DEFAULT NULL,
  options         VARCHAR2   DEFAULT 'GATHER',
  objlist         OUT        ObjectTab,
  statown        VARCHAR2   DEFAULT NULL,
  gather_sys      BOOLEAN    DEFAULT TRUE,
  no_invalidate   BOOLEAN    DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  obj_filter_list ObjectTab  DEFAULT NULL);
```

```
DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER      DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
  block_sample      BOOLEAN    DEFAULT FALSE,
  method_opt       VARCHAR2   DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER     DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN    DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab         VARCHAR2   DEFAULT NULL,
  statid          VARCHAR2   DEFAULT NULL,
  options         VARCHAR2   DEFAULT 'GATHER',
  statown        VARCHAR2   DEFAULT NULL,
  gather_sys      BOOLEAN    DEFAULT TRUE,
  no_invalidate   BOOLEAN    DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  obj_filter_list ObjectTab  DEFAULT NULL);
```

### Parameters

**Table 141–39 GATHER\_DATABASE\_STATS Procedure Parameters**

Parameter	Description
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

**Table 141–39 (Cont.) GATHER\_DATABASE\_STATS Procedure Parameters**

Parameter	Description
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer: Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT: Collects histograms only on the columns that already have histograms.</li> <li>- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
degree	<p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p>
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics</p>

**Table 141–39 (Cont.) GATHER\_DATABASE\_STATS Procedure Parameters**

Parameter	Description
<code>cascade</code>	Gather statistics on the indexes as well. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the database in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
<code>stattab</code>	User statistics table identifier describing where to save the current statistics.  The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code> .
<code>options</code>	Further specification of which objects to gather statistics for:  <code>GATHER</code> : Gathers statistics on all objects in the schema.  <code>GATHER AUTO</code> : Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When <code>GATHER AUTO</code> is specified, the only additional valid parameters are <code>stattab</code> , <code>statid</code> , <code>objlist</code> and <code>statown</code> ; all other parameter settings are ignored. Returns a list of processed objects.  <code>GATHER STALE</code> : Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, return a list of objects found to be stale.  <code>GATHER EMPTY</code> : Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics.  <code>LIST AUTO</code> : Returns a list of objects to be processed with <code>GATHER AUTO</code>  <code>LIST STALE</code> : Returns a list of stale objects as determined by looking at the <code>*_tab_modifications</code> views  <code>LIST EMPTY</code> : Returns a list of objects which currently have no statistics
<code>objlist</code>	List of objects found to be stale or empty
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)
<code>gather_sys</code>	Gathers statistics on the objects owned by the 'SYS' user
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> . to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .

**Table 141–39 (Cont.) GATHER\_DATABASE\_STATS Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>obj_filter_list</code>	A list of object filters. When provided, <code>GATHER_DATABASE_STATS</code> will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code> , <code>s2</code> , ... are specified for attributes <code>a1</code> , <code>a2</code> , ... in one object filter. An object <code>o</code> is said to satisfy this object filter if <code>(o.a1 like s1)</code> and <code>(o.a2 like s2)</code> and ... is true. See <a href="#">Applying an Object Filter List</a> .

## Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

## GATHER\_DICTIONARY\_STATS Procedure

This procedure gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components.

### Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                          (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN   DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER    DEFAULT to_degree_type(get_param('DEGREE')),
  granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN   DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER AUTO',
  objlist          OUT      ObjectTab,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN   DEFAULT to_no_invalidate_type (
                          get_param('NO_INVALIDATE')),
  obj_filter_list  ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT
                          to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN   DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
  degree           NUMBER    DEFAULT to_degree_type(GET_PARAM('DEGREE')),
  granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN   DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER AUTO',
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN   DEFAULT
                          to_no_invalidate_type(get_param('NO_INVALIDATE')),
  obj_filter_list  ObjectTab DEFAULT NULL);
```

### Parameters

**Table 141–40 GATHER\_DICTIONARY\_STATS Procedure Parameters**

Parameter	Description
comp_id	Component id of the schema to analyze (NULL will result in analyzing schemas of all RDBMS components). Please refer to comp_id column of DBA_REGISTRY view. The procedure always gather statistics on 'SYS' and 'SYSTEM' schemas regardless of this argument.

**Table 141–40 (Cont.) GATHER\_DICTIONARY\_STATS Procedure Parameters**

Parameter	Description
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
block_sample	Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer: Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT: Collects histograms only on the columns that already have histograms.</li> <li>- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

**Table 141–40 (Cont.) GATHER\_DICTIONARY\_STATS Procedure Parameters**

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics</p>
cascade	<p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics</p>
statid	<p>The (optional) identifier to associate with these statistics within <code>stattab</code></p>
options	<p>Further specification of objects for which to gather statistics:</p> <ul style="list-style-type: none"> <li>■ 'GATHER' - Gathers statistics on all objects in the schema</li> <li>■ 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are <code>comp_id</code>, <code>stattab</code>, <code>statid</code> and <code>statown</code>; all other parameter settings will be ignored. Also, returns a list of objects processed.</li> <li>■ 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, returns a list of objects found to be stale.</li> <li>■ 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics.</li> <li>■ 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO'</li> <li>■ 'LIST STALE' - Returns list of stale objects as determined by looking at the <code>*_tab_modifications</code> views</li> <li>■ 'LIST EMPTY' - Returns list of objects which currently have no statistics</li> </ul>

**Table 141–40 (Cont.) GATHER\_DICTIONARY\_STATS Procedure Parameters**

Parameter	Description
objlist	The list of objects found to be stale or empty
statown	Schema containingstattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
obj_filter_list	A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See <a href="#">Applying an Object Filter List</a> .

## Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

## Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

## GATHER\_FIXED\_OBJECTS\_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

### Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
  statab      VARCHAR2 DEFAULT NULL,
  statid      VARCHAR2 DEFAULT NULL,
  statown     VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')));
```

### Parameters

**Table 141-41** GATHER\_FIXED\_OBJECTS\_STATS Procedure Parameters

Parameter	Description
statab	User statistics table identifier describing where to save the current statistics
statid	Identifier to associate with these statistics within statab (optional)
statown	Schema containing statab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .

### Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

## GATHER\_INDEX\_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible. Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

### Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                     (GET_PARAM('ESTIMATE_PERCENT')),
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 141–42 GATHER\_INDEX\_STATS Procedure Parameters**

Parameter	Description
<code>ownname</code>	Schema of index to analyze
<code>indname</code>	Name of index
<code>partname</code>	Name of partition
<code>estimate_percent</code>	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
<code>statab</code>	User statistics table identifier describing where to save the current statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>statab</code>
<code>statown</code>	Schema containing <code>statab</code> (if different than <code>ownname</code> )

**Table 141-42 (Cont.) GATHER\_INDEX\_STATS Procedure Parameters**

Parameter	Description
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	Gather statistics on object even if it is locked

## Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

## GATHER\_SCHEMA\_STATS Procedures

This procedure gathers statistics for all objects in a schema.

### Syntax

```

DBMS_STATS.GATHER_SCHEMA_STATS (
  ownname          VARCHAR2,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER',
  objlist          OUT      ObjectTab,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE,
  obj_filter_list  ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_SCHEMA_STATS (
  ownname          VARCHAR2,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER',
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE,
  obj_filter_list  ObjectTab DEFAULT NULL);

```

### Parameters

**Table 141–43 GATHER\_SCHEMA\_STATS Procedure Parameters**

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .

**Table 141-43 (Cont.) GATHER\_SCHEMA\_STATS Procedure Parameters**

Parameter	Description
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer: Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT: Collects histograms only on the columns that already have histograms</li> <li>- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
degree	<p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p>

**Table 141–43 (Cont.) GATHER\_SCHEMA\_STATS Procedure Parameters**

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>
cascade	<p>Gather statistics on the indexes as well. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DEMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics</p>
statid	<p>Identifier (optional) to associate with these statistics within stattab</p>
options	<p>Further specification of which objects to gather statistics for:</p> <p><b>GATHER:</b> Gathers statistics on all objects in the schema.</p> <p><b>GATHER AUTO:</b> Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When <b>GATHER AUTO</b> is specified, the only additional valid parameters are <code>ownname</code>, <code>stattab</code>, <code>statid</code>, <code>objlist</code> and <code>statown</code>; all other parameter settings are ignored. Returns a list of processed objects.</p> <p><b>GATHER STALE:</b> Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, return a list of objects found to be stale.</p> <p><b>GATHER EMPTY:</b> Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics.</p> <p><b>LIST AUTO:</b> Returns a list of objects to be processed with <b>GATHER AUTO</b>.</p> <p><b>LIST STALE:</b> Returns list of stale objects as determined by looking at the <code>*_tab_modifications</code> views.</p> <p><b>LIST EMPTY:</b> Returns list of objects which currently have no statistics.</p>

**Table 141–43 (Cont.) GATHER\_SCHEMA\_STATS Procedure Parameters**

Parameter	Description
objlist	List of objects found to be stale or empty
statown	Schema containingstattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See <a href="#">Applying an Object Filter List</a> .

## Usage Notes

When you use a specific value for the sampling percentage, DBMS\_STATS honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

## Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

## Examples

### Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the SAMPLE schema and any table in the SYS schema, if stale, will have statistics gathered upon it.

```

DECLARE
    filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SAMPLE';
    filter_lst(1).objname := 'T%';
    filter_lst(2).ownname := 'SYS';
    DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                   options => 'GATHER STALE');
END;
```

## GATHER\_SYSTEM\_STATS Procedure

This procedure gathers system statistics.

### Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
  gathering_mode  VARCHAR2 DEFAULT 'NOWORKLOAD' ,
  interval        INTEGER   DEFAULT NULL,
  stattab         VARCHAR2  DEFAULT NULL,
  statid          VARCHAR2  DEFAULT NULL,
  statown         VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 141–44 GATHER\_SYSTEM\_STATS Procedure Parameters**

Parameter	Description
<code>gathering_mode</code>	<p>Mode values are:</p> <p><b>NOWORKLOAD:</b> Will capture characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period Oracle will estimate the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. Oracle recommends to run <code>GATHER_SYSTEM_STATS ('noworkload')</code> after creation of the database and tablespaces. To fine tune system statistics for the workload use 'START' and 'STOP' or 'INTERVAL' options. If you gather both 'NOWORKLOAD' and workload specific (statistics collected using 'INTERVAL' or 'START' and 'STOP'), the workload statistics will be used by optimizer. Collected components: <code>cpuspeednw</code>, <code>ioseektim</code>, <code>iotfrspeed</code>.</p> <p><b>INTERVAL:</b> Captures system activity during a specified interval. This works in combination with the <code>interval</code> parameter. You should provide an interval value in minutes, after which system statistics are created or updated in the dictionary or <code>stattab</code>. You can use <code>GATHER_SYSTEM_STATS (gathering_mode=&gt; 'STOP')</code> to stop gathering earlier than scheduled. Collected components: <code>maxthr</code>, <code>slavethr</code>, <code>cpuspeed</code>, <code>sreadtim</code>, <code>mreadtim</code>, <code>mbrc</code>.</p> <p><b>START   STOP:</b> Captures system activity during specified start and stop times and refreshes the dictionary or <code>stattab</code> with statistics for the elapsed period. Interval value is ignored. Collected components: <code>maxthr</code>, <code>slavethr</code>, <code>cpuspeed</code>, <code>sreadtim</code>, <code>mreadtim</code>, <code>mbrc</code>.</p>
<code>interval</code>	Time, in minutes, to gather statistics. This parameter applies only when <code>gathering_mode= 'INTERVAL'</code>
<code>stattab</code>	Identifier of the user statistics table where the statistics will be saved
<code>statid</code>	Optional identifier associated with the statistics saved in the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

### Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Error in the INTERVAL mode: system parameter job\_queue\_processes must be >0

## GATHER\_TABLE\_STATS Procedure

This procedure gathers table and column (and index) statistics. It attempts to parallelize as much of the work as possible, but there are some restrictions as described in the individual parameters.

### Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                     (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
 stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  stattype         VARCHAR2 DEFAULT 'DATA',
  force           BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 141–45 GATHER\_TABLE\_STATS Procedure Parameters**

Parameter	Description
ownname	Schema of table to analyze
tabname	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

**Table 141–45 (Cont.) GATHER\_TABLE\_STATS Procedure Parameters**

Parameter	Description
method_opt	<p>Accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns.</li> <li>- column_name : Name of a column</li> <li>- extension : can be either a column group in the format of (column_name, Column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
degree	<p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p>

**Table 141–45 (Cont.) GATHER\_TABLE\_STATS Procedure Parameters**

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if <code>partname</code> is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>
cascade	<p>Gathers statistics on the indexes for this table. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the table's indexes. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics</p>
statid	<p>Identifier (optional) to associate with these statistics within <code>stattab</code></p>
statown	<p>Schema containing <code>stattab</code> (if different than <code>ownname</code>)</p>
no_invalidate	<p>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code>. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
stattype	<p>Statistics type. The only value allowed is DATA.</p>
force	<p>Gather statistics of table even if it is locked</p>

## Usage Notes

Index statistics collection can be parallelized except for cluster, domain and join indexes.

## Exceptions

ORA-20000: Table does not exist or insufficient privileges

ORA-20001: Bad input value

## Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

### Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(  
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

### Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(  
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

## GENERATE\_STATS Procedure

This procedure generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

### Syntax

```
DBMS_STATS.GENERATE_STATS (
  ownname    VARCHAR2,
  objname    VARCHAR2,
  organized  NUMBER DEFAULT 7,
  force      BOOLEAN default FALSE);
```

### Parameters

**Table 141–46** *GENERATE\_STATS Procedure Parameters*

Parameter	Description
ownname	Schema of object
objname	Name of object
organized	Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk.  This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.
force	If TRUE, generates statistics for the target object even if it is locked

### Usage Notes

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

### Exceptions

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics

## GET\_COLUMN\_STATS Procedures

These procedures gets all column-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

### Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  colname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  statab       VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  distcnt     OUT NUMBER,
  density     OUT NUMBER,
  nullcnt     OUT NUMBER,
  srec        OUT StatRec,
  avgclen     OUT NUMBER,
  statown     VARCHAR2 DEFAULT NULL);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  colname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  statab       VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  ext_stats    OUT RAW,
  statypown   OUT VARCHAR2 DEFAULT NULL,
  statypname   OUT VARCHAR2 DEFAULT NULL,
  statown     VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–47** GET\_COLUMN\_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, statistics are retrieved from the global table level.
statab	User statistics table identifier describing from where to retrieve the statistics. If statab is NULL, statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)
ext_stats	The user-defined statistics
statypown	Schema of the statistics type

**Table 141–47 (Cont.) GET\_COLUMN\_STATS Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density
nullcnt	Number of NULLs
srec	Structure holding internal representation of column minimum, maximum, and histogram values
avgclen	Average length of the column (in bytes)
statown	Schema containing stattab (if different than ownname)

## Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

## GET\_INDEX\_STATS Procedures

These procedures get all index-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

### Syntax

```
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    statab           VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    numrows          OUT NUMBER,
    numlblks         OUT NUMBER,
    numdist          OUT NUMBER,
    avglblk          OUT NUMBER,
    avgdblks         OUT NUMBER,
    clstfct          OUT NUMBER,
    indlevel         OUT NUMBER,
    statown          VARCHAR2 DEFAULT NULL,
    cachedblk       OUT NUMBER,
    cachehit         OUT NUMBER);
```

```
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    statab           VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    numrows          OUT NUMBER,
    numlblks         OUT NUMBER,
    numdist          OUT NUMBER,
    avglblk          OUT NUMBER,
    avgdblks         OUT NUMBER,
    clstfct          OUT NUMBER,
    indlevel         OUT NUMBER,
    statown          VARCHAR2 DEFAULT NULL,
    guessq           OUT NUMBER,
    cachedblk       OUT NUMBER,
    cachehit         OUT NUMBER);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    statab           VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    ext_stats        OUT RAW,
    statypown        OUT VARCHAR2 DEFAULT NULL,
    statypname       OUT VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    cachedblk       OUT NUMBER,
    cachehit         OUT NUMBER);
```

## Parameters

**Table 141–48** *GET\_INDEX\_STATS Procedure Parameters*

Parameter	Description
<code>ownname</code>	Name of the schema
<code>indname</code>	Name of the index
<code>partname</code>	Name of the index partition for which to get the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved for the global index level.
<code>stattab</code>	User statistics table identifier describing from where to retrieve the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are retrieved directly from the dictionary.
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code> )
<code>ext_stats</code>	User-defined statistics
<code>stattypown</code>	Schema of the statistics type
<code>stattypname</code>	Name of the statistics type
<code>numrows</code>	Number of rows in the index (partition)
<code>numlblks</code>	Number of leaf blocks in the index (partition)
<code>numdist</code>	Number of distinct keys in the index (partition)
<code>avglblk</code>	Average integral number of leaf blocks in which each distinct key appears for this index (partition)
<code>avgdblks</code>	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)
<code>clstfct</code>	Clustering factor for the index (partition)
<code>indlevel</code>	Height of the index (partition)
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code> )
<code>guessq</code>	Guess quality for the index (partition)
<code>cachedblk</code>	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
<code>cachehit</code>	The average cache hit ratio for the segment (index/table/index partition/table partition)

## Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

## GET\_PARAM Function

---

---

**Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [GET\\_PREFS Function](#).

See also [Deprecated Subprograms](#) on page 141-12.

---

---

This function returns the default value of parameters of DBMS\_STATS procedures.

### Syntax

```
DBMS_STATS.GET_PARAM (  
    pname      IN  VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 141–49** *GET\_PARAM Function Parameters*

Parameter	Description
pname	Parameter name

### Exceptions

ORA-20001: Invalid input values

## GET\_PREFS Function

This function returns the default value of the specified preference.

### Syntax

```
DBMS_STATS.GET_PREFS (
    pname      IN   VARCHAR2,
    ownname    IN   VARCHAR2 DEFAULT NULL,
    tabname    IN   VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 141–50** GET\_PREFS Function Parameters

Parameter	Description
pname	<p>Preference name. The default value for following preferences can be retrieved:</p> <ul style="list-style-type: none"> <li>▪ AUTOSTATS_TARGET</li> <li>▪ CASCADE</li> <li>▪ DEGREE</li> <li>▪ ESTIMATE_PERCENT</li> <li>▪ METHOD_OPT</li> <li>▪ NO_INVALIDATE</li> <li>▪ GRANULARITY</li> <li>▪ PUBLISH</li> <li>▪ INCREMENTAL</li> <li>▪ STALE_PERCENT</li> </ul> <p>AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection. It takes the following values:</p> <ul style="list-style-type: none"> <li>▪ 'ALL' - Statistics collected for all objects in system</li> <li>▪ 'ORACLE' - Statistics collected for all Oracle owned objects</li> <li>▪ 'AUTO' - Oracle decides on which objects to collect statistics</li> </ul> <p>CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics.</p> <p>DEGREE - Determines degree of parallelism used for gathering statistics.</p> <p>ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>

**Table 141–50 (Cont.) GET\_PREFS Function Parameters**

Parameter	Description
.	<p>METHOD_OPT - Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms.</li> <li>- AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns.</li> <li>- column_name : name of a column</li> <li>- extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>
.	<p>NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>

**Table 141–50 (Cont.) GET\_PREFS Function Parameters**

Parameter	Description
.	<p>PUBLISH - Determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>■ INCREMENTAL value for the partitioned table is set to TRUE</li> <li>■ PUBLISH value for the partitioned table is set to TRUE;</li> <li>■ User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>
.	<p>STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%.</p>
ownname	Owner name
tabname	Table name

## Exceptions

ORA-20001: Invalid input values

## Usage Notes

If the ownname and tabname are provided and a preference has been entered for the table, the function returns the preference as specified for the table. In all other cases it returns the global preference if it has been specified, otherwise the default value is returned.

## GET\_STATS\_HISTORY\_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

### Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY  
RETURN TIMESTAMP WITH TIMEZONE;
```

## GET\_STATS\_HISTORY\_RETENTION Function

This function returns the current retention value.

### Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION  
RETURN NUMBER;
```

## GET\_SYSTEM\_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

### Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (
  status      OUT  VARCHAR2,
  dstart      OUT  DATE,
  dstop       OUT  DATE,
  pname       VARCHAR2,
  pvalue      OUT  NUMBER,
  stattab     IN   VARCHAR2 DEFAULT NULL,
  statid      IN   VARCHAR2 DEFAULT NULL,
  statown     IN   VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–51** GET\_SYSTEM\_STATS Procedure Parameters

Parameter	Description
<code>status</code>	Output is one of the following: <ul style="list-style-type: none"> <li>▪ <code>COMPLETED</code> :</li> <li>▪ <code>AUTOGATHERING</code> :</li> <li>▪ <code>MANUALGATHERING</code> :</li> <li>▪ <code>BADSTATS</code> :</li> </ul>
<code>dstart</code>	Date when statistics gathering started. If <code>status = MANUALGATHERING</code> , the start date is returned.
<code>dstop</code>	Date when statistics gathering stopped. <ul style="list-style-type: none"> <li>▪ If <code>status = COMPLETE</code>, the finish date is returned.</li> <li>▪ If <code>status = AUTOGATHERING</code>, the future finish date is returned.</li> <li>▪ If <code>status = BADSTATS</code>, the must-finished-by date is returned.</li> </ul>

**Table 141-51 (Cont.) GET\_SYSTEM\_STATS Procedure Parameters**

Parameter	Description
<code>pname</code>	The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> <li>▪ <code>iotfrspeed</code> - I/O transfer speed in bytes for each millisecond</li> <li>▪ <code>ioseektim</code> - seek time + latency time + operating system overhead time, in milliseconds</li> <li>▪ <code>sreadtim</code> - average time to read single block (random read), in milliseconds</li> <li>▪ <code>mreadtim</code> - average time to read an mbrc block at once (sequential read), in milliseconds</li> <li>▪ <code>cpuspeed</code> - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</li> <li>▪ <code>cpuspeednw</code> - average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option.</li> <li>▪ <code>mbrc</code> - average multiblock read count for sequential read, in blocks</li> <li>▪ <code>maxthr</code> - maximum I/O system throughput, in bytes/second</li> <li>▪ <code>slavethr</code> - average slave I/O throughput, in bytes/second</li> </ul>
<code>pvalue</code>	Parameter value to get
<code>stattab</code>	Identifier of the user statistics table where the statistics will be obtained. If <code>stattab</code> is null, the statistics will be obtained from the dictionary.
<code>statid</code>	Optional identifier associated with the statistics saved in the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Parameter does not exist

## GET\_TABLE\_STATS Procedure

This procedure gets all table-related information.

### Syntax

```
DBMS_STATS.GET_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab         VARCHAR2 DEFAULT NULL,
    statid          VARCHAR2 DEFAULT NULL,
    numRows         OUT NUMBER,
    numblks        OUT NUMBER,
    avgrlen        OUT NUMBER,
    statown         VARCHAR2 DEFAULT NULL,
    cachedblk      OUT NUMBER,
    cachehit       OUT NUMBER);
```

### Parameters

**Table 141–52 GET\_TABLE\_STATS Procedure Parameters**

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code> )
numrows	Number of rows in the table (partition)
numblks	Number of blocks the table (partition) occupies
avgrlen	Average row length for the table (partition)
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code> )
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

### Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_`

[TABLE/INDEX/SCHEMA/DATABASE]\_STATS procedure for auto mode or DBMS\_STATS.GATHER\_SYSTEM\_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## IMPORT\_COLUMN\_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    colname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–53** *IMPORT\_COLUMN\_STATS Procedure Parameters*

Parameter	Description
<code>ownname</code>	Name of the schema
<code>tabname</code>	Name of the table to which this column belongs
<code>colname</code>	Name of the column or extension
<code>partname</code>	Name of the table partition. If the table is partitioned and <code>partname</code> is <code>NULL</code> , then global and partition column statistics are imported.
<code>stattab</code>	User statistics table identifier describing from where to retrieve the statistics
<code>statid</code>	Identifier to associate with these statistics within <code>stattab</code> (optional)
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code> )
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
<code>force</code>	If set to <code>TRUE</code> , imports statistics even if statistics are locked

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

## Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## IMPORT\_DATABASE\_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL,
  add_sys      IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–54** *IMPORT\_DATABASE\_PREFS Procedure Parameters*

Parameter	Description
<code>stattab</code>	Statistics table name where to import the statistics
<code>statid</code>	Optional identifier to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code> )
<code>add_sys</code>	Value <code>TRUE</code> will include the Oracle-owned tables

### Exceptions

ORA-20000: Insufficient privileges.

### Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY system` privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

## IMPORT\_DATABASE\_STATS Procedure

This procedure retrieves statistics for all objects in the database from the user statistics table(s) and stores them in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
  statab          VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force          BOOLEAN DEFAULT FALSE,
  stat_category  VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 141–55** *IMPORT\_DATABASE\_STATS Procedure Parameters*

Parameter	Description
statab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within statab
statown	Schema containing statab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	Overrides statistics locked at the object (table) level: <ul style="list-style-type: none"> <li>▪ TRUE - Ignores the statistics lock and imports the statistics</li> <li>▪ FALSE - The statistics will be imported only if they are not locked</li> </ul>
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>▪ 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</li> <li>▪ 'SYNOPSIS' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</li> </ul>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## IMPORT\_DICTIONARY\_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(
                    get_param('NO_INVALIDATE')),
  force            BOOLEAN DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 141–56** *IMPORT\_DICTIONARY\_STATS Procedure Parameters*

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	The (optional) identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	Overrides statistics lock at the object (table) level: <ul style="list-style-type: none"> <li>■ TRUE - Ignores the statistics lock and imports the statistics.</li> <li>■ FALSE - The statistics will be imported only if there is no lock.</li> </ul>
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>■ 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</li> <li>■ 'SYNOPSIS' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</li> </ul>

### Usage Notes

- You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

## IMPORT\_FIXED\_OBJECTS\_STATS Procedure

This procedure retrieves statistics for fixed tables from the user statistics table(s) and stores them in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–57** *IMPORT\_FIXED\_OBJECTS\_STATS Procedure Parameters*

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	Overrides statistics lock: <ul style="list-style-type: none"> <li>■ TRUE - Ignores the statistics lock and imports the statistics</li> <li>■ FALSE - The statistics will be imported only if there is no lock</li> </ul>

### Usage Notes

- You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

## IMPORT\_INDEX\_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–58** *IMPORT\_INDEX\_STATS Procedure Parameters*

Parameter	Description
<code>ownname</code>	Name of the schema
<code>indname</code>	Name of the index
<code>partname</code>	Name of the index partition. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition index statistics are imported.
<code>stattab</code>	User statistics table identifier describing from where to retrieve the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code> )
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
<code>force</code>	Imports statistics even if index statistics are locked

### Exceptions

ORA-20000: Object does not exist or insufficient privileges  
 ORA-20001: Invalid or inconsistent values in the user statistics table  
 ORA-20005: Object statistics are locked

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## IMPORT\_SCHEMA\_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

### Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (
  ownname      IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–59** *IMPORT\_SCHEMA\_PREFS Procedure Parameters*

Parameter	Description
ownname	Owner name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within <code>stattab</code>
statown	Schema containing <code>stattab</code> (if other than <code>ownname</code> )

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

## IMPORT\_SCHEMA\_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (
  ownname          VARCHAR2,
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(
                    get_param('NO_INVALIDATE')),
  force            BOOLEAN DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 141–60** *IMPORT\_SCHEMA\_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	Overrides statistics locked at the object (table) level: <ul style="list-style-type: none"> <li>▪ TRUE - Ignores the statistics lock and imports the statistics.</li> <li>▪ FALSE - Statistics will be imported only if there is no lock.</li> </ul>
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>▪ 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</li> <li>▪ 'SYNOPSIS' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</li> </ul>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

## Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## IMPORT\_SYSTEM\_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–61** *IMPORT\_SYSTEM\_STATS Procedure Parameters*

Parameter	Description
<code>stattab</code>	Identifier of the user statistics table where the statistics will be retrieved
<code>statid</code>	Optional identifier associated with the statistics retrieved from the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to import system statistics

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## IMPORT\_TABLE\_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

### Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
    ownname     IN  VARCHAR2,
    tablename   IN  VARCHAR2,
    stattab     IN  VARCHAR2,
    statid      IN  VARCHAR2 DEFAULT NULL,
    statown     IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–62** *IMPORT\_TABLE\_PREFS Procedure Parameters*

Parameter	Description
ownname	Owner name
tablename	Table name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

## IMPORT\_TABLE\_STATS Procedure

This procedure retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary. Cascade results in all index statistics associated with the specified table being imported as well.

### Syntax

```
DBMS_STATS.IMPORT_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    cascade          BOOLEAN DEFAULT TRUE,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE,
    stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 141–63** *IMPORT\_TABLE\_STATS Procedure Parameters*

Parameter	Description
<code>ownname</code>	Name of the schema
<code>tabname</code>	Name of the table
<code>partname</code>	Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition table statistics are imported.
<code>stattab</code>	User statistics table identifier describing from where to retrieve the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>cascade</code>	If true, column and index statistics for this table are also imported
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code> )
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>
<code>force</code>	Imports statistics even if table statistics are locked
<code>stat_category</code>	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>▪ <code>'OBJECT_STATS'</code> - table statistics, column statistics and index statistics (Default)</li> <li>▪ <code>'SYNOPSIS'</code> - auxiliary statistics information gathered on a partitioned table when <code>incremental</code> is <code>TRUE</code></li> </ul>

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

## Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## LOCK\_PARTITION\_STATS Procedure

This procedure enables the user to lock statistics for a partition.

### Syntax

```
DBMS_STATS.LOCK_PARTITION_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    partname   VARCHAR2);
```

### Parameters

**Table 141-64** LOCK\_PARTITION\_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock
tabname	Name of the table
partname	Partition name

## LOCK\_SCHEMA\_STATS Procedure

This procedure locks the statistics of all tables of a schema.

### Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

### Parameters

**Table 141–65** LOCK\_SCHEMA\_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock

### Usage Notes

See "Usage Notes" for [LOCK\\_TABLE\\_STATS Procedure](#).

## LOCK\_TABLE\_STATS Procedure

This procedure locks the statistics on the table.

### Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (
  ownname    VARCHAR2,
  tabname    VARCHAR2);
```

### Parameters

**Table 141–66** LOCK\_TABLE\_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema
tabname	The name of the table

### Usage Notes

- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET\_\*, DELETE\_\*, IMPORT\_\*, GATHER\_\* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER\_SCHEMA\_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use Dynamic Sampling.
- The locked or unlocked state is not exported along with the table statistics when using EXPORT\_\*\_STATS procedures.

## MERGE\_COL\_USAGE Procedure

This procedure merges column usage information from a source database by means of a dblink into the local database. If column usage information already exists for a given table or column MERGE\_COL\_USAGE will combine both the local and the remote information.

### Syntax

```
DBMS_STATS.MERGE_COL_USAGE (  
    dblink    IN    VARCHAR2);
```

### Parameters

**Table 141–67 MERGE\_COL\_USAGE Procedure Parameters**

Parameter	Description
dblink	Name of dblink

### Usage Notes

User must be SYS to execute this procedure.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Parameter dblink cannot be NULL

ORA-20002: Unable to create a TEMP table

## PREPARE\_COLUMN\_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET\_COLUMN\_STATS.

### Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  charvals  CHARARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  datevals  DATEARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  dblvals   DBLARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  fltvals   FLTARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  numvals   NUMARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  rawvals   RAWARRAY);
```

### Pragmas

```
pragma restrict_references(prepare_column_values, WNDS, RNDS, WNPS, RNPS);
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS,
RNPS);
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 141–68** PREPARE\_COLUMN\_VALUES Procedure Parameters

Parameter	Description
srec.epc	<p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p>

**Table 141–68 (Cont.) PREPARE\_COLUMN\_VALUES Procedure Parameters**

Parameter	Description
<code>srec.bkvals</code>	If you want a frequency distribution, this array contains the number of occurrences of each distinct value specified in <code>charvals</code> , <code>datevals</code> , <code>dblvals</code> , <code>fltvals</code> , <code>numvals</code> , or <code>rawvals</code> . Otherwise, it is merely an output parameter, and it must be set to <code>NULL</code> when this procedure is called.

Datatype-specific input parameters (use one) are shown in [Table 141–69](#).

**Table 141–69 Datatype-Specific Input Parameters**

Type	Description
<code>charvals</code>	The array of values when the column type is character-based. Up to the first 32 bytes of each string should be provided. Arrays must have between 2 and 256 entries, inclusive. If the datatype is fixed <code>CHAR</code> , the strings must be space-padded to 15 characters for correct normalization.
<code>datevals</code>	Array of values when the column type is date-based
<code>dblvals</code>	Array of values when the column type is double-based
<code>fltvals</code>	Array of values when the column type is float-based
<code>numvals</code>	Array of values when the column type is numeric-based
<code>rawvals</code>	Array of values when the column type is <code>RAW</code> . Up to the first 32 bytes of each strings should be provided.
<code>nvmin</code> , <code>nvmax</code>	Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed <code>CHAR</code> , the strings must be space-padded to 15 characters for correct normalization.
<code>rwmin</code> , <code>rwmax</code>	Minimum and maximum values when the column type is <code>rowid</code> . No histogram information is provided for a column of this type.

## Output Parameters

**Table 141–70 PREPARE\_COLUMN\_VALUES Procedure Output Parameters**

Parameter	Description
<code>srec.minval</code>	Internal representation of the minimum suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.maxval</code>	Internal representation of the maximum suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.bkvals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.novals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code>

## Exceptions

ORA-20001: Invalid or inconsistent input values

## PREPARE\_COLUMN\_VALUES\_NVARCHAR2 Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET\_COLUMN\_STATS.

### Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR2 (
  srec      IN OUT StatRec,
  nvmin     NVARCHAR2,
  nvmax     NVARCHAR2);
```

### Pragmas

```
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS,
RNPS);
```

### Parameters

**Table 141–71** PREPARE\_COLUMN\_VALUES\_NVARCHAR2 Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).  The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in [Table 141–69](#).

**Table 141–72** Datatype-Specific Input Parameters

Type	Description
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.

## Output Parameters

**Table 141–73** *PREPARE\_COLUMN\_VALUES Procedure Output Parameters*

<b>Parameter</b>	<b>Description</b>
<code>srec.minval</code>	Internal representation of the minimum suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.maxval</code>	Internal representation of the maximum suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.bkvals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code> .
<code>srec.novals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code>

## Exceptions

ORA-20001: Invalid or inconsistent input values

## PREPARE\_COLUMN\_VALUES\_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET\_COLUMN\_STATS.

### Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
  srec IN OUT StatRec,
  rwmn          ROWID,
  rwmax          ROWID);
```

### Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 141–74** PREPARE\_COLUMN\_VALUES\_ROWID Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).  The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency distribution, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in [Table 141–69](#).

**Table 141–75** Datatype-Specific Input Parameters

Type	Description
rwmn, rwmax	Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

### Output Parameters

**Table 141–76** PREPARE\_COLUMN\_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.

**Table 141-76 (Cont.) PREPARE\_COLUMN\_VALUES Procedure Output Parameters**

<b>Parameter</b>	<b>Description</b>
<code>srec.maxval</code>	Internal representation of the maximum suitable for use in a call to <code>SET_COLUMN_STATS</code> .
<code>srec.bkvals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code> .
<code>srec.novals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code> .

## Exceptions

ORA-20001: Invalid or inconsistent input values

## PUBLISH\_PENDING\_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

### Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (
  ownname          IN VARCHAR2 DEFAULT USER,
  tabname          IN VARCHAR2,
  no_invalidate    BOOLEAN DEFAULT
    to_no_invalidate_type(get_param('NO_INVALIDATE')),
  force            IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141-77 PUBLISH\_PENDING\_STATS Procedure Parameters**

Parameter	Description
ownname	Owner name
tabname	Table name
no_invalidate	Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	If TRUE, will override the lock

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

- If the parameter `tabname` is NULL then publish applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

### Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

## PURGE\_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary. To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

### Syntax

```
DBMS_STATS.PURGE_STATS(  
    before_timestamp          TIMESTAMP WITH TIME ZONE);
```

### Parameters

**Table 141–78** PURGE\_STATS Procedure Parameters

Parameter	Description
before_timestamp	Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

## RESET\_GLOBAL\_PREF\_DEFAULTS Procedure

This procedure sets global preference, such as `CASCADE`, `ESTIMATE_PERCENT` and `GRANULARITY`, to default values. This reverses the global preferences set by the [SET\\_GLOBAL\\_PREFS Procedure](#).

### Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

## RESET\_PARAM\_DEFAULTS Procedure

---

---

**Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [RESET\\_GLOBAL\\_PREF\\_DEFAULTS Procedure](#).

See also [Deprecated Subprograms](#) on page 141-12.

---

---

This procedure resets the default values of all parameters to Oracle recommended values.

### Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

## RESTORE\_DATABASE\_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (`as_of_timestamp`).

### Syntax

```
DBMS_STATS.RESTORE_DATABASE_STATS (
  as_of_timestamp    TIMESTAMP WITH TIME ZONE,
  force              BOOLEAN DEFAULT FALSE,
  no_invalidate      BOOLEAN DEFAULT to_no_invalidate_type
                    (GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 141–79 RESTORE\_DATABASE\_STATS Procedure Parameters**

Parameter	Description
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> . to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## RESTORE\_DICTIONARY\_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (`as_of_timestamp`).

### Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS (
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,
  force                BOOLEAN DEFAULT FALSE,
  no_invalidate       BOOLEAN DEFAULT to_no_invalidate_type
                      (GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 141–80 RESTORE\_DICTIONARY\_STATS Procedure Parameters**

Parameter	Description
<code>as_of_timestamp</code>	Timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .

### Usage Notes

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## RESTORE\_FIXED\_OBJECTS\_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (`as_of_timestamp`).

### Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
  as_of_timestamp    TIMESTAMP WITH TIME ZONE,
  force              BOOLEAN DEFAULT FALSE,
  no_invalidate      BOOLEAN DEFAULT to_no_invalidate_type
                    (GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 141–81 RESTORE\_FIXED\_OBJECTS\_STATS Procedure Parameters**

Parameter	Description
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .

### Usage Notes

To run this procedure, you must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## RESTORE\_SCHEMA\_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (`as_of_timestamp`).

### Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS (
  ownname          VARCHAR2,
  as_of_timestamp  TIMESTAMP WITH TIME ZONE,
  force            BOOLEAN DEFAULT FALSE,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type
                  (GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 141–82** RESTORE\_SCHEMA\_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Schema of the tables for which the statistics are to be restored
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## RESTORE\_SYSTEM\_STATS Procedure

This procedure restores system statistics as of a specified timestamp (`as_of_timestamp`).

### Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS (  
    as_of_timestamp          TIMESTAMP WITH TIME ZONE);
```

### Parameters

**Table 141–83** *RESTORE\_SYSTEM\_STATS Procedure Parameters*

Parameter	Description
<code>as_of_timestamp</code>	The timestamp to which to restore statistics

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## RESTORE\_TABLE\_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (`as_of_timestamp`). The procedure will restore statistics of associated indexes and columns as well. If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

### Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  as_of_timestamp  TIMESTAMP WITH TIME ZONE,
  restore_cluster_index  BOOLEAN DEFAULT FALSE,
  force            BOOLEAN DEFAULT FALSE,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 141–84 RESTORE\_TABLE\_STATS Procedure Parameters**

Parameter	Description
<code>ownname</code>	The schema of the table for which the statistics are to be restored
<code>tabname</code>	The table name
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>restore_cluster_index</code>	If the table is part of a cluster, restore statistics of the cluster index if set to <code>TRUE</code>
<code>force</code>	Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## SEED\_COL\_USAGE Procedure

This procedure iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements.

### Syntax

```
DBMS_STATS.SEED_COL_USAGE (  
    sqlset_name    IN    VARCHAR2,  
    owner_name     IN    VARCHAR2,  
    time_limit     IN    POSITIVE DEFAULT NULL);
```

### Parameters

**Table 141–85 SEED\_COL\_USAGE Procedure Parameters**

Parameter	Description
sqlset_name	Name of the SQL tuning set
owner_name	Owner of the SQL tuning set
time_limit	Time limit (in seconds)

### Exceptions

ORA-20000: Insufficient privileges

## SET\_COLUMN\_STATS Procedures

This procedure sets column-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

### Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    colname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    distcnt          NUMBER DEFAULT NULL,
    density          NUMBER DEFAULT NULL,
    nullcnt          NUMBER DEFAULT NULL,
    srec             StatRec DEFAULT NULL,
    avgclen          NUMBER DEFAULT NULL,
    flags            NUMBER DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    colname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    ext_stats        RAW,
    stattypown       VARCHAR2 DEFAULT NULL,
    stattypname      VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–86 SET\_COLUMN\_STATS Procedure Parameters**

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
colname	Name of the column or extension
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.

**Table 141–86 (Cont.) SET\_COLUMN\_STATS Procedure Parameters**

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code> )
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density. If this value is <code>NULL</code> and if <code>distcnt</code> is not <code>NULL</code> , then density is derived from <code>distcnt</code> .
nullcnt	Number of <code>NULL</code> s
srec	<code>StatRec</code> structure filled in by a call to <code>PREPARE_COLUMN_VALUES</code> or <code>GET_COLUMN_STATS</code>
avgclen	Average length for the column (in bytes)
flags	For internal Oracle use (should be left as <code>NULL</code> )
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code> )
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> . to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
force	Sets the values even if statistics of the column are locked

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent input values

ORA-20005: Object statistics are locked

## SET\_DATABASE\_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
    pname          IN   VARCHAR2,
    pvalue        IN   VARCHAR2,
    add_sys       IN   BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 141–87 SET\_DATABASE\_PREFS Procedure Parameters**

Parameter	Description
<code>pname</code>	<p>Preference name. The default value for following parameters can be set:</p> <ul style="list-style-type: none"> <li>▪ CASCADE</li> <li>▪ DEGREE</li> <li>▪ ESTIMATE_PERCENT</li> <li>▪ METHOD_OPT</li> <li>▪ NO_INVALIDATE</li> <li>▪ GRANULARITY</li> <li>▪ PUBLISH</li> <li>▪ INCREMENTAL</li> <li>▪ STALE_PERCENT</li> </ul> <p>. CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics.</p> <p>. DEGREE - Determines degree of parallelism used for gathering statistics.</p> <p>. ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>

**Table 141–87 (Cont.) SET\_DATABASE\_PREFS Procedure Parameters**

Parameter	Description
.	<p>METHOD_OPT - Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns.</li> <li>- column_name : Name of a column</li> <li>- extension : Can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>

**Table 141–87 (Cont.) SET\_DATABASE\_PREFS Procedure Parameters**

Parameter	Description
.	<p>PUBLISH - Determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>■ the INCREMENTAL value for the partitioned table is set to TRUE;</li> <li>■ the PUBLISH value for the partitioned table is set to TRUE;</li> <li>■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>
.	<p>STALE_PERCENT - Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%.</p>
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s
add_sys	Value TRUE will include the Oracle-owned tables

## Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

## Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE', '99');
```

## SET\_GLOBAL\_PREFS Procedure

This procedure is used to set the global statistics preferences.

### Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
  pname      IN   VARCHAR2,
  pvalue     IN   VARCHAR2);
```

### Parameters

**Table 141–88** SET\_GLOBAL\_PREFS Procedure Parameters

Parameter	Description
pname	<p>Preference name. The default value for the following preferences can be set:</p> <ul style="list-style-type: none"> <li>▪ AUTOSTATS_TARGET</li> <li>▪ CASCADE</li> <li>▪ DEGREE</li> <li>▪ ESTIMATE_PERCENT</li> <li>▪ METHOD_OPT</li> <li>▪ NO_INVALIDATE</li> <li>▪ GRANULARITY</li> <li>▪ PUBLISH</li> <li>▪ INCREMENTAL</li> <li>▪ STALE_PERCENT</li> </ul> <p>AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for stats collection. It takes the following values:</p> <ul style="list-style-type: none"> <li>▪ 'ALL' - Statistics collected for all objects in system</li> <li>▪ 'ORACLE' - Statistics collected for all Oracle owned objects</li> <li>▪ 'AUTO' - Oracle decides on which objects to collect statistics</li> </ul> <p>CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics</p> <p>DEGREE - Determines degree of parallelism used for gathering statistics</p> <p>ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>

**Table 141–88 (Cont.) SET\_GLOBAL\_PREFS Procedure Parameters**

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms.</li> <li>- AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns.</li> <li>- column_name : Name of a column</li> <li>- extension : Can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

**Table 141–88 (Cont.) SET\_GLOBAL\_PREFS Procedure Parameters**

Parameter	Description
.	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>■ INCREMENTAL value for the partitioned table is set to TRUE</li> <li>■ PUBLISH value for the partitioned table is set to TRUE;</li> <li>■ User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>
.	<p>STALE_PERCENT - Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%.</p>
pvalue	<p>Preference value. If NULL is specified, it will set the Oracle default value.s</p>

## Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

## Usage Notes

- This setting is honored only if there is no preference specified for the table to be analyzed.
- To run this procedure, you need to have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.SET_GLOBAL_PREFS('ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_GLOBAL_PREFS('DEGREE', '99');
```

## SET\_INDEX\_STATS Procedures

These procedures set index-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

### Syntax

```
DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  stattab      VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  numrows      NUMBER    DEFAULT NULL,
  numlblks     NUMBER    DEFAULT NULL,
  numdist      NUMBER    DEFAULT NULL,
  avglblk      NUMBER    DEFAULT NULL,
  avgdblks     NUMBER    DEFAULT NULL,
  clstfct      NUMBER    DEFAULT NULL,
  indlevel     NUMBER    DEFAULT NULL,
  flags        NUMBER    DEFAULT NULL,
  statown      VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  guessq       NUMBER    DEFAULT NULL,
  cachedblk    NUMBER    DEFAULT NULL,
  cachehit     NUMBER    DEFUALT NULL,
  force        BOOLEAN  DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  stattab      VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  ext_stats    RAW,
  statypown    VARCHAR2  DEFAULT NULL,
  statypname   VARCHAR2  DEFAULT NULL,
  statown      VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  cachedblk    NUMBER    DEFAULT NULL,
  cachehit     NUMBER    DEFUALT NULL,
  force        BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 141–89** SET\_INDEX\_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index

**Table 141–89 (Cont.) SET\_INDEX\_STATS Procedure Parameters**

Parameter	Description
partname	Name of the index partition in which to store the statistics. If the index is partitioned and if partname is NULL, then the statistics are stored at the global index level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from numlblks and numdist.
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from clstfct and numdist.
clstfct	See clustering_factor column of the all_indexes view for a description
indlevel	Height of the index (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
guessq	Guess quality. See the pct_direct_access column of the all_indexes view for a description.
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)
force	Sets the values even if statistics of the index are locked

## Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

## SET\_PARAM Procedure

---

**Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [SET\\_GLOBAL\\_PREFS Procedure](#).

See also [Deprecated Subprograms](#) on page 141-12.

---

This procedure sets default values for parameters of DBMS\_STATS procedures. You can use the GET\_PARAM Function to get the current default value of a parameter.

### Syntax

```
DBMS_STATS.SET_PARAM (
  pname      IN   VARCHAR2,
  pval       IN   VARCHAR2);
```

### Parameters

**Table 141–90 SET\_PARAM Procedure Parameters**

Parameter	Description
pname	<p>The parameter name The default value for following parameters can be set.</p> <ul style="list-style-type: none"> <li>■ CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures.It is used only by gather procedures.</li> <li>■ DEGREE</li> <li>■ ESTIMATE_PERCENT</li> <li>■ METHOD_OPT</li> <li>■ NO_INVALIDATE</li> <li>■ GRANULARITY</li> <li>■ AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)</li> </ul>
pval	<p>The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values:</p> <ul style="list-style-type: none"> <li>■ 'ALL' - Statistics are collected for all objects in the system</li> <li>■ 'ORACLE' - Statistics are collected for all Oracle owned objects</li> <li>■ 'AUTO' - Oracle decides for which objects to collect statistics</li> </ul>

### Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.

- Note also the difference between NULL and 'NULL':
  - When NULL is unquoted, this sets the parameter to the value Oracle recommends.
  - In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## Examples

```
DBMS_STATS.SET_PARAM('CASCADE', 'DBMS_STATS.AUTO_CASCADE');  
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT', '5');  
DBMS_STATS.SET_PARAM('DEGREE', 'NULL');
```

## SET\_SCHEMA\_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables owned by the specified owner name.

### Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname    IN    VARCHAR2,
    pname      IN    VARCHAR2,
    pvalue     IN    VARCHAR2);
```

### Parameters

**Table 141–91 SET\_SCHEMA\_PREFS Procedure Parameters**

Parameter	Description
ownname	Owner name
pname	Preference name. The default value for following parameters can be set: <ul style="list-style-type: none"> <li>■ CASCADE</li> <li>■ DEGREE</li> <li>■ ESTIMATE_PERCENT</li> <li>■ METHOD_OPT</li> <li>■ NO_INVALIDATE</li> <li>■ GRANULARITY</li> <li>■ PUBLISH</li> <li>■ INCREMENTAL</li> <li>■ STALE_PERCENT</li> </ul>
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

### Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

### Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'DEGREE', '99');
```

## SET\_SYSTEM\_STATS Procedure

This procedure sets systems statistics.

### Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
  pname          VARCHAR2,
  pvalue         NUMBER,
  statab        IN   VARCHAR2 DEFAULT NULL,
  statid        IN   VARCHAR2 DEFAULT NULL,
  statown       IN   VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 141–92 SET\_SYSTEM\_STATS Procedure Parameters**

Parameter	Description
pname	The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> <li>■ <code>iotfrspeed</code>—I/O transfer speed in bytes for each millisecond</li> <li>■ <code>ioseektim</code> - Seek time + latency time + operating system overhead time, in milliseconds</li> <li>■ <code>sreadtim</code> - Average time to read single block (random read), in milliseconds</li> <li>■ <code>mreadtim</code> - Average time to read an mbrc block at once (sequential read), in milliseconds</li> <li>■ <code>cpuspeed</code> - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</li> <li>■ <code>cpuspeednw</code> - Average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option).</li> <li>■ <code>mbrc</code> - Average multiblock read count for sequential read, in blocks</li> <li>■ <code>maxthr</code> - Maximum I/O system throughput, in bytes/second</li> <li>■ <code>slavethr</code> - Average slave I/O throughput, in bytes/second</li> </ul>
pvalue	Parameter value to get
statab	Identifier of the user statistics table where the statistics will be obtained. If statab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the statab
statown	Schema containing statab (if different from current schema)

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to set system statistics

ORA-20004: Parameter does not exist

## SET\_TABLE\_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

### Syntax

```
DBMS_STATS.SET_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2,
    pvalue     IN  VARCHAR2);
```

### Parameters

**Table 141–93 SET\_TABLE\_PREFS Procedure Parameters**

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. The default value for following preferences can be set: <ul style="list-style-type: none"> <li>▪ CASCADE</li> <li>▪ DEGREE</li> <li>▪ ESTIMATE_PERCENT</li> <li>▪ METHOD_OPT</li> <li>▪ NO_INVALIDATE</li> <li>▪ GRANULARITY</li> <li>▪ PUBLISH</li> <li>▪ INCREMENTAL</li> <li>▪ STALE_PERCENT</li> </ul>
.	CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - Determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

**Table 141–93 (Cont.) SET\_TABLE\_PREFS Procedure Parameters**

Parameter	Description
.	<p>METHOD_OPT - Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>■ FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>■ FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column is defined as column := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,254].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns.</li> <li>- column_name : Name of a column</li> <li>- extension : Can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>

**Table 141–93 (Cont.) SET\_TABLE\_PREFS Procedure Parameters**

Parameter	Description
.	<p>PUBLISH - Determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>■ INCREMENTAL value for the partitioned table is set to TRUE;</li> <li>■ PUBLISH value for the partitioned table is set to TRUE;</li> <li>■ User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>
.	<p>STALE_PERCENT - Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%.</p>
pvalue	<p>Preference value. If NULL is specified, it will set the Oracle default value.</p>

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

## Usage Notes

- To run this procedure, you need to connect as owner of the table or should have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

## SET\_TABLE\_STATS Procedure

This procedure sets table-related information.

### Syntax

```
DBMS_STATS.SET_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab         VARCHAR2 DEFAULT NULL,
    statid          VARCHAR2 DEFAULT NULL,
    numrows         NUMBER  DEFAULT NULL,
    numblks         NUMBER  DEFAULT NULL,
    avgrlen         NUMBER  DEFAULT NULL,
    flags           NUMBER  DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    cachedblk      NUMBER  DEFAULT NULL,
    cachehit        NUMBER  DEFAULT NULL,
    force           BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 141–94 SET\_TABLE\_STATS Procedure Parameters**

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
numrows	Number of rows in the table (partition)
numblks	Number of blocks the table (partition) occupies
avgrlen	Average row length for the table (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)

**Table 141–94 (Cont.) SET\_TABLE\_STATS Procedure Parameters**

Parameter	Description
<code>cachehit</code>	The average cache hit ratio for the segment (index/table/index partition/table partition)
<code>force</code>	Sets the values even if statistics of the table are locked

## Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

## SHOW\_EXTENDED\_STATS\_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

### Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
  ownname   VARCHAR2,
  tabname   VARCHAR2,
  extension VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 141–95** *SHOW\_EXTENDED\_STATS\_NAME Function Parameters*

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

## UNLOCK\_PARTITION\_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

### Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    partname   VARCHAR2);
```

### Parameters

**Table 141–96 UNLOCK\_PARTITION\_STATS Procedure Parameters**

Parameter	Description
ownname	Name of the schema to unlock
tabname	Name of the table
partname	Partition name

## UNLOCK\_SCHEMA\_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

### Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (
    ownname    VARCHAR2);
```

### Parameters

**Table 141–97 UNLOCK\_SCHEMA\_STATS Procedure Parameters**

Parameter	Description
ownname	The name of the schema

### Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET\_\*, DELETE\_\*, IMPORT\_\*, GATHER\_\* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER\_SCHEMA\_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

## UNLOCK\_TABLE\_STATS Procedure

This procedure unlocks the statistics on the table.

### Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2);
```

### Parameters

**Table 141–98 UNLOCK\_TABLE\_STATS Procedure Parameters**

Parameter	Description
ownname	The name of the schema
tabname	The name of the table

### Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET\_\*, DELETE\_\*, IMPORT\_\*, GATHER\_\* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER\_SCHEMA\_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

## UPGRADE\_STAT\_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

### Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (  
    ownname    VARCHAR2,  
    statab     VARCHAR2);
```

### Parameters

**Table 141-99 UPGRADE\_STAT\_TABLE Procedure Parameters**

Parameter	Description
ownname	Name of the schema
statab	Name of the table

### Exceptions

ORA-20000: Unable to upgrade table

---

---

## DBMS\_STORAGE\_MAP

With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process `FMON` to invoke mapping operations that populate mapping views. `FMON` communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- [Using DBMS\\_STORAGE\\_MAP](#)
  - Overview
  - Operational Notes
- [Summary of DBMS\\_STORAGE\\_MAP Subprograms](#)

---

## Using DBMS\_STORAGE\_MAP

- [Overview](#)
- [Operational Notes](#)

## Overview

The following terminology and descriptions will help you understand the DBMS\_STORAGE\_MAP API:

- Mapping libraries

Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- Mapping files

A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

**See Also:**

- *Oracle Database Administrator's Guide* for more information
- *Oracle Database Reference* for V\$MAP views, including V\$MAP\_FILE, V\$MAP\_ELEMENT, V\$MAP\_SUBELEMENT, V\$MAP\_FILE\_EXTENT

## Operational Notes

For `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL`: Invoking these functions when mapping information already exists will refresh the mapping if configuration IDs are supported. If configuration IDs are not supported, then invoking these functions again will rebuild the mapping.

**See Also:** *Oracle Database Administrator's Guide* for a discussion of the configuration ID, an attribute of the element or file that is changed.

---

## Summary of DBMS\_STORAGE\_MAP Subprograms

**Table 142–1 DBMS\_STORAGE\_MAP Package Subprograms**

Subprogram	Description
<a href="#">DROP_ALL Function</a> on page 142-6	Drops all mapping information in the shared memory of the instance
<a href="#">DROP_ELEMENT Function</a> on page 142-7	Drops the mapping information for the element defined by <code>elemname</code>
<a href="#">DROP_FILE Function</a> on page 142-8	Drops the file mapping information defined by <code>filename</code>
<a href="#">LOCK_MAP Procedure</a> on page 142-9	Locks the mapping information in the shared memory of the instance
<a href="#">MAP_ALL Function</a> on page 142-10	Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements
<a href="#">MAP_ELEMENT Function</a> on page 142-11	Builds mapping information for the element identified by <code>elemname</code>
<a href="#">MAP_FILE Function</a> on page 142-12	Builds mapping information for the file identified by <code>filename</code>
<a href="#">MAP_OBJECT Function</a> on page 142-13	Builds the mapping information for the Oracle object identified by the object name, owner, and type
<a href="#">RESTORE Function</a> on page 142-14	Loads the entire mapping information from the data dictionary into the shared memory of the instance
<a href="#">SAVE Function</a> on page 142-15	Saves information needed to regenerate the entire mapping into the data dictionary
<a href="#">UNLOCK_MAP Procedure</a> on page 142-16	Unlocks the mapping information in the shared memory of the instance.

## DROP\_ALL Function

This function drops all mapping information in the shared memory of the instance.

### Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 142–2** *DROP\_ALL Function Parameters*

Parameter	Description
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

## DROP\_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

### Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(  
    elemname          IN VARCHAR2,  
    cascade           IN BOOLEAN,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 142-3** *DROP\_ELEMENT Function Parameters*

Parameter	Description
<code>elemname</code>	The element for which mapping information is dropped.
<code>cascade</code>	If <code>TRUE</code> , then <code>DROP_ELEMENT</code> is invoked recursively on all elements of the DAG defined by <code>elemname</code> , if possible.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

## DROP\_FILE Function

This function drops the file mapping information defined by `filename`.

### Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(  
    filename          IN VARCHAR2,  
    cascade           IN BOOLEAN,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 142–4** *DROP\_FILE Function Parameters*

Parameter	Description
<code>filename</code>	The file for which file mapping information is dropped.
<code>cascade</code>	If <code>TRUE</code> , then the mapping DAGs for the elements where the file resides are also dropped, if possible.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

## LOCK\_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance. This is useful when you need a consistent snapshot of the V\$MAP tables. Without locking the mapping information, V\$MAP\_ELEMENT and V\$MAP\_SUBELEMENT, for example, may be inconsistent.

### Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

## MAP\_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

### Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(  
    max_num_fileext IN NUMBER DEFAULT 100,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 142–5** MAP\_ALL Function Parameters

Parameter	Description
max_num_fileext	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

### Usage Notes

You must explicitly call MAP\_ALL in a cold startup scenario.

## MAP\_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

### Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT (
  elemname          IN VARCHAR2,
  cascade           IN BOOLEAN,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 142–6** MAP\_ELEMENT Function Parameters

Parameter	Description
<code>elemname</code>	The element for which mapping information is built.
<code>cascade</code>	If <code>TRUE</code> , all elements within the <code>elemname</code> I/O stack DAG are mapped.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

## MAP\_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

### Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(
  filename          IN VARCHAR2,
  filetype          IN VARCHAR2,
  cascade           IN BOOLEAN,
  max_num_fileextent IN NUMBER DEFAULT 100,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 142–7** MAP\_FILE Function Parameters

Parameter	Description
<code>filename</code>	The file for which mapping information is built.
<code>filetype</code>	Defines the type of the file to be mapped. It can be "DATAFILE", "SPFILE", "TEMPFILE", "CONTROLFILE", "LOGFILE", or "ARCHIVEFILE".
<code>cascade</code>	Should be <code>TRUE</code> only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an <code>ALTER SYSTEM</code> command or DML operations on extended files), <code>cascade</code> can be set to <code>FALSE</code> because the mapping changes are limited to the file extents only.  If <code>TRUE</code> , mapping DAGs are also built for the elements where the file resides.
<code>max_num_fileextent</code>	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; <code>max_num_fileextent</code> is an overloaded argument.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

### Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

## MAP\_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

### Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(  
  objname IN VARCHAR2,  
  owner   IN VARCHAR2,  
  objtype IN VARCHAR2);
```

### Parameters

**Table 142–8** *MAP\_OBJECT Function Parameters*

Parameter	Description
objname	The name of the object.
owner	The owner of the object.
objtype	The type of the object.

## RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance. You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

### Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

## SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

### Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

## UNLOCK\_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

### Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

The `DBMS_STREAMS` package, one of a set of Oracle Streams packages, provides subprograms to convert `ANYDATA` objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

This chapter contains the following topics:

- [Using DBMS\\_STREAMS](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_STREAMS Subprograms](#)

---

## Using DBMS\_STREAMS

This section contains topics which relate to using the DBMS\_STREAMS package.

- [Overview](#)
- [Security Model](#)

## Overview

This package provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

**See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

## Security Model

PUBLIC is granted EXECUTE privilege on this package.

**See Also:** *Oracle Database Security Guide* for more information about user group PUBLIC

---

## Summary of DBMS\_STREAMS Subprograms

**Table 143–1 DBMS\_STREAMS Package Subprograms**

Subprogram	Description
<a href="#">COMPATIBLE_11_2 Function</a> on page 143-6	Returns the DBMS_STREAMS.COMPATIBLE_11_2 constant
<a href="#">COMPATIBLE_11_1 Function</a> on page 143-7	Returns the DBMS_STREAMS.COMPATIBLE_11_1 constant
<a href="#">COMPATIBLE_10_2 Function</a> on page 143-8	Returns the DBMS_STREAMS.COMPATIBLE_10_2 constant
<a href="#">COMPATIBLE_10_1 Function</a> on page 143-9	Returns the DBMS_STREAMS.COMPATIBLE_10_1 constant
<a href="#">COMPATIBLE_9_2 Function</a> on page 143-10	Returns the DBMS_STREAMS.COMPATIBLE_9_2 constant
<a href="#">CONVERT_ANYDATA_TO_LCR_DDL Function</a> on page 143-11	Converts a ANYDATA object to a SYS.LCR\$_DDL_RECORD object
<a href="#">CONVERT_ANYDATA_TO_LCR_ROW Function</a> on page 143-12	Converts a ANYDATA object to a SYS.LCR\$_ROW_RECORD object
<a href="#">CONVERT_LCR_TO_XML Function</a> on page 143-13	Converts a logical change record (LCR) encapsulated in a ANYDATA object into an XML object that conforms to the XML schema for LCRs
<a href="#">CONVERT_XML_TO_LCR Function</a> on page 143-14	Converts an XML object that conforms to the XML schema for LCRs into a logical change record (LCR) encapsulated in a ANYDATA object
<a href="#">GET_INFORMATION Function</a> on page 143-15	Returns information about various Oracle Streams attributes
<a href="#">GET_STREAMS_NAME Function</a> on page 143-16	Returns the name of the invoker
<a href="#">GET_STREAMS_TYPE Function</a> on page 143-17	Returns the type of the invoker
<a href="#">GET_TAG Function</a> on page 143-18	Gets the binary tag for all redo entries generated by the current session
<a href="#">MAX_COMPATIBLE Function</a> on page 143-19	Returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database
<a href="#">SET_TAG Procedure</a> on page 143-20	Sets the binary tag for all redo entries subsequently generated by the current session

---

**Note:** The subprograms in this package do not commit.

---

## COMPATIBLE\_11\_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_11_2` constant.

### Syntax

```
DBMS_STREAMS.COMPATIBLE_11_2  
RETURN INTEGER;
```

### Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.2.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

#### See Also:

- [GET\\_COMPATIBLE Member Function](#) on page 248-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

## COMPATIBLE\_11\_1 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_11_1` constant.

### Syntax

```
DBMS_STREAMS.COMPATIBLE_11_1  
RETURN INTEGER;
```

### Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.1.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

#### See Also:

- [GET\\_COMPATIBLE Member Function](#) on page 248-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

## COMPATIBLE\_10\_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_10_2` constant.

### Syntax

```
DBMS_STREAMS.COMPATIBLE_10_2  
RETURN INTEGER;
```

### Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.2.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

#### See Also:

- [GET\\_COMPATIBLE Member Function](#) on page 248-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

## COMPATIBLE\_10\_1 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_10_1` constant.

### Syntax

```
DBMS_STREAMS.COMPATIBLE_10_1  
RETURN INTEGER;
```

### Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.1.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

#### See Also:

- [GET\\_COMPATIBLE Member Function](#) on page 248-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

## COMPATIBLE\_9\_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.

### Syntax

```
DBMS_STREAMS.COMPATIBLE_9_2  
RETURN INTEGER;
```

### Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 9.2.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

#### See Also:

- [GET\\_COMPATIBLE Member Function](#) on page 248-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

## CONVERT\_ANYDATA\_TO\_LCR\_DDL Function

This function converts a ANYDATA object into a SYS.LCR\$\_DDL\_RECORD object.

### Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_DDL(
  source IN ANYDATA)
RETURN SYS.LCR$_DDL_RECORD;
```

### Parameters

**Table 143–2** *CONVERT\_ANYDATA\_TO\_LCR\_DDL Function Parameters*

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a DDL logical change record (DDL LCR), then the function raises an exception.

### Usage Notes

You can use this function in a transformation created by the CREATE\_TRANSFORMATION procedure in the DBMS\_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of DDL LCRs from a ANYDATA queue to a SYS.LCR\$\_DDL\_RECORD typed queue.

**See Also:** *Oracle Streams Advanced Queuing User's Guide*

## CONVERT\_ANYDATA\_TO\_LCR\_ROW Function

This function converts a ANYDATA object into a SYS.LCR\$\_ROW\_RECORD object.

### Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_ROW(
    source IN ANYDATA)
RETURN SYS.LCR$_ROW_RECORD;
```

### Parameters

**Table 143–3 CONVERT\_ANYDATA\_TO\_LCR\_ROW Function Parameters**

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a row logical change record (row LCR), then the function raises an exception.

### Usage Notes

You can use this function in a transformation created by the CREATE\_TRANSFORMATION procedure in the DBMS\_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of row LCRs from a ANYDATA queue to a SYS.LCR\$\_ROW\_RECORD typed queue.

**See Also:** *Oracle Streams Advanced Queuing User's Guide*

## CONVERT\_LCR\_TO\_XML Function

This function converts a logical change record (LCR) encapsulated in a `ANYDATA` object into an XML object that conforms to the XML schema for LCRs. The LCR can be a row LCR or a DDL LCR.

**See Also:** *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

### Syntax

```
DBMS_STREAMS.CONVERT_LCR_TO_XML(  
    anylcr IN ANYDATA)  
RETURN SYS.XMLTYPE;
```

### Parameters

**Table 143–4** *CONVERT\_LCR\_TO\_XML Function Parameters*

Parameter	Description
<code>anylcr</code>	The <code>ANYDATA</code> encapsulated LCR to be converted. If this object is not a <code>ANYDATA</code> encapsulated LCR, then the function raises an exception.

## CONVERT\_XML\_TO\_LCR Function

This function converts an XML object that conforms to the XML schema for logical change records (LCRs) into an LCR encapsulated in a `ANYDATA` object. The LCR can be a row or DDL LCR.

**See Also:** *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

### Syntax

```
DBMS_STREAMS.CONVERT_XML_TO_LCR(
    xml_dat IN SYS.XMLTYPE)
RETURN ANYDATA;
```

### Parameters

**Table 143–5** *CONVERT\_XML\_TO\_LCR Function Parameters*

Parameter	Description
<code>xml_dat</code>	The XML LCR object to be converted. If this object does not conform to XML schema for LCRs, then the function raises an exception.

## GET\_INFORMATION Function

This function returns information about various Oracle Streams attributes.

### Syntax

```
DBMS_STREAMS.GET_INFORMATION(  
    name IN VARCHAR2)  
RETURN ANYDATA;
```

### Parameters

**Table 143–6** *GET\_INFORMATION Function Parameters*

Parameter	Description
name	<p>The type of information you want to retrieve. Currently, the following names are available:</p> <ul style="list-style-type: none"> <li>▪ <b>SENDER:</b> Returns the name of the sender for the current logical change record (LCR) from its AQ message properties. This function is called inside a procedure DML handler, a DDL handler, an error handler, or a message handler. Returns <code>NULL</code> if called outside of an apply handler. The return value is to be interpreted as a <code>VARCHAR2</code>.</li> <li>▪ <b>CONSTRAINT_NAME:</b> Returns the name of the constraint that was violated for an LCR that raised an error. This function is called inside a procedure DML handler or error handler for an apply process. Returns <code>NULL</code> if called outside of a procedure DML handler or error handler. The return value is to be interpreted as a <code>VARCHAR2</code>.</li> </ul>

## GET\_STREAMS\_NAME Function

This function gets the Oracle Streams name of the invoker if the invoker is one of the following Oracle Streams types:

- CAPTURE
- APPLY
- ERROR\_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

### Syntax

```
DBMS_STREAMS.GET_STREAMS_NAME  
RETURN VARCHAR2;
```

### Usage Notes

You can use this function in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, if you use one error handler for multiple apply processes, then you can use the `GET_STREAMS_NAME` function to determine the name of the apply process that raised the error.

## GET\_STREAMS\_TYPE Function

This function gets the Oracle Streams type of the invoker and returns one of the following types:

- CAPTURE
- APPLY
- ERROR\_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

### Syntax

```
DBMS_STREAMS.GET_STREAMS_TYPE  
RETURN VARCHAR2;
```

### Usage Notes

This function can be used in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, you can use the `GET_STREAMS_TYPE` function to instruct a procedure DML handler to operate differently if it is processing messages from the error queue (`ERROR_EXECUTION` type) instead of the apply process's queue (`APPLY` type).

## GET\_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

---

---

**Note:**

- To execute this function, a user must be granted either EXECUTE\_CATALOG\_ROLE or EXECUTE privilege on the DBMS\_STREAMS\_ADM package.
  - Instead of using the DBMS\_STREAMS.GET\_TAG function, Oracle recommends that you use the DBMS\_STREAMS\_ADM.GET\_TAG function. See [GET\\_TAG Function](#) on page 144-86.
- 
- 

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

### Syntax

```
DBMS_STREAMS.GET_TAG  
RETURN RAW;
```

### Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON  
DECLARE  
    raw_tag RAW(2000);  
BEGIN  
    raw_tag := DBMS_STREAMS.GET_TAG();  
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));  
END;  
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_STREAMS.GET_TAG FROM DUAL;
```

## MAX\_COMPATIBLE Function

This function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

### Syntax

```
DBMS_STREAMS.MAX_COMPATIBLE  
RETURN INTEGER;
```

### Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The `MAX_COMPATIBLE` function always returns the maximum compatibility for the release of Oracle Database on which it is run. Therefore, when you use this function in rule conditions, the rule conditions do not need to be changed when you upgrade to a later release of Oracle Database.

#### See Also:

- [GET\\_COMPATIBLE Member Function](#) on page 248-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

## SET\_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session has this tag. This procedure affects only the current session.

---

---

### Note:

- To execute this procedure, a user must be granted either EXECUTE\_CATALOG\_ROLE or EXECUTE privilege on the DBMS\_STREAMS\_ADM package.
  - Instead of using the DBMS\_STREAMS.SET\_TAG procedure, Oracle recommends that you use the DBMS\_STREAMS\_ADM.SET\_TAG procedure. See [SET\\_TAG Procedure](#) on page 144-171.
- 
- 

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

## Syntax

```
DBMS_STREAMS.SET_TAG (
    tag IN RAW DEFAULT NULL);
```

## Parameters

**Table 143–7 SET\_TAG Procedure Parameters**

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits.  By default, the tag for a session is NULL.  The size limit for a tag value is 2000 bytes.

## Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_STREAMS.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET\_TAG procedure:

- This procedure is not transactional. That is, the effects of SET\_TAG cannot be rolled back.
- If the SET\_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET\_TAG procedure in a session. A data dictionary build happens when the DBMS\_CAPTURE\_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

**See Also:** [BUILD Procedure](#) on page 32-18

---

---

## DBMS\_STREAMS\_ADM

The `DBMS_STREAMS_ADM` package, one of a set of Oracle Streams packages, provides subprograms for configuring Oracle Streams environments. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. This package also includes subprograms for configuring and managing XStream outbound servers and inbound servers.

This chapter contains the following topics:

- [Using DBMS\\_STREAMS\\_ADM](#)
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Operational Notes
- [Summary of DBMS\\_STREAMS\\_ADM Subprograms](#)

## Using DBMS\_STREAMS\_ADM

This section contains topics that relate to using the DBMS\_STREAMS\_ADM package.

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)

## Overview

The DBMS\_STREAMS\_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring an Oracle Streams environment. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. These rules support logical change records (LCRs), which include row LCRs and data definition language (DDL) LCRs. This package also contains subprograms for creating message rules for specific message types. This package also contains subprograms for creating queues, and for managing Oracle Streams metadata, such as data dictionary information.

If you require more sophisticated rules, then refer to [Chapter 126, "DBMS\\_RULE"](#) package.

### See Also:

- *Oracle Streams Concepts and Administration*, *Oracle Streams Replication Administrator's Guide*, and *Oracle Database 2 Day + Data Replication and Integration Guide* for more information about this package and Oracle Streams
- [Chapter 126, "DBMS\\_RULE"](#)

## Deprecated Subprograms

---

---

**Note:** Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

---

---

The following subprograms are deprecated with Oracle Database 10g Release 2 and later:

- `MAINTAIN_SIMPLE_TABLESPACE`

This procedure is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

**See Also:** [MAINTAIN\\_SIMPLE\\_TTS Procedure](#) on page 144-111

- `MAINTAIN_TABLESPACES`

This procedure is replaced by the `MAINTAIN_TTS` procedure.

**See Also:** [MAINTAIN\\_TTS Procedure](#) on page 144-126

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

A user is associated with each Oracle Streams client. The following sections describe these users:

- [Oracle Streams Administrator](#)
- [Capture User](#)
- [Propagation User](#)
- [Apply User for an Oracle Streams Apply Process](#)
- [Apply User for an XStream Inbound Server](#)
- [Messaging Client User](#)

---

---

**Note:** The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as creating a synchronous capture. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

---

---

### Oracle Streams Administrator

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

### Capture User

The following procedures can create a capture process:

- [ADD\\_GLOBAL\\_RULES Procedure](#)
- [ADD\\_SCHEMA\\_RULES Procedure](#)
- [ADD\\_SUBSET\\_RULES Procedure](#)
- [ADD\\_TABLE\\_RULES Procedure](#)

The following procedures can create a synchronous capture:

- [ADD\\_SUBSET\\_RULES Procedure](#)
- [ADD\\_TABLE\\_RULES Procedure](#)

If one of these procedures creates a capture process or a synchronous capture, then it configures the current user as the capture user. The capture user is the user in whose security domain a capture process or synchronous capture captures changes that

satisfy its rule set(s) and runs custom rule-based transformations configured for these rules. This user must have the necessary privileges to capture changes. The procedure grants the capture user `ENQUEUE` privilege on the queue used by the capture process or synchronous capture and configures the user as a secure queue user of the queue.

**See Also:** [CREATE\\_CAPTURE Procedure](#) on page 32-19 and [CREATE\\_SYNC\\_CAPTURE Procedure](#) on page 32-29 for information about the privileges required to capture changes (refer to the `capture_user` parameter)

## Propagation User

The following procedures can create a propagation:

- [ADD\\_GLOBAL\\_PROPAGATION\\_RULES Procedure](#)
- [ADD\\_MESSAGE\\_PROPAGATION\\_RULE Procedure](#)
- [ADD\\_SCHEMA\\_PROPAGATION\\_RULES Procedure](#)
- [ADD\\_SUBSET\\_PROPAGATION\\_RULES Procedure](#)
- [ADD\\_TABLE\\_PROPAGATION\\_RULES Procedure](#)

When a propagation is created, a propagation job also might be created. If a propagation job is created when one of these procedures is run, then the user who runs the procedure owns the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

---

---

**Note:**

- The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users might or might not be the same.
  - For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate messages.
- 
- 

**See Also:**

- [CREATE\\_PROPAGATION Procedure](#) on page 107-8 for more information about the required privileges
- "Propagation Rules for LCRs" on page 144-11 for information about when a propagation job is created

## Apply User for an Oracle Streams Apply Process

The following procedures can create an apply process:

- [ADD\\_GLOBAL\\_RULES Procedure](#)
- [ADD\\_MESSAGE\\_RULE Procedure](#)
- [ADD\\_SCHEMA\\_RULES Procedure](#)
- [ADD\\_SUBSET\\_RULES Procedure](#)
- [ADD\\_TABLE\\_RULES Procedure](#)

If one of these procedures creates an apply process, then it configures the current user as the apply user. For an apply process, the apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets.

An apply user applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. The procedure grants the apply user `DEQUEUE` privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

**See Also:** [CREATE\\_APPLY Procedure](#) on page 21-18 for information about the privileges required to apply changes (refer to the `apply_user` parameter)

## Apply User for an XStream Inbound Server

The following procedures can create an XStream inbound server:

- [ADD\\_GLOBAL\\_RULES Procedure](#)
- [ADD\\_SCHEMA\\_RULES Procedure](#)
- [ADD\\_SUBSET\\_RULES Procedure](#)
- [ADD\\_TABLE\\_RULES Procedure](#)

---

---

**Note:** These procedures cannot create an outbound server.

---

---

If the `streams_name` parameter is set to `NULL` and no relevant apply process, inbound server, or outbound server exists, then the procedure creates an apply process automatically with a system-generated name.

The apply process remains an apply process if it receives captured logical change records (LCRs) from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives captured LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

If one of these procedures creates an inbound server, then it configures the current user as the apply user. The apply user is the user in whose security domain an XStream client application attaches to an Oracle database.

An apply user applies changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to apply changes. The procedure grants the apply user `DEQUEUE` privilege on the queue used by the inbound server and configures the user as a secure queue user.

Each inbound server must have a unique name. The name cannot be used by an apply process, outbound server, or messaging client in the same database, and the name cannot be used by another inbound server in the same database.

If a relevant apply process, inbound server, or outbound server exists, then the procedure does not create an inbound server. Instead, the procedure uses the relevant apply process, inbound server, or outbound server. If the `streams_name` parameter specifies an existing apply process, inbound server, or outbound server, then the specified client is used.

When `streams_name` parameter is `NULL` and the `streams_type` parameter is set to `apply`, the relevant apply process, inbound server, or outbound server is identified in one of the following ways:

- If one existing apply process or outbound server has the source database specified in the `source_database` parameter and uses the queue specified in the `queue_name` parameter, then the procedure uses this apply process or outbound server.
- If the `source_database` parameter is set to `NULL` and one existing apply process, inbound server, or outbound server is using the queue specified in the `queue_name` parameter, then the procedure uses this apply process, inbound server, or outbound server.

If the `streams_name` parameter is set to `NULL` and multiple relevant apply processes, inbound servers, or outbound servers exist, then the procedure raises an error.

---

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

---

## Messaging Client User

The following procedures can create a messaging client:

- [ADD\\_GLOBAL\\_RULES Procedure](#)
- [ADD\\_MESSAGE\\_RULE Procedure](#)
- [ADD\\_SCHEMA\\_RULES Procedure](#)
- [ADD\\_SUBSET\\_RULES Procedure](#)
- [ADD\\_TABLE\\_RULES Procedure](#)

If one of these procedures creates a messaging client, then the user who runs this procedure is granted the privileges to dequeue from the queue using the messaging client. The procedure configures this user as a secure queue user of the queue, and only this user can use the messaging client.

## Operational Notes

Several procedures in this package create rules for Oracle Streams clients and XStream clients, and several procedures configure an Oracle Streams environment. The following sections provide information about using these procedures:

- [Procedures That Create Rules for Oracle Streams Clients and XStream Clients](#)
- [Procedures That Configure an Oracle Streams Environment](#)

### Procedures That Create Rules for Oracle Streams Clients and XStream Clients

Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. XStream clients include XStream outbound servers and inbound servers. Some of the procedures in the `DBMS_STREAMS_ADM` package add rules to the rule sets of Oracle Streams clients and XStream clients. The rules can pertain to changes in the redo log, to data manipulation language (DML) changes made to a table, to logical change records (LCRs), or to user messages.

An LCR represents either a row change that results from a DML operation or a data definition language (DDL) change. An LCR that represents a row change is a row LCR, and an LCR that represents a DDL change is a DDL LCR. LCRs can either represent changes that were captured by a capture process or a synchronous capture, or they can represent changes created by a user or application. A user message is a custom message that is based on a user-defined type and created by users or applications.

A capture process, propagation, apply process, messaging client, outbound server, or inbound server can have both positive and negative rule sets. A synchronous capture can have only a positive rule set.

For all of the procedures except the ones that create subset rules, and for all clients except for synchronous captures, you use the `inclusion_rule` parameter to specify the type of rule set (either positive or negative) for the created rules. If the client does not have a rule set of the specified type, then a rule set is created automatically, and the rules are added to the rule set. Other rules in an existing rule set for the client are not affected. Additional rules can be added to a rule set using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If an client has both a positive and a negative rule set, then the negative rule set is always evaluated first.

The following sections describe each type of rule in detail:

- [Capture Process Rules for Changes in the Redo Log](#)
- [Synchronous Capture Rules for DML Changes to Tables](#)
- [Propagation Rules for LCRs](#)
- [Propagation Rules for User Messages](#)
- [Apply Process Rules for LCRs](#)
- [Apply Process Rules for User Messages](#)
- [Messaging Client Rules for LCRs](#)
- [Messaging Client Rules for User Messages](#)
- [XStream Outbound Server Rules for LCRs](#)
- [XStream Inbound Server Rules for LCRs](#)

---

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

---

**See Also:** *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

### Capture Process Rules for Changes in the Redo Log

The following procedures add rules to a rule set of a capture process when you specify capture for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all changes made to a source database. See [ADD\\_GLOBAL\\_RULES Procedure](#) on page 144-34.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified schema. See [ADD\\_SCHEMA\\_RULES Procedure](#) on page 144-50.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for DML changes made to a subset of rows in a specified table. See [ADD\\_SUBSET\\_RULES Procedure](#) on page 144-59.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified table. See [ADD\\_TABLE\\_RULES Procedure](#) on page 144-70.

If one of these procedures adds rules to the positive rule set for a capture process, then the capture process captures row changes resulting from DML changes, or DDL changes, or both from a source database and enqueues these changes into the specified queue. If one of these procedures adds rules to the negative rule set for a capture process, then the capture process discards row changes, or DDL changes, or both from a source database.

A capture process can capture changes locally at a source database or remotely at a downstream database. Therefore, for capture process rules, you should execute the procedure either at the source database or at a downstream database.

If the capture process is a local capture process, or if the capture process is a downstream capture process that uses a database link to the source database, then these procedures automatically prepare the appropriate database objects for instantiation:

- `ADD_GLOBAL_RULES` invokes the `PREPARE_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SCHEMA_RULES` invokes the `PREPARE_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SUBSET_RULES` and `ADD_TABLE_RULES` invoke the `PREPARE_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

These procedures also enable supplemental logging for the primary key, unique key, foreign key, and bitmap index columns in the tables prepared for instantiation. The primary key columns are unconditionally logged. The unique key, foreign key, and bitmap index columns are conditionally logged.

If the capture process is a downstream capture process that does not use a database link to the source database, then you must prepare the appropriate objects for

instantiation and specify the necessary supplemental logging manually at the source database.

If one of these procedures is executed at a downstream database, then you specify the source database using the `source_database` parameter, and the specified capture process must exist. The procedure cannot create a capture process if it is run at a downstream database. You can create a capture process at a downstream database using the `CREATE_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

**See Also:** [Chapter , "Summary of DBMS\\_CAPTURE\\_ADM Subprograms"](#) on page 32-5 for more information about the `CREATE_CAPTURE` procedure and the procedures that prepare database objects for instantiation

### Synchronous Capture Rules for DML Changes to Tables

The following procedures add rules to the rule set of a synchronous capture when you specify `sync_capture` for the `streams_type` parameter:

- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to TRUE for DML changes made to a subset of rows in a specified table. See [ADD\\_SUBSET\\_RULES Procedure](#) on page 144-59.
- The `ADD_TABLE_RULES` procedure adds a rule whose rule condition evaluates to TRUE for DML changes made to a specified table. See [ADD\\_TABLE\\_RULES Procedure](#) on page 144-70.

If one of these procedures adds rules to the positive rule set for a synchronous capture, then the synchronous capture captures row changes resulting from DML changes to the table at the source database and enqueues these changes into the specified queue. A synchronous capture cannot have a negative rule set.

A synchronous capture captures changes locally at the database where it is configured. This database is the source database for changes captured by the synchronous capture. Therefore, for synchronous capture rules, you should execute the procedure at the source database.

These procedures automatically prepare the appropriate tables for instantiation by invoking the `PREPARE_SYNC_INSTANTIATION` function in the `DBMS_CAPTURE_ADM` package at the source database.

---

---

#### Note:

- A synchronous capture ignores rules in its rule set that were created by a procedure other than `ADD_SUBSET_RULES` or `ADD_TABLE_RULES`.
  - When the `ADD_TABLE_RULES` or the `ADD_SUBSET_RULES` procedure adds rules to a synchronous capture rule set, the procedure must obtain an exclusive lock on the specified table. If there are outstanding transactions on the specified table, then the procedure waits until it can obtain a lock.
- 
- 

### Propagation Rules for LCRs

The following procedures add propagation rules for LCRs to a rule set of a propagation:

- The `ADD_GLOBAL_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in a source queue. See [ADD\\_GLOBAL\\_PROPAGATION\\_RULES Procedure](#) on page 144-30.
- The `ADD_SCHEMA_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified schema. See [ADD\\_SCHEMA\\_PROPAGATION\\_RULES Procedure](#) on page 144-46.
- The `ADD_SUBSET_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in a source queue containing the results of DML changes made to a subset of rows in a specified table. See ["ADD\\_SUBSET\\_PROPAGATION\\_RULES Procedure"](#) on page 144-55.
- The `ADD_TABLE_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified table. See ["ADD\\_TABLE\\_PROPAGATION\\_RULES Procedure"](#) on page 144-65.

If one of these procedures adds rules to the positive rule set for the propagation, then the rules specify that the propagation propagates LCRs in a source queue to a destination queue. If one of these procedures adds rules to the negative rule set for the propagation, then the rules specify that the propagation discards LCRs in a source queue. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database.

#### **Propagation Rules for User Messages**

The `ADD_MESSAGE_PROPAGATION_RULE` procedure adds a message rule to a rule set of a propagation. If this procedure adds a rule to the positive rule set for the propagation, then the rule specifies that the propagation propagates the user messages of a specific message type that evaluate to `TRUE` for the rule condition from a source queue to a destination queue. If this procedure adds a rule to the negative rule set for the propagation, then the rule specifies that the propagation discards the user messages in a source queue of a specific message type that evaluate to `TRUE` for the rule condition. This procedure generates a rule name for the rule.

**See Also:** ["ADD\\_MESSAGE\\_PROPAGATION\\_RULE Procedure"](#) on page 144-39

#### **Apply Process Rules for LCRs**

The following procedures add rules to a rule set of an apply process when you specify `apply` for the `streams_type` parameter and an apply process for the `streams_name` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in the apply process's queue. See ["ADD\\_GLOBAL\\_RULES Procedure"](#) on page 144-34.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the apply process's queue containing changes made to a specified schema. See ["ADD\\_SCHEMA\\_RULES Procedure"](#) on page 144-50.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in the apply process's queue containing the results of DML changes made to a subset of rows in a specified table. See ["ADD\\_SUBSET\\_RULES Procedure"](#) on page 144-59.

- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the apply process's queue containing changes made to a specified table. See "[ADD\\_TABLE\\_RULES Procedure](#)" on page 144-70.

If one of these procedures adds rules to the positive rule set for the apply process, then the rules specify that the apply process applies LCRs in its queue. If one of these procedures adds rules to the negative rule set for the apply process, then the rules specify that the apply process discards LCRs in its queue. For apply process rules, you should execute these procedures at the destination database.

Changes applied by an apply process created by one of these procedures generate tags in the redo log at the destination database with a value of '00' (double zero). You can use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to alter the tag value after the apply process is created, if necessary.

An apply process can apply captured LCRs from only one source database. If one of these procedures creates an apply process, then specify the source database for the apply process using the `source_database` parameter. If the `source_database` parameter is `NULL`, and one of these procedures creates an apply process, then the source database name of the first LCR received by the apply process is used for the source database.

The rules in the apply process rule sets determine which messages are dequeued by the apply process. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database. If the apply process dequeues an LCR with a source database that is different from the source database for the apply process, then an error is raised. In addition, when adding rules to an existing apply process, the database specified in the `source_database` parameter cannot be different from the source database for the apply process. You can determine the source database for an apply process by querying the `DBA_APPLY_PROGRESS` data dictionary view.

An apply process created by one of these procedures can apply messages only at the local database and can apply only captured messages. To create an apply process that applies messages at a remote database or an apply process that applies user messages, use the `CREATE_APPLY` procedure in the `DBMS_APPLY_ADM` package.

You can also use the `DBMS_APPLY_ADM.CREATE_APPLY` procedure to specify nondefault values for the `apply_captured`, `apply_user`, `apply_database_link`, and `apply_tag` parameters when you run that procedure. You can use one of the procedures in the `DBMS_STREAMS_ADM` package to add rules to a rule set used by the apply process after you create it.

#### See Also:

- "[ALTER\\_APPLY Procedure](#)" on page 21-10
- "[CREATE\\_APPLY Procedure](#)" on page 21-18

#### Apply Process Rules for User Messages

The `ADD_MESSAGE_RULE` procedure adds a message rule to a rule set of an apply process when you specify `apply` for the `streams_type` parameter. For an apply process rule, you should execute this procedure at the destination database.

If this procedure adds a rule to the positive rule set for an apply process, then the apply process dequeues user messages of a specific message type that satisfy the apply process rule and sends these messages to its message handler. If no message handler is specified for the apply process, then use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to set the message handler. If this procedure adds a rule to the

negative rule set for an apply process, then the apply process discards user messages of a specific message type that satisfy the apply process rule.

**See Also:**

- [ADD\\_MESSAGE\\_RULE Procedure](#) on page 144-43
- [ALTER\\_APPLY Procedure](#) on page 21-10

**Messaging Client Rules for LCRs**

The following procedures add rules to a rule set of a messaging client when you specify `dequeue` for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in the messaging client's queue. See "[ADD\\_GLOBAL\\_RULES Procedure](#)" on page 144-34.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client's queue containing changes made to a specified schema. See "[ADD\\_SCHEMA\\_RULES Procedure](#)" on page 144-50.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in the messaging client's queue containing the results of DML changes made to a subset of rows in a specified table. See "[ADD\\_SUBSET\\_RULES Procedure](#)" on page 144-59.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client's queue containing changes made to a specified table. See "[ADD\\_TABLE\\_RULES Procedure](#)" on page 144-70.

If one of these procedures adds rules to the positive rule set for a messaging client, then the messaging client can dequeue persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the `source_database` parameter. If one of these procedures adds rules to the negative rule set for a messaging client, then the messaging client discards persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the `source_database` parameter. You should execute these procedures at the database where you want to dequeue the messages with the messaging client.

**Messaging Client Rules for User Messages**

The `ADD_MESSAGE_RULE` procedure adds a message rule to a rule set of a messaging client when you specify `dequeue` for the `streams_type` parameter. You should execute this procedure at the database that will dequeue messages.

If this procedure adds a rule to the positive rule set for a messaging client, then the messaging client dequeues user messages of a specific message type that satisfy the message rule. If this procedure adds a rule to the negative rule set for a messaging client, then the messaging client discards user messages of a specific message type that satisfy the message rule.

**See Also:** "[ADD\\_MESSAGE\\_RULE Procedure](#)" on page 144-43

**XStream Outbound Server Rules for LCRs**

When you specify `apply` for the `streams_type` parameter and an XStream outbound server for the `streams_name` parameter, the following procedures add rules to a rule set of the specified outbound server:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for all LCRs.

- The `ADD_SCHEMA_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for LCRs that contain changes made to a specified schema.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for row LCRs that contain the results of DML changes made to a subset of rows in a specified table.
- The `ADD_TABLE_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for LCRs that contain changes made to a specified table.

These rules are evaluated against LCRs in the outbound server's queue.

If one of the preceding procedures adds rules to the positive rule set for the outbound server, then the rules specify that the outbound server sends LCRs in its queue to the XStream client application. If one of these procedures adds rules to the negative rule set for the outbound server, then the rules specify that the outbound server discards LCRs in its queue. For outbound server rules, execute these procedures at the database to which the XStream client application attaches.

An outbound server can process captured LCRs from only one source database. The source database is the database where the changes originated. If one of these procedures adds rules to the rule set of an outbound server, then specify the source database for the outbound server using the `source_database` parameter.

The rules in the outbound server's rule sets determine which LCRs are dequeued by the outbound server. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database. If the outbound server dequeues an LCR with a source database that is different from the source database for the outbound server, then an error is raised. In addition, when adding rules to an existing outbound server, the database specified in the `source_database` parameter cannot be different from the source database for the outbound server. You can determine the source database for an outbound server by querying the `DBA_XSTREAM_OUTBOUND` data dictionary view.

---

---

**Note:** These procedures cannot create an XStream outbound server. You can use one of the procedures in the `DBMS_STREAMS_ADM` package to add rules to a rule set used by the outbound server after you create it.

---

---

**See Also:** *Oracle Database XStream Guide* for information about creating an outbound server

### XStream Inbound Server Rules for LCRs

When you specify `apply` for the `streams_type` parameter and an XStream inbound server for the `streams_name` parameter, the following procedures add rules to a rule set of the specified inbound server:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for all LCRs sent to the inbound server.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for LCRs sent to the inbound server that contain changes made to a specified schema.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs sent to the inbound server that contain the results of data definition language (DML) changes made to a subset of rows in a specified table.

- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs sent to the inbound server that contain changes made to a specified table.

If one of the preceding procedures adds rules to the positive rule set for the inbound server, then the rules specify that the inbound server applies LCRs sent to it by the XStream client application. If one of these procedures adds rules to the negative rule set for the inbound server, then the rules specify that the inbound server discards LCRs sent to it by the XStream client application. For inbound server rules, execute these procedures at the database to which the XStream client application attaches. If an inbound server has no rule sets, then it applies all of the LCRs sent to it by the XStream client application.

Changes applied by an inbound server created by one of these procedures generate tags in the redo log at the destination database with a value of '00' (double zero). You can use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to alter the tag value after the inbound server is created, if necessary.

The rules in the XStream inbound server rule sets determine which LCRs are either applied or discarded after the LCRs are received from the XStream client application. An inbound server can only process LCRs sent from an XStream client application.

When one of these procedures creates rules for an inbound server, the procedure ignores the `source_database` parameter.

---

---

**Note:** If the name specified in the `streams_name` parameter does not exist, then these procedures always create an apply process. The apply process remains an apply process if it receives captured LCRs from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

---

---

**See Also:** *Oracle Database XStream Guide* for information about creating an inbound server

## Procedures That Configure an Oracle Streams Environment

The following procedures in this package configure an environment that is maintained by Oracle Streams:

- [MAINTAIN\\_CHANGE\\_TABLE Procedure](#) configures an Oracle Streams environment that records in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database.
- [MAINTAIN\\_GLOBAL Procedure](#) configures an Oracle Streams environment that replicates changes at the database level between two databases.
- [MAINTAIN\\_SCHEMAS Procedure](#) configures an Oracle Streams environment that replicates changes to specified schemas between two databases.
- [MAINTAIN\\_SIMPLE\\_TTS Procedure](#) clones a simple tablespace from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespace between these two databases.

- [MAINTAIN\\_TABLES Procedure](#) configures an Oracle Streams environment that replicates changes to specified tables between two databases.
- [MAINTAIN\\_TTS Procedure](#) clones a set of tablespaces from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespaces between these two databases.
- [PRE\\_INSTANTIATION\\_SETUP Procedure](#) and [POST\\_INSTANTIATION\\_SETUP Procedure](#)

The `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures must be used together to complete the Oracle Streams replication configuration. Typically, the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures are used to perform database maintenance operations with little or no down time. See *Oracle Streams Concepts and Administration* for more information.

The following sections contain information about using these procedures:

- [Automatic Platform Conversion](#)
- [Actions Performed by These Procedures](#)
- [Configuration Progress and Recoverability](#)

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about using these procedures

### Automatic Platform Conversion

If the source and destination databases run on different platforms, then these procedures, or the scripts generated by these procedures, convert transferred datafiles to the appropriate platform automatically.

### Actions Performed by These Procedures

To view all of the actions performed by one of these procedures in detail, use the procedure to generate a script, and view the script in a text editor.

### Configuration Progress and Recoverability

When one of these procedures is run with the `perform_actions` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

---

**Note:** When one of these procedures is run with the `perform_actions` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by one of these procedures is run.

---

**See Also:** "[RECOVER\\_OPERATION Procedure](#)" on page 144-147

### Requirements for Running These Procedures

Meet the following requirements when you use one of these procedures:

- Run the procedure at the capture database. The capture database is the database that will contain the capture process that captures changes made to the source database. If the capture database is the same as the source database, then a local capture process is configured. If the capture database is different from the source database, then a downstream capture process is configured. See *Oracle Streams Replication Administrator's Guide* for more information about the capture database.
- The user who runs the procedure must be able to use a database link from the source database to the destination database. This database link should have the same name as the global name of the destination database.
- If the procedure configures downstream capture, then the corresponding user at the capture database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- If the procedure configures downstream capture, and the capture database is different from the destination database, then the corresponding user at the capture database must be able to use a database link to access the destination database. This database link should have the same name as the global name of the destination database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- Grant the user who runs the procedure the DBA role. This user must have the necessary privileges to complete the following actions:
  - Create ANYDATA queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the `DBMS_STREAMS_ADM` and `DBMS_AQADM` packages.
  - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.

Typically, the DBA role can be revoked from the user, if necessary, after the configuration is complete.

- The procedure, or the scripts generated by these procedure, must be run at an Oracle Database 10g Release 2 or later database.
- If the `perform_actions` parameter is set to `TRUE` in the procedure to configure the Oracle Streams environment directly, then all of the databases configured by the procedure must be Oracle Database 10g Release 2 or later databases.
- If the `perform_actions` parameter is set to `FALSE` in the procedure, and the environment is configured with a generated script, then the databases configured by the script must be Oracle Database 10g Release 1 or later databases. If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes the procedure must have `READ` and `WRITE` privilege on each one.
- For procedures that include the `bi_directional` parameter, if the `bi_directional` parameter is set to `TRUE`, or if the source database is not the capture database, then the `source_database` parameter must specify a database that contains the database objects to be shared. The database specified in the `destination_database` parameter might or might not contain these database objects. If the destination database does not contain the shared database objects, then the procedure instantiates the database objects at the destination database (excluding the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures).
- For procedures that include the `bi_directional` parameter, if the `bi_directional` parameter is set to `TRUE` or if a network instantiation will be performed, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

To ensure that the user who runs these procedures has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

### Common Parameters for the Configuration Procedures

Table 144–1 describes the common parameters for the procedures in this package that configure an Oracle Streams environment. Some of the procedures do not include all of the parameters in Table 144–1.

**Table 144–1 Common Parameters for Configuration Procedures**

Parameter	Description
<code>perform_actions</code>	<p>If <code>TRUE</code>, then the procedure performs the necessary actions to configure the environment directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to configure the environment directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li>■ <code>script_name</code></li> <li>■ <code>script_directory_object</code></li> </ul>

**Table 144–1 (Cont.) Common Parameters for Configuration Procedures**

Parameter	Description
script_name	<p>If non-NULL and the <code>perform_actions</code> parameter is <code>FALSE</code>, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure generates the specified script and performs the actions to configure the environment directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure performs the actions to configure the environment directly and does not generate a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is <code>FALSE</code>, then the procedure raises an error.</p>
script_directory_object	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>
capture_name	<p>The name of each capture process configured to capture changes. Do not specify an owner. If the <code>bi_directional</code> parameter is set to <code>TRUE</code>, then each capture process created by this procedure has the specified name.</p> <p>If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</p> <p>If NULL, then the system generates a name for each capture process it creates.</p> <p><b>Note:</b> The capture process name cannot be altered after the capture process is created.</p>
capture_queue_table	<p>The name of the queue table for each queue used by a capture process, specified as [<i>schema_name</i>.] <i>queue_table_name</i>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.</p>

**Table 144–1 (Cont.) Common Parameters for Configuration Procedures**

Parameter	Description
capture_queue_name	<p>The name of each queue used by a capture process, specified as [<i>schema_name</i>.] <i>queue_name</i>. For example, <i>strmadmin.streams_queue</i>.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If NULL, then the system generates a name for each queue used by a capture process.</p>
capture_queue_user	<p>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</p> <p>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</p>
propagation_name	<p>The name of each propagation configured to propagate changes. Do not specify an owner.</p> <p>If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set.</p> <p>If NULL, then the system generates a name for each propagation it creates.</p> <p><b>Note:</b> The propagation name cannot be altered after the propagation is created.</p>
apply_name	<p>The name of each apply process configured to apply changes. Do not specify an owner.</p> <p>If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set.</p> <p>The specified name must not match the name of an existing messaging client at the destination database.</p> <p>If NULL, then the system generates a name for each apply process it creates. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter.</p> <p><b>Note:</b> The apply process name cannot be altered after the apply process is created.</p>
apply_queue_table	<p>The name of the queue table for each queue used by an apply process, specified as [<i>schema_name</i>.] <i>queue_table_name</i>. For example, <i>strmadmin.streams_queue_table</i>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the system generates a name for the queue table of each queue used by an apply process, and the current user is the owner of each queue table.</p>

**Table 144–1 (Cont.) Common Parameters for Configuration Procedures**

Parameter	Description
apply_queue_name	<p>The name of each queue used by an apply process, specified as [<i>schema_name</i>.] <i>queue_name</i>. For example, <i>strmadmin.streams_queue</i>.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If NULL, then the system generates a name for each queue used by an apply process.</p>
apply_queue_user	<p>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</p> <p>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</p>
bi_directional	<p>Specify TRUE to configure bi-directional replication between the database specified in <i>source_database</i> and the database specified in <i>destination_database</i>. Both databases are configured as source and destination databases, a capture and apply process is configured to capture changes to both databases, and propagations are configured to propagate these changes. If TRUE, then a database link from the destination database to the source database with the same global name as the source database must exist.</p> <p>Specify FALSE to configure one way replication from the database specified in <i>source_database</i> and the database specified in <i>destination_database</i>. A capture process is configured at the current database and an apply process is configured at the destination database. A propagation is configured if necessary.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for information about when propagations are configured</p>
include_ddl	<p>Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes.</p> <p>Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, are not replicated.</p>

---

## Summary of DBMS\_STREAMS\_ADM Subprograms

**Table 144–2 DBMS\_STREAMS\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ADD_COLUMN Procedure</a> on page 144-27	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
<a href="#">ADD_GLOBAL_PROPAGATION_RULES Procedure</a> on page 144-30	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
<a href="#">ADD_GLOBAL_RULES Procedure</a> on page 144-34	Adds global rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
<a href="#">ADD_MESSAGE_PROPAGATION_RULE Procedure</a> on page 144-39	Either adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist
<a href="#">ADD_MESSAGE_RULE Procedure</a> on page 144-43	Adds a message rule to either the positive or negative rule set of an apply process or messaging client, and creates the specified apply process or messaging client if it does not exist
<a href="#">ADD_SCHEMA_PROPAGATION_RULES Procedure</a> on page 144-46	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
<a href="#">ADD_SCHEMA_RULES Procedure</a> on page 144-50	Adds schema rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
<a href="#">ADD_SUBSET_PROPAGATION_RULES Procedure</a> on page 144-55	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
<a href="#">ADD_SUBSET_RULES Procedure</a> on page 144-59	Adds subset rules to the positive rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist
<a href="#">ADD_TABLE_PROPAGATION_RULES Procedure</a> on page 144-65	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
<a href="#">ADD_TABLE_RULES Procedure</a> on page 144-70	Adds table rules to the rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist

**Table 144–2 (Cont.) DBMS\_STREAMS\_ADM Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CLEANUP_INSTANTIATION_SETUP Procedure</a> on page 144-76	Removes an Oracle Streams replication configuration that was set up by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures in this package
<a href="#">DELETE_COLUMN Procedure</a> on page 144-80	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
<a href="#">GET_MESSAGE_TRACKING Function</a> on page 144-83	Returns the tracking label for the current session
<a href="#">GET_SCN_MAPPING Procedure</a> on page 144-84	Gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment
<a href="#">GET_TAG Function</a> on page 144-86	Gets the binary tag for all redo entries generated by the current session
<a href="#">KEEP_COLUMNS Procedure</a> on page 144-87	Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule
<a href="#">MAINTAIN_CHANGE_TABLE Procedure</a> on page 144-90	Configures an Oracle Streams environment that records in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database
<a href="#">MAINTAIN_GLOBAL Procedure</a> on page 144-97	Configures an Oracle Streams environment that replicates changes at the database level between two databases
<a href="#">MAINTAIN_SCHEMAS Procedure</a> on page 144-101	Configures an Oracle Streams environment that replicates changes to specified schemas between two databases
<a href="#">MAINTAIN_SIMPLE_TABLESPACE Procedure</a> on page 144-106	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure is deprecated.
<a href="#">MAINTAIN_SIMPLE_TTS Procedure</a> on page 144-111	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases
<a href="#">MAINTAIN_TABLES Procedure</a> on page 144-114	Configures an Oracle Streams environment that replicates changes to specified tables between two databases
<a href="#">MAINTAIN_TABLESPACES Procedure</a> on page 144-119	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure is deprecated.
<a href="#">MAINTAIN_TTS Procedure</a> on page 144-126	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases
<a href="#">MERGE_STREAMS Procedure</a> on page 144-130	Merges a stream flowing from one capture process with a stream flowing from another capture process

**Table 144–2 (Cont.) DBMS\_STREAMS\_ADM Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">MERGE_STREAMS_JOB Procedure</a> on page 144-133	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the MERGE_STREAMS procedure to merge the two streams
<a href="#">POST_INSTANTIATION_SETUP Procedure</a> on page 144-136	Performs the actions required after instantiation to configure an Oracle Streams replication environment
<a href="#">PRE_INSTANTIATION_SETUP Procedure</a> on page 144-141	Performs the actions required before instantiation to configure an Oracle Streams replication environment
<a href="#">PURGE_SOURCE_CATALOG Procedure</a> on page 144-146	Removes all Oracle Streams data dictionary information at the local database for the specified object
<a href="#">RECOVER_OPERATION Procedure</a> on page 144-147	Provides options for an Oracle Streams replication configuration operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
<a href="#">REMOVE_QUEUE Procedure</a> on page 144-149	Removes the specified ANYDATA queue
<a href="#">REMOVE_RULE Procedure</a> on page 144-150	Removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, propagation, apply process, or messaging client.
<a href="#">REMOVE_STREAMS_CONFIGURATION Procedure</a> on page 144-152	Removes the Oracle Streams configuration at the local database
<a href="#">RENAME_COLUMN Procedure</a> on page 144-154	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule
<a href="#">RENAME_SCHEMA Procedure</a> on page 144-157	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
<a href="#">RENAME_TABLE Procedure</a> on page 144-159	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
<a href="#">SET_MESSAGE_NOTIFICATION Procedure</a> on page 144-161	Sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue
<a href="#">SET_MESSAGE_TRACKING Procedure</a> on page 144-166	Sets the tracking label for logical change records (LCRs) produced by the current session
<a href="#">SET_RULE_TRANSFORM_FUNCTION Procedure</a> on page 144-167	Sets or removes the transformation function name for a rule-based transformation
<a href="#">SET_TAG Procedure</a> on page 144-171	Sets the binary tag for all redo entries subsequently generated by the current session
<a href="#">SET_UP_QUEUE Procedure</a> on page 144-172	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of Oracle Streams

**Table 144–2 (Cont.) DBMS\_STREAMS\_ADM Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">SPLIT_STREAMS Procedure</a> on page 144-175	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process

---

---

**Note:** All subprograms commit unless specified otherwise.

---

---

## ADD\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

---

---

### Note:

- `ADD_COLUMN` transformations cannot add columns of the following data types: `BLOB`, `CLOB`, `NCLOB`, `BFILE`, `LONG`, `LONG RAW`, `ROWID`, user-defined types (including object types, `REFs`, `varrays`, nested tables), and Oracle-supplied types (including any types, `XML` types, spatial types, and media types).
  - Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
- 
- 

**See Also:** *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

## Syntax

```
DBMS_STREAMS_ADM.ADD_COLUMN(
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_name    IN  VARCHAR2,
  column_value   IN  ANYDATA,
  value_type     IN  VARCHAR2      DEFAULT 'NEW',
  step_number    IN  NUMBER        DEFAULT 0,
  operation      IN  VARCHAR2      DEFAULT 'ADD');
```

```
DBMS_STREAMS_ADM.ADD_COLUMN(
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_name    IN  VARCHAR2,
  column_function IN  VARCHAR2,
  value_type     IN  VARCHAR2      DEFAULT 'NEW',
  step_number    IN  NUMBER        DEFAULT 0,
  operation      IN  VARCHAR2      DEFAULT 'ADD');
```

## Parameters

**Table 144–3 ADD\_COLUMN Procedure Parameters**

Parameter	Description
rule_name	The name of the rule, specified as [ <i>schema_name.</i> ] <i>rule_name</i> . If NULL, then the procedure raises an error.  For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table to which the column is added in the row LCR, specified as [ <i>schema_name.</i> ] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column added to each row LCR that satisfies the rule.
column_value	The value of the added column. Specify the appropriate ANYDATA function for the column data type and the column value. For example, if the data type of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function.  This parameter cannot be specified if the column_function parameter is specified.
column_function	Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function.  The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The data type of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter.  The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE.  The function executes when the rule evaluates to TRUE.  This parameter cannot be specified if the column_value parameter is specified.
value_type	Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.
step_number	The order of execution of the transformation.  <b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

## Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table\_name, column\_name, and step\_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD\_COLUMN procedures when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.

<b>table_name</b>	<b>column_name</b>	<b>step_number</b>	<b>Result</b>
NULL	NULL	non-NULL	Remove all add column transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified <code>column_name</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all add column transformations with the specified <code>column_name</code> for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified <code>table_name</code> for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.

## ADD\_GLOBAL\_PROPAGATION\_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

### Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES (
    streams_name          IN   VARCHAR2  DEFAULT NULL,
    source_queue_name     IN   VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_dml           IN   BOOLEAN   DEFAULT TRUE,
    include_ddl           IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr    IN   BOOLEAN   DEFAULT FALSE,
    source_database       IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name         OUT  VARCHAR2,
    ddl_rule_name         OUT  VARCHAR2,
    inclusion_rule        IN   BOOLEAN   DEFAULT TRUE,
    and_condition         IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue        IN   BOOLEAN   DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES (
    streams_name          IN   VARCHAR2  DEFAULT NULL,
    source_queue_name     IN   VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_dml           IN   BOOLEAN   DEFAULT TRUE,
    include_ddl           IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr    IN   BOOLEAN   DEFAULT FALSE,
    source_database       IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule        IN   BOOLEAN   DEFAULT TRUE,
    and_condition         IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue        IN   BOOLEAN   DEFAULT NULL);
```

### Parameters

**Table 144–4 ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>

**Table 144–4 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name</i>.] <i>queue_name</i>[@<i>dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema and use a database link named <i>db2.net</i>, enter <i>strmadmin.streams_queue@db2.net</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <i>inclusion_rule</i> parameter is set to FALSE.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

**Table 144–4 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database. The source database is where the changes originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The <code>:lcr</code> in the specified condition must be <code>:dml</code> or <code>:ddl</code>. For example, to specify that the global rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Streams tag is the hexadecimal equivalent of <code>'02'</code>, specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Chapter 248, "Logical Change Record TYPES"</a></p>

**Table 144-4 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
queue_to_queue	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>■ If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

## Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

### See Also:

- ["Operational Notes"](#) on page 144-9 and ["Propagation Rules for LCRs"](#) on page 144-11 for more information about the rules created by this procedure
- ["Propagation User"](#) on page 144-6

## Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

## ADD\_GLOBAL\_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database. See ["Capture Process Rules for Changes in the Redo Log"](#) on page 144-10 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying all logical change records (LCRs) in a queue. The rules can specify that the LCRs must be from a particular source database. See ["Apply Process Rules for LCRs"](#) on page 144-12 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing all persistent LCRs from a queue. The rules can specify that the LCRs must be from a particular source database. See ["Messaging Client Rules for LCRs"](#) on page 144-14 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

---

---

**Caution:** If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not supported by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

---

---

---

---

**Note:** Currently, messaging clients cannot dequeue buffered messages.

---

---

### Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES (
    streams_type      IN   VARCHAR2,
    streams_name      IN   VARCHAR2 DEFAULT NULL,
    queue_name        IN   VARCHAR2 DEFAULT 'streams_queue',
    include_dml       IN   BOOLEAN  DEFAULT TRUE,
    include_ddl       IN   BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr IN   BOOLEAN  DEFAULT FALSE,
    source_database   IN   VARCHAR2 DEFAULT NULL,
    dml_rule_name     OUT  VARCHAR2,
    ddl_rule_name     OUT  VARCHAR2,
    inclusion_rule    IN   BOOLEAN  DEFAULT TRUE,
    and_condition     IN   VARCHAR2 DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES (
    streams_type      IN   VARCHAR2,
```

```

streams_name      IN  VARCHAR2  DEFAULT NULL,
queue_name        IN  VARCHAR2  DEFAULT 'streams_queue',
include_dml       IN  BOOLEAN   DEFAULT TRUE,
include_ddl       IN  BOOLEAN   DEFAULT FALSE,
include_tagged_lcr IN  BOOLEAN   DEFAULT FALSE,
source_database   IN  VARCHAR2  DEFAULT NULL,
inclusion_rule     IN  BOOLEAN   DEFAULT TRUE,
and_condition     IN  VARCHAR2  DEFAULT NULL);

```

## Parameters

**Table 144–5 ADD\_GLOBAL\_RULES Procedure Parameters**

Parameter	Description
streams_type	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> <li>Specify <code>capture</code> for a capture process.</li> <li>Specify <code>apply</code> for an apply process.</li> <li>Specify <code>dequeue</code> for a messaging client.</li> </ul>
streams_name	<p>The name of the capture process, apply process, or messaging client. Do not specify an owner.</p> <p>If NULL, if <code>streams_type</code> is <code>capture</code> or <code>dequeue</code>, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If NULL, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> <li>If <code>source_database</code> is NULL and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process and messaging client must have a unique name.</p>
queue_name	<p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</p>

**Table 144–5 (Cont.) ADD\_GLOBAL\_RULES Procedure Parameters**

Parameter	Description
<code>include_dml</code>	If <code>TRUE</code> , then the procedure creates a rule for DML changes. If <code>FALSE</code> , then the procedure does not create a DML rule. <code>NULL</code> is not permitted.
<code>include_ddl</code>	If <code>TRUE</code> , then the procedure creates a rule for DDL changes. If <code>FALSE</code> , then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.
<code>include_tagged_lcr</code>	<p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry or LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
<code>source_database</code>	<p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>For messaging client rules, specify <code>NULL</code> if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>

**Table 144-5 (Cont.) ADD\_GLOBAL\_RULES Procedure Parameters**

Parameter	Description
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the Oracle Streams client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the Oracle Streams client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the global rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Chapter 248, "Logical Change Record TYPES"</a></p>

## Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

## Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

## ADD\_MESSAGE\_PROPAGATION\_RULE Procedure

This procedure adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains the OUT parameter `rule_name`, and the other does not.

### Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE (
  message_type          IN   VARCHAR2,
  rule_condition        IN   VARCHAR2,
  streams_name         IN   VARCHAR2  DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
  rule_name            OUT  VARCHAR2,
  queue_to_queue       IN   BOOLEAN   DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE (
  message_type          IN   VARCHAR2,
  rule_condition        IN   VARCHAR2,
  streams_name         IN   VARCHAR2  DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
  queue_to_queue       IN   BOOLEAN   DEFAULT NULL);
```

### Parameters

**Table 144–6 ADD\_MESSAGE\_PROPAGATION\_RULE Procedure Parameters**

Parameter	Description
<code>message_type</code>	<p>The type of the message. The type can be an Oracle built-in type, such as <code>VARCHAR2</code> or <code>NUMBER</code>, or it can be a user-defined type.</p> <p>If the type is not an Oracle built-in type, then it is specified as <code>[schema_name.] type_name</code>. If the schema is not specified, then the current user is the default.</p> <p>For example, to specify <code>VARCHAR2</code>, enter <code>VARCHAR2 (n)</code>, where <code>n</code> is the size specification. To specify a type named <code>usr_msg</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.usr_msg</code> for this parameter.</p> <p>The following data types require a size specification: <code>VARCHAR2</code>, <code>NVARCHAR2</code>, and <code>RAW</code>.</p> <p><b>See Also:</b> <i>Oracle Database SQL Language Reference</i> for more information about data types</p>
<code>rule_condition</code>	<p>The rule condition for this message type. The rule variable name specified in the rule condition must be the following:</p> <pre>:msg</pre>

**See Also:** "Examples" on page 144-41

**Table 144–6 (Cont.) ADD\_MESSAGE\_PROPAGATION\_RULE Procedure Parameters**

Parameter	Description
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name.</i>] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name.</i>] <i>queue_name</i>[<i>@dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema and use a database link named <i>db2.net</i>, enter <i>strmadmin.streams_queue@db2.net</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>
inclusion_rule	<p>If <i>inclusion_rule</i> is TRUE, then the procedure adds the rule to the positive rule set for the propagation.</p> <p>If <i>inclusion_rule</i> is FALSE, then the procedure adds the rule to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
rule_name	Contains the rule name

**Table 144–6 (Cont.) ADD\_MESSAGE\_PROPAGATION\_RULE Procedure Parameters**

Parameter	Description
queue_to_queue	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>▪ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>▪ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>▪ If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

## Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

### See Also:

- ["Operational Notes"](#) on page 144-9 and ["Propagation Rules for User Messages"](#) on page 144-12 for more information about the rules created by this procedure
- ["Propagation User"](#) on page 144-6

## Examples

Suppose the message type is `VARCHAR2 (128)`. Given this type, the following rule condition can be specified:

```
':msg = 'HQ'''
```

This rule condition evaluates to TRUE if a user message of type `VARCHAR2 (128)` has HQ for its value.

Suppose the message type is `usr_msg`, and that this type has the following attributes: `source_dbname`, `owner`, `name`, and `message`. Given this type, the following rule condition can be specified:

```
':msg.source_dbname = 'DBS1.NET' AND ' || ':msg.owner = 'HR' AND ' ||  
' :msg.name = 'EMPLOYEES''
```

This rule condition evaluates to TRUE if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

---

---

**Note:** The quotation marks in the preceding examples are all single quotation marks.

---

---

## ADD\_MESSAGE\_RULE Procedure

This procedure adds a message rule to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `apply`, this procedure adds an apply process rule for dequeuing user messages of a specific message type from a queue. See ["Apply Process Rules for User Messages"](#) on page 144-13 for more information about such rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds a messaging client rule for dequeuing user messages of a specific message type from a queue. See ["Messaging Client Rules for User Messages"](#) on page 144-14 for more information about such rules.

This procedure also creates the specified Oracle Streams client if it does not exist.

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

---

---

**Note:** Currently, messaging clients cannot dequeue buffered messages.

---

---

### Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE (
  message_type      IN   VARCHAR2,
  rule_condition    IN   VARCHAR2,
  streams_type      IN   VARCHAR2,
  streams_name      IN   VARCHAR2 DEFAULT NULL,
  queue_name        IN   VARCHAR2 DEFAULT 'streams_queue',
  inclusion_rule    IN   BOOLEAN  DEFAULT TRUE,
  rule_name         OUT  VARCHAR2);
```

```
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE (
  message_type      IN   VARCHAR2,
  rule_condition    IN   VARCHAR2,
  streams_type      IN   VARCHAR2,
  streams_name      IN   VARCHAR2 DEFAULT NULL,
  queue_name        IN   VARCHAR2 DEFAULT 'streams_queue',
  inclusion_rule    IN   BOOLEAN  DEFAULT TRUE);
```

## Parameters

**Table 144–7 ADD\_MESSAGE\_RULE Procedure Parameters**

Parameter	Description
message_type	<p>The type of the message. The type can be an Oracle built-in type, such as VARCHAR2 or NUMBER, or it can be a user-defined type.</p> <p>If the type is not an Oracle built-in type, then it is specified as [<i>schema_name</i>.] <i>type_name</i>. If the schema is not specified, then the current user is the default.</p> <p>For example, to specify VARCHAR2, enter VARCHAR2 (<i>n</i>), where <i>n</i> is the size specification. To specify a type named <i>usr_msg</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.usr_msg</i> for this parameter.</p> <p>The following data types require a size specification: VARCHAR2, NVARCHAR2, and RAW.</p> <p><b>See Also:</b> <i>Oracle Database SQL Language Reference</i> for more information about data types</p>
rule_condition	<p>The rule condition for this message type. The rule variable name specified in the rule condition must be the following:</p> <p>:msg</p> <p><b>See Also:</b> "Examples" on page 144-45</p>
streams_type	The type of message consumer, either <i>apply</i> for apply process or <i>dequeue</i> for messaging client
streams_name	<p>The name of the Oracle Streams apply process or messaging client.</p> <p>If the specified <i>streams_type</i> is <i>apply</i>, then specify the name of the apply process. Do not specify an owner. If the specified apply process does not exist, then the procedure creates it automatically with a system-generated name.</p> <p>If the specified <i>streams_type</i> is <i>dequeue</i>, then specify the messaging client. For example, if the user <i>strmadmin</i> is the messaging client, then specify <i>strmadmin</i>.</p> <p>If NULL and a relevant apply process or messaging client for the queue exists, then the procedure uses the relevant apply process or messaging client. If NULL and multiple relevant apply processes or messaging clients for the queue exist, then the procedure raises an error.</p> <p>If NULL and no Oracle Streams client of the specified <i>streams_type</i> exists for the queue, then the procedure creates an apply process or messaging client automatically with a system-generated name.</p> <p>An apply process and a messaging client cannot have the same name.</p>
queue_name	<p>The name of the local queue from which messages will be dequeued, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter. If the schema is not specified, then the current user is the default.</p>
inclusion_rule	<p>If <i>inclusion_rule</i> is TRUE, then the procedure adds the rule to the positive rule set for the apply process or messaging client.</p> <p>If <i>inclusion_rule</i> is FALSE, then the procedure adds the rule to the negative rule set for the apply process or messaging client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
rule_name	Contains the rule name

## Usage Notes

If an apply process rule is added, then this procedure creates the apply process if it does not exist. An apply process created by this procedure can apply only user messages, and dequeued messages are sent to the message handler for the apply process. If a messaging client rule is added, then this procedure creates a messaging client if it does not exist.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

- ["Operational Notes"](#) on page 144-9
- ["Security Model"](#) on page 144-5
- [ALTER\\_APPLY Procedure](#) on page 21-10 for more information about setting a message handler for an apply process

## Examples

Suppose the message type is `VARCHAR2 (128)`. Given this type, the following rule condition can be specified:

```
':msg = 'HQ'''
```

This rule condition evaluates to `TRUE` if a user message of type `VARCHAR2 (128)` has `HQ` for its value.

Suppose the message type is `usr_msg`, and that this type has the following attributes: `source_dbname`, `owner`, `name`, and `message`. Given this type, the following rule condition can be specified:

```
':msg.source_dbname = 'DBS1.NET'' AND ' || ':msg.owner = 'HR'' AND ' || ':msg.name = 'EMPLOYEES'''
```

This rule condition evaluates to `TRUE` if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

---

---

**Note:** The quotation marks in the preceding examples are all single quotation marks.

---

## ADD\_SCHEMA\_PROPAGATION\_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

### Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES (
  schema_name          IN   VARCHAR2,
  streams_name         IN   VARCHAR2  DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_dml          IN   BOOLEAN  DEFAULT TRUE,
  include_ddl          IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
  source_database      IN   VARCHAR2  DEFAULT NULL,
  dml_rule_name        OUT  VARCHAR2,
  ddl_rule_name        OUT  VARCHAR2,
  inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
  and_condition        IN   VARCHAR2  DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN  DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES (
  schema_name          IN   VARCHAR2,
  streams_name         IN   VARCHAR2  DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_dml          IN   BOOLEAN  DEFAULT TRUE,
  include_ddl          IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
  source_database      IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
  and_condition        IN   VARCHAR2  DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN  DEFAULT NULL);
```

### Parameters

**Table 144–8 ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
schema_name	The name of the schema. For example, hr.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

**Table 144–8 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name</i>.] <i>queue_name</i>[<i>@dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema and use a database link named <i>db2.net</i>, enter <i>strmadmin.streams_queue@db2.net</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <i>inclusion_rule</i> parameter is set to FALSE.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

**Table 144–8 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The <code>:lcr</code> in the specified condition must be <code>:dml</code> or <code>:ddl</code>. For example, to specify that the schema rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Streams tag is the hexadecimal equivalent of <code>'02'</code>, specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Chapter 248, "Logical Change Record TYPES"</a></p>

**Table 144–8 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
queue_to_queue	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>■ If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

## Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

### See Also:

- ["Operational Notes"](#) on page 144-9 and ["Propagation Rules for LCRs"](#) on page 144-11 for more information about the rules created by this procedure
- ["Propagation User"](#) on page 144-6

## Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

## ADD\_SCHEMA\_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema. See ["Capture Process Rules for Changes in the Redo Log"](#) on page 144-10 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See ["Apply Process Rules for LCRs"](#) on page 144-12 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See ["Messaging Client Rules for LCRs"](#) on page 144-14 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

---

---

**Caution:** If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

---

---

---

---

**Note:** Currently, messaging clients cannot dequeue buffered messages.

---

---

### Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES (
  schema_name          IN   VARCHAR2,
  streams_type         IN   VARCHAR2,
  streams_name        IN   VARCHAR2  DEFAULT NULL,
  queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN   DEFAULT TRUE,
  include_ddl         IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
  source_database     IN   VARCHAR2  DEFAULT NULL,
  dml_rule_name       OUT  VARCHAR2,

  inclusion_rule  IN   BOOLEAN   DEFAULT TRUE,
  and_condition   IN   VARCHAR2  DEFAULT NULL);

```

## Parameters

**Table 144–9 ADD\_SCHEMA\_RULES Procedure Parameters**

Parameter	Description
schema_name	<p>The name of the schema. For example, hr.</p> <p>You can specify a schema that does not yet exist, because Oracle Streams does not validate the existence of the schema.</p>
streams_type	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> <li>▪ Specify <code>capture</code> for a capture process.</li> <li>▪ Specify <code>apply</code> for an apply process.</li> <li>▪ Specify <code>dequeue</code> for a messaging client.</li> </ul>
streams_name	<p>The name of the capture process, apply process, or messaging client. Do not specify an owner.</p> <p>If NULL, if <code>streams_type</code> is <code>capture</code> or <code>dequeue</code>, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If NULL, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>▪ If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> <li>▪ If <code>source_database</code> is NULL and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process and messaging client must have a unique name.</p>

**Table 144–9 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

Parameter	Description
queue_name	<p>The name of the local queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

**Table 144–9 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>For messaging client rules, specify <code>NULL</code> if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the Oracle Streams client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the Oracle Streams client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

**Table 144–9 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

Parameter	Description
<code>and_condition</code>	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Chapter 248, "Logical Change Record TYPES"</a></p>

## Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

**See Also:**

- ["Operational Notes"](#) on page 144-9
- ["Security Model"](#) on page 144-5

## Examples

The following is an example of a schema rule condition created for DML changes:

```
( (:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

## ADD\_SUBSET\_PROPAGATION\_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

### Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES (
  table_name          IN   VARCHAR2,
  dml_condition       IN   VARCHAR2,
  streams_name        IN   VARCHAR2  DEFAULT NULL,
  source_queue_name   IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2  DEFAULT NULL,
  insert_rule_name    OUT  VARCHAR2,
  update_rule_name    OUT  VARCHAR2,
  delete_rule_name    OUT  VARCHAR2,
  queue_to_queue      IN   BOOLEAN  DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES (
  table_name          IN   VARCHAR2,
  dml_condition       IN   VARCHAR2,
  streams_name        IN   VARCHAR2  DEFAULT NULL,
  source_queue_name   IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2  DEFAULT NULL,
  queue_to_queue      IN   BOOLEAN  DEFAULT NULL);
```

### Parameters

**Table 144–10 ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
table_name	The name of the table specified as [ <i>schema_name.</i> ] <i>object_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default.  The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.
dml_condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.  For example, to specify rows in the <i>hr.employees</i> table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition:  ' salary > 4000 and job_id = 'SA_MAN' '
	<b>Note:</b> The quotation marks in the preceding example are all single quotation marks.

**Table 144–10 (Cont.) ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name</i>.] <i>queue_name</i>[@<i>dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema and use a database link named <i>db2.net</i>, enter <i>strmadmin.streams_queue@db2.net</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>
include_tagged_lcr	<p>If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.</p> <p>If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
source_database	<p>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <i>DBS1</i> and the domain is <i>.NET</i>, then the procedure specifies <i>DBS1.NET</i> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>

**Table 144–10 (Cont.) ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes
queue_to_queue	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>■ If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

## Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the `dml_condition` parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified `dml_condition`, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified `dml_condition`, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the DBMS\_STREAMS\_ADM package or the DBMS\_RULE\_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD\_SUBSET\_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

---

---

**Attention:** Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

---

---

**See Also:**

- ["Operational Notes"](#) on page 144-9 and ["Propagation Rules for LCRs"](#) on page 144-11 for more information about the rules created by this procedure
- ["Propagation User"](#) on page 144-6

## Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `db1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

## ADD\_SUBSET\_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table. See ["Capture Process Rules for Changes in the Redo Log"](#) on page 144-10 for more information about these rules.
- When the `streams_type` parameter is set to `sync_capture`, this procedure adds rules for capturing changes to a subset of rows in a specified table. See ["Synchronous Capture Rules for DML Changes to Tables"](#) on page 144-11 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See ["Apply Process Rules for LCRs"](#) on page 144-12 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See ["Messaging Client Rules for LCRs"](#) on page 144-14 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

---

---

### Note:

- Currently, messaging clients cannot dequeue buffered messages.
  - The invoking user must be granted the `DBA` role to create a synchronous capture.
- 
- 

## Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_RULES (
  table_name          IN   VARCHAR2,
  dml_condition       IN   VARCHAR2,
  streams_type        IN   VARCHAR2 DEFAULT 'apply',
  streams_name        IN   VARCHAR2 DEFAULT NULL,
  queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2 DEFAULT NULL,
  insert_rule_name    OUT  VARCHAR2,
  update_rule_name    OUT  VARCHAR2,
  delete_rule_name    OUT  VARCHAR2);
```

```
DBMS_STREAMS_ADM.ADD_SUBSET_RULES (
  table_name          IN   VARCHAR2,
  dml_condition       IN   VARCHAR2,
  streams_type        IN   VARCHAR2 DEFAULT 'apply',
```

```

streams_name      IN  VARCHAR2 DEFAULT NULL,
queue_name        IN  VARCHAR2 DEFAULT 'streams_queue',
include_tagged_lcr IN  BOOLEAN  DEFAULT FALSE,
source_database   IN  VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 144–11 ADD\_SUBSET\_RULES Procedure Parameters**

Parameter	Description
table_name	<p>The name of the table specified as [<i>schema_name.</i>] <i>object_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p> <p>The specified table must exist in the same database as the capture process, synchronous capture, apply process, or messaging client. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</p>
dml_condition	<p>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.</p> <p>For example, to specify rows in the <i>hr.employees</i> table where the <i>salary</i> is greater than 4000 and the <i>job_id</i> is <i>SA_MAN</i>, enter the following as the condition:</p> <pre>' salary &gt; 4000 and job_id = 'SA_MAN' '</pre> <p><b>Note:</b> The quotation marks in the preceding example are all single quotation marks.</p>
streams_type	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> <li>▪ Specify <i>capture</i> for a capture process.</li> <li>▪ Specify <i>sync_capture</i> for a synchronous capture.</li> <li>▪ Specify <i>apply</i> for an apply process.</li> <li>▪ Specify <i>dequeue</i> for a messaging client.</li> </ul>

**Table 144–11 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters**

Parameter	Description
streams_name	<p>The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner.</p> <p>If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error.</p> <p>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</li> <li>■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process and messaging client must have a unique name.</p>
queue_name	<p>The name of the local queue, specified as [ schema_name . ] queue_name. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</p>

**Table 144–11 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters**

Parameter	Description
<code>include_tagged_lcr</code>	<p>If <code>TRUE</code>, then the Oracle Streams client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> <li>■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.</li> <li>■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag.</li> <li>■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag.</li> </ul> <p>If <code>FALSE</code>, then an Oracle Streams client performs its action only when the tag is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li>■ A redo entry is considered for capture by a capture process only when the redo entry contains a <code>NULL</code> tag.</li> <li>■ A change is considered for capture by a synchronous capture only when the session that makes the change has a <code>NULL</code> tag.</li> <li>■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a <code>NULL</code> tag.</li> </ul> <p>A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
<code>source_database</code>	<p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For synchronous capture rules, specify the name of the local database.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>For messaging client rules, specify <code>NULL</code> if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>
<code>insert_rule_name</code>	<p>Contains the system-generated <code>INSERT</code> rule name. This rule handles inserts and updates that must be converted into inserts.</p>

**Table 144–11 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters**

Parameter	Description
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes

## Usage Notes

Running this procedure generates three rules for the specified capture process, synchronous capture, apply process, or messaging client: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the `dml_condition` parameter are captured, applied, or dequeued. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified `dml_condition`, then the DML change is captured, applied, or dequeued without any changes.
- If neither the new or old values in a DML change satisfy the specified `dml_condition`, then the DML change is not captured, applied, or dequeued.
- If the old values for a DML change satisfy the specified `dml_condition`, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified `dml_condition`, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering. If the Oracle Streams client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

---

---

**Attention:** Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

---

---

**See Also:**

- ["Operational Notes"](#) on page 144-9
- ["Security Model"](#) on page 144-5

**Examples**

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'  
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'  
AND :dml.get_command_type()='UPDATE'  
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)  
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)  
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)  
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

## ADD\_TABLE\_PROPAGATION\_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

### Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name           IN   VARCHAR2,
    streams_name        IN   VARCHAR2  DEFAULT NULL,
    source_queue_name   IN   VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml         IN   BOOLEAN   DEFAULT TRUE,
    include_ddl        IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
    source_database     IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name       OUT  VARCHAR2,
    ddl_rule_name       OUT  VARCHAR2,
    inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
    and_condition       IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue     IN   BOOLEAN   DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name           IN   VARCHAR2,
    streams_name        IN   VARCHAR2  DEFAULT NULL,
    source_queue_name   IN   VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml         IN   BOOLEAN   DEFAULT TRUE,
    include_ddl        IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
    source_database     IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
    and_condition       IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue     IN   BOOLEAN   DEFAULT NULL);
```

### Parameters

**Table 144–12 ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
table_name	The name of the table specified as [ <i>schema_name</i> .] <i>table_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

**Table 144–12 (Cont.) ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name</i>.] <i>queue_name</i>[<i>@dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema and use a database link named <i>db2.net</i>, enter <i>strmadmin.streams_queue@db2.net</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>
include_dml	<p>If <b>TRUE</b>, then the procedure creates a rule for DML changes. If <b>FALSE</b>, then the procedure does not create a DML rule. <b>NULL</b> is not permitted.</p>
include_ddl	<p>If <b>TRUE</b>, then the procedure creates a rule for DDL changes. If <b>FALSE</b>, then the procedure does not create a DDL rule. <b>NULL</b> is not permitted.</p> <p>The generated rule evaluates to <b>TRUE</b> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <b>FALSE</b> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <b>FALSE</b> for changes that create synonyms or views based on the table. The rule also evaluates to <b>FALSE</b> for a change to a PL/SQL subprogram that refers to the table.</p>

**Table 144–12 (Cont.) ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
include_tagged_lcr	<p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a logical change record (LCR) has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if an LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
source_database	<p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

**Table 144–12 (Cont.) ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
<code>and_condition</code>	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Chapter 248, "Logical Change Record TYPES"</a></p>
<code>queue_to_queue</code>	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>■ If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

## Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The

sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

**See Also:**

- ["Operational Notes"](#) on page 144-9 and ["Propagation Rules for LCRs"](#) on page 144-11 for more information about the rules created by this procedure
- ["Security Model"](#) on page 144-5

## Examples

The following is an example of a table rule condition created for filtering DML statements:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))  
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

## ADD\_TABLE\_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table. See ["Capture Process Rules for Changes in the Redo Log"](#) on page 144-10 for more information about these rules.
- When the `streams_type` parameter is set to `sync_capture`, this procedure adds rules for capturing changes to a specified table. See ["Synchronous Capture Rules for DML Changes to Tables"](#) on page 144-11 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See ["Apply Process Rules for LCRs"](#) on page 144-12 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See ["Messaging Client Rules for LCRs"](#) on page 144-14 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

---

---

### Note:

- Currently, messaging clients cannot dequeue buffered messages.
  - The invoking user must be granted the `DBA` role to create a synchronous capture.
-

## Parameters

**Table 144–13 ADD\_TABLE\_RULES Procedure Parameters**

Parameter	Description
table_name	<p>The name of the table specified as [<i>schema_name</i>.] <i>object_name</i>. For example, hr.employees. If the schema is not specified, then the current user is the default.</p> <p>You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table.</p>
streams_type	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> <li>■ Specify <i>capture</i> for a capture process.</li> <li>■ Specify <i>sync_capture</i> for a synchronous capture.</li> <li>■ Specify <i>apply</i> for an apply process.</li> <li>■ Specify <i>dequeue</i> for a messaging client.</li> </ul>
streams_name	<p>The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner.</p> <p>If NULL, if <i>streams_type</i> is <i>capture</i>, <i>sync_capture</i>, or <i>dequeue</i>, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified <i>streams_type</i> for the queue exist, then the procedure raises an error.</p> <p>If NULL, if <i>streams_type</i> is <i>apply</i>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>■ If one existing apply process has the source database specified in <i>source_database</i> and uses the queue specified in <i>queue_name</i>, then the procedure uses this apply process.</li> <li>■ If <i>source_database</i> is NULL and one existing apply process is using the queue specified in <i>queue_name</i>, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process and messaging client must have a unique name.</p>

**Table 144–13 (Cont.) ADD\_TABLE\_RULES Procedure Parameters**

Parameter	Description
queue_name	<p>The name of the local queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</p>
include_dml	<p>If <code>TRUE</code>, then the procedure creates a DML rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p>
include_ddl	<p>If <code>TRUE</code>, then the procedure creates a DDL rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p> <p>The generated rule evaluates to <code>TRUE</code> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <code>FALSE</code> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <code>FALSE</code> for changes that create synonyms or views based on the table. The rule also evaluates to <code>FALSE</code> for a change to a PL/SQL subprogram that refers to the table.</p>

**Table 144–13 (Cont.) ADD\_TABLE\_RULES Procedure Parameters**

Parameter	Description
<code>include_tagged_lcr</code>	<p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry, session, or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the Oracle Streams client, then the Oracle Streams client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> <li>■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-<code>NULL</code> tag.</li> <li>■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-<code>NULL</code> tag.</li> <li>■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-<code>NULL</code> tag.</li> </ul> <p>If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the Oracle Streams client, then whether a database change is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry, session, or LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for an Oracle Streams client, then the Oracle Streams client performs its action only when the tag is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li>■ A redo entry is considered for capture by a capture process only when the redo entry contains a <code>NULL</code> tag.</li> <li>■ A change is considered for capture by a synchronous capture only when the session that makes the change has a <code>NULL</code> tag.</li> <li>■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a <code>NULL</code> tag.</li> </ul> <p>If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the Oracle Streams client, then a database change can be discarded only if it has a <code>NULL</code> tag.</p> <p>A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

**Table 144–13 (Cont.) ADD\_TABLE\_RULES Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For synchronous capture rules, specify the name of the local database.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>
dml_rule_name	<p>If include_dml is TRUE, then this parameter contains the DML rule name.</p> <p>If include_dml is FALSE, then this parameter contains a NULL.</p>
ddl_rule_name	<p>If include_ddl is TRUE, then this parameter contains the DDL rule name.</p> <p>If include_ddl is FALSE, then this parameter contains a NULL.</p>
inclusion_rule	<p>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client.</p> <p>If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. A synchronous capture cannot have a negative rule set. Specifying FALSE for a synchronous capture raises an error.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

**Table 144–13 (Cont.) ADD\_TABLE\_RULES Procedure Parameters**

Parameter	Description
and_condition	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p><b>See Also:</b> <a href="#">Chapter 248, "Logical Change Record TYPES"</a></p>

## Usage Notes

This procedure creates DML and DDL rules automatically based on include\_dml and include\_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering.

## Examples

The following is an example of a table rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

## CLEANUP\_INSTANTIATION\_SETUP Procedure

This procedure removes an Oracle Streams replication configuration that was set up by the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures in this package. This procedure either remove the configuration directly, or it can generate a script that removes the configuration.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

---

---

**Attention:** When the `CLEANUP_INSTANTIATION_SETUP` procedure is run, the parameter values must match the parameter values specified when the corresponding `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures were run, except for the values of the following parameters: `perform_actions`, `script_name`, and `script_directory_object`.

---

---

    apply_queue_user       IN VARCHAR2   DEFAULT NULL,
    bi_directional         IN BOOLEAN   DEFAULT FALSE,
    change_global_name     IN BOOLEAN   DEFAULT FALSE);
```

## Parameters

**Table 144–14 CLEANUP\_INSTANTIATION\_SETUP Procedure Parameters**

Parameter	Description
maintain_mode	<p>Specify one of the following:</p> <ul style="list-style-type: none"> <li>■ GLOBAL to clean up the Oracle Streams configuration that maintained the entire database in both the source and destination databases</li> <li>■ TRANSPORTABLE TABLESPACES to cleanup the Oracle Streams configuration that maintained a set of tablespaces at both the source and destination database</li> </ul>
tablespace_names	<p>If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects.</p> <p>If maintain_mode is set to GLOBAL, then specify an empty tablespace set.</p> <p>Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL.</p> <p><b>See Also:</b> <a href="#">TABLESPACE_SET Table Type</a> on page 149-9</p>
source_database	<p>The global name of the source database.</p> <p>If NULL, then the procedure uses the global name of the local database.</p>
destination_database	<p>The global name of the destination database. A database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure raises an error.</p>
perform_actions	<p>If TRUE, then this procedure performs the necessary actions to clean up the Oracle Streams configuration directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to clean up the Oracle Streams configuration directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> <li>■ script_name</li> <li>■ script_directory_object</li> </ul>

**Table 144–14 (Cont.) CLEANUP\_INSTANTIATION\_SETUP Procedure Parameters**

Parameter	Description
<code>script_name</code>	<p>If non-NULL and the <code>perform_actions</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to clean up the Oracle Streams configuration. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the statements are appended to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is TRUE, then this procedure generates the specified script and performs the actions to clean up the Oracle Streams configuration directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is TRUE, then this procedure directly performs the actions to clean up the Oracle Streams configuration without generating a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is FALSE, then the procedure raises an error.</p>
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then this parameter is ignored, and this procedure does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>
<code>capture_name</code>	<p>The name of the capture processes configured to capture changes in the Oracle Streams configuration. Do not specify an owner.</p> <p>If NULL, then the procedure automatically identifies the capture processes with system-generated names created by the <code>PRE_INSTANTIATION_SETUP</code> and <code>POST_INSTANTIATION_SETUP</code> procedures.</p>
<code>capture_queue_table</code>	<p>The name of the queue table for each queue used by a capture process, specified as [<i>schema_name</i>.] <i>queue_table_name</i>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the procedure automatically identifies the capture queue tables with system-generated names created by the <code>PRE_INSTANTIATION_SETUP</code> and <code>POST_INSTANTIATION_SETUP</code> procedures.</p>
<code>capture_queue_name</code>	<p>The name of each queue used by a capture process, specified as [<i>schema_name</i>.] <i>queue_name</i>. For example, <code>strmadmin.streams_queue</code>.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If NULL, then the procedure automatically identifies the capture queues with system-generated names created by the <code>PRE_INSTANTIATION_SETUP</code> and <code>POST_INSTANTIATION_SETUP</code> procedures.</p>
<code>capture_queue_user</code>	<p>The name of the user who has <code>ENQUEUE</code> and <code>DEQUEUE</code> privileges for the queue at the source database. This user is a secure queue user of the queue.</p>

**Table 144–14 (Cont.) CLEANUP\_INSTANTIATION\_SETUP Procedure Parameters**

Parameter	Description
propagation_name	<p>The name of the propagations configured to propagate changes in the Oracle Streams configuration. Do not specify an owner.</p> <p>If NULL, then the procedure automatically identifies the propagations with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</p>
apply_name	<p>The name of the apply processes configured to apply changes in the Oracle Streams configuration. Do not specify an owner.</p> <p>If NULL, then the procedure automatically identifies the apply processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</p>
apply_queue_table	<p>The name of the queue table for each queue used by an apply process, specified as <i>[schema_name.]queue_table_name</i>. For example, <i>strmadmin.streams_queue_table</i>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the procedure automatically identifies the apply queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</p>
apply_queue_name	<p>The name of each queue used by an apply process, specified as <i>[schema_name.]queue_name</i>. For example, <i>strmadmin.streams_queue</i>.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If NULL, then the procedure automatically identifies the apply queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</p>
apply_queue_user	<p>The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user is a secure queue user of the queue.</p>
bi_directional	<p>Specify TRUE if the Oracle Streams replication configuration is bi-directional between the database specified in <i>source_database</i> and the database specified in <i>destination_database</i>.</p> <p>Specify FALSE if the Oracle Streams replication configuration is one way replication from the current database to the database specified in <i>destination_database</i>.</p>
change_global_name	<p>If TRUE, then the procedure changes the global name of the database specified in <i>destination_database</i> to match the global name of the current database.</p> <p>If FALSE, then the procedure does not change the global name of the database specified in <i>destination_database</i>.</p>

## DELETE\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

---

---

### Note:

- The `DELETE_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
  - The `DELETE_COLUMN` procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the `KEEP_COLUMNS` procedure in this package.
  - Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
- 
- 

### See Also:

- *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "[KEEP\\_COLUMNS Procedure](#)" on page 144-87

## Syntax

```
DBMS_STREAMS_ADM.DELETE_COLUMN(
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_name    IN  VARCHAR2,
  value_type     IN  VARCHAR2  DEFAULT '*',
  step_number    IN  NUMBER     DEFAULT 0,
  operation      IN  VARCHAR2  DEFAULT 'ADD');
```

## Parameters

**Table 144–15** *DELETE\_COLUMN Procedure Parameters*

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as [ <i>schema_name.</i> ] <i>rule_name</i> . If <code>NULL</code> , then the procedure raises an error.  For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.

**Table 144–15 (Cont.) DELETE\_COLUMN Procedure Parameters**

Parameter	Description
table_name	The name of the table from which the column is deleted in the row LCR, specified as [ <i>schema_name</i> . ] <i>object_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default.
column_name	The name of the column deleted from each row LCR that satisfies the rule.
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation.  <b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. See " <a href="#">Usage Notes</a> " on page 144-81 for more information about this parameter.

## Usage Notes

When 'REMOVE' is specified for the *operation* parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified *table\_name*, *column\_name*, and *step\_number* parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE\_COLUMN procedure when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified <i>step_number</i> for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified <i>column_name</i> and <i>step_number</i> for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified <i>table_name</i> and <i>step_number</i> for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified <i>column_name</i> for the specified rule.
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified <i>table_name</i> and <i>column_name</i> for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified <i>table_name</i> for the specified rule.

<b>table_name</b>	<b>column_name</b>	<b>step_number</b>	<b>Result</b>
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.

## GET\_MESSAGE\_TRACKING Function

Returns the tracking label for the current session.

**See Also:** [SET\\_MESSAGE\\_TRACKING Procedure](#) on page 144-166

### Syntax

```
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING  
RETURN VARCHAR2;
```

## GET\_SCN\_MAPPING Procedure

This procedure gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment. This information can be used for the following purposes:

- To recover transactions after point-in-time recovery is performed on a source database in a multiple source Oracle Streams environment
- To run flashback queries for the corresponding SCN at a source database and destination database in an Oracle Streams single source replication environment

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about point-in-time recovery and flashback queries in an Oracle Streams replication environment

### Syntax

```
DBMS_STREAMS_ADM.GET_SCN_MAPPING (
  apply_name          IN  VARCHAR2,
  src_pit_scn         IN  NUMBER,
  dest_instantiation_scn OUT NUMBER,
  dest_start_scn      OUT NUMBER,
  dest_skip_txn_ids   OUT DBMS_UTILITY.NAME_ARRAY);
```

### Parameters

**Table 144–16** GET\_SCN\_MAPPING Procedure Parameters

Parameter	Description
apply_name	Name of the apply process which applies logical change records (LCRs) from the source database. The procedure raises an error if the specified apply process does not exist.
src_pit_scn	The SCN at the source database. For point-in-time recovery, specify the point-in-time recovery SCN at the source database. If the specified SCN is greater than the source commit SCN of the last applied transaction, then NULL is returned for both dest_start_scn and dest_instantiation_scn. In this case, no values can be returned for these parameters because the corresponding transaction has not been applied at the destination database yet.
dest_instantiation_scn	The SCN at the destination database that corresponds to the specified src_pit_scn at the source database. For point-in-time recovery, use this value for the instantiation SCNs at the source database during recovery.
dest_start_scn	For point in time recovery, the SCN to use for the start_scn parameter for the recovery capture process.

**Table 144–16 (Cont.) GET\_SCN\_MAPPING Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>dest_skip_txn_ids</code>	<p>Transaction IDs of transactions that were skipped at the <code>dest_instantiation_scn</code> because the apply process was applying nondependent transactions out of order.</p> <p>For point in time recovery, these transaction IDs should be ignored by the recovery apply process.</p> <p>This parameter is relevant only if the <code>commit_serialization</code> for the apply process that applied these transactions was set to <code>DEPENDENT_TRANSACTIONS</code>, and the transactions were applied out of order.</p>

## GET\_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

**See Also:**

- ["SET\\_TAG Procedure"](#) on page 144-171
- *Oracle Streams Replication Administrator's Guide* for more information about tags

### Syntax

```
DBMS_STREAMS_ADM.GET_TAG  
RETURN RAW;
```

### Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON  
DECLARE  
    raw_tag RAW(2000);  
BEGIN  
    raw_tag := DBMS_STREAMS_ADM.GET_TAG();  
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));  
END;  
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
```

## KEEP\_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

---

---

### Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Streams capture processes.
  - The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
  - Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
- 
- 

### See Also:

- *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- ["DELETE\\_COLUMN Procedure"](#) on page 144-80

## Syntax

```
DBMS_STREAMS_ADM.KEEP_COLUMNS (
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_list    IN  VARCHAR2,
  value_type     IN  VARCHAR2 DEFAULT '*',
  step_number    IN  NUMBER DEFAULT 0,
  operation      IN  VARCHAR2 DEFAULT 'ADD');
```

```
DBMS_STREAMS_ADM.KEEP_COLUMNS (
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_table   IN  DBMS_UTILITY.LNAME_ARRAY,
  value_type     IN  VARCHAR2 DEFAULT '*',
  step_number    IN  NUMBER DEFAULT 0,
```

```
operation      IN VARCHAR2 DEFAULT 'ADD');
```

## Parameters

**Table 144–17** KEEP\_COLUMNS Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [ <i>schema_name.</i> ] <i>rule_name</i> . If NULL, then the procedure raises an error.  For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table for which the columns are kept in the row LCR, specified as [ <i>schema_name.</i> ] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
column_list	The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR.  If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.
column_table	The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL.  The transformation removes columns that are not in the table from the row LCR.  If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.
value_type	Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.
step_number	The order of execution of the transformation.  <b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.  See " <a href="#">Usage Notes</a> " on page 144-88 for more information about this parameter.

## Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table\_name, column\_list, column\_table, and step\_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP\_COLUMNS procedure when one or more of these parameters is NULL:

table_name	column_list/column_table	step_number	Result
NULL	NULL	NULL	Remove all keep columns transformations for the specified rule.

<b>table_name</b>	<b>column_list/column_table</b>	<b>step_number</b>	<b>Result</b>
NULL	NULL	non-NULL	Remove all keep columns transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified <code>column_list/column_table</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all keep columns transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all keep columns transformations with the specified <code>column_list/column_table</code> for the specified rule.
non-NULL	non-NULL	NULL	Remove all keep columns transformations with the specified <code>table_name</code> and <code>column_list/column_table</code> for the specified rule.
non-NULL	NULL	NULL	Remove all keep columns transformations with the specified <code>table_name</code> for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified <code>table_name</code> , <code>column_list/column_table</code> , and <code>step_number</code> for the specified rule.

## MAINTAIN\_CHANGE\_TABLE Procedure

This procedure configures an Oracle Streams environment that uses change handlers to record in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

A change handler is a special type of statement DML handler that tracks table changes and was created by either this MAINTAIN\_CHANGE\_TABLE procedure or the DBMS\_APPLY\_ADM.SET\_CHANGE\_HANDLER procedure. Information about change handlers is stored in the ALL\_APPLY\_CHANGE\_HANDLERS and DBA\_APPLY\_CHANGE\_HANDLERS views.

The change table can reside in the same database as the source table or in a different database.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

---

---

**Note:** The environment configured by this procedure does not record or replicate data definition language (DDL) changes made to the source table.

---

---

**See Also:** ["Procedures That Configure an Oracle Streams Environment"](#) on page 144-16 for more information about this procedure

### Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE(
  change_table_name      IN VARCHAR2,
  source_table_name      IN VARCHAR2,
  column_type_list       IN VARCHAR2,
  extra_column_list      IN VARCHAR2  DEFAULT 'command_type, value_type',
  capture_values         IN VARCHAR2,
  options_string         IN VARCHAR2  DEFAULT NULL,
  script_name            IN VARCHAR2  DEFAULT NULL,
  script_directory_object IN VARCHAR2  DEFAULT NULL,
  perform_actions        IN BOOLEAN   DEFAULT TRUE,
  capture_name           IN VARCHAR2  DEFAULT NULL,
  propagation_name      IN VARCHAR2  DEFAULT NULL,
  apply_name             IN VARCHAR2  DEFAULT NULL,
  source_database        IN VARCHAR2  DEFAULT NULL,
  destination_database  IN VARCHAR2  DEFAULT NULL,
  keep_change_columns_only IN BOOLEAN  DEFAULT TRUE,
  execute_lcr            IN BOOLEAN   DEFAULT FALSE);
```

## Parameters

**Table 144–18 MAINTAIN\_CHANGE\_TABLE Procedure Parameters**

Parameter	Description
<code>change_table_name</code>	<p>The table that records changes to the source table. This table is maintained by Oracle Streams after configuration.</p> <p>Specify the table as <code>[<i>schema_name</i>.] <i>table_name</i></code>. For example, <code>hr.jobs_change_table</code>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the procedure raises an error.</p> <p>If the specified table exists at the database specified in the <code>destination_database</code> parameter, then the procedure raises an error.</p>
<code>source_table_name</code>	<p>The table at the source database for which changes are recorded.</p> <p>Specify the table as <code>[<i>schema_name</i>.] <i>table_name</i></code>. For example, <code>hr.jobs</code>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the procedure raises an error.</p>
<code>column_type_list</code>	<p>A list of the columns in the source table for which changes are recorded. Specify a comma-delimited list of each column and its data type.</p> <p>For example, specify the following for the <code>hr.jobs</code> table:</p> <pre>job_id VARCHAR2(10), job_title VARCHAR2(35), min_salary NUMBER(6), max_salary NUMBER(6)</pre> <p>The procedure automatically places columns with names that match the source database columns into an unconditional supplemental log group.</p> <p>If NULL, then the procedure raises an error.</p>

**Table 144–18 (Cont.) MAINTAIN\_CHANGE\_TABLE Procedure Parameters**

Parameter	Description
extra_column_list	<p>A comma-delimited list of metadata attributes to include in the change table. The column name for a metadata attribute is in the format of attribute name followed by a \$ symbol. For example, the <code>source_database_name</code> attribute is stored in the <code>source_database_name\$</code> column in the change table.</p> <p>The following metadata attributes can be included:</p> <ul style="list-style-type: none"> <li>▪ <code>value_type</code></li> <li>▪ <code>source_database_name</code></li> <li>▪ <code>command_type</code></li> <li>▪ <code>object_owner</code></li> <li>▪ <code>object_name</code></li> <li>▪ <code>tag</code></li> <li>▪ <code>transaction_id</code></li> <li>▪ <code>scn</code></li> <li>▪ <code>commit_scn</code></li> <li>▪ <code>compatible</code></li> <li>▪ <code>instance_number</code></li> <li>▪ <code>message_number</code></li> <li>▪ <code>row_text</code></li> <li>▪ <code>row_id</code></li> <li>▪ <code>serial#</code></li> <li>▪ <code>session#</code></li> <li>▪ <code>source_time</code></li> <li>▪ <code>thread#</code></li> <li>▪ <code>tx_name</code></li> <li>▪ <code>username</code></li> </ul> <p>All of these metadata attributes, except for <code>value_type</code> and <code>message_number</code>, are row LCR attributes that can be stored in row LCRs. For information about LCR attributes, see <i>Oracle Streams Concepts and Administration</i>.</p> <p>The <code>value_type\$</code> column in the change table contains either <code>OLD</code> or <code>NEW</code>, depending on whether the column value is the original column value or the new column value, respectively.</p> <p>The <code>message_number\$</code> column in the change table contains the identification number of each row LCR within a transaction. The message number increases incrementally for each row LCR within a transaction and shows the order of the row LCRs within a transaction.</p> <p>The procedure automatically configures the source database to place information about extra attributes, such as <code>serial#</code>, into the redo log so that the information can be captured and recorded.</p>

**Table 144–18 (Cont.) MAINTAIN\_CHANGE\_TABLE Procedure Parameters**

Parameter	Description
capture_values	<p>Specify which values to capture when update operations are performed on the source table:</p> <ul style="list-style-type: none"> <li>▪ old - To capture the original values for an updated column in the source table</li> <li>▪ new - To capture the new values for an updated column in the source table</li> <li>▪ * - To capture both the original and the new values for an updated column in the source table</li> </ul> <p>If NULL, then the procedure raises an error.</p> <p><b>Note:</b> For insert operations, only new column values can be captured. For delete operations, only old column values can be captured.</p>
options_string	<p>String of options passed to the CREATE TABLE statement that creates the change table. The string is appended to the generated CREATE TABLE statement after the closing parenthesis that defines the columns of the table. The string must be syntactically correct.</p>
script_name	<p>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the replication environment directly.</p> <p>If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the replication environment directly and does not generate a script.</p> <p>If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</p>
script_directory_object	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>
perform_actions	<p>If TRUE, then the procedure performs the necessary actions to configure the environment directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to configure the environment directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> <li>▪ script_name</li> <li>▪ script_directory_object</li> </ul>

**Table 144–18 (Cont.) MAINTAIN\_CHANGE\_TABLE Procedure Parameters**

Parameter	Description
capture_name	<p>The name of each capture process configured to capture changes. Do not specify an owner.</p> <p>If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</p> <p>If NULL, then the system generates a name for each capture process it creates.</p> <p><b>Note:</b> The capture process name cannot be altered after the capture process is created.</p>
propagation_name	<p>The name of the propagation configured to propagate changes from the source database to the destination database. Do not specify an owner.</p> <p>If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set.</p> <p>If NULL, then the system generates a name for the propagation.</p> <p>If non-NULL and the source_database and destination_database are set to the same value, then this procedure raises an error. When the capture process and apply process are in the same database, they can use the same queue, and a propagation is not needed.</p> <p><b>Note:</b> The propagation name cannot be altered after the propagation is created.</p>
apply_name	<p>The name of each apply process configured to apply changes. Do not specify an owner.</p> <p>If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set.</p> <p>The specified name must not match the name of an existing messaging client at the destination database.</p> <p>If NULL, then the system generates a name for the apply process. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter.</p> <p><b>Note:</b> The apply process name cannot be altered after the apply process is created.</p>
source_database	<p>The global name of the source database.</p> <p>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</p> <p>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure uses the global name of the local database.</p>

**Table 144–18 (Cont.) MAINTAIN\_CHANGE\_TABLE Procedure Parameters**

Parameter	Description
<code>destination_database</code>	<p>The global name of the destination database.</p> <p>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure uses the global name of the local database.</p>
<code>keep_change_columns_only</code>	<p>If TRUE, then this procedure adds a declarative rule-based transformation which keeps the list of columns specified in the <code>column_type_list</code> parameter. The columns that are not specified in the <code>column_type_list</code> parameter are removed from each row LCR captured by the capture process.</p> <p>If FALSE, then this procedure does not create a declarative rule-based transformation, and all of the columns in the row LCRs are kept.</p> <p>Specify FALSE when information about columns that are not included in the <code>column_type_list</code> parameter is needed at the destination database. For example, if the <code>execute_lcr</code> parameter is set to TRUE and the configuration will replicate all of the columns in a source table, but the <code>column_type_list</code> parameter includes a subset of these columns, then the <code>keep_change_columns_only</code> parameter should be set to FALSE.</p> <p><b>Note:</b> When this parameter is set to TRUE, a declarative rule-based transformation is always created, even if the <code>column_type_list</code> includes all of the columns in the source table.</p>
<code>execute_lcr</code>	<p>If TRUE, then this procedure creates a change handler that executes each row LCR at the destination database.</p> <p>If FALSE, then the row LCRs are not executed at the destination database.</p>

## Usage Notes

The following are usage notes for this procedure:

### Types of Oracle Streams Environments Configured by the Procedure

This procedure can configure the following types of Oracle Streams environments:

- **Local capture and apply on one database:** Specify the same global name for the `source_database` and the `destination_database` parameter.
- **Local capture and remote apply:** Specify the global name of the local database for the `source_database` parameter and a remote database for the `destination_database` parameter.
- **Downstream capture and local apply:** Specify a remote database for the `source_database` parameter and the local database for the `destination_database` parameter.
- **Downstream capture and remote apply:** Specify a remote database for the `source_database` parameter and a remote database for the `destination_database` parameter.

**Optional One-Way Replication With This Procedure**

To configure one-way replication of the table, in addition to recording changes to the table, set the `execute_lcr` parameter to `TRUE`. The apply process executes each row LCR and applies the change in the row LCR to the replica table at the destination database. In this case, ensure that the source table is instantiated at the destination database before running the procedure. Specifically, the source table must be prepared for instantiation, the instantiation SCN must be set for the replica table at the destination database, and, usually, the source table replica table should be consistent.

**See Also:** *Oracle Streams Replication Administrator's Guide*

**Statement DML Handlers, the Change Table, and Row LCR Execution**

This procedure configures one or more statement DML handlers that perform the following actions:

- Record changes in the change table using the information in row LCRs.
- Execute row LCRs if the `execute_lcr` parameter is set to `TRUE`.

The procedure ensures that the row LCRs contain the required attributes to record the changes specified in the `capture_type_list`, `extra_column_list`, and `capture_values` parameters. The procedure adds the statement DML handlers to the apply process specified in the `apply_name` parameter.

**See Also:** [Chapter 147, "DBMS\\_STREAMS\\_HANDLER\\_ADM"](#)

## MAINTAIN\_GLOBAL Procedure

This procedure configures an Oracle Streams environment that replicates changes at the database level between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

---

---

### Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
  - If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the destination database while the `MAINTAIN_GLOBAL` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.
  - A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.
- 
- 

**See Also:** ["Procedures That Configure an Oracle Streams Environment"](#) on page 144-16 for more information about this procedure

## Parameters

**See Also:** ["Common Parameters for the Configuration Procedures"](#) on page 144-19 for descriptions of the procedure parameters

**Table 144–19** MAINTAIN\_GLOBAL Procedure Parameters

Parameter	Description
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>source_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred.</p> <p>If the source database and destination database run on the same computer system, then the source and destination directories must be different.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In these cases, specify <code>NULL</code> for the <code>destination_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>

**Table 144–19 (Cont.) MAINTAIN\_GLOBAL Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database.</p> <p>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</p> <p>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure uses the global name of the local database.</p>
destination_database	<p>The global name of the destination database.</p> <p>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure raises an error.</p>
dump_file_name	<p>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the <code>source_directory_object</code> or <code>destination_directory_object</code> parameter, then the procedure raises an error.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If NULL and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code>, then the export dump file name is generated by the system. In this case, the export dump file name is <code>expatnn.dmp</code>, where <code>nn</code> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>
log_file	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If NULL and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code>, then the log file name is the same name as the export dump file name with an extension of <code>.clg</code>.</p>

**Table 144–19 (Cont.) MAINTAIN\_GLOBAL Procedure Parameters**

Parameter	Description
instantiation	<p>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code> performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the <code>instantiation</code> parameter is set to this value, then the user who runs this procedure must have <code>EXECUTE</code> privilege on the <code>DBMS_FILE_TRANSFER</code> package.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the <code>instantiation</code> parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code> does not perform an instantiation. This setting is valid only if the <code>perform_actions</code> parameter is set to <code>FALSE</code>, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If you use the <code>RMAN DUPLICATE</code> or <code>CONVERT DATABASE</code> command for database instantiation, then the destination database cannot be the capture database.</p> <p>If this parameter is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code>, then the database objects being instantiated must exist at the source database.</p> <p>If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.</p>

## MAINTAIN\_SCHEMAS Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of schemas in different ways and are mutually exclusive.

---

---

### Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the schemas from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
  - If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_SCHEMAS` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.
- 
- 

**See Also:** ["Procedures That Configure an Oracle Streams Environment"](#) on page 144-16 for more information about this procedure

## Syntax

```

## Parameters

**See Also:** ["Common Parameters for the Configuration Procedures"](#) on page 144-19 for descriptions of the procedure parameters that are not in [Table 144–20](#)

**Table 144–20** *MAINTAIN\_SCHEMAS Procedure Parameters*

Parameter	Description
schema_names	<p>The schemas to be configured for replication and maintained by Oracle Streams after configuration. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>■ Comma-delimited list of type VARCHAR2</li> <li>■ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. The first schema should be in position 1. The last position must be NULL.</li> </ul> <p>This procedure raises an error in any of the following cases:</p> <ul style="list-style-type: none"> <li>■ When a specified schema does not exist at the source database</li> <li>■ When the schema_names parameter is set to NULL</li> </ul>

**Table 144–20 (Cont.) MAINTAIN\_SCHEMAS Procedure Parameters**

Parameter	Description
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>source_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred.</p> <p>If the source database and destination database run on the same computer system, then the source and destination directories must be different.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>destination_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>
source_database	<p>The global name of the source database.</p> <p>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</p> <p>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p>If <code>NULL</code>, then the procedure uses the global name of the local database.</p>

**Table 144–20 (Cont.) MAINTAIN\_SCHEMAS Procedure Parameters**

Parameter	Description
<code>destination_database</code>	<p>The global name of the destination database.</p> <p>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure raises an error.</p>
<code>dump_file_name</code>	<p>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the <code>source_directory_object</code> or <code>destination_directory_object</code> parameter, then the procedure raises an error.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If NULL and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code>, then the export dump file name is generated by the system. In this case, the export dump file name is <code>expatnn.dmp</code>, where <code>nn</code> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>
<code>capture_queue_user</code>	<p>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</p> <p>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the <code>DBMS_AQADM</code> package.</p>
<code>log_file</code>	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If NULL and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code>, then the log file name is the same name as the export dump file name with an extension of <code>.clg</code>.</p>

**Table 144–20 (Cont.) MAINTAIN\_SCHEMAS Procedure Parameters**

Parameter	Description
instantiation	<p>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code> performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the <code>instantiation</code> parameter is set to this value, then the user who runs this procedure must have <code>EXECUTE</code> privilege on the <code>DBMS_FILE_TRANSFER</code> package.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the <code>instantiation</code> parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code> does not perform an instantiation. This setting is valid only if the <code>perform_actions</code> parameter is set to <code>FALSE</code>, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly.</p> <p>If this parameter is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code>, then the database objects being instantiated must exist at the source database, and the tablespaces that contain the schemas must exist at the destination database.</p> <p>If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.</p>

## MAINTAIN\_SIMPLE\_TABLESPACE Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

---

---

**Note:** This procedure is deprecated. It is replaced by the MAINTAIN\_SIMPLE\_TTS procedure.

---

---

**See Also:**

- ["Deprecated Subprograms"](#) on page 144-4
- [MAINTAIN\\_SIMPLE\\_TTS Procedure](#) on page 144-111

### Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TABLESPACE (
    tablespace_name          IN VARCHAR2,
    source_directory_object  IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_database     IN VARCHAR2,
    setup_streams            IN BOOLEAN   DEFAULT TRUE,
    script_name              IN VARCHAR2  DEFAULT NULL,
    script_directory_object  IN VARCHAR2  DEFAULT NULL,
    bi_directional           IN BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 144–21 MAINTAIN\_SIMPLE\_TABLESPACE Procedure Parameters**

Parameter	Description
tablespace_name	<p>The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespace must exist at the source database, but it must not exist at the destination database.</p> <p>A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have READ privilege on this directory object. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p> <p>If NULL, then the procedure raises an error.</p>
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes.</p> <p>If NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>

**Table 144–21 (Cont.) MAINTAIN\_SIMPLE\_TABLESPACE Procedure Parameters**

Parameter	Description
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred.</p> <p>If the source database and destination database run on the same computer system, then the source and destination directories must be different.</p> <p>If NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>
destination_database	<p>The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist.</p> <p>If NULL, then the procedure raises an error.</p>
setup_streams	<p>If TRUE, then the procedure performs the necessary actions to maintain the tablespace directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to maintain the tablespace directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> <li>▪ script_name</li> <li>▪ script_directory_object</li> </ul>
script_name	<p>If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly.</p> <p>If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace directly.</p> <p>If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.</p>
script_directory_object	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>

**Table 144–21 (Cont.) MAINTAIN\_SIMPLE\_TABLESPACE Procedure Parameters**

Parameter	Description
bi_directional	<p>Specify <code>TRUE</code> to configure bi-directional replication between the current database and the database specified in <code>destination_database</code>. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages.</p> <p>Specify <code>FALSE</code> to configure one way replication from the current database to the database specified in <code>destination_database</code>. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.</p>

## Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

### DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate `ALTER TABLESPACE` statements on the tablespace, nor is it configured to replicate `ALTER TABLE` statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

### Additional Documentation for this Procedure

The following documentation applies to the `MAINTAIN_SIMPLE_TABLESPACE` procedure:

- [Automatic Platform Conversion](#) on page 144-17
- *Oracle Streams Replication Administrator's Guide*

### Requirements for Running this Procedure

Meet the following requirements when run the `MAINTAIN_SIMPLE_TABLESPACE` procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- Grant the user who runs this procedure the `DBA` role. This user must have the necessary privileges to complete the following actions:
  - Create `ANYDATA` queues, capture processes, propagations, and apply processes.

- Specify supplemental logging
- Run subprograms in the DBMS\_STREAMS\_ADM and DBMS\_AQADM packages.
- Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.
- Run subprograms in the DBMS\_STREAMS\_TABLESPACES\_ADM package
- The necessary privileges to run the `CLONE_SIMPLE_TABLESPACE` procedure in the DBMS\_STREAMS\_TABLESPACES\_ADM package at the source database. See [CLONE\\_SIMPLE\\_TABLESPACE Procedure](#) on page 149-18 for the list of required privileges.
- The necessary privileges to run the `ATTACH_SIMPLE_TABLESPACE` procedure in the DBMS\_STREAMS\_TABLESPACES\_ADM package at the destination database. See [ATTACH\\_SIMPLE\\_TABLESPACE Procedure](#) on page 149-11 for the list of required privileges.

To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.

Typically, the DBA role can be revoked from the user, if necessary, after the configuration is complete.

- If the `bi_directional` parameter is set to `TRUE`, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE` privilege on each one.
- The databases configured by this procedure must be Oracle Database 10g Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10g Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The `setup_streams` parameter is set to `FALSE` in this procedure, and the replication environment is configured with a generated script.

If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

- If the procedure is run at an Oracle Database 10g Release 1 database, then the databases configured by the procedure must be Oracle Database 10g Release 1 or later databases.

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

**Default Values for Parameters Excluded From the MAINTAIN\_SIMPLE\_TABLESPACE Procedure**

This procedure uses the default values for the parameters in the MAINTAIN\_TABLESPACES procedure that do not exist in the MAINTAIN\_SIMPLE\_TABLESPACE procedure. For example, this procedure creates a capture process at the source database named `capture`, because that is the default value for the `capture_name` parameter in the MAINTAIN\_TABLESPACES procedure.

**See Also:** [MAINTAIN\\_TABLESPACES Procedure](#) on page 144-119

**Configuration Progress and Recoverability**

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

---

---

**Note:** When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

---

---

**See Also:** ["RECOVER\\_OPERATION Procedure"](#) on page 144-147

## MAINTAIN\_SIMPLE\_TTS Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

---

---

### Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespace from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA\_STREAMS\_UNsupported data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
  - This procedure replaces the deprecated MAINTAIN\_SIMPLE\_TABLESPACE procedure.
- 
-

### Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TTS (
  tablespace_name          IN VARCHAR2,
  source_directory_object  IN VARCHAR2,
  destination_directory_object IN VARCHAR2,
  source_database          IN VARCHAR2,
  destination_database     IN VARCHAR2,
  perform_actions          IN BOOLEAN  DEFAULT TRUE,
  script_name              IN VARCHAR2  DEFAULT NULL,
  script_directory_object  IN VARCHAR2  DEFAULT NULL,
  bi_directional           IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**See Also:** ["Common Parameters for the Configuration Procedures"](#) on page 144-19 for descriptions of the procedure parameters that are not in [Table 144-22](#)

**Table 144–22 MAINTAIN\_SIMPLE\_TTS Procedure Parameters**

Parameter	Description
tablespace_name	<p>The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespace must exist at the source database, but it must not exist at the destination database.</p> <p>A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have <code>READ</code> privilege on this directory object. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred.</p> <p>If the source database and destination database run on the same computer system, then the source and destination directories must be different.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>
source_database	<p>The global name of the source database.</p> <p>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</p> <p>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p>If <code>NULL</code>, then the procedure uses the global name of the local database.</p>

**Table 144–22 (Cont.) MAINTAIN\_SIMPLE\_TTS Procedure Parameters**

Parameter	Description
<code>destination_database</code>	<p>The global name of the destination database.</p> <p>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure raises an error.</p>

## Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

### DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

### Additional Privileges Required by the MAINTAIN\_SIMPLE\_TTS Procedure

In addition to the required privileges described in "[Requirements for Running These Procedures](#)" on page 144-18, the user who runs the MAINTAIN\_SIMPLE\_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS\_STREAMS\_TABLESPACES\_ADM package
- The necessary privileges to run the CLONE\_SIMPLE\_TABLESPACE procedure in the DBMS\_STREAMS\_TABLESPACES\_ADM package at the source database. See [CLONE\\_SIMPLE\\_TABLESPACE Procedure](#) on page 149-18 for the list of required privileges.
- The necessary privileges to run the ATTACH\_SIMPLE\_TABLESPACE procedure in the DBMS\_STREAMS\_TABLESPACES\_ADM package at the destination database. See [ATTACH\\_SIMPLE\\_TABLESPACE Procedure](#) on page 149-11 for the list of required privileges.

### Default Values for Parameters Excluded From the MAINTAIN\_SIMPLE\_TTS Procedure

This procedure uses the default values for the parameters in the MAINTAIN\_TTS procedure that do not exist in the MAINTAIN\_SIMPLE\_TTS procedure. For example, this procedure automatically generates the capture process name, because NULL is the default value for the `capture_name` parameter in the MAINTAIN\_TTS procedure, and the procedure generates the capture process name when NULL is specified for `capture_name`.

**See Also:** [MAINTAIN\\_TTS Procedure](#) on page 144-126

## MAINTAIN\_TABLES Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables in different ways and are mutually exclusive.

---

---

**Note:** If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_TABLES` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

---

---

**See Also:** ["Procedures That Configure an Oracle Streams Environment"](#) on page 144-16 for more information about this procedure

### Syntax

```

DBMS_STREAMS_ADM.MAINTAIN_TABLES (
    table_names                IN VARCHAR2,
    source_directory_object    IN VARCHAR2,

```

## Parameters

**See Also:** ["Common Parameters for the Configuration Procedures"](#) on page 144-19 for descriptions of the procedure parameters that are not in [Table 144-23](#)

**Table 144-23** *MAINTAIN\_TABLES Procedure Parameters*

Parameter	Description
table_names	<p>The tables to be configured for replication and maintained by Oracle Streams after configuration. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type VARCHAR2</li> <li>A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. The first table should be in position 1. The last position must be NULL.</li> </ul> <p>Each table should be specified as [<i>schema_name.</i>] <i>table_name</i>. For example, hr.employees. If the schema is not specified, then the current user is the default.</p> <p>This procedure raises an error in any of the following cases:</p> <ul style="list-style-type: none"> <li>When a specified table does not exist at the source database</li> <li>When the table_names parameter is set to NULL</li> </ul>

**Table 144–23 (Cont.) MAINTAIN\_TABLES Procedure Parameters**

Parameter	Description
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remain in this directory after the procedure completes.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>source_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred.</p> <p>If the source database and destination database run on the same computer system, then the source and destination directories must be different.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>destination_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>
source_database	<p>The global name of the source database.</p> <p>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</p> <p>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p>If <code>NULL</code>, then the procedure uses the global name of the local database.</p>

**Table 144–23 (Cont.) MAINTAIN\_TABLES Procedure Parameters**

Parameter	Description
<code>destination_database</code>	<p>The global name of the destination database.</p> <p>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure raises an error.</p>
<code>dump_file_name</code>	<p>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the <code>source_directory_object</code> or <code>destination_directory_object</code> parameter, then the procedure raises an error.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If NULL and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code>, then the export dump file name is generated by the system. In this case, the export dump file name is <code>expatnn.dmp</code>, where <code>nn</code> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>
<code>capture_queue_user</code>	<p>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</p> <p>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</p>
<code>log_file</code>	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If NULL and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code>, then the log file name is the same name as the export dump file name with an extension of <code>.clg</code>.</p>

**Table 144–23 (Cont.) MAINTAIN\_TABLES Procedure Parameters**

Parameter	Description
instantiation	<p>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code> performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. If the <code>instantiation</code> parameter is set to this value, then the user who runs this procedure must have <code>EXECUTE</code> privilege on the <code>DBMS_FILE_TRANSFER</code> package.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code> performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. If the <code>instantiation</code> parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code> does not perform an instantiation. This setting is valid only if the <code>perform_actions</code> parameter is set to <code>FALSE</code>, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly.</p> <p>If this parameter is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code>, then the tables being instantiated must exist at the source database, and the tablespaces that contain the tables must exist at the destination database.</p> <p>If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.</p> <p>Also, if an instantiated table does not exist at the destination database, then this procedure sets the instantiation SCN for the table. However, if an instantiated table exist at the destination database before instantiation, then this procedure does not set the instantiation SCN for the table. In this case, you must set the instantiation SCN for the table manually after the procedure completes.</p>

## MAINTAIN\_TABLESPACES Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

---

---

**Note:** This procedure is deprecated. It is replaced by the MAINTAIN\_TTS procedure.

---

---

```

## Parameters

**Table 144–24** *MAINTAIN\_TABLESPACES Procedure Parameters*

Parameter	Description
tablespace_names	<p>The local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have <code>READ</code> privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p> <p><b>See Also:</b> <a href="#">TABLESPACE_SET Table Type</a> on page 149-9</p>
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred.</p> <p>If the source database and destination database run on the same computer system, then the source and destination directories must be different.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>
destination_database	<p>The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>

**Table 144–24 (Cont.) MAINTAIN\_TABLESPACES Procedure Parameters**

Parameter	Description
setup_streams	<p>If TRUE, then the procedure performs the necessary actions to maintain the tablespaces directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to maintain the tablespaces directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> <li>■ script_name</li> <li>■ script_directory_object</li> </ul>
script_name	<p>If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace set. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly.</p> <p>If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace set directly.</p> <p>If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.</p>
script_directory_object	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>
dump_file_name	<p>The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error.</p> <p>If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is <i>expatnn.dmp</i>, where <i>nn</i> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>

**Table 144–24 (Cont.) MAINTAIN\_TABLESPACES Procedure Parameters**

Parameter	Description
source_queue_table	The name of the queue table for the queue at the source database, specified as [ <i>schema_name</i> .] <i>queue_table_name</i> . For example, <i>strmadmin.streams_queue_table</i> . If the schema is not specified, then the current user is the default.
source_queue_name	The name of the queue at the source database that will function as the ANYDATA queue, specified as [ <i>schema_name</i> .] <i>queue_name</i> . For example, <i>strmadmin.streams_queue</i> .  If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.
source_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.  If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
destination_queue_table	The name of the queue table for the queue at the destination database, specified as [ <i>schema_name</i> .] <i>queue_table_name</i> . For example, <i>strmadmin.streams_queue_table</i> . If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the queue at the destination database that will function as the ANYDATA queue, specified as [ <i>schema_name</i> .] <i>queue_name</i> . For example, <i>strmadmin.streams_queue</i> .  If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.
destination_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.  If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
capture_name	The name of each capture process configured to capture changes to the database objects in the tablespace set. Do not specify an owner.  If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database objects in the tablespace set to the positive capture process rule set.  <b>Note:</b> The capture process name cannot be altered after the capture process is created.

**Table 144–24 (Cont.) MAINTAIN\_TABLESPACES Procedure Parameters**

Parameter	Description
propagation_name	<p>The name of each propagation configured to propagate changes to the database objects in the tablespace set. Do not specify an owner.</p> <p>If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the database objects in the tablespace set to the positive propagation rule set.</p> <p>If NULL, then the system generates a name for each propagation it creates.</p> <p><b>Note:</b> The propagation name cannot be altered after the propagation is created.</p>
apply_name	<p>The name of each apply process configured to apply changes to the database objects in the tablespace set. Do not specify an owner.</p> <p>If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the database objects in the tablespace set to the positive apply process rule set.</p> <p>The specified name must not match the name of an existing messaging client at the destination database.</p> <p>If NULL, then the system generates a name for each apply process it creates.</p> <p><b>Note:</b> The apply process name cannot be altered after the apply process is created.</p>
log_file	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>If NULL, then the log file name is the same name as the export dump file name with an extension of <code>.clg</code>.</p>
bi_directional	<p>Specify TRUE to configure bi-directional replication between the current database and the database specified in <code>destination_database</code>. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages.</p> <p>Specify FALSE to configure one way replication from the current database to the database specified in <code>destination_database</code>. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.</p>
include_ddl	<p>Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes.</p> <p>Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, will not be replicated.</p>

## Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

**See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

### Additional Documentation for this Procedure

The following documentation applies to the MAINTAIN\_TABLESPACES procedure:

- [Automatic Platform Conversion](#) on page 144-17
- *Oracle Streams Replication Administrator's Guide*

### Requirements for Running this Procedure

Meet the following requirements when run the MAINTAIN\_TABLESPACES procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted the DBA role. This user must have the necessary privileges to complete the following actions:
  - Create ANYDATA queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the DBMS\_STREAMS\_ADM and DBMS\_AQADM packages.
  - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the DBMS\_STREAMS\_TABLESPACES\_ADM package
  - The necessary privileges to run the CLONE\_TABLESPACES procedure in the DBMS\_STREAMS\_TABLESPACES\_ADM package at the source database. See [CLONE\\_TABLESPACES Procedure](#) on page 149-20 for the list of required privileges.
  - The necessary privileges to run the ATTACH\_TABLESPACES procedure in the DBMS\_STREAMS\_TABLESPACES\_ADM package at the destination database. See [ATTACH\\_TABLESPACES Procedure](#) on page 149-13 for the list of required privileges.

To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.

- If the `bi_directional` parameter is set to TRUE, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE` privilege on each one.
- The databases configured by this procedure must be Oracle Database 10g Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10g Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The `setup_streams` parameter is set to `FALSE` in this procedure, and the replication environment is configured with a generated script.

If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

- If the procedure is run at an Oracle Database 10g Release 1 database, then the databases configured by the procedure must be Oracle Database 10g Release 1 or later databases.

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

### Configuration Progress and Recoverability

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

---

---

**Note:** When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

---

---

**See Also:** ["RECOVER\\_OPERATION Procedure"](#) on page 144-147

## MAINTAIN\_TTS Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

---

---

**Note:**

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespaces from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNUNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
  - This procedure replaces the deprecated `MAINTAIN_TABLESPACES` procedure.
- 
- 

**See Also:** ["Procedures That Configure an Oracle Streams Environment"](#) on page 144-16 for more information about this procedure

### Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TTS(
    tablespace_names          IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_directory_object   IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database           IN VARCHAR2,
    destination_database      IN VARCHAR2,
    perform_actions           IN BOOLEAN   DEFAULT TRUE,
    script_name               IN VARCHAR2   DEFAULT NULL,
    script_directory_object   IN VARCHAR2   DEFAULT NULL,
    dump_file_name            IN VARCHAR2   DEFAULT NULL,
    capture_name              IN VARCHAR2   DEFAULT NULL,
    capture_queue_table       IN VARCHAR2   DEFAULT NULL,
    capture_queue_name        IN VARCHAR2   DEFAULT NULL,
    capture_queue_user        IN VARCHAR2   DEFAULT NULL,
    propagation_name         IN VARCHAR2   DEFAULT NULL,
    apply_name                IN VARCHAR2   DEFAULT NULL,
    apply_queue_table         IN VARCHAR2   DEFAULT NULL,
    apply_queue_name          IN VARCHAR2   DEFAULT NULL,
    apply_queue_user          IN VARCHAR2   DEFAULT NULL,
    log_file                  IN VARCHAR2   DEFAULT NULL,
    bi_directional            IN BOOLEAN   DEFAULT FALSE,
    include_ddl               IN BOOLEAN   DEFAULT FALSE);
```

## Parameters

**See Also:** ["Common Parameters for the Configuration Procedures"](#) on page 144-19 for descriptions of the procedure parameters that are not in [Table 144-25](#)

**Table 144-25** *MAINTAIN\_TTS Procedure Parameters*

Parameter	Description
tablespace_names	<p>The local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p> <p>If NULL, then the procedure raises an error.</p> <p><b>See Also:</b> <a href="#">TABLESPACE_SET Table Type</a> on page 149-9</p>
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes.</p> <p>If NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred.</p> <p>If the source database and destination database run on the same computer system, then the source and destination directories must be different.</p> <p>If NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle ASM disk group.</p>

**Table 144–25 (Cont.) MAINTAIN\_TTS Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database.</p> <p>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</p> <p>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure uses the global name of the local database.</p>
destination_database	<p>The global name of the destination database.</p> <p>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure raises an error.</p>
dump_file_name	<p>The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error.</p> <p>If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is <code>expatnn.dmp</code>, where <code>nn</code> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>
log_file	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>If NULL, then the log file name is the same name as the export dump file name with an extension of <code>.clg</code>.</p>

## Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

**See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

**Additional Privileges Required by the MAINTAIN\_TTS Procedure**

In addition to the required privileges described in "[Requirements for Running These Procedures](#)" on page 144-18, the user who runs the MAINTAIN\_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS\_STREAMS\_TABLESPACES\_ADM package
- The necessary privileges to run the CLONE\_TABLESPACES procedure in the DBMS\_STREAMS\_TABLESPACES\_ADM package at the source database. See [CLONE\\_TABLESPACES Procedure](#) on page 149-20 for the list of required privileges.
- The necessary privileges to run the ATTACH\_TABLESPACES procedure in the DBMS\_STREAMS\_TABLESPACES\_ADM package at the destination database. See [ATTACH\\_TABLESPACES Procedure](#) on page 149-13 for the list of required privileges.

## MERGE\_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the `MERGE_STREAMS_JOB` procedure. The `MERGE_STREAMS_JOB` procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the `MERGE_STREAMS_JOB` procedure does nothing. Typically, it is best to run the `MERGE_STREAMS_JOB` procedure instead of running the `MERGE_STREAMS` procedure directly.

However, you can choose to run the `MERGE_STREAMS` procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$STREAMS_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
  - The acknowledged SCN of the cloned propagation.
  - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

**See Also:**

- [MERGE\\_STREAMS\\_JOB Procedure](#) on page 144-133
- [SPLIT\\_STREAMS Procedure](#) on page 144-175

**Syntax**

```
DBMS_STREAMS_ADM.MERGE_STREAMS (
  cloned_propagation_name  IN  VARCHAR2,
  propagation_name        IN  VARCHAR2  DEFAULT NULL,
  queue_name              IN  VARCHAR2  DEFAULT NULL,
  perform_actions         IN  BOOLEAN   DEFAULT TRUE,
  script_name             IN  VARCHAR2  DEFAULT NULL,
  script_directory_object IN  VARCHAR2  DEFAULT NULL);
```

**Parameters****Table 144–26 MERGE\_STREAMS Procedure Parameters**

Parameter	Description
cloned_propagation_name	<p>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</p> <p>You must specify an existing propagation name. Do not specify an owner.</p>
propagation_name	<p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. See "Usage Notes" on page 144-132 for more information.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> <li>■ The queue specified in the <code>queue_name</code> parameter does not exist.</li> <li>■ The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.</li> </ul>

**Table 144–26 (Cont.) MERGE\_STREAMS Procedure Parameters**

Parameter	Description
queue_name	<p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure.</p> <p>Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See "Usage Notes" on page 144-132 for more information.</p>
perform_actions	<p>If TRUE, then the procedure performs the necessary actions to merge the streams directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to merge the streams directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> <li>▪ script_name</li> <li>▪ script_directory_object</li> </ul>
script_name	<p>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script.</p> <p>If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</p>
script_directory_object	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>

## Usage Notes

You can use the MERGE\_STREAMS procedure to merge two streams that were not split using the SPLIT\_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The DBA\_STREAMS\_SPLIT\_MERGE view contains information about split and merge operations.

## MERGE\_STREAMS\_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the `MERGE_STREAMS` procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

If the `auto_merge_threshold` parameter was set to a positive number in the `SPLIT_STREAMS` procedure that split the streams, then a merge job runs the `MERGE_STREAMS_JOB` procedure automatically according to its schedule. The schedule name is specified for the `schedule_name` parameter, and the merge job name is specified for the `merge_job_name` parameter when the `MERGE_STREAMS_JOB` procedure is run automatically. The merge job and its schedule were created by the `SPLIT_STREAMS` procedure.

If the `auto_merge_threshold` parameter was set to `NULL` or 0 (zero) in the `SPLIT_STREAMS` procedure that split the streams, then you can run the `MERGE_STREAMS_JOB` procedure manually. In this case, it is not run automatically.

## Syntax

```
DBMS_STREAMS_ADM.MERGE_STREAMS_JOB(
  cloned_propagation_name      IN VARCHAR2,
  propagation_name            IN VARCHAR2 DEFAULT NULL,
  queue_name                   IN VARCHAR2 DEFAULT NULL,
  merge_threshold              IN NUMBER,
  schedule_name                IN VARCHAR2 DEFAULT NULL,
  merge_job_name               IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 144–27 MERGE\_STREAMS\_JOB Procedure Parameters**

Parameter	Description
cloned_propagation_name	<p>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</p> <p>You must specify an existing propagation name. Do not specify an owner.</p>
propagation_name	<p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. See <a href="#">"Usage Notes"</a> on page 144-135 for more information.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> <li>■ The queue specified in the <code>queue_name</code> parameter does not exist.</li> <li>■ The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.</li> </ul>
queue_name	<p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If <code>NULL</code>, then the existing, original queue is the source queue for the propagation that is merged back. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See <a href="#">"Usage Notes"</a> on page 144-135 for more information.</p>
merge_threshold	<p>The merge threshold in seconds.</p> <p>The value of the <code>CAPTURE_MESSAGE_CREATE_TIME</code> column for each capture process in the <code>GV\$STREAMS_CAPTURE</code> dynamic performance view determines whether the streams are merged.</p> <p>Specifically, if the difference, in seconds, between the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the <code>MERGE_STREAMS</code> procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.</p>
schedule_name	<p>The name of the schedule for the merge job.</p> <p>If <code>NULL</code>, then no schedule name is specified. Typically, you set this parameter to <code>NULL</code> when the <code>auto_merge_threshold</code> parameter was set to <code>NULL</code> or 0 (zero) in the <code>SPLIT_STREAMS</code> procedure that split the streams.</p> <p>Specify <code>NULL</code> if you run this procedure manually.</p>

**Table 144–27 (Cont.) MERGE\_STREAMS\_JOB Procedure Parameters**

Parameter	Description
merge_job_name	<p>The name of the job that merges the streams.</p> <p>If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p>

## Usage Notes

You can use the MERGE\_STREAMS\_JOB procedure to merge two streams that were not split using the SPLIT\_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE\_STREAMS\_JOB procedure completes, you can query the DBA\_CAPTURE and DBA\_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule\_name and merge\_job\_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The DBA\_STREAMS\_SPLIT\_MERGE view contains information about split and merge operations.

## POST\_INSTANTIATION\_SETUP Procedure

This procedure performs the actions required after instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the source database.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

---

---

**Attention:** When the `POST_INSTANTIATION_SETUP` procedure is run, the parameter values must match the parameter values specified when the corresponding `PRE_INSTANTIATION_SETUP` procedure was run, except for the values of the following parameters: `perform_actions`, `script_name`, `script_directory_object`, and `start_processes`.

---

---

---

---

**Note:** A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

---

---

## Parameters

**See Also:** ["Common Parameters for the Configuration Procedures"](#) on page 144-19 for descriptions of the procedure parameters that are not in [Table 144-28](#)

**Table 144-28** *POST\_INSTANTIATION\_SETUP Procedure Parameters*

Parameter	Description
maintain_mode	Specify one of the following: <ul style="list-style-type: none"> <li>GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter</li> <li>TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter</li> </ul>
tablespace_names	<p>If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects.</p> <p>If maintain_mode is set to GLOBAL, then specify an empty tablespace set.</p> <p>Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL.</p> <p><b>See Also:</b> <a href="#">TABLESPACE_SET Table Type</a> on page 149-9</p>

**Table 144–28 (Cont.) POST\_INSTANTIATION\_SETUP Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database.</p> <p>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</p> <p>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure uses the global name of the local database.</p>
destination_database	<p>The global name of the destination database.</p> <p>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure raises an error.</p>
start_processes	<p>If TRUE, then the procedure starts each capture process and apply process. Any disabled capture or apply process created by the PRE_INSTANTIATION_SETUP procedure also is started.</p> <p>If FALSE, then the procedure does not start any capture processes or apply processes.</p>
instantiation_scn	<p>Specify the instantiation SCN for the database objects at the destination database if the instantiation SCN was not set during instantiation. The instantiation SCN is not set automatically during RMAN instantiations, but the correct instantiation SCN value should be determined during an RMAN instantiation. See the <i>Oracle Streams Replication Administrator's Guide</i> for more information.</p> <p>Specify NULL if the instantiation SCN was set for the database objects at the destination database during instantiation. The instantiation SCN can be set during export/import instantiations.</p>
exclude_schemas	<p>A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas.</p> <p>Specify an asterisk (*) to exclude all of the schemas in the database.</p> <p>If NULL, then the procedure does not exclude any schemas in the database.</p> <p>This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.</p>

**Table 144–28 (Cont.) POST\_INSTANTIATION\_SETUP Procedure Parameters**

Parameter	Description
exclude_flags	Specify what is excluded from the replication configuration in the schemas specified by the exclude_schemas parameter. This parameter works the same way in the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures. See "Usage Notes" on page 144-143 for the PRE_INSTANTIATION_SETUP procedure for more information.

## Usage Notes

The following sections contain usage notes for this procedure.

### Self-Contained Tablespace Sets

If the maintain\_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

**See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

### Destination Database Renamed During RMAN Database Instantiation

If the maintain\_mode parameter is set to GLOBAL, then database instantiation is required before running the POST\_INSTANTIATION\_SETUP procedure. If the RMAN DUPLICATE or RMAN CONVERT DATABASE command is used for database instantiation, then the global name of the destination database can be renamed to the global name of the source database during instantiation. In this case, before you run the POST\_INSTANTIATION\_SETUP procedure, complete the following steps:

1. Rename the global name of the destination database back to the name specified in the destination\_database parameter.
2. At the destination database, drop and re-create any loopback database links that existed on the source and were cloned on the destination database. For example, suppose the source database dbs1.net has a database link that refers to itself. Suppose the destination database is dbs2.net. At the destination database, drop and re-create this database link as a loopback database link that refers to itself (dbs2.net).
3. At the destination database, drop any database links that were cloned from the source database and are from the source database to the destination database. For example, if the source database is dbs1.net and the destination database is dbs2.net, then drop any database links on the destination database that are from dbs1.net to dbs2.net.
4. Create a database link from the destination database to the source database with the same name as the global name of the source database. The database link must be accessible to the Oracle Streams administrator at the destination database.

This database link is required because the POST\_INSTANTIATION\_SETUP procedure runs the SET\_GLOBAL\_INSTANTIATION\_SCN procedure in the DBMS\_APPLY\_ADM package at the destination database, and the SET\_GLOBAL\_INSTANTIATION\_SCN procedure requires the database link. The instantiation

SCN is set to the value specified in the `instantiation_scn` parameter of the `POST_INSTANTIATION_SETUP` procedure.

---

---

**Note:** When the RMAN `DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation, the destination database cannot be the capture database.

---

---

### Oracle Streams Components Removed From the Destination Database

If the `maintain_mode` parameter is set to `GLOBAL`, then database instantiation is required before running the `POST_INSTANTIATION_SETUP` procedure. During database instantiation, Oracle Streams components created by the `PRE_INSTANTIATION_SETUP` procedure, such as Oracle Streams clients and queues, can be copied from the source database to the destination database. The `POST_INSTANTIATION_SETUP` procedure removes the Stream components created by the `PRE_INSTANTIATION_SETUP` procedure from the destination database.

In some cases, rule sets and rules created by the `PRE_INSTANTIATION_SETUP` procedure might not be removed from the destination database. The `POST_INSTANTIATION_SETUP` procedure does not associate these rule sets and rules with any Stream clients in the destination database. Optionally, you can remove these rule sets and rules from the destination database after the `POST_INSTANTIATION_SETUP` procedure, or the script generated by the procedure, completes.

---

---

**Note:** The `POST_INSTANTIATION_SETUP` procedure only removes Oracle Streams components that were created by the `PRE_INSTANTIATION_SETUP` procedure. It does not remove Oracle Streams components that were created in a different way.

---

---

## PRE\_INSTANTIATION\_SETUP Procedure

This procedure performs the actions required before instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the database that will be the source database in the Stream replication environment.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

---

---

### Note:

- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.
  - When the `RMAN DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation, the destination database cannot be the capture database.
- 
-

## Syntax

```
DBMS_STREAMS_ADM.PRE_INSTANTIATION_SETUP(
  maintain_mode          IN VARCHAR2,
  tablespace_names      IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
  source_database        IN VARCHAR2,
  destination_database  IN VARCHAR2,
```

```

perform_actions      IN BOOLEAN          DEFAULT TRUE,
script_name          IN VARCHAR2        DEFAULT NULL,
script_directory_object IN VARCHAR2    DEFAULT NULL,
capture_name         IN VARCHAR2        DEFAULT NULL,
capture_queue_table  IN VARCHAR2        DEFAULT NULL,
capture_queue_name   IN VARCHAR2        DEFAULT NULL,
capture_queue_user   IN VARCHAR2        DEFAULT NULL,
propagation_name     IN VARCHAR2        DEFAULT NULL,
apply_name           IN VARCHAR2        DEFAULT NULL,
apply_queue_table    IN VARCHAR2        DEFAULT NULL,
apply_queue_name     IN VARCHAR2        DEFAULT NULL,
apply_queue_user     IN VARCHAR2        DEFAULT NULL,
bi_directional       IN BOOLEAN          DEFAULT FALSE,
include_ddl          IN BOOLEAN          DEFAULT FALSE,
start_processes      IN BOOLEAN          DEFAULT FALSE,
exclude_schemas     IN VARCHAR2        DEFAULT NULL,
exclude_flags        IN BINARY_INTEGER  DEFAULT NULL);

```

## Parameters

**See Also:** ["Common Parameters for the Configuration Procedures"](#) on page 144-19 for descriptions of the procedure parameters that are not in [Table 144-29](#)

**Table 144-29** PRE\_INSTANTIATION\_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: <ul style="list-style-type: none"> <li>GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter</li> <li>TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter</li> </ul>
tablespace_names	<p>If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects.</p> <p>If maintain_mode is set to GLOBAL, then specify an empty tablespace set.</p> <p>Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL.</p>

**See Also:** [TABLESPACE\\_SET Table Type](#) on page 149-9

**Table 144–29 (Cont.) PRE\_INSTANTIATION\_SETUP Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database.</p> <p>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</p> <p>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure uses the global name of the local database.</p>
destination_database	<p>The global name of the destination database.</p> <p>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure raises an error.</p>
capture_queue_table	<p>The name of the queue table for each queue used by a capture process, specified as [<i>schema_name</i>.] <i>queue_table_name</i>. For example, <i>strmadmin.streams_queue_table</i>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.</p>
start_processes	<p>If TRUE, then the procedure starts each capture process and apply process.</p> <p>If FALSE, then the procedure does not start any capture processes or apply processes.</p>
exclude_schemas	<p>A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas.</p> <p>Specify an asterisk (*) to exclude all of the schemas in the database.</p> <p>If NULL, then the procedure does not exclude any schemas in the database.</p> <p>This parameter is valid only if the <code>MAINTAIN_MODE</code> parameter is set to <code>GLOBAL</code>. If the <code>MAINTAIN_MODE</code> parameter is set to <code>TRANSPORTABLE TABLESPACES</code>, then the procedure ignores this parameter.</p>
exclude_flags	<p>Specify what to exclude from the replication configuration in the schemas specified by the <code>exclude_schemas</code> parameter. See "Usage Notes" on page 144-143 for more information.</p>

## Usage Notes

The following sections contain usage notes for this procedure.

### Self-Contained Tablespace Sets

If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

**See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

### The `exclude_flags` Parameter

Specify one of the following values:

- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` to exclude changes to the schemas and all of the database objects in the schemas
- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED` to exclude changes to the database objects that are not supported by Oracle Streams in the schemas

If both of these values are specified, then the procedure raises an error.

In addition to `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` or `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED`, specify one or both of the following values:

- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML` to exclude data manipulation language (DML) changes made to the excluded database objects
- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` to exclude data definition language (DDL) changes made to the excluded database objects

Use the plus sign (+) to specify more than one of these values. For example, to maintain DML changes to the tables in a schemas specified by the `exclude_schemas` parameter but exclude DDL changes to these schemas and the database objects in these schemas, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

To exclude DML and DDL changes made to unsupported database objects in the schemas specified by the `exclude_schemas` parameter, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

Rules for the excluded database objects are added to the negative rule set of each capture process. Therefore, changes to the excluded database objects will not be captured and replicated.

This parameter is valid only if the `maintain_mode` parameter is set to `GLOBAL` and the `exclude_schemas` parameter is set to a non-NULL value. If the `maintain_mode` parameter is set to `GLOBAL` and the `exclude_schemas` parameter is set to a NULL, then the procedure ignores this parameter. If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then this the procedure ignores this parameter and excludes any database objects in the specified tablespace set that are not supported by Oracle Streams from the Oracle Streams configuration automatically.

Also, if schemas are specified in the `exclude_schemas` parameter, but the `exclude_flags` parameter is set to NULL, then the procedure does not add any rules to the

negative rule set of any capture process, and the procedure includes the schemas specified in the `exclude_schemas` parameter in the replication environment.

## PURGE\_SOURCE\_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

### Syntax

```
DBMS_STREAMS_ADM.PURGE_SOURCE_CATALOG(
  source_database      IN  VARCHAR2,
  source_object_name  IN  VARCHAR2,
  source_object_type  IN  VARCHAR2);
```

### Parameters

**Table 144–30** *PURGE\_SOURCE\_CATALOG Procedure Parameters*

Parameter	Description
source_database	The global name of the source database containing the object.  If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
source_object_name	The name of the object specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
source_object_type	Type of the object. Currently, TABLE is the only possible object type.

### Usage Notes

The global name of the source database containing the object must be specified for the `source_database` parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the `hr.employees` table at the `dbs1.net` source database are being applied to the `hr.employees` table at the `dbs2.net` destination database. Also, suppose `hr.employees` at `dbs2.net` is not a source at all. In this case, specifying `dbs2.net` as the `source_database` for this table results in an error. However, specifying `dbs1.net` as the `source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions are true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

---

**Note:** These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

---

## RECOVER\_OPERATION Procedure

This procedure provides options for operations that stopped because they encountered an errors. These operations include split and merge operations, Oracle Streams replication configuration operations, and Oracle Streams change table configuration operations. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.

This procedure only can perform these actions for the following operations:

- Split and merge operations using:
  - The `split_threshold` and `merge_threshold` capture process parameters set to non-NULL values to enable automatic split and merge
  - [SPLIT\\_STREAMS Procedure](#)
  - [MERGE\\_STREAMS\\_JOB Procedure](#)
- Change table configuration operations performed by the [MAINTAIN\\_CHANGE\\_TABLE Procedure](#)
- Replication configuration operations performed by the following procedures:
  - [MAINTAIN\\_GLOBAL Procedure](#)
  - [MAINTAIN\\_SCHEMAS Procedure](#)
  - [MAINTAIN\\_SIMPLE\\_TABLESPACE Procedure](#)
  - [MAINTAIN\\_SIMPLE\\_TTS Procedure](#)
  - [MAINTAIN\\_TABLES Procedure](#)
  - [MAINTAIN\\_TABLESPACES Procedure](#)
  - [MAINTAIN\\_TTS Procedure](#)
  - [PRE\\_INSTANTIATION\\_SETUP Procedure](#)
  - [POST\\_INSTANTIATION\\_SETUP Procedure](#)

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

For split and merge operations, the data dictionary views are populated at the database that contains the capture process. For the configuration operations, the data dictionary views are populated at the database where the replication configuration procedure was run.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or

purge the metadata about the operation using the RECOVER\_OPERATION procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in DBA\_RECOVERABLE\_SCRIPT\_ERRORS before proceeding.

For split and merge operations, run the RECOVER\_OPERATION procedure at the database that contains the capture process. For the configuration operations, run the RECOVER\_OPERATION procedure at the database where the replication configuration procedure was run.

---

---

**Note:**

- Regarding the configuration operations, the procedure must configure the environment directly (`perform_actions => TRUE`), not by generating a script, for information about the operation to be stored in the recoverable views and for the operation to be managed by the RECOVER\_OPERATION procedure.
  - To run the RECOVER\_OPERATION procedure, both databases must be Oracle Database 10g Release 2 or later databases.
- 
- 

**See Also:** *Oracle Streams Replication Administrator's Guide*

## Syntax

```
DBMS_STREAMS_ADM.RECOVER_OPERATION(
    script_id      IN RAW,
    operation_mode IN VARCHAR2 DEFAULT 'FORWARD');
```

## Parameters

**Table 144–31 RECOVER\_OPERATION Procedure Parameters**

Parameter	Description
<code>script_id</code>	The operation id of the operation that is being rolled forward, rolled back, or purged. Query the <code>SCRIPT_ID</code> column of the <code>DBA_RECOVERABLE_SCRIPT</code> data dictionary view to determine the operation id.
<code>operation_mode</code>	<p>If <code>FORWARD</code>, then the procedure rolls forward the operation. Specify <code>FORWARD</code> to try to complete the operation.</p> <p>If <code>ROLLBACK</code>, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view. The other views retain information about the operation for 30 days.</p> <p>If <code>PURGE</code>, then the procedure moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view without rolling the operation back. The other views retain information about the operation for 30 days.</p>

## REMOVE\_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the `drop_unused_queue_table` parameter is set to `TRUE`, then drops the queue table if it is empty and no other queues are using it.
5. If the `cascade` parameter is set to `TRUE`, then drops all of the Oracle Streams clients that are using the queue.

---

**Note:** The specified queue must be a ANYDATA queue.

---

### Syntax

```
DBMS_STREAMS_ADM.REMOVE_QUEUE(
  queue_name          IN  VARCHAR2,
  cascade             IN  BOOLEAN  DEFAULT FALSE,
  drop_unused_queue_table IN  BOOLEAN  DEFAULT TRUE);
```

### Parameters

**Table 144–32 REMOVE\_QUEUE Procedure Parameters**

Parameter	Description
<code>queue_name</code>	The name of the queue to remove, specified as [ <i>schema_name</i> .] <i>queue_name</i> . For example, <code>strmadmin.streams_queue</code> . If the schema is not specified, then the current user is the default.
<code>cascade</code>	If <code>TRUE</code> , then the procedure drops any Oracle Streams clients that use the queue.  If <code>FALSE</code> , then the procedure raises an error if there are any Oracle Streams clients that use the queue. Before you run this procedure with the <code>cascade</code> parameter set to <code>FALSE</code> , make sure no Oracle Streams clients are using the queue currently.
<code>drop_unused_queue_table</code>	If <code>TRUE</code> and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue.  If <code>FALSE</code> , then the procedure does not drop the queue table.

## REMOVE\_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, apply process, propagation, or messaging client.

If this procedure results in an empty positive rule set for a messaging client, then the procedure drops the messaging client automatically.

---

---

**Note:** If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

---

---

### Syntax

```
DBMS_STREAMS_ADM.REMOVE_RULE (
    rule_name          IN  VARCHAR2,
    streams_type       IN  VARCHAR2,
    streams_name       IN  VARCHAR2,
    drop_unused_rule   IN  BOOLEAN  DEFAULT TRUE,
    inclusion_rule     IN  BOOLEAN  DEFAULT TRUE);
```

### Parameters

**Table 144–33 REMOVE\_RULE Procedure Parameters**

Parameter	Description
<code>rule_name</code>	<p>The name of the rule to remove, specified as <code>[ schema_name . ] rule_name</code>. If <code>NULL</code>, then the procedure removes all rules from the specified capture process, synchronous capture, apply process, propagation, or messaging client rule set.</p> <p>For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code>, enter <code>hr.prop_rule1</code>. If the schema is not specified, then the current user is the default.</p>
<code>streams_type</code>	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> <li>■ Specify <code>capture</code> for a capture process.</li> <li>■ Specify <code>sync_capture</code> for a synchronous capture.</li> <li>■ Specify <code>propagation</code> for a propagation.</li> <li>■ Specify <code>apply</code> for an apply process.</li> <li>■ Specify <code>dequeue</code> for a messaging client.</li> </ul>
<code>streams_name</code>	<p>The name of the Oracle Streams client, which can be a capture process, synchronous capture, propagation, apply process, or messaging client. Do not specify an owner.</p> <p>If the specified Oracle Streams client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata.</p> <p>If the specified Oracle Streams client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.</p>

**Table 144–33 (Cont.) REMOVE\_RULE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>drop_unused_rule</code>	<p>If <code>TRUE</code> and the rule is not in any rule set, then the procedure drops the rule from the database.</p> <p>If <code>TRUE</code> and the rule exists in any rule set, then the procedure does not drop the rule from the database.</p> <p>If <code>FALSE</code>, then the procedure does not drop the rule from the database.</p>
<code>inclusion_rule</code>	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure removes the rule from the positive rule set for the Oracle Streams client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure removes the rule from the negative rule set for the Oracle Streams client.</p>

## REMOVE\_STREAMS\_CONFIGURATION Procedure

This procedure removes the Oracle Streams configuration at the local database.

### Syntax

```
DBMS_STREAMS_ADM.REMOVE_STREAMS_CONFIGURATION;
```

### Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_STREAMS_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_STREAMS_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_STREAMS_ADM` package.

- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the DBMS\_STREAMS\_ADM package or the DBMS\_RULE\_ADM package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the DBMS\_RULE\_ADM package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

---

---

**Attention:** Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire Oracle Streams configuration at a database.

---

---

---

---

**Note:**

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
  - This procedure commits multiple times.
- 
- 

**See Also:**

- [STOP\\_CAPTURE Procedure](#) on page 32-50 in the DBMS\_CAPTURE\_ADM package
- [STOP\\_APPLY Procedure](#) on page 21-78 in the DBMS\_APPLY\_ADM package

## RENAME\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

---

---

**Note:**

- The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
  - Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
- 
- 

**See Also:** *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

### Syntax

```
DBMS_STREAMS_ADM.RENAME_COLUMN(
    rule_name          IN  VARCHAR2,
    table_name         IN  VARCHAR2,
    from_column_name   IN  VARCHAR2,
    to_column_name     IN  VARCHAR2,
    value_type         IN  VARCHAR2  DEFAULT '*',
    step_number        IN  NUMBER     DEFAULT 0,
    operation          IN  VARCHAR2   DEFAULT 'ADD');
```

### Parameters

**Table 144–34** *RENAME\_COLUMN Procedure Parameters*

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.] rule_name</code> . If <code>NULL</code> , then the procedure raises an error.  For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>table_name</code>	The name of the table in which the column is renamed in the row LCR, specified as <code>[schema_name.] object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>from_column_name</code>	The name of the column to be renamed in each row LCR that satisfies the rule.
<code>to_column_name</code>	The new name of the column in each row LCR that satisfies the rule.

**Table 144–34 (Cont.) RENAME\_COLUMN Procedure Parameters**

Parameter	Description
value_type	Specify 'NEW' to rename the column in the new values in the row LCR.  Specify 'OLD' to rename the column in the old values in the row LCR.  Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation.  <b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule.  Specify 'REMOVE' to remove the transformation from the rule.

## Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_COLUMN` procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified <code>step_number</code> for the specified rule.
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>to_column_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>column_name</code> for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> for the specified rule.

<b>table_name</b>	<b>from_column_name</b>	<b>to_column_name</b>	<b>step_number</b>	<b>Result</b>
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.

## RENAME\_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

---

**Note:** Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

---

**See Also:** *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

### Syntax

```
DBMS_STREAMS_ADM.RENAME_SCHEMA(
  rule_name          IN  VARCHAR2,
  from_schema_name  IN  VARCHAR2,
  to_schema_name    IN  VARCHAR2,
  step_number       IN  NUMBER    DEFAULT 0,
  operation         IN  VARCHAR2  DEFAULT 'ADD');
```

### Parameters

**Table 144–35** *RENAME\_SCHEMA Procedure Parameters*

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as [ <i>schema_name.</i> ] <i>rule_name</i> . If <code>NULL</code> , then the procedure raises an error.  For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>from_schema_name</code>	The name of the schema to be renamed in each row LCR that satisfies the rule.
<code>to_schema_name</code>	The new name of the schema in each row LCR that satisfies the rule.
<code>step_number</code>	The order of execution of the transformation.  <b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering
<code>operation</code>	Specify <code>'ADD'</code> to add the transformation to the rule.  Specify <code>'REMOVE'</code> to remove the transformation from the rule.

### Usage Notes

When `'REMOVE'` is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table

lists the behavior of the RENAME\_SCHEMA procedure when one or more of these parameters is NULL:

<b>from_schema_name</b>	<b>to_schema_name</b>	<b>step_number</b>	<b>Result</b>
NULL	NULL	NULL	Remove all rename schema transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename schema transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified to_schema_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified from_schema_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.

## RENAME\_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

---

**Note:** Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

---

**See Also:** *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

### Syntax

```
DBMS_STREAMS_ADM.RENAME_TABLE(
  rule_name          IN  VARCHAR2,
  from_table_name    IN  VARCHAR2,
  to_table_name      IN  VARCHAR2,
  step_number       IN  NUMBER   DEFAULT 0,
  operation          IN  VARCHAR2 DEFAULT 'ADD');
```

### Parameters

**Table 144–36** *RENAME\_TABLE Procedure Parameters*

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as [ <i>schema_name.</i> ] <i>rule_name</i> . If <code>NULL</code> , then the procedure raises an error.  For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>from_table_name</code>	The name of the table to be renamed in each row LCR that satisfies the rule, specified as [ <i>schema_name.</i> ] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>to_table_name</code>	The new name of the table in each row LCR that satisfies the rule, specified as [ <i>schema_name.</i> ] <i>object_name</i> . For example, <code>humres.staff</code> .  The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.
<code>step_number</code>	The order of execution of the transformation.  <b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering

**Table 144–36 (Cont.) RENAME\_TABLE Procedure Parameters**

Parameter	Description
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

### Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified from\_table\_name, to\_table\_name, and step\_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME\_TABLE procedure when one or more of these parameters is NULL:

from_table_name	to_table_name	step_number	Result
NULL	NULL	NULL	Remove all rename table transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename table transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified to_table_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename table transformations with the specified from_table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename table transformations with the specified to_table_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename table transformations with the specified from_table_name and to_table_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename table transformations with the specified from_table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.

## SET\_MESSAGE\_NOTIFICATION Procedure

This procedure sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue. A notification is sent when a message is enqueued into the specified queue and the specified messaging client can dequeue the message because the message satisfies its rule sets.

---

---

### Note:

- Currently, messaging clients cannot dequeue buffered messages.
  - The DBMS\_AQ package can also configure notifications. The DBMS\_AQ package provides some notification features that are not available in DBMS\_STREAMS\_ADM package, such as buffered message notifications and notification grouping by time.
- 
- 

### Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_NOTIFICATION(
  streams_name      IN  VARCHAR2,
  notification_action  IN  VARCHAR2,
  notification_type   IN  VARCHAR2      DEFAULT 'PROCEDURE',
  notification_context IN  ANYDATA      DEFAULT NULL,
  include_notification IN  BOOLEAN      DEFAULT TRUE,
  queue_name         IN  VARCHAR2      DEFAULT 'streams_queue');
```

### Parameters

**Table 144–37 SET\_MESSAGE\_NOTIFICATION Procedure Parameters**

Parameter	Description
streams_name	The name of the Oracle Streams messaging client. Do not specify an owner.  For example, if the user strmadmin is the messaging client, then specify strmadmin.

**Table 144–37 (Cont.) SET\_MESSAGE\_NOTIFICATION Procedure Parameters**

Parameter	Description
notification_action	<p>The action to be performed on message notification. Specify one of the following:</p> <ul style="list-style-type: none"> <li>■ For URL notifications, specify a URL without the prefix <code>http://</code>. For example, to specify the URL <code>http://www.company.com:8080</code>, enter the following: <code>www.company.com:8080</code></li> <li>■ For email notifications, specify an email address. For example, to specify an the email address <code>xyz@company.com</code>, enter the following: <code>xyz@company.com</code></li> <li>■ For PL/SQL procedure notifications, specify an existing user-defined PL/SQL procedure in the form <code>[schema_name.]procedure_name</code>. If the <code>schema_name</code> is not specified, then the user who invokes the SET_MESSAGE_NOTIFICATION procedure is the default. The procedure must be a PLSQLCALLBACK data structure. For example, to specify a procedure named <code>notify_orders</code> in the <code>oe</code> schema, enter the following: <code>oe.notify_orders</code></li> </ul> <p><b>See Also:</b> <a href="#">Examples</a> on page 144-164 for more information about message notification procedures</p>
notification_type	<p>The type of notification. Specify one of the following:</p> <ul style="list-style-type: none"> <li>■ HTTP if you specified a URL for <code>notification_action</code></li> <li>■ MAIL if you specified an email address for <code>notification_action</code></li> <li>■ PROCEDURE if you specified a user-defined procedure for <code>notification_action</code></li> </ul> <p>The type must match the specification for the <code>notification_action</code> parameter.</p>
notification_context	<p>The context of the notification. The context must be specified using RAW data type information. For example, to specify the hexadecimal equivalent of 'FF', enter the following: <code>ANYDATA.ConvertRaw(HEXTORAW('FF'))</code></p> <p>The notification context is passed the PL/SQL procedure in procedure notifications and is not relevant for mail or HTTP notifications.</p>
include_notification	<p>If TRUE, then the procedure adds this notification for the specified <code>streams_name</code> and <code>queue_name</code>. That is, specifying TRUE turns on the notification for the <code>streams_name</code> and <code>queue_name</code>.</p> <p>If FALSE, then the procedure removes this notification for the specified <code>streams_name</code> and <code>queue_name</code>. That is, specifying FALSE turns off the notification for the <code>streams_name</code> and <code>queue_name</code>. If you specify FALSE, then this procedure ignores any specified values for the <code>notification_action</code> or <code>notification_context</code> parameters.</p>

**Table 144-37 (Cont.) SET\_MESSAGE\_NOTIFICATION Procedure Parameters**

Parameter	Description
queue_name	<p>The name of a local ANYDATA queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue. The specified queue must be a ANYDATA queue.</p> <p>For example, to specify a queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter. If the schema is not specified, then the current user is the default.</p>

## Usage Notes

You can specify one of the following types of notifications:

- An email address to which message notifications are sent. When a relevant message is enqueued into the queue, an email with the message properties is mailed to the specified email address.
- A PL/SQL procedure to be invoked on a notification. When a relevant message is enqueued into the queue, the specified PL/SQL procedure is invoked with the message properties. This PL/SQL procedure can dequeue the message.
- An HTTP URL to which the notification is posted. When a relevant message is enqueued into the queue, a notification with the message properties is posted to the specified URL specified.

A client does not need to be connected to the database to receive a notification.

If you register for email notifications, then you should use the DBMS\_AQELM package to set the host name and port name for the SMTP server that will be used by the database to send email notifications. If required, then you should set the send-from email address, which is set by the database as the *sent from* field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you might want to use the DBMS\_AQELM package to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

Each notification is an AQXMLNotification, which includes of the following:

- *notification\_options*, which includes the following:
  - *destination* - The destination queue from which the message was dequeued
  - *consumer\_name* - The name of the messaging client that dequeued the message
- *message\_set* - The set of message properties

**See Also:**

- The documentation for the DBMS\_AQELM package for more information on email notifications and HTTP notifications
- *Oracle Database 2 Day + Data Replication and Integration Guide* for an example that configures message notification to automatically dequeue of messages of interest
- *Oracle Streams Advanced Queuing User's Guide* and *Oracle XML DB Developer's Guide* for more information about message notifications and XML
- *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

**Examples**

If you use a message notification procedure, then this PL/SQL procedure must have the following signature:

```
PROCEDURE procedure_name(
    context IN ANYDATA,
    reginfo IN SYS.AQ$_REG_INFO,
    descr   IN SYS.AQ$_DESCRIPTOR);
```

Here, *procedure\_name* stands for the name of the procedure. The procedure is a PLSQLCALLBACK data structure that specifies the user-defined PL/SQL procedure to be invoked on message notification.

The following is a simple example of a notification procedure that dequeues a message of type `oe.user_msg` using the message identifier and consumer name sent by the notification. To complete the example, first create the type:

```
CREATE TYPE oe.user_msg AS OBJECT(
    object_name  VARCHAR2(30),
    object_owner VARCHAR2(30),
    message      VARCHAR2(50));
/
```

Next, create the procedure:

```
CREATE OR REPLACE PROCEDURE oe.notification_dequeue(
    context ANYDATA,
    reginfo SYS.AQ$_REG_INFO,
    descr   SYS.AQ$_DESCRIPTOR)
AS
    dequeue_options DBMS_AQ.DEQUEUE_OPTIONS_T;
    message_properties DBMS_AQ.MESSAGE_PROPERTIES_T;
    message_handle RAW(16);
    message ANYDATA;
    oe_message oe.user_msg;
    rc PLS_INTEGER;
BEGIN
    -- Get the message identifier and consumer name from the descriptor
    dequeue_options.msgid := descr.msg_id;
    dequeue_options.consumer_name := descr.consumer_name;
    -- Dequeue the message
    DBMS_AQ.DEQUEUE(
        queue_name => descr.queue_name,
        dequeue_options => dequeue_options,
        message_properties => message_properties,
```

```
    payload          => message,  
    msgid           => message_handle);  
rc := message.getobject(oe_message);  
COMMIT;  
END;  
/
```

**See Also:** *Oracle Database PL/SQL Packages and Types Reference* for more information about PLSQLCALLBACK data structures

## SET\_MESSAGE\_TRACKING Procedure

Sets the tracking label for logical change records (LCRs) produced by the current session. This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

---

**Note:** The tracking label set by this procedure does not track non-LCR messages.

---

**See Also:** [GET\\_MESSAGE\\_TRACKING Function](#) on page 144-83

### Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_TRACKING (
  tracking_label IN VARCHAR2 DEFAULT 'Streams_tracking',
  actions       IN NUMBER   DEFAULT DBMS_STREAMS_ADM.ACTION_MEMORY);
```

### Parameters

**Table 144–38 SET\_MESSAGE\_TRACKING Procedure Parameters**

Parameter	Description
tracking_label	<p>The label used to track the LCRs produced by the session.</p> <p>Set this parameter to NULL to stop message tracking in the current session.</p> <p>The size limit for a label is 4,000 bytes.</p>
actions	<p>When DBMS_STREAMS_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory, and the V\$STREAMS_MESSAGE_TRACKING dynamic performance view is populated with information about the LCRs.</p> <p>Currently, DBMS_STREAMS_ADM.ACTION_MEMORY is the only valid setting for this parameter.</p> <p>The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.</p>

## SET\_RULE\_TRANSFORM\_FUNCTION Procedure

This procedure sets or removes the transformation function name for a custom rule-based transformation.

### Syntax

```
DBMS_STREAMS_ADM.SET_RULE_TRANSFORM_FUNCTION(
  rule_name          IN  VARCHAR2,
  transform_function IN  VARCHAR2);
```

### Parameters

**Table 144–39 SET\_RULE\_TRANSFORM\_FUNCTION Procedure Parameters**

Parameter	Description
<code>rule_name</code>	<p>The name of the rule whose rule-based transformation function you are setting or removing, specified as <code>[schema_name.]rule_name</code>.</p> <p>For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code>, enter <code>hr.prop_rule1</code>. If the schema is not specified, then the current user is the default.</p>
<code>transform_function</code>	<p>Either the name of the transformation function to be used in the rule-based transformation for the rule or <code>NULL</code>.</p> <p>If you specify a transformation function name, then specify an existing function in one of the following forms:</p> <ul style="list-style-type: none"> <li>▪ <code>[schema_name.]function_name</code></li> <li>▪ <code>[schema_name.]package_name.function_name</code></li> </ul> <p>If the function is in a package, then you must specify the <code>package_name</code>. For example, to specify a function in the <code>transform_pkg</code> package in the <code>hr</code> schema named <code>executive_to_management</code>, enter <code>hr.transform_pkg.executive_to_management</code>. An error is returned if the specified procedure does not exist.</p> <p>If the <code>schema_name</code> is not specified, then the user who invokes the rule-based transformation function is the default.</p> <p>If you specify <code>NULL</code>, then the <code>SET_RULE_TRANSFORM_FUNCTION</code> procedure removes the current custom rule-based transformation from the rule.</p>

### Usage Notes

The following sections contain usage notes for this procedure:

- [Transformation Function Signature](#)
- [Rule Action Context](#)
- [User Who Calls the Transformation Function](#)
- [Function Verification](#)

#### Transformation Function Signature

A custom rule-based transformation function always operates on one message, but it can return one message or many messages. A custom rule-based transformation function that returns one message is a one-to-one transformation function. A one-to-one transformation function must have the following signature:

```
FUNCTION user_function (  
    parameter_name IN ANYDATA)  
RETURN ANYDATA;
```

Here, *user\_function* stands for the name of the function and *parameter\_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an ANYDATA encapsulation of a message.

A custom rule-based transformation function that can return multiple messages is a one-to-many transformation function. A one-to-many transformation function must have the following signature:

```
FUNCTION user_function (  
    parameter_name IN ANYDATA)  
RETURN STREAMS$_ANYDATA_ARRAY;
```

Here, *user\_function* stands for the name of the function and *parameter\_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an array that contains zero or more ANYDATA encapsulations of a message. If the array contains zero ANYDATA encapsulations of a message, then the original message is discarded.

The STREAMS\$\_ANYDATA\_ARRAY type is an Oracle-supplied type that has the following definition:

```
CREATE OR REPLACE TYPE SYS.STREAMS$_ANYDATA_ARRAY  
    AS VARRAY(2147483647) of ANYDATA  
/
```

The following restrictions apply to custom rule-based transformations that use one-to-many functions:

- Rules that are associated with one-to-many functions are supported for Oracle Streams capture processes only. These rules must not be added to rule sets used by other Oracle Streams clients, including propagations, apply processes, and messaging clients.
- One-to-many functions only can operate on row logical change records (row LCRs). They cannot operate on DDL LCRs.
- Row LCRs returned by a one-to-many function cannot contain piecewise LOB, LONG, or LONG RAW operations.
- The one-to-many function must return row LCRs in the correct order. The order of row LCRs in the array (starting from index 1) is the order that the row LCRs will be executed in the transaction.

When an apply process dequeues row LCRs that are the result of a transformation by a one-to-many function, the apply process uses the instantiation SCN of the LCR passed to the one-to-many function for all of row LCRs.

**Note:**

- An error is raised if a one-to-one or one-to-many transformation function returns NULL.
- Only one custom rule-based transformation can be specified for a particular rule. You cannot specify both a one-to-one and a one-to-many transformation function for the same rule.
- For any LCR constructed and returned by a custom rule-based transformation, the `source_database_name`, `transaction_id`, and `scn` parameter values must match the values in the original LCR. Oracle automatically specifies the values in the original LCR for these parameters, even if an attempt is made to construct LCRs with different values.

**Rule Action Context**

This procedure modifies the specified rule's action context to specify the transformation. A rule's action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. The client of the rules engine can be a user-created application or an internal feature of Oracle, such as Oracle Streams. The Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A custom rule-based transformation in Oracle Streams always consists of the following name-value pair in an action context:

- If the function is a one-to-one transformation function, then the name is `STREAMS$_TRANSFORM_FUNCTION`. If the function is a one-to-many transformation function, then the name is `STREAMS$_ARRAY_TRANS_FUNCTION`.
- The value is a `ANYDATA` instance containing a PL/SQL function name specified as a `VARCHAR2`. This function performs the transformation.

**User Who Calls the Transformation Function**

The user that calls the transformation function must have `EXECUTE` privilege on the function. The following list describes which user calls the transformation function:

- If a transformation is specified for a rule used by a capture process, then the user who calls the transformation function is the capture user for the capture process.
- If a transformation is specified for a rule used by a synchronous capture, then the user who calls the transformation function is the capture user for the synchronous capture.
- If a transformation is specified for a rule used by a propagation, then the user who calls the transformation function is the owner of the source queue for the propagation.
- If a transformation is specified on a rule used by an apply process, then the user who calls the transformation function is the apply user for the apply process.
- If a transformation is specified on a rule used by a messaging client, then the user who calls the transformation function is the user who invokes the messaging client.

**Function Verification**

This procedure does not verify that the specified transformation function exists. If the function does not exist, then an error is raised when an Oracle Streams client tries to invoke the transformation function.

## SET\_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

### See Also:

- ["GET\\_TAG Function"](#) on page 144-86
- *Oracle Streams Replication Administrator's Guide* for more information about tags

## Syntax

```
DBMS_STREAMS_ADM.SET_TAG(
    tag IN RAW DEFAULT NULL);
```

## Parameters

**Table 144–40 SET\_TAG Procedure Parameters**

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits.  By default, the tag for a session is NULL.  The size limit for a tag value is 2000 bytes.

## Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_STREAMS_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET\_TAG procedure:

- This procedure is not transactional. That is, the effects of SET\_TAG cannot be rolled back.
- If the SET\_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET\_TAG procedure in a session. A data dictionary build happens when the DBMS\_CAPTURE\_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

**See Also:** [BUILD Procedure](#) on page 32-18

## SET\_UP\_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

### Syntax

```
DBMS_STREAMS_ADM.SET_UP_QUEUE(
  queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
  storage_clause IN VARCHAR2 DEFAULT NULL,
  queue_name IN VARCHAR2 DEFAULT 'streams_queue',
  queue_user IN VARCHAR2 DEFAULT NULL,
  comment IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 144–41 SET\_UP\_QUEUE Procedure Parameters**

Parameter	Description
queue_table	<p>The name of the queue table specified as [<i>schema_name.</i>] <i>queue_table_name</i>. For example, <i>strmadmin.streams_queue_table</i>. If the schema is not specified, then the current user is the default.</p> <p>If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner.</p> <p>Queue table names can be a maximum of 24 bytes.</p>
storage_clause	<p>The storage clause for queue table</p> <p>The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause.</p> <p>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</p> <p>If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</p> <p><b>See Also:</b> <i>Oracle Database SQL Language Reference</i> for more information about storage clauses</p>
queue_name	<p>The name of the queue that will function as the ANYDATA queue, specified as [<i>schema_name.</i>] <i>queue_name</i>. For example, <i>strmadmin.streams_queue</i>.</p> <p>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If the schema is not specified for this parameter, and the queue table owner is not specified in <i>queue_table</i>, then the current user is the default.</p> <p>Queue names can be a maximum of 24 bytes.</p>

**Table 144–41 (Cont.) SET\_UP\_QUEUE Procedure Parameters**

Parameter	Description
queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.  If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
comment	The comment for the queue

## Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE\_QUEUE\_TABLE procedure in the DBMS\_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

Also, if the database is Oracle Database 10g release 2 or later, the `sort_list` setting in CREATE\_QUEUE\_TABLE is set to `commit_time`. If the database is a release before Oracle Database 10g release 2, the `sort_list` setting in CREATE\_QUEUE\_TABLE is set to `enq_time`.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the CREATE\_QUEUE procedure in the DBMS\_AQADM package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants ENQUEUE and DEQUEUE privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. SET\_UP\_QUEUE then runs the ENABLE\_DB\_ACCESS procedure in the DBMS\_AQADM package, specifying the agent and the user.

---

---

### Note:

- To enqueue messages into and dequeue messages from a queue, a queue user must have EXECUTE privilege on the DBMS\_STREAMS\_MESSAGING package or the DBMS\_AQ package. The SET\_UP\_QUEUE procedure does not grant this privilege.
  - If the agent that SET\_UP\_QUEUE tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry SET\_UP\_QUEUE.
- 
-

**See Also:** *Oracle Streams Concepts and Administration* for more information about secure queue users

## SPLIT\_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill messages to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates messages from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.
5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

The `DBA_STREAMS_SPLIT_MERGE` view contains the name of each cloned component and information about the split and merge operation.

---

---

**Note:** If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

---

---

**See Also:**

- ["MERGE\\_STREAMS Procedure"](#) on page 144-130
- ["MERGE\\_STREAMS\\_JOB Procedure"](#) on page 144-133
- *Oracle Streams Replication Administrator's Guide* for instructions on using the SPLIT\_STREAMS procedure

**Syntax**

```
DBMS_STREAMS_ADM.SPLIT_STREAMS (
  propagation_name          IN          VARCHAR2,
  cloned_propagation_name   IN          VARCHAR2  DEFAULT NULL,
  cloned_queue_name         IN          VARCHAR2  DEFAULT NULL,
  cloned_capture_name       IN          VARCHAR2  DEFAULT NULL,
  perform_actions           IN          BOOLEAN   DEFAULT TRUE,
  script_name               IN          VARCHAR2  DEFAULT NULL,
  script_directory_object   IN          VARCHAR2  DEFAULT NULL,
  auto_merge_threshold      IN          NUMBER    DEFAULT NULL,
  schedule_name             IN OUT     VARCHAR2,
  merge_job_name            IN OUT     VARCHAR2);
```

**Parameters****Table 144–42 SPLIT\_STREAMS Procedure Parameters**

Parameter	Description
propagation_name	The name of the propagation that cannot send messages to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
cloned_propagation_name	The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.
cloned_queue_name	The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.
cloned_capture_name	The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.

**Table 144-42 (Cont.) SPLIT\_STREAMS Procedure Parameters**

Parameter	Description
perform_actions	<p>If TRUE, then the procedure performs the necessary actions to split the stream directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to split the stream directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> <li>▪ script_name</li> <li>▪ script_directory_object</li> </ul>
script_name	<p>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script.</p> <p>If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</p>
script_directory_object	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>

**Table 144–42 (Cont.) SPLIT\_STREAMS Procedure Parameters**

Parameter	Description
auto_merge_threshold	<p>If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV\$STREAMS_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.</p> <p>If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process.</p> <p>The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.</p>
schedule_name	<p>The Oracle Scheduler schedule name, specified as [<i>schema_name</i>.] <i>schedule_name</i>. For example, <i>strmadmin.merge_schedule</i>. If the schema is not specified, then the current user is the default.</p> <p>If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.</p> <p>If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name.</p> <p>If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.</p> <p>If an existing schedule name is specified, an error is raised.</p>
merge_job_name	<p>The Oracle Scheduler job name, specified as [<i>schema_name</i>.] <i>merge_job_name</i>. For example, <i>strmadmin.merge_job</i>. If the schema is not specified, then the current user is the default.</p> <p>If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.</p> <p>If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name.</p> <p>If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If an existing job name is specified, an error is raised.</p>

---

---

## DBMS\_STREAMS\_ADVISOR\_ADM

The `DBMS_STREAMS_ADVISOR_ADM` package, one of a set of Oracle Streams packages, provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered. This package is part of the Oracle Streams Performance Advisor.

This chapter contains the following topics:

- [Using DBMS\\_STREAMS\\_ADVISOR\\_ADM](#)
  - Overview
  - Security Model
  - Constants
  - Views
- [Summary of DBMS\\_STREAMS\\_ADVISOR\\_ADM Subprograms](#)

**See Also:** *Oracle Streams Concepts and Administration* for instructions about using this package

## Using DBMS\_STREAMS\_ADVISOR\_ADM

This section contains topics which relate to using the DBMS\_STREAMS\_ADVISOR\_ADM package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)

## Overview

The DBMS\_STREAMS\_ADVISOR\_ADM package enables you to gather and analyze information about an Oracle Streams environment. You can use this information in the following ways:

- To populate data dictionary views with an Oracle Streams topology that contains information about the Oracle Streams components at one or more databases
- To examine the Oracle Streams components at one or more databases in your environment and the ways in which information flows through streams that include these components
- To analyze the performance of the Oracle Streams components in your environment
- To detect performance problems with Oracle Streams components and correct these problems

**See Also:** *Oracle Streams Concepts and Administration* for instructions about using this package

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

## Constants

The DBMS\_STREAMS\_ADVISOR\_ADM package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS\_DBMS\_ADVISOR\_ADM.CAPTURE\_TYPE.

**Table 145–1 DBMS\_STREAMS\_ADVISOR\_ADM Parameters With Enumerated Constants**

Parameter	Option	Type	Description
component_type	<ul style="list-style-type: none"> <li>■ CAPTURE_TYPE</li> <li>■ PROPAGATION_SENDER_TYPE</li> <li>■ PROPAGATION_RECEIVER_TYPE</li> <li>■ APPLY_TYPE</li> <li>■ QUEUE_TYPE</li> </ul>	NUMBER	<p>CAPTURE_TYPE indicates that the Oracle Streams component is a capture process. The constant number for this option is 1.</p> <p>PROPAGATION_SENDER_TYPE indicates that the Oracle Streams component is a propagation sender. The constant number for this option is 2.</p> <p>PROPAGATION_RECEIVER_TYPE indicates that the Oracle Streams component is a propagation receiver. The constant number for this option is 3.</p> <p>APPLY_TYPE indicates that the Oracle Streams component is an apply process. The constant number for this option is 4.</p> <p>QUEUE_TYPE indicates that the Oracle Streams component is a queue. The constant number for this option is 5.</p>

## Views

The DBMS\_STREAMS\_ADVISOR\_ADM package uses the following views:

- DBA\_STREAMS\_TP\_COMPONENT contains information about each Oracle Streams component at each database.
- DBA\_STREAMS\_TP\_COMPONENT\_LINK contains information about how messages flow between Oracle Streams components.
- DBA\_STREAMS\_TP\_COMPONENT\_STAT contains temporary performance statistics about each Oracle Streams component.
- DBA\_STREAMS\_TP\_DATABASE contains information about each database that contains Oracle Streams components.
- DBA\_STREAMS\_TP\_PATH\_BOTTLENECK contains temporary information about Oracle Streams components that might be slowing down the flow of a stream.
- DBA\_STREAMS\_TP\_PATH\_STAT contains temporary performance statistics about each stream path that exists in the Oracle Streams topology.

The topology information is stored permanently in the following data dictionary views: DBA\_STREAMS\_TP\_DATABASE, DBA\_STREAMS\_TP\_COMPONENT, and DBA\_STREAMS\_TP\_COMPONENT\_LINK.

However, the following views contain temporary information: DBA\_STREAMS\_TP\_COMPONENT\_STAT, DBA\_STREAMS\_TP\_PATH\_BOTTLENECK, and DBA\_STREAMS\_TP\_PATH\_STAT. Some of the data in these views is retained only for the user session that runs the ANALYZE\_CURRENT\_PERFORMANCE procedure. When this user session ends, this temporary information is purged.

**See Also:**

- *Oracle Database Reference*
- *Oracle Streams Concepts and Administration* for sample queries that use these views

## Operational Notes

This section contains the following operational notes for the DBMS\_STREAMS\_ADVISOR\_ADM package:

- [Oracle Streams Components Analyzed by the DBMS\\_STREAMS\\_ADVISOR\\_ADM Package](#)
- [General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information](#)

### Oracle Streams Components Analyzed by the DBMS\_STREAMS\_ADVISOR\_ADM Package

The DBMS\_STREAMS\_ADVISOR\_ADM analyzes the following Oracle Streams components at the specified databases:

- Capture processes
- Propagations
- Apply processes
- Queues

The DBMS\_STREAMS\_ADVISOR\_ADM package does not analyze the following Oracle Streams components:

- Synchronous captures
- Messaging clients

### General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

To use the DBMS\_STREAMS\_ADVISOR\_ADM package, complete the following general steps:

1. Identify the database that you will use to gather the information.

An administrative user at this database must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Streams components.
- The user must have been granted privileges using the DBMS\_STREAMS\_AUTH.GRANT\_ADMIN\_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS\_STREAMS\_AUTH.GRANT\_ADMIN\_PRIVILEGE procedure.

In an Oracle Streams environment, the Oracle Streams administrator uses this package.

If no database in your environment meets these requirements, then choose a database, configure the necessary database links, and grant the necessary privileges to the users before proceeding.

2. Connect as the administrative user to the database you identified in Step 1, and remain connected to the session while you complete the remaining steps.
3. Run the ANALYZE\_CURRENT\_PERFORMANCE procedure.
4. Optionally, allow messages to flow in the environment for some time.
5. Optionally, rerun the ANALYZE\_CURRENT\_PERFORMANCE procedure one or more times.

6. Query the data dictionary views listed in "[Views](#)" on page 145-6 to analyze the Oracle Streams environment.
7. If you want to update the information in the data dictionary views or if you add new Oracle Streams components to any database in the environment, repeat Steps 2-6.

---

---

**Note:** When you exit the user session, the rate, bandwidth, event, and flow control statistics are purged from the data dictionary views.

---

---

## Summary of DBMS\_STREAMS\_ADVISOR\_ADM Subprograms

**Table 145-2 DBMS\_STREAMS\_ADVISOR\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ANALYZE_CURRENT_PERFORMANCE Procedure</a> on page 145-10	Gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered

## ANALYZE\_CURRENT\_PERFORMANCE Procedure

This procedure gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered.

The performance analyses includes:

- Calculating bottleneck components for each separate stream
- Calculating the throughput of each Oracle Streams component
- Calculating the latency of each Oracle Streams component
- Calculating the top wait event of each Oracle Streams component
- Calculating the message rate of each stream
- Calculating the transaction rate of each stream

The procedure places the gathered information in data dictionary views.

---

---

**Note:** The parameters in this procedure must all be either non-NULL or NULL.

---

---

### See Also:

- *Oracle Streams Concepts and Administration* for instructions on using this procedure
- ["Views"](#) on page 145-6

## Syntax

```
DBMS_STREAMS_ADVISOR_ADM.ANALYZE_CURRENT_PERFORMANCE (
  component_name IN VARCHAR2 DEFAULT NULL,
  component_db   IN VARCHAR2 DEFAULT NULL,
  component_type IN NUMBER   DEFAULT NULL);
```

## Parameters

**Table 145–3 ANALYZE\_CURRENT\_PERFORMANCE Procedure Parameters**

Parameter	Description
component_name	The name of the Oracle Streams component to analyze. For example, to analyze a capture process named <code>capture01</code> , then specify <code>capture01</code> .  If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.
component_db	The global name of the database that contains the component specified in the <code>component_name</code> parameter. For example, if the <code>db.net</code> database contains the component, then specify <code>db.net</code> .  If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.

**Table 145-3 (Cont.) ANALYZE\_CURRENT\_PERFORMANCE Procedure Parameters**

Parameter	Description
component_type	<p>The type of the component specified in the component_name parameter. If the component_name parameter is non-NULL, then specify one of the following:</p> <ul style="list-style-type: none"> <li>■ DBMS_STREAMS_ADVISOR_ADM.CAPTURE_TYPE</li> <li>■ DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_SENDER_TYPE</li> <li>■ DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_RECEIVER_TYPE</li> <li>■ DBMS_STREAMS_ADVISOR_ADM.APPLY_TYPE</li> <li>■ DBMS_STREAMS_ADVISOR_ADM.QUEUE_TYPE</li> </ul> <p>See "Constants" on page 145-5 for information about these constants.</p> <p>If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.</p>

---

---

## DBMS\_STREAMS\_AUTH

The DBMS\_STREAMS\_AUTH package, one of a set of Oracle Streams packages, provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

This chapter contains the following topics:

- [Using DBMS\\_STREAMS\\_AUTH](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_STREAMS\\_AUTH Subprograms](#)

---

## Using DBMS\_STREAMS\_AUTH

This section contains topics which relate to using the DBMS\_STREAMS\_AUTH package.

- [Overview](#)
- [Security Model](#)

## Overview

This package provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

**See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams administrators

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

---

## Summary of DBMS\_STREAMS\_AUTH Subprograms

**Table 146–1 DBMS\_STREAMS\_AUTH Package Subprograms**

Subprogram	Description
<a href="#">GRANT_ADMIN_PRIVILEGE Procedure</a> on page 146-6	Either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that you can use to grant these privileges
<a href="#">GRANT_REMOTE_ADMIN_ACCESS Procedure</a> on page 146-9	Enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link
<a href="#">REVOKE_ADMIN_PRIVILEGE Procedure</a> on page 146-10	Either revokes Oracle Streams administrator privileges from a user directly, or generates a script that you can use to revoke these privileges
<a href="#">REVOKE_REMOTE_ADMIN_ACCESS Procedure</a> on page 146-12	Disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link

---

**Note:** All subprograms commit unless specified otherwise.

---

## GRANT\_ADMIN\_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that you can use to grant these privileges.

### Syntax

```
DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE (
  grantee          IN  VARCHAR2,
  grant_privileges IN  BOOLEAN   DEFAULT TRUE,
  file_name        IN  VARCHAR2  DEFAULT NULL,
  directory_name   IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 146–2 GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

Parameter	Description
grantee	The user to whom privileges are granted
grant_privileges	<p>If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fail, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view.</p> <p>You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.</p>
file_name	<p>The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file.</p> <p>If NULL, then the procedure does not generate a file.</p>
directory_name	<p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object.</p> <p>If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</p>

### Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege

- EXECUTE on the following packages:
  - DBMS\_APPLY\_ADM
  - DBMS\_AQ
  - DBMS\_AQADM
  - DBMS\_AQIN
  - DBMS\_AQELM
  - DBMS\_CAPTURE\_ADM
  - DBMS\_FLASHBACK
  - DBMS\_LOCK
  - DBMS\_PROPAGATION\_ADM
  - DBMS\_RULE\_ADM
  - DBMS\_STREAMS\_ADM
  - DBMS\_STREAMS\_ADVISOR\_ADM
  - DBMS\_STREAMS\_HANDLER\_ADM
  - DBMS\_STREAMS\_MESSAGING
  - DBMS\_TRANSFORM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

In addition, the grantee can grant these privileges to other users.

- SELECT\_CATALOG\_ROLE
- SELECT privilege on data dictionary views related to Oracle Streams
- The ability to allow a remote Oracle Streams administrator to perform administrative actions through a database link by connecting to the grantee. This ability is enabled by running the GRANT\_REMOTE\_ADMIN\_ACCESS procedure in this package.

---

---

**Note:**

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
  - This procedure does not grant any roles to the grantee.
  - This procedure grants only the privileges necessary to configure and administer an Oracle Streams environment. You can grant more privileges to the grantee if necessary.
- 
-

**See Also:**

- [GRANT\\_REMOTE\\_ADMIN\\_ACCESS Procedure](#) on page 146-9
- *Oracle Streams Replication Administrator's Guide* for more information about configuring an Oracle Streams administrator

## GRANT\_REMOTE\_ADMIN\_ACCESS Procedure

This procedure enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

### Syntax

```
DBMS_STREAMS_AUTH.GRANT_REMOTE_ADMIN_ACCESS (
  grantee IN VARCHAR2);
```

### Parameters

**Table 146–3 GRANT\_REMOTE\_ADMIN\_ACCESS Procedure Parameter**

Parameter	Description
grantee	The user who allows remote access. The procedure adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.

### Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The Oracle Streams administrator at a downstream capture database administers the source database using this connection. You can also run the procedure at a database running an apply process so that a remote Oracle Streams administrator can set instantiation SCNs at the local database.

---

**Note:** The GRANT\_ADMIN\_PRIVILEGE procedure runs this procedure.

---

**See Also:** [GRANT\\_ADMIN\\_PRIVILEGE Procedure](#) on page 146-6

## REVOKE\_ADMIN\_PRIVILEGE Procedure

This procedure either revokes Oracle Streams administrator privileges from a user directly, or generates a script that you can use to revoke these privileges.

### Syntax

```
DBMS_STREAMS_AUTH.REVOKE_ADMIN_PRIVILEGE(
  grantee          IN VARCHAR2,
  revoke_privileges IN BOOLEAN   DEFAULT TRUE,
  file_name       IN VARCHAR2   DEFAULT NULL,
  directory_name  IN VARCHAR2   DEFAULT NULL);
```

### Parameters

**Table 146–4 REVOKE\_ADMIN\_PRIVILEGE Procedure Parameters**

Parameter	Description
grantee	The user from whom privileges are revoked
revoke_privileges	<p>If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fail, then the procedure raises an error. A revoke statement will fail if the user is not granted the privilege that is being revoked.</p> <p>If FALSE, then the procedure does not revoke the privileges to the specified user directly, and does not remove the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view.</p> <p>You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.</p>
file_name	<p>The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file.</p> <p>If NULL, then the procedure does not generate a file.</p>
directory_name	<p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object.</p> <p>If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</p>

### Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT\_ADMIN\_PRIVILEGE procedure in this package.

---

---

**Note:** To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

---

---

**See Also:** [GRANT\\_ADMIN\\_PRIVILEGE Procedure](#) on page 146-6

## REVOKE\_REMOTE\_ADMIN\_ACCESS Procedure

This procedure disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.

---

**Note:** The REVOKE\_ADMIN\_PRIVILEGE procedure runs this procedure.

---

**See Also:** [REVOKE\\_ADMIN\\_PRIVILEGE Procedure](#) on page 146-10

### Syntax

```
DBMS_STREAMS_AUTH.REVOKE_REMOTE_ADMIN_ACCESS (
  grantee IN VARCHAR2);
```

### Parameters

**Table 146-5 REVOKE\_REMOTE\_ADMIN\_ACCESS Procedure Parameter**

Parameter	Description
grantee	<p>The user for whom access from a remote Oracle Streams administrator is disabled.</p> <p>If a row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then the procedure removes the grantee from the view.</p> <p>If no row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.</p>

---

---

## DBMS\_STREAMS\_HANDLER\_ADM

The DBMS\_STREAMS\_HANDLER\_ADM package, one of a set of Oracle Streams packages, provides interfaces to manage statement DML handlers.

This chapter contains the following topics:

- [Using DBMS\\_STREAMS\\_HANDLER\\_ADM](#)
  - Overview
  - Security Model
  - Views
  - Operational Notes
- [Summary of DBMS\\_STREAMS\\_HANDLER\\_ADM Subprograms](#)

## Using DBMS\_STREAMS\_HANDLER\_ADM

This section contains topics that relate to using the DBMS\_STREAMS\_HANDLER\_ADM package.

- [Overview](#)
- [Security Model](#)
- [Views](#)
- [Operational Notes](#)

## Overview

A statement DML handler runs one or more data manipulation language (DML) statements on row logical change records (row LCRs) that are dequeued by an apply process. A single statement DML handler can include multiple statements, and you control the execution order of the statements.

Statement DML handlers are similar to procedure DML handlers for apply processes. Both statement DML handlers and procedure DML handlers provide custom processing of row changes that are encapsulated in row LCRs. Statement DML handlers and procedure DML handlers both run when an apply process dequeues a row LCR. However, statement DML handlers have the following advantages over procedure DML handlers:

- Statement DML handlers typically perform better than procedure DML handlers because statement DML handlers do not require PL/SQL processing.
- The syntax for statement DML handlers is same as DML syntax. Statement DML handlers do not require PL/SQL programming. Procedure DML handlers require PL/SQL programming.
- Statement DML handlers do not require the manipulation of `ANYDATA` values to access the information in row LCRs. Typically, procedure DML handlers must manipulate `ANYDATA` values.
- A statement DML handler can coexist with an error handler for same operation on the same database object. In contrast, you cannot specify both a procedure DML handler and an error handler for the same operation on the same database object.

---

---

**Note:** You can specify multiple statement DML handlers for the same operation on the database object. In this case, the statement DML handlers can execute in any order, and each statement DML handler receives a copy of the original row LCR that was dequeued by the apply process.

---

---

**See Also:** *Oracle Streams Concepts and Administration*

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

## Views

The DBMS\_STREAMS\_HANDLER\_ADM package uses the views listed in the *Oracle Database Reference*.

- DBA\_APPLY\_DML\_HANDLERS
- DBA\_STREAMS\_STMTS
- DBA\_STREAMS\_STMT\_HANDLERS

## Operational Notes

The following sections contain operational notes about the `DBMS_STREAMS_HANDLER_ADM` package:

- [Statement Execution Order](#)
- [Supported SQL Statements](#)
- [Supported Row LCR Column Attributes](#)
- [Supported Row LCR Attributes](#)
- [Supported Row LCR Extra Attributes](#)
- [Supported Row LCR Method](#)

### Statement Execution Order

Each statement in a statement DML handler has a unique execution sequence number. When a statement DML handler is invoked, it executes its statements in order from the statement with the lowest execution sequence number to the statement with the highest execution sequence number.

### Supported SQL Statements

You can use statement DML handlers for any valid DML operation on a row logical change record (row LCR). For example, a statement DML handler can audit the DML changes made to a table.

The following SQL statements are supported in statement DML handlers:

- `INSERT`
- `UPDATE`
- `DELETE`
- `MERGE`

In addition, define variables are not supported in the SQL statements in a statement DML handler.

However, the SQL statements in a statement DML handler can include calls to member subprograms for the row LCR type (`LCR$_ROW_RECORD`), such as `ADD_COLUMN`, `DELETE_COLUMN`, `KEEP_COLUMNS`, and `RENAME_COLUMN`.

---

---

**Note:** A statement DML handler cannot modify the value of a column in a row LCR.

---

---

**See Also:** ["LCR\\$\\_ROW\\_RECORD Type"](#) on page 248-15

### Supported Row LCR Column Attributes

Statements in statement DML handlers can contain the row LCR column attributes described in [Table 147-1](#).

**Table 147-1 Row LCR Column Attributes**

Attribute	Description
new	Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns the old value.
new_exists	Returns TRUE if a new column value exists in a row LCR. Returns FALSE if a new column value does not exist in a row LCR.
new_only	Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns NULL and does not return the old column value.
old	Returns the old column value in a row LCR.
old_exists	Returns TRUE if an old column value exists in a row LCR. Returns FALSE if an old column value does not exist in a row LCR.

Specify these attributes in the following way in a statement:

```
:attribute.column_name
```

For example, to specify the `new_only` attribute for the `salary` column, enter the following in a statement:

```
:new_only.salary
```

## Supported Row LCR Attributes

Statements in statement DML handlers can contain the row LCR attributes described in [Table 147-2](#).

**Table 147-2 Row LCR Attributes**

Attribute	Description
command_type	Returns the type of DML statement that produced the change, either INSERT, UPDATE, or DELETE. DBMS_LOB piecewise LOB operations are not supported by statement DML handlers.
commit_scn	Returns the commit system change number (SCN) of the transaction to which the LCR belongs.
compatible	Returns the minimal database compatibility required to support the LCR.
instance_number	Returns the instance number of the database instance that made the change that is encapsulated in the LCR. Typically, the instance number is relevant in an Oracle Real Application Clusters (Oracle RAC) configuration.
object_owner	Returns the schema name that contains the table with the changed row.
object_name	Returns the name of the table that contains the changed row.
scn	Returns the SCN at the time when the change was made.
source_database_name	Returns the name of the source database where the row change occurred.
source_time	Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.
tag	Returns a raw tag that can be used to track the LCR.

**Table 147-2 (Cont.) Row LCR Attributes**

Attribute	Description
<code>transaction_id</code>	Returns the identifier of the transaction in which the DML statement was run.

Specify these attributes in the following way in a statement:

```
:attribute_name
```

For example, to specify the `source_database_name` attribute for a row LCR, enter the following in a statement:

```
:source_database_name
```

### Supported Row LCR Extra Attributes

Statements in statement DML handlers can contain the row LCR extra attributes described in [Table 147-3](#).

**Table 147-3 Row LCR Extra Attributes**

Attribute	Description
<code>row_id</code>	Returns the rowid of the row changed in a row LCR.
<code>serial#</code>	Returns the serial number of the session that performed the change captured in the LCR.
<code>session#</code>	Returns the identifier of the session that performed the change captured in the LCR.
<code>thread#</code>	Returns the thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle RAC configuration.
<code>tx_name</code>	Returns the name of the transaction that includes the LCR.
<code>username</code>	Returns the name of the current user who performed the change captured in the LCR.

Specify these attributes in the following way in a statement:

```
:extra_attribute.attribute_name
```

For example, to specify the `row_id` extra attribute for a row LCR, enter the following in a statement:

```
:extra_attribute.row_id
```

### Supported Row LCR Method

A statement in a statement DML handler can include a call to the `EXECUTE` member procedure for row LCRs. The `EXECUTE` member procedure executes the row LCR under the security domain of the current user.

A statement that runs the `EXECUTE` member procedure can be placed anywhere in the execution sequence order of the statement DML handler. It is not necessary to execute a row LCR unless the goal is to apply the changes in the row LCR to a table in addition to performing any other SQL statements in the statement DML handler.

When you call the `EXECUTE` member procedure in a statement, the `conflict_resolution` parameter controls whether any conflict resolution defined for the table

using the `SET_UPDATE_CONFLICT_HANDLER` procedure in the `DBMS_APPLY_ADM` package is used to resolve conflicts resulting from the execution of the LCR:

```
:lcr.execute TRUE|FALSE
```

A `TRUE` argument indicates that conflict resolution is used. A `FALSE` argument indicates that conflict resolution is not used.

For example, to use conflict resolution, enter the following in a statement:

```
:lcr.execute TRUE
```

An error is raised if this parameter is not specified or is set to `NULL`.

---

## Summary of DBMS\_STREAMS\_HANDLER\_ADM Subprograms

**Table 147-4** *DBMS\_STREAMS\_HANDLER\_ADM Package Subprograms*

Subprogram	Description
<a href="#">ADD_STMT_TO_HANDLER Procedure</a> on page 147-11	Adds a statement to a statement DML handler
<a href="#">CREATE_STMT_HANDLER Procedure</a> on page 147-12	Creates a statement DML handler
<a href="#">DROP_STMT_HANDLER Procedure</a> on page 147-13	Drops a statement DML handler
<a href="#">REMOVE_STMT_FROM_HANDLER Procedure</a> on page 147-14	Removes a statement from a statement DML handler

---

---

**Note:** The subprograms in this package do not commit.

---

---

## ADD\_STMT\_TO\_HANDLER Procedure

This procedure adds a statement to a statement DML handler.

### Syntax

```
DBMS_STREAMS_HANDLER_ADM.ADD_STMT_TO_HANDLER (
  handler_name      IN VARCHAR2,
  statement         IN CLOB,
  execution_sequence IN NUMBER  DEFAULT NULL);
```

### Parameters

**Table 147-5 ADD\_STMT\_TO\_HANDLER Procedure Parameters**

Parameter	Description
handler_name	The name of the statement DML handler.
statement	The text of the SQL statement to add to the statement DML handler. If NULL, then the procedure raises an error.
execution_sequence	The position of the statement in the statement DML handler at which a SQL statement is to be set to execute. Statements are executed in order from the lowest execution sequence number to the highest execution sequence number.  You can specify a positive or negative integer or decimal, or you can specify 0 (zero).  If you specify an execution sequence number that is used by an existing statement in the statement DML handler, then the statement in the statement parameter replaces the existing statement.  If NULL, then the statement is added to the statement DML handler with an execution sequence number that is larger than the execution sequence number for any statement in the statement DML handler.

## CREATE\_STMT\_HANDLER Procedure

This procedure creates a statement DML handler.

### Syntax

```
DBMS_STREAMS_HANDLER_ADM.CREATE_STMT_HANDLER(  
    handler_name IN VARCHAR2,  
    comment      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 147–6 CREATE\_STMT\_HANDLER Procedure Parameters**

Parameter	Description
handler_name	The name of the statement DML handler.
comment	A comment for the statement DML handler. If NULL, then no comment is recorded for the statement DML handler.

## DROP\_STMT\_HANDLER Procedure

This procedure drops a statement DML handler.

### Syntax

```
DBMS_STREAMS_HANDLER_ADM.DROP_STMT_HANDLER(  
    handler_name IN VARCHAR2);
```

### Parameters

**Table 147-7** *DROP\_STMT\_HANDLER Procedure Parameters*

Parameter	Description
handler_name	The name of the statement DML handler.

## REMOVE\_STMT\_FROM\_HANDLER Procedure

This procedure removes a statement from a statement DML handler.

### Syntax

```
DBMS_STREAMS_HANDLER_ADM.REMOVE_STMT_FROM_HANDLER(  
    handler_name      IN VARCHAR2,  
    execution_sequence IN NUMBER  DEFAULT NULL);
```

### Parameters

**Table 147–8 REMOVE\_STMT\_FROM\_HANDLER Procedure Parameters**

Parameter	Description
handler_name	The name of the statement DML handler.
execution_ sequence	The position of the statement to remove. You can specify a positive or negative integer or decimal, or you can specify 0 (zero). If NULL, the procedure removes the last statement in the statement DML handler. If the specified execution sequence number does not exist for the statement DML handler, then the procedure raises an error.

---

---

## DBMS\_STREAMS\_MESSAGING

The `DBMS_STREAMS_MESSAGING` package, one of a set of Oracle Streams packages, provides interfaces to enqueue messages into and dequeue messages from a `ANYDATA` queue.

This chapter contains the following topics:

- [Using DBMS\\_STREAMS\\_MESSAGING](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_STREAMS\\_MESSAGING Subprograms](#)

## Using DBMS\_STREAMS\_MESSAGING

This section contains topics which relate to using the DBMS\_CAPTURE\_ADM package.

- [Overview](#)
- [Security Model](#)

## Overview

This package provides interfaces to enqueue messages into and dequeue messages from a ANYDATA queue.

---

---

**Note:** Currently, messaging clients cannot dequeue buffered messages. In addition, the DBMS\_STREAMS\_MESSAGING package cannot be used to enqueue messages into or dequeue messages from a buffered queue. However, you can use the DBMS\_AQ package to enqueue and dequeue buffered messages.

---

---

### See Also:

- *Oracle Database 2 Day + Data Replication and Integration Guide* for more information about Oracle Streams and for an example that uses the procedures in this package
- *Oracle Streams Advanced Queuing User's Guide* for more information about queues, messaging, and the DBMS\_AQ package

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

---

## Summary of DBMS\_STREAMS\_MESSAGING Subprograms

**Table 148–1** *DBMS\_STREAMS\_MESSAGING Package Subprograms*

Subprogram	Description
<a href="#">DEQUEUE Procedure</a> on page 148-6	Uses the specified Oracle Streams messaging client to dequeue a message from the specified queue
<a href="#">ENQUEUE Procedure</a> on page 148-8	The current user enqueues a message into the specified queue

---

**Note:** The subprograms in this package do not commit.

---

## DEQUEUE Procedure

This procedure uses the specified Oracle Streams messaging client to dequeue a message from the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid` OUT parameter, and the other does not.

### Syntax

```
DBMS_STREAMS_MESSAGING.DEQUEUE (
  queue_name      IN   VARCHAR2,
  streams_name    IN   VARCHAR2,
  payload         OUT  ANYDATA,
  dequeue_mode    IN   VARCHAR2          DEFAULT 'REMOVE',
  navigation      IN   VARCHAR2          DEFAULT 'NEXT MESSAGE',
  wait           IN   BINARY_INTEGER     DEFAULT FOREVER,
  msgid          OUT  RAW);
```

```
DBMS_STREAMS_MESSAGING.DEQUEUE (
  queue_name      IN   VARCHAR2,
  streams_name    IN   VARCHAR2,
  payload         OUT  ANYDATA,
  dequeue_mode    IN   VARCHAR2          DEFAULT 'REMOVE',
  navigation      IN   VARCHAR2          DEFAULT 'NEXT MESSAGE',
  wait           IN   BINARY_INTEGER     DEFAULT FOREVER);
```

### Parameters

**Table 148–2 DEQUEUE Procedure Parameters**

Parameter	Description
<code>queue_name</code>	<p>The name of the local queue from which messages will be dequeued, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue, and the queue must be a secure queue of ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p>
<code>streams_name</code>	<p>The name of the Oracle Streams messaging client. For example, if the user <code>strmadmin</code> is the messaging client, then specify <code>strmadmin</code>.</p> <p>If NULL and a relevant messaging client for the queue exists, then the procedure uses the relevant messaging client. If NULL and multiple relevant messaging clients for the queue exist, then the procedure raises an error.</p>
<code>payload</code>	The payload that is dequeued
<code>dequeue_mode</code>	<p>Specify one of the following settings:</p> <p>REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.</p> <p>LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.</p> <p>BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.</p>

**Table 148–2 (Cont.) DEQUEUE Procedure Parameters**

Parameter	Description
navigation	<p>The position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved.</p> <p>Specify one of the following settings:</p> <p><b>NEXT MESSAGE:</b> Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then retrieve the next available message that matches the search criteria and belongs to the message group. This setting is the default.</p> <p><b>NEXT TRANSACTION:</b> Skip the remainder of the current message group (if any) and retrieve the first message of the next message group. This setting can only be used if message grouping is enabled for the current queue.</p> <p><b>FIRST MESSAGE:</b> Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</p> <p><b>Note:</b> Each message group contains the messages in a single transaction.</p> <p><b>See Also:</b> <i>Oracle Streams Advanced Queuing User's Guide</i> for more information about dequeue options</p>
wait	<p>Either <code>FOREVER</code> or <code>NO_WAIT</code></p> <p>If <code>FOREVER</code>, then the dequeue call is blocked without a time out until a message is available in the queue.</p> <p>If <code>NO_WAIT</code>, then a wait time of zero seconds is used. In this case, the dequeue will return immediately even if there are no messages in the queue.</p>
msgid	The message identifier of the message that is dequeued

## Exceptions

**Table 148–3 DEQUEUE Procedure Exceptions**

Exception	Description
ENDOFCURTRANS	<p>Dequeue has reached the end of the messages in the current transaction. Specify this exception in the following way:</p> <pre>SYS.DBMS_STREAMS_MESSAGING.ENDOFCURTRANS</pre> <p>Every dequeue procedure should include an exception handler that handles this exception.</p>
NOMOREMSGS	<p>There are no more messages in the queue for the dequeue operation. Specify this exception in the following way:</p> <pre>SYS.DBMS_STREAMS_MESSAGING.NOMOREMSGS</pre> <p>A dequeue procedure that specifies <code>NO_WAIT</code> for the <code>wait</code> parameter should include an exception handler that handles this exception.</p>

## ENQUEUE Procedure

This procedure enables the current user to enqueue a message into the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid` OUT parameter, and the other does not.

### Syntax

```
DBMS_STREAMS_MESSAGING.ENQUEUE (
  queue_name IN  VARCHAR2,
  payload    IN  ANYDATA,
  msgid      OUT RAW);
```

```
DBMS_STREAMS_MESSAGING.ENQUEUE (
  queue_name IN  VARCHAR2,
  payload    IN  ANYDATA);
```

### Parameters

**Table 148–4 ENQUEUE Procedure Parameters**

Parameter	Description
<code>queue_name</code>	The name of the local queue into which messages will be enqueued, specified as <code>[schema_name.]queue_name</code> . The current database must contain the queue, and the queue must be a secure queue of ANYDATA type.  For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>payload</code>	The payload that is enqueued
<code>msgid</code>	The message identifier of the message that is enqueued

### Usage Notes

To successfully enqueue messages into a queue, the current user must be mapped to a unique Advanced Queuing agent with the same name as the current user. You can run the `DBMS_STREAMS_ADM.SET_UP_QUEUE` procedure and specify a user as the queue user to grant the necessary privileges to the user to perform enqueues. The Advanced Queuing agent is created automatically when you run `SET_UP_QUEUE` and specify a queue user.

**See Also:** [SET\\_UP\\_QUEUE Procedure](#) on page 144-172

---

---

## DBMS\_STREAMS\_TABLESPACE\_ADM

The DBMS\_STREAMS\_TABLESPACE\_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for copying tablespaces between databases and moving tablespaces from one database to another. This package uses transportable tablespaces, Data Pump, the DBMS\_FILE\_TRANSFER package, and the DBMS\_FILE\_GROUP package.

This chapter contains the following topics:

- [Using DBMS\\_STREAMS\\_TABLESPACE\\_ADM](#)
  - Overview
  - Security Model
- [Data Structures](#)
- [Summary of DBMS\\_STREAMS\\_TABLESPACE\\_ADM Subprograms](#)

**See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

## Using DBMS\_STREAMS\_TABLESPACE\_ADM

This section contains topics which relate to using the DBMS\_STREAMS\_TABLESPACE\_ADM package.

- [Overview](#)
- [Security Model](#)

## Overview

Either a simple tablespace or a self-contained tablespace set must be specified in each procedure in this package.

A **self-contained tablespace** has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. A **simple tablespace** is a self-contained tablespace that uses only one datafile.

A simple tablespace must be specified in the following procedures:

- [ATTACH\\_SIMPLE\\_TABLESPACE Procedure](#)
- [CLONE\\_SIMPLE\\_TABLESPACE Procedure](#)
- [DETACH\\_SIMPLE\\_TABLESPACE Procedure](#)
- [PULL\\_SIMPLE\\_TABLESPACE Procedure](#)

A **self-contained tablespace set** has no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

A self-contained tablespace set must be specified in the following procedures:

- [ATTACH\\_TABLESPACES Procedure](#)
- [CLONE\\_TABLESPACES Procedure](#)
- [DETACH\\_TABLESPACES Procedure](#)
- [PULL\\_TABLESPACES Procedure](#)

To determine whether a set of tablespaces is self-contained, use the `TRANSPORT_SET_CHECK` procedure in the Oracle supplied package `DBMS_TTS`.

**See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespaces and tablespace sets

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

## Data Structures

The DBMS\_STREAMS\_TABLESPACE\_ADM package defines RECORD types and TABLE types.

### RECORD Types

- [FILE Record Type](#)

### TABLE Types

- [DIRECTORY\\_OBJECT\\_SET Table Type](#)
- [FILE\\_SET Table Type](#)
- [TABLESPACE\\_SET Table Type](#)

## DIRECTORY\_OBJECT\_SET Table Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement `CREATE DIRECTORY`.

### Syntax

```
TYPE DIRECTORY_OBJECT_SET IS TABLE OF VARCHAR2(32)
INDEX BY BINARY_INTEGER;
```

## FILE Record Type

Contains the directory object associated with a directory and the name of the file in the directory.

### Syntax

```
TYPE FILE IS RECORD(  
    directory_object VARCHAR2(32),  
    file_name        VARCHAR2(4000));
```

### Fields

**Table 149-1 FILE Fields**

Field	Description
directory_object	The name of a directory object. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.
file_name	The name of the file in the corresponding directory associated with the directory object

## FILE\_SET Table Type

Contains one or more files.

### Syntax

```
TYPE FILE_SET IS TABLE OF FILE  
INDEX BY BINARY_INTEGER;
```

## TABLESPACE\_SET Table Type

Contains the names of one or more tablespaces.

### Syntax

```
TYPE TABLESPACE_SET IS TABLE OF VARCHAR2(32)  
INDEX BY BINARY_INTEGER;
```

---

## Summary of DBMS\_STREAMS\_TABLESPACE\_ADM Subprograms

**Table 149–2 DBMS\_STREAMS\_TABLESPACE\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ATTACH_SIMPLE_TABLESPACE Procedure</a> on page 149-11	Uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package or Data Pump export
<a href="#">ATTACH_TABLESPACES Procedure</a> on page 149-13	Uses Data Pump to import a self-contained tablespace set previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) <code>TRANSPORT TABLESPACE</code> command
<a href="#">CLONE_SIMPLE_TABLESPACE Procedure</a> on page 149-18	Clones a simple tablespace. The tablespace can later be attached to a database.
<a href="#">CLONE_TABLESPACES Procedure</a> on page 149-20	Clones a set of self-contained tablespaces. The tablespaces can later be attached to a database.
<a href="#">DETACH_SIMPLE_TABLESPACE Procedure</a> on page 149-24	Detaches a simple tablespace. The tablespace can later be attached to a database.
<a href="#">DETACH_TABLESPACES Procedure</a> on page 149-26	Detaches a set of self-contained tablespaces. The tablespaces can later be attached to a database.
<a href="#">PULL_SIMPLE_TABLESPACE Procedure</a> on page 149-30	Copies a simple tablespace from a remote database and attaches it to the current database
<a href="#">PULL_TABLESPACES Procedure</a> on page 149-32	Copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database

---

**Note:** All subprograms commit unless specified otherwise.

## ATTACH\_SIMPLE\_TABLESPACE Procedure

This procedure uses Data Pump to import a simple tablespace previously exported using the DBMS\_STREAMS\_TABLESPACE\_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

### Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_SIMPLE_TABLESPACE (
  directory_object      IN  VARCHAR2,
  tablespace_file_name IN  VARCHAR2,
  converted_file_name   IN  VARCHAR2  DEFAULT NULL,
  datafile_platform    IN  VARCHAR2  DEFAULT NULL,
  tablespace_name      OUT VARCHAR2);
```

### Parameters

**Table 149–3** ATTACH\_SIMPLE\_TABLESPACE Procedure Parameters

Parameter	Description
directory_object	<p>The directory that contains the Data Pump dump file and the datafile for the tablespace. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.</p> <p>The name of the Data Pump export dump file must be the same as the data file name for the tablespace, except with a .dmp extension. If the converted_file_name is non-NULL, specify the dump file produced by the export database, not the file name after conversion.</p> <p>The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with an .alg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</p> <p>If NULL, then the procedure raises an error.</p>
tablespace_file_name	<p>The name of the datafile for the tablespace being imported.</p> <p>If NULL, then the procedure raises an error.</p>
converted_file_name	<p>If the datafile_platform parameter is non-NULL and is different from the platform of the local import database, then specify a file name for the converted datafile. The datafile is converted to the platform of the local import database and copied to the new file name. The existing datafile is not modified nor deleted.</p> <p>If non-NULL and the datafile_platform parameter is NULL, then the procedure ignores this parameter.</p> <p>If non-NULL and the datafile_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter.</p> <p>If NULL and the datafile_platform parameter is non-NULL, then the procedure raises an error.</p>

**Table 149–3 (Cont.) ATTACH\_SIMPLE\_TABLESPACE Procedure Parameters**

Parameter	Description
datafile_platform	<p>Specify NULL if the platform is the same for the export database and the current import database.</p> <p>Specify the platform for the export database if the platform is different for the export database and the import database.</p> <p>You can determine the platform of a database by querying the PLATFORM_NAME column in the V\$DATABASE dynamic performance view. The V\$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</p>
tablespace_name	<p>Contains the name of the attached tablespace. The attached tablespace is read-only. Use an ALTER TABLESPACE statement to make the tablespace read/write if necessary.</p>

## Usage Notes

To run this procedure, a user must meet the following requirements:

- Have IMP\_FULL\_DATABASE role
- Have READ and WRITE privilege on the directory object that contains the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the directory\_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

**See Also:** [Overview](#) on page 149-3

## ATTACH\_TABLESPACES Procedure

This procedure uses Data Pump to import a self-contained tablespace set previously exported using the DBMS\_STREAMS\_TABLESPACE\_ADM package, Data Pump export, or the Recovery Manager (RMAN) `TRANSPORT TABLESPACE` command.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump import to complete the attach operation. In addition, if the platform at the export database is different than the local database platform, then this procedure optionally can create datafiles for the tablespace set that can be used with the local platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump import is performed. This version of the procedure uses the files in a file group version and can copy the export dump file, export log file, and the datafiles that comprise the tablespace set into the specified directories. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a datafiles platform specification if the platform at the export database is different than the local database platform. Instead, the tablespace set is migrated automatically to the correct platform when it is attached.

### Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES (
  datapump_job_name      IN OUT VARCHAR2,
  dump_file              IN      FILE,
  tablespace_files       IN      FILE_SET,
  converted_files        IN      FILE_SET,
  datafiles_platform     IN      VARCHAR2  DEFAULT NULL,
  log_file               IN      FILE      DEFAULT NULL,
  tablespace_names       OUT     TABLESPACE_SET);
```

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES (
  file_group_name        IN      VARCHAR2,
  version_name           IN      VARCHAR2  DEFAULT NULL,
  datafiles_directory_object IN  VARCHAR2  DEFAULT NULL,
  logfile_directory_object IN  VARCHAR2  DEFAULT NULL,
  repository_db_link     IN      VARCHAR2  DEFAULT NULL,
  tablespace_names       OUT     TABLESPACE_SET);
```

### Parameters

**Table 149–4 ATTACH\_TABLESPACES Procedure Parameters**

Parameter	Description
<code>data_pump_job_name</code>	The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily.  If <code>NULL</code> , then the system generates a Data Pump job name.

**Table 149–4 (Cont.) ATTACH\_TABLESPACES Procedure Parameters**

Parameter	Description
dump_file	The file name of the Data Pump dump file to import. If NULL or if a file attribute is NULL, then the procedure raises an error.
tablespace_files	The file set that contains the datafiles for the tablespace set being imported. If NULL, then the procedure raises an error.
converted_files	If the datafiles_platform parameter is non-NULL and is different from the platform for the local import database, then specify a file set with the names of the converted datafiles. The datafiles are converted to the platform of the local import database and copied to the new file names. In this case, the number of files in the specified file set must match the number of files in the file set specified for the tablespace_files parameter. The existing datafiles are not modified nor deleted.  If non-NULL and the datafiles_platform parameter is NULL, then the procedure ignores this parameter.  If non-NULL and the datafiles_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter.  If NULL and the datafiles_platform parameter is non-NULL, then the procedure raises an error.
datafiles_platform	Specify NULL if the platform is the same for the export database and the current import database.  Specify the platform for the export database if the platform is different for the export database and the import database.  You can determine the platform of a database by querying the PLATFORM_NAME column in the V\$DATABASE dynamic performance view. The V\$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
log_file	Specify the log file name for the Data Pump import. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .alg and places it in the Data Pump export dump file directory.  If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.
file_group_name	The name of the file group, specified as [ <i>schema_name</i> .] <i>file_group_name</i> . For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.
version_name	The name of the file group version to attach. If NULL, then the procedure uses the version with the latest creation time for the file group.

**Table 149–4 (Cont.) ATTACH\_TABLESPACES Procedure Parameters**

Parameter	Description
<code>datafiles_directory_object</code>	<p>The directory object into which the datafiles and Data Pump export dump file are copied. The files are copied from the tablespace repository directories to this directory.</p> <p>If non-NULL, the attached tablespaces use the files in specified directory. However, the file group version specified in the <code>version_name</code> parameter consists of the files in the original directory, not in the directory specified by this <code>datafiles_directory_object</code> parameter.</p> <p>If NULL, then the procedure does not copy the datafiles and dump file.</p>
<code>logfile_directory_object</code>	<p>The directory object into which the Data Pump import log file is placed. The system generates a log file name with the extension <code>.alg</code>.</p> <p>If NULL, then the procedure places the import log file in the same directory as the dump file.</p>
<code>repository_db_link</code>	<p>If the file group is in a different database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.</p> <p>If this parameter is non-NULL, then meet the following requirements:</p> <ul style="list-style-type: none"> <li>■ Each directory object that contains files in the version being attached must exist on both databases.</li> <li>■ The corresponding directory objects must have the same names on both databases.</li> </ul> <p>If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.</p>
<code>tablespace_names</code>	<p>Contains the names of the attached tablespaces. The attached tablespaces are read-only. Use <code>ALTER TABLESPACE</code> statements to make the tablespaces read/write if necessary.</p>

## Usage Notes

The following sections contain usage notes for this procedure:

- [User Requirements](#)
- [Procedures Used to Clone or Detach a Tablespace Set](#)
- [When the Attach Database Is Different Than the Clone or Detach Database](#)
- [Automatic Storage Management Directories](#)

### See Also:

- [Overview](#) on page 149-3
- *Oracle Streams Concepts and Administration*

### User Requirements

To run either version of this procedure, a user must meet the following requirements:

- Have `IMP_FULL_DATABASE` role

- Have `READ` and `WRITE` privilege on the directory objects that contain the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the `dump_file` and `tablespace_files` parameters, or by the `datafiles_directory_object` parameter
- Have `WRITE` privilege on the directory object that will hold the Data Pump import log file, specified by the `log_file` parameter or `logfile_directory_object` parameter if it is non-NULL

If the Data Pump job version of the procedure is run, then the user must have `WRITE` privilege on the directory objects that will hold the converted datafiles for the tablespaces in the set if platform conversion is necessary. These directory objects are specified by the `converted_files` parameter if it is non-NULL.

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

### Procedures Used to Clone or Detach a Tablespace Set

After a tablespace set is cloned or detached using the `CLONE_TABLESPACES` or `DETACH_TABLESPACES` procedure, respectively, the tablespace set can be attached to a database using the `ATTACH_TABLESPACES` procedure. If the Data Pump job version of the `CLONE_TABLESPACES` or `DETACH_TABLESPACES` procedure was used, then use the Data Pump job version of the `ATTACH_TABLESPACES` procedure. If the file group version of the `CLONE_TABLESPACES` or `DETACH_TABLESPACES` procedure was used, then use the file group version of the `ATTACH_TABLESPACES` procedure.

#### See Also:

- [CLONE\\_TABLESPACES Procedure](#) on page 149-20
- [DETACH\\_TABLESPACES Procedure](#) on page 149-26

### When the Attach Database Is Different Than the Clone or Detach Database

You can attach a tablespace set to a different database than the database from which the tablespace set was cloned or detached. The two databases might or might not share a file system. If the two databases do not share a file system, then you must transfer the dump file and datafiles to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method. You can attach the tablespace set in one of the following ways depending on the version of the `ATTACH_TABLESPACES` procedure you use:

- If you use the Data Pump job version of the procedure, then specify the relevant files on the file system. The directory object names can be different in the databases.
- If you use the file group version of the procedure, then you can use the `repository_db_link` parameter to specify the database where tablespace repository resides. The directory objects for the files must exist and must match in the databases.

#### See Also:

- [CLONE\\_TABLESPACES Procedure](#) on page 149-20
- [DETACH\\_TABLESPACES Procedure](#) on page 149-26
- [Chapter 67, "DBMS\\_FILE\\_GROUP"](#) for more information about file groups

### **Automatic Storage Management Directories**

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

**See Also:** *Oracle Database Utilities* for information about specifying ASM directories for directory objects

## CLONE\_SIMPLE\_TABLESPACE Procedure

This procedure clones a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the specified directory
3. Places the datafile for the specified tablespace in the specified directory
4. If this procedure made the tablespace read-only, then makes the tablespace read/write

In addition, this procedure optionally can create a datafile for the tablespace that can be used with a platform that is different than the local database platform.

### Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_SIMPLE_TABLESPACE (
    tablespace_name      IN  VARCHAR2,
    directory_object     IN  VARCHAR2,
    destination_platform IN  VARCHAR2 DEFAULT NULL,
    tablespace_file_name OUT VARCHAR2);
```

### Parameters

**Table 149–5 CLONE\_SIMPLE\_TABLESPACE Procedure Parameters**

Parameter	Description
tablespace_name	The tablespace to be cloned. If NULL, then the procedure raises an error.
directory_object	The directory where the Data Pump export dump file, the Data Pump export log file, and the datafile for the tablespace are placed. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.  The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file exists with the same name as the dump file in the directory, then the procedure raises an error.  The name of the log file is the same as the data file name for the tablespace, except with a .clg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.  If NULL, then the procedure raises an error.
destination_platform	Specify NULL if the platform is the same for the current export database and the intended import database.  Specify the platform for the intended import database if the platform is different for the export database and the import database.  You can determine the platform of a database by querying the PLATFORM_NAME column in the V\$DATABASE dynamic performance view. The V\$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.

**Table 149-5 (Cont.) CLONE\_SIMPLE\_TABLESPACE Procedure Parameters**

Parameter	Description
tablespace_file_name	Contains the name of the cloned tablespace datafile. This datafile is placed in the directory specified by the parameter <code>directory_object</code> .

## Usage Notes

To run this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `directory_object` parameter
- If the file group version of the procedure is run, then the user must have the necessary privileges to manage file group.

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

### See Also:

## CLONE\_TABLESPACES Procedure

This procedure clones a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set and places the dump file in the specified directory
3. Places the datafiles that comprise the specified tablespace set in the specified directory
4. If this procedure made a tablespace read-only, then makes the tablespace read/write

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the specified directories, but the files are not added to a file group version. In addition, this version of the procedure optionally can create datafiles for the tablespace set that can be used with a platform that is different than the local database platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the appropriate file group version. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a destination platform specification if the destination platform is different. Instead, the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

### Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES (
  datapump_job_name          IN OUT VARCHAR2,
  tablespace_names           IN     TABLESPACE_SET,
  dump_file                  IN     FILE,
  tablespace_directory_objects IN  DIRECTORY_OBJECT_SET,
  destination_platform       IN  VARCHAR2  DEFAULT NULL,
  log_file                   IN     FILE    DEFAULT NULL,
  tablespace_files           OUT    FILE_SET);
```

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES (
  tablespace_names           IN  TABLESPACE_SET,
  tablespace_directory_object IN  VARCHAR2  DEFAULT NULL,
  log_file_directory_object  IN  VARCHAR2  DEFAULT NULL,
  file_group_name            IN  VARCHAR2,
  version_name               IN  VARCHAR2  DEFAULT NULL,
  repository_db_link         IN  VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 149–6 CLONE\_TABLESPACES Procedure Parameters**

Parameter	Description
data_pump_job_name	<p>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily.</p> <p>If NULL, then the system generates a Data Pump job name.</p>
tablespace_names	<p>The tablespace set to be cloned.</p> <p>If NULL, then the procedure raises an error.</p>
dump_file	<p>The file name of the Data Pump dump file that is exported.</p> <p>If NULL or if a file attribute is NULL, then the procedure raises an error.</p> <p>If the specified file exists, then the procedure raises an error.</p>
tablespace_directory_objects	<p>The set of directory objects into which the datafiles for the tablespaces are copied. If multiple directory objects are in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set.</p> <p>If NULL, then the procedure copies datafiles for the tablespace set to the dump file directory.</p>
destination_platform	<p>Specify NULL if the platform is the same for the current export database and the intended import database.</p> <p>Specify the platform for the intended import database if the platform is different for the export database and the import database.</p> <p>You can determine the platform of a database by querying the PLATFORM_NAME column in the V\$DATABASE dynamic performance view. The V\$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</p>
log_file	<p>Specify the log file name for the Data Pump export.</p> <p>If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .clg and places it in the dump file directory.</p> <p>If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</p>

**Table 149–6 (Cont.) CLONE\_TABLESPACES Procedure Parameters**

Parameter	Description
tablespace_directory_object	<p>The directory object into which the data files are copied and Data Pump export dump file is placed. The system generates a dump file name with the extension <code>.dmp</code>.</p> <p>If <code>NULL</code>, then the procedure copies the datafiles to and places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group.</p> <p>If <code>NULL</code> and no default directory object exists for the version or file group, then the procedure raises an error.</p>
log_file_directory_object	<p>The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension <code>.clg</code>.</p> <p>If <code>NULL</code>, then the procedure uses the directory object specified in <code>tablespace_directory_object</code>.</p>
file_group_name	<p>The name of the file group, specified as <code>[schema_name.]file_group_name</code>. For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales</code>, then specify <code>hq_dba.sales</code>. If the schema is not specified, then the current user is the default.</p> <p>If the specified file group does not exist, then the procedure creates it.</p>
version_name	<p>The name of the version into which the cloned tablespace set is placed. The specified version name cannot be a positive integer.</p> <p>If the specified version does not exist, then the procedure creates it.</p> <p>If the specified version exists, then the procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version.</p> <p>If <code>NULL</code>, then the procedure creates a new version, and the version number can be used to manage the version.</p>
repository_db_link	<p>If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.</p> <p>If this parameter is non-<code>NULL</code>, then the directory object specified in <code>tablespace_directory_object</code> must exist on the local database and on the remote database. If <code>tablespace_directory_object</code> is <code>NULL</code>, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system.</p> <p>If <code>NULL</code>, then the procedure does not use a database link, and the procedure uses the file group in the local database.</p>
tablespace_files	<p>Contains the datafiles for the cloned tablespace set. These datafiles are placed in the directories specified by the directory objects in the parameter <code>tablespace_directory_objects</code>.</p>

## Usage Notes

To run either version of this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `dump_file` parameter or the `tablespace_directory_object` parameter
- Have `WRITE` privilege on the directory objects that will contain the copied datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter if non-NULL or the `tablespace_directory_object` parameter
- Have `WRITE` privilege on the directory object that will contain the Data Pump export log file, specified by the `log_file` parameter if non-NULL or the `log_file_directory_object` parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After cloning a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

### See Also:

## DETACH\_SIMPLE\_TABLESPACE Procedure

This procedure detaches a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the directory that contains the tablespace datafile
3. Drops the tablespace and its contents from the database

### Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_SIMPLE_TABLESPACE (
  tablespace_name      IN VARCHAR2,
  directory_object     OUT VARCHAR2,
  tablespace_file_name OUT VARCHAR2);
```

### Parameters

**Table 149–7 DETACH\_SIMPLE\_TABLESPACE Procedure Parameters**

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.
directory_object	Contains the directory where the Data Pump export dump file and the Data Pump export log file are placed. The procedure uses the directory of the datafile for the tablespace. Therefore, make sure a directory object created using the SQL statement CREATE DIRECTORY exists for this directory.  The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file exists with the same name as the dump file in the directory, then the procedure raises an error.  The name of the log file is the same as the data file name for the tablespace, except with a .dlg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.
tablespace_file_name	Contains the name of the detached tablespace datafile.

### Usage Notes

To run this procedure, a user must meet the following requirements:

- Have EXP\_FULL\_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA\_TABLESPACES and USER\_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ and WRITE privilege on the directory object for the directory that contains the tablespace datafile. The name of this tablespace is specified by the

tablespace\_name parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure. This directory also will contain the Data Pump export dump file generated by this procedure.

After detaching a tablespace using this procedure, you can add the tablespace to a different database using the ATTACH\_SIMPLE\_TABLESPACE procedure. If the database is a remote database and you want to use the ATTACH\_SIMPLE\_TABLESPACE procedure, then you can transfer the dump file and datafile to the remote system using the DBMS\_FILE\_TRANSFER package, FTP, or some other method. You can use the two OUT parameters in this procedure to accomplish the attach or pull operation.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

---

---

**Note:** Do not use the DETACH\_SIMPLE\_TABLESPACE procedure on a tablespace if the tablespace is using the Oracle-managed files feature. If you do, then the datafile for the tablespace is dropped automatically when the tablespace is dropped.

---

---

**See Also:**

## DETACH\_TABLESPACES Procedure

This procedure detaches a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online and any table partitions must not span tablespaces in the tablespace set.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespace set and places the dump file in the specified directory
3. Drops the tablespaces in the specified tablespace set and their contents from the database

This procedure does not move or copy the datafiles that comprise the specified tablespace set.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the detach operation by placing the export dump file and export log file in the specified directories, but the files are not added to a file group version.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the detach operation by placing the export dump file and export log file in the appropriate file group version. The datafiles that comprise the tablespace set are not moved or copied, but they are referenced in the version that is detached. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. Also, if the destination platform is different, then the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

---

---

**Note:** Do not use the `DETACH_TABLESPACES` procedure if any of the tablespaces in the tablespace set are using the Oracle-managed files feature. If you do, then the datafiles for these tablespaces are dropped automatically when the tablespaces are dropped.

---

---

### Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES (
    datapump_job_name      IN OUT VARCHAR2,
    tablespace_names       IN     TABLESPACE_SET,
    dump_file              IN     FILE,
    log_file               IN     FILE DEFAULT NULL,
    tablespace_files       OUT    FILE_SET);
```

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES (
    tablespace_names       IN TABLESPACE_SET,
    export_directory_object IN VARCHAR2 DEFAULT NULL,
    log_file_directory_object IN VARCHAR2 DEFAULT NULL,
    file_group_name        IN VARCHAR2,
```

```

version_name          IN VARCHAR2  DEFAULT NULL,
repository_db_link    IN VARCHAR2  DEFAULT NULL);

```

## Parameters

**Table 149–8 DETACH\_TABLESPACES Procedure Parameters**

Parameter	Description
data_pump_job_name	<p>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily.</p> <p>If NULL, then the system generates a Data Pump job name.</p>
tablespace_names	<p>The tablespace set to be detached.</p> <p>If NULL, then the procedure raises an error.</p>
dump_file	<p>The file name of the Data Pump dump file that is exported.</p> <p>If NULL or if a file attribute is NULL, then the procedure raises an error.</p> <p>If the specified file exists, then the procedure raises an error.</p>
log_file	<p>Specify the log file name for the Data Pump export.</p> <p>If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .dlg and places it in the dump file directory.</p> <p>If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</p>
tablespace_files	<p>Contains the names of the datafiles for the detached tablespace set.</p>
export_directory_object	<p>The directory object into which the Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp.</p> <p>If NULL, then procedure places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group.</p> <p>If NULL and no default directory object exists for the version or file group, then the procedure raises an error.</p>
log_file_directory_object	<p>The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .dlg.</p> <p>If NULL, then the procedure places the export log file in the same directory as the export dump file.</p>
file_group_name	<p>The name of the file group, specified as <i>[schema_name.]file_group_name</i>. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.</p> <p>If the specified file group does not exist, then the procedure creates it.</p>

**Table 149–8 (Cont.) DETACH\_TABLESPACES Procedure Parameters**

Parameter	Description
<code>version_name</code>	<p>The name of the version into which the detached tablespace set is placed. The specified version name cannot be a positive integer.</p> <p>If the specified version does not exist, then the procedure creates it.</p> <p>If the specified version exists, then procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version.</p> <p>If NULL, then the procedure creates a new version, and the version number can be used to manage the version.</p>
<code>repository_db_link</code>	<p>If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.</p> <p>If this parameter is non-NULL, then the directory object specified in <code>export_directory_object</code> must exist on the local database and on the remote database. If <code>export_directory_object</code> is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system.</p> <p>If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.</p>

## Usage Notes

To run this either version of this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `DROP TABLESPACE` privilege
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `dump_file` parameter or the `export_directory_object` parameter
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-NULL or by the `log_file_directory_object` parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After detaching a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

## PULL\_SIMPLE\_TABLESPACE Procedure

This procedure copies a simple tablespace from a remote database and attaches it to the current database. The specified tablespace at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only at the remote database if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace
3. Uses a database link and the `DBMS_FILE_TRANSFER` package to transfer the datafile for the tablespace and the log file for the Data Pump export to the current database
4. Places the datafile for the specified tablespace and the log file for the Data Pump export in the specified directory at the local database
5. If this procedure made the tablespace read-only, then makes the tablespace read/write
6. Uses Data Pump to import the metadata for the tablespace in the local database

In addition, this procedure optionally can create a datafile for the tablespace that can be used with the local platform, if the platform at the remote database is different than the local database platform.

### Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_SIMPLE_TABLESPACE (
    tablespace_name      IN VARCHAR2,
    database_link        IN VARCHAR2,
    directory_object     IN VARCHAR2  DEFAULT NULL,
    conversion_extension IN VARCHAR2  DEFAULT NULL,
    convert_directory_object IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 149–9 PULL\_SIMPLE\_TABLESPACE Procedure Parameters**

Parameter	Description
<code>tablespace_name</code>	The tablespace to be pulled. If <code>NULL</code> , then the procedure raises an error.
<code>database_link</code>	The name of the database link to the database that contains the tablespace to pull. The database link must be accessible to the user who runs the procedure. If <code>NULL</code> , then the procedure raises an error.
<code>directory_object</code>	The directory object to which the datafile for the tablespace is copied on the local database. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code> . The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with a <code>.plg</code> extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file. If <code>NULL</code> , then the procedure raises an error.

**Table 149–9 (Cont.) PULL\_SIMPLE\_TABLESPACE Procedure Parameters**

Parameter	Description
<code>conversion_extension</code>	Specify NULL if the platform is the same for the remote export database and the current import database.  If the platform is different for the export database and the import database, then specify an extension for the tablespace datafile that is different than the extension for the tablespace datafile at the remote database. In this case, the procedure transfers the datafile to the import database and converts it to be compatible with the current import database platform automatically. After conversion is complete, the original datafile is deleted at the import database.
<code>convert_directory_object</code>	Specify NULL if the platform is the same for the remote export database and the current import database.  If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code> .

## Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the `EXP_FULL_DATABASE` role
- Have `EXECUTE` privilege on the `DBMS_STREAMS_TABLESPACE_ADM` package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` privilege on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles `IMP_FULL_DATABASE` and `EXECUTE_CATALOG_ROLE`
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-NULL
- Have `WRITE` privilege on the directory object that will hold the datafile for the tablespace, specified by the `directory_object` parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

**See Also:** [Overview](#) on page 149-3

## PULL\_TABLESPACES Procedure

This procedure copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database. All of the tablespaces in the specified tablespace set at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set at the remote database read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
3. Uses a database link and the `DBMS_FILE_TRANSFER` package to transfer the datafiles for the tablespace set and the log file for the Data Pump export to the current database
4. Places the datafiles that comprise the specified tablespace set in the specified directories at the local database
5. Places the log file for the Data Pump export in the specified directory at the local database
6. If this procedure made a tablespace read-only, then makes the tablespace read/write
7. Uses Data Pump to import the metadata for the tablespaces in the tablespace set at the local database

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the remote database is different than the local database platform.

### Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_TABLESPACES (
  datapump_job_name          IN OUT VARCHAR2,
  database_link              IN      VARCHAR2,
  tablespace_names          IN      TABLESPACE_SET,
  tablespace_directory_objects IN  DIRECTORY_OBJECT_SET,
  log_file                  IN      FILE,
  conversion_extension      IN      VARCHAR2  DEFAULT NULL,
  convert_directory_object  IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 149–10 PULL\_TABLESPACES Procedure Parameters**

Parameter	Description
<code>data_pump_job_name</code>	The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily.  If <code>NULL</code> , then the system generates a Data Pump job name.
<code>database_link</code>	The name of the database link to the database that contains the tablespace set to pull. The database link must be accessible to the user who runs the procedure.  If <code>NULL</code> , then the procedure raises an error.

**Table 149–10 (Cont.) PULL\_TABLESPACES Procedure Parameters**

Parameter	Description
tablespace_names	The tablespace set to be pulled. If NULL, then the procedure raises an error.
tablespace_directory_objects	The set of directory objects to which the datafiles for the tablespaces are copied. If multiple directory objects are in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure raises an error.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .plg and places it in one of the data file directories. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.
conversion_extension	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafiles that is different than the extension for the tablespace datafiles at the remote database. In this case, the procedure transfers the datafiles to the import database and converts them to be compatible with the current import database platform automatically. After conversion is complete, the original datafiles are deleted at the import database.
convert_directory_object	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.

## Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the EXP\_FULL\_DATABASE role
- Have EXECUTE privilege on the DBMS\_STREAMS\_TABLESPACE\_ADM package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA\_TABLESPACES and USER\_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE privilege on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the tablespace\_names parameter. If a directory object does not exist for one or

more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles `IMP_FULL_DATABASE` and `EXECUTE_CATALOG_ROLE`
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-NULL
- Have `WRITE` privilege on the directory objects that will hold the datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

**See Also:** [Overview](#) on page 149-3

The DBMS\_TDB package reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

**See Also:** *Oracle Database Backup and Recovery User's Guide* regarding database transport using CONVERT DATABASE

This chapter contains the following topics:

- [Using DBMS\\_TDB](#)
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- [Summary of DBMS\\_TDB Subprograms](#)

## Using DBMS\_TDB

This section contains topics which relate to using DBMS\_TDB.

- [Overview](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)

## Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The DBMS\_TDB package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the DBMS\_TDB subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

## Security Model

Use of this package requires the DBA privilege.

## Constants

The DBMS\_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS\_TDB.SKIP\_NONE.

The DBMS\_TDB package uses the constants shown in [Table 150-1](#).

**Table 150-1 DBMS\_TDB Constants**

Name	Type	Value	Description
SKIP_NONE	NUMBER	0	Check all files when checking whether a database is ready for transport.
SKIP_OFFLINE	NUMBER	2	Skip files in offline tablespaces when checking whether a database is ready for transport.
SKIP_READONLY	NUMBER	3	Skip files in readonly tablespaces when checking whether a database is ready for transport.

## Views

The DBMS\_TDB package uses the following view listed in *Oracle Database Reference*:

- V\$DB\_TRANSPORTABLE\_PLATFORM, which specifies which combinations of source and target platforms support database transport

## Operational Notes

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.

## Summary of DBMS\_TDB Subprograms

**Table 150–2 DBMS\_TDB Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CHECK_DB Function</a> on page 150-9	Checks whether a database can be transported to a target platform
<a href="#">CHECK_EXTERNAL Function</a> on page 150-9	Checks whether a database has external tables, directory or BFILEs

## CHECK\_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

### Syntax

```
DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2,
    skip_option           IN NUMBER)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
RETURN BOOLEAN;
```

### Parameters

**Table 150–3 CHECK\_DB Function Parameters**

Parameter	Description
target_platform_name	The name of the destination platform, as it appears in V\$DB_TRANSPORTABLE_PLATFORM.
skip_option	Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in <a href="#">Table 150–1, "DBMS_TDB Constants"</a> on page 150-5.

### Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns FALSE. If the database is ready for transport, returns TRUE.

### Usage Notes

- If SERVEROUTPUT is ON, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see [Table 150–4, "Reasons for CHECK\\_DB Function to Return FALSE"](#) on page 150-9.

**Table 150–4 Reasons for CHECK\_DB Function to Return FALSE**

Cause	Action
Unrecognized target platform name.	Check V\$DB_TRANSPORTABLE_PLATFORM for recognized platform names.

**Table 150–4 (Cont.) Reasons for CHECK\_DB Function to Return FALSE**

<b>Cause</b>	<b>Action</b>
Target platform has a different endian format.	Conversion is not supported.
Database is not open read-only.	Open database read-only and retry.
There are active or in-doubt transactions in the database.	Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.
Deferred transaction rollback needs to be done.	Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.
Database compatibility version is below 10.0.0.	Change the COMPATIBLE initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.
Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.	Change the COMPATIBLE initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.

## Examples

This example illustrates the use of CHECK\_DB with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    db_ready BOOLEAN;
BEGIN
    db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
END;
/
```

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.

## CHECK\_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

### Syntax

```
DBMS_TDB.CHECK_EXTERNAL  
RETURN BOOLEAN;
```

### Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

### Usage Notes

- If `SERVEROUTPUT` is `ON`, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

### Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON  
SQL> DECLARE  
    external BOOLEAN;  
BEGIN  
    external := DBMS_TDB.CHECK_EXTERNAL;  
END;  
/
```

The following external tables exist in the database:

```
SH.SALES_TRANSACTIONS_EXT
```

The following directories exist in the database:

```
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
```

The following BFILEs exist in the database:

```
PM.PRINT_MEDIA
```

PL/SQL procedure successfully completed.

The DBMS\_TRACE package contains the interface to trace PL/SQL functions, procedures, and exceptions.

## Using DBMS\_TRACE

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Operational Notes](#)

## Overview

DBMS\_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

- Starting PL/SQL tracing in session (DBMS\_TRACE.SET\_PLSQL\_TRACE).
- Running an application to be traced.
- Stopping PL/SQL tracing in session (DBMS\_TRACE.CLEAR\_PLSQL\_TRACE).

## Security Model

This package must be created under SYS.

## Constants

The DBMS\_TRACE package uses the constants shown in [Table 151-1, "DBMS\\_TRACE Constants"](#):

**Table 151-1 DBMS\_TRACE Constants**

Name	Type	Value	Description
TRACE_MINOR_VERSION	INTEGER	0	
TRACE_MAJOR_VERSION	INTEGER	1	
TRACE_ALL_CALLS	INTEGER	1	Traces calls or returns
TRACE_ENABLED_CALLS	INTEGER	2	
TRACE_ALL_EXCEPTIONS	INTEGER	4	Traces exceptions
TRACE_ENABLED_EXCEPTIONS	INTEGER	8	Traces exceptions and handlers
TRACE_LIMIT	INTEGER	16	Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag.
TRACE_ALL_SQL	INTEGER	32	Traces SQL statements
TRACE_ENABLED_SQL	INTEGER	64	Traces SQL statements at PL/SQL level. This does not invoke SQL Trace
TRACE_ALL_LINES	INTEGER	128	Traces each line
TRACE_ENABLED_LINES	INTEGER	256	
TRACE_PAUSE	INTEGER	4096	Pauses tracing
TRACE_RESUME	INTEGER	8192	Resume tracing
TRACE_STOP	INTEGER	16384	Stops tracing
NO_TRACE_ADMINISTRATIVE	INTEGER	32768	Prevents tracing of 'administrative events such as <ul style="list-style-type: none"> <li>■ PL/SQL Trace Tool started</li> <li>■ Trace flags changed</li> <li>■ PL/SQL Virtual Machine started</li> <li>■ PL/SQL Virtual Machine stopped</li> </ul>
NO_TRACE_HANDLED_EXCEPTIONS	INTEGER	65536	Prevents tracing of handled exceptions

Oracle recommends using the symbolic form for all these constants.

## Restrictions

You cannot use PL/SQL tracing in a shared server environment.

## Operational Notes

- [Controlling Data Volume](#)
- [Creating Database Tables to Collect DBMS\\_TRACE Output](#)
- [Collecting Trace Data](#)
- [Collected Data](#)
- [Trace Control](#)

### Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

---

**Note:** You cannot use the second method for anonymous blocks.

---

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

### Creating Database Tables to Collect DBMS\_TRACE Output

You must create database tables into which the `DBMS_TRACE` package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by `SYS`.

### Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:

- [Tracing Calls](#)
- [Tracing Exceptions](#)
- [Tracing SQL](#)
- [Tracing Lines](#)

Additional features of `DBMS_TRACE` also allow pausing and resuming trace, and limiting the output.

#### Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.

- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

### Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

### Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

### Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

---

---

**Note:** For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

---

---

## Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller's unit is enabled, the calling procedure name will also be output. If the callee's unit is enabled, the called procedure name will be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled.

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

## Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level  $n$  changes the record limit to  $1024 * n$ .

## Summary of DBMS\_TRACE Subprograms

**Table 151–2 DBMS\_TRACE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CLEAR_PLSQL_TRACE Procedure</a> on page 151-11	Stops trace data dumping in session
<a href="#">GET_PLSQL_TRACE_LEVEL Function</a> on page 151-12	Gets the trace level
<a href="#">PLSQL_TRACE_VERSION Procedure</a> on page 151-13	Gets the version number of the trace package
<a href="#">SET_PLSQL_TRACE Procedure</a> on page 151-14	Starts tracing in the current session

## **CLEAR\_PLSQL\_TRACE Procedure**

This procedure disables trace data collection.

### **Syntax**

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

## GET\_PLSQL\_TRACE\_LEVEL Function

This procedure returns the current trace level as a list of the enabled constants.

### Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL  
RETURN BINARY_INTEGER;
```

## PLSQL\_TRACE\_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS\_TRACE package.

### Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

### Parameters

**Table 151-3 PLSQL\_TRACE\_VERSION Procedure Parameters**

Parameter	Description
major	Major version number of DBMS_TRACE.
minor	Minor version number of DBMS_TRACE.

## SET\_PLSQL\_TRACE Procedure

This procedure enables PL/SQL trace data collection.

### Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (  
    trace_level INTEGER);
```

### Parameters

**Table 151–4** SET\_PLSQL\_TRACE Procedure Parameters

Parameter	Description
trace_level	You must supply one or more of the constants as listed in <a href="#">Table 151–1</a> , "DBMS_TRACE Constants". By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "TRACE_PAUSE", "TRACE_RESUME" and "TRACE_STOP" should not be used in combination with other constants  Also see " <a href="#">Collecting Trace Data</a> " on page 151-7 for more information.

---

## DBMS\_TRANSACTION

The DBMS\_TRANSACTION package provides access to SQL transaction statements from stored procedures.

**See Also:** *Oracle Database SQL Language Reference*

This chapter contains the following topics:

- [Using DBMS\\_TRANSACTION](#)
  - Security Model
- [Summary of DBMS\\_TRANSACTION Subprograms](#)

## Using DBMS\_TRANSACTION

- [Security Model](#)

## Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

---

## Summary of DBMS\_TRANSACTION Subprograms

**Table 152–1 DBMS\_TRANSACTION Package Subprograms**

Subprogram	Description
<a href="#">ADVISE_COMMIT Procedure</a> on page 152-5	Equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT
<a href="#">ADVISE_NOTHING Procedure</a> on page 152-6	Equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING
<a href="#">ADVISE_ROLLBACK Procedure</a> on page 152-7	Equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK
<a href="#">COMMIT Procedure</a> on page 152-8	Equivalent to the SQL statement: COMMIT
<a href="#">COMMIT_COMMENT Procedure</a> on page 152-9	Equivalent to the SQL statement: COMMIT COMMENT <text>
<a href="#">COMMIT_FORCE Procedure</a> on page 152-10	Equivalent to the SQL statement: COMMIT FORCE <text>, <number>"
<a href="#">LOCAL_TRANSACTION_ID Function</a> on page 152-11	Returns the local (to instance) unique identifier for the current transaction
<a href="#">PURGE_LOST_DB_ENTRY Procedure</a> on page 152-12	Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes
<a href="#">PURGE_MIXED Procedure</a> on page 152-14	Deletes information about a given mixed outcome transaction
<a href="#">READ_ONLY Procedure</a> on page 152-15	Equivalent to the SQL statement: SET TRANSACTION READ ONLY
<a href="#">READ_WRITE Procedure</a> on page 152-16	equivalent to the SQL statement: SET TRANSACTION READ WRITE
<a href="#">ROLLBACK Procedure</a> on page 152-17	Equivalent to the SQL statement: ROLLBACK
<a href="#">ROLLBACK_FORCE Procedure</a> on page 152-18	Equivalent to the SQL statement: ROLLBACK FORCE <text>
<a href="#">ROLLBACK_SAVEPOINT Procedure</a> on page 152-19	Equivalent to the SQL statement: ROLLBACK TO SAVEPOINT <savepoint_name>
<a href="#">SAVEPOINT Procedure</a> on page 152-20	Equivalent to the SQL statement: SAVEPOINT <savepoint_name>
<a href="#">STEP_ID Function</a> on page 152-21	Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction
<a href="#">USE_ROLLBACK_SEGMENT Procedure</a> on page 152-22	Equivalent to the SQL statement: SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>

## **ADVISE\_COMMIT Procedure**

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE COMMIT
```

### **Syntax**

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

## ADVISE\_NOTHING Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE NOTHING
```

### Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

## **ADVISE\_ROLLBACK Procedure**

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE ROLLBACK
```

### **Syntax**

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

## COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.COMMIT;
```

## COMMIT\_COMMENT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT COMMENT <text>
```

### Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (  
    cmnt VARCHAR2);
```

### Parameters

**Table 152–2** COMMIT\_COMMENT Procedure Parameters

Parameter	Description
cmnt	Comment to associate with this commit.

## COMMIT\_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT FORCE <text>, <number>"
```

### Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (  
    xid VARCHAR2,  
    scn VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 152–3 COMMIT\_FORCE Procedure Parameters**

Parameter	Description
xid	Local or global transaction ID.
scn	System change number.

## LOCAL\_TRANSACTION\_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

### Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (  
    create_transaction BOOLEAN := FALSE)  
RETURN VARCHAR2;
```

### Parameters

**Table 152-4 LOCAL\_TRANSACTION\_ID Function Parameters**

Parameter	Description
create_transaction	If true, then start a transaction if one is not currently active.

## PURGE\_LOST\_DB\_ENTRY Procedure

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in `DBA_2PC_PENDING` and associated tables are never removed, and recovery will periodically retry. Procedure `PURGE_LOST_DB_ENTRY` enables removal of such transactions from the local site.

### Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
    xid VARCHAR2);
```

### Parameters

**Table 152–5** *PURGE\_LOST\_DB\_ENTRY Procedure Parameters*

Parameter	Description
<code>xid</code>	Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.

### Usage Notes

---

---

**WARNING:** `PURGE_LOST_DB_ENTRY` should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

---

---

Before automatic recovery runs, the transaction may show up in `DBA_2PC_PENDING` as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the `MIXED` column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is `ORA-02062`). In this case, the DBA may use the procedure `PURGE_LOST_DB_ENTRY` to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

**Table 152–6 PURGE\_LOST\_DB\_ENTRY Procedure States**

<b>State of Column</b>	<b>State of Global Transaction</b>	<b>State of Local Transaction</b>	<b>Normal DBA Action</b>	<b>Alternative DBA Action</b>
Collecting	Rolled back	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Committed	Committed	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Prepared	Unknown	Prepared	None	FORCE COMMIT or ROLLBACK
Forced commit	Unknown	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced rollback	Unknown	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced commit (mixed)	Mixed	Committed	(See Note 2)	
Forced rollback (mixed)	Mixed	Rolled back	(See Note 2)	

---

**NOTE 1:** Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

---

---

**NOTE 2:** Examine and take any manual action to remove inconsistencies; then use the procedure PURGE\_MIXED.

---

## PURGE\_MIXED Procedure

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome: Some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle; however, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

### Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (  
    xid VARCHAR2);
```

### Parameters

**Table 152–7** *PURGE\_MIXED Procedure Parameters*

Parameter	Description
<code>xid</code>	Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.

## **READ\_ONLY Procedure**

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ ONLY
```

### **Syntax**

```
DBMS_TRANSACTION.READ_ONLY;
```

## **READ\_WRITE Procedure**

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

### **Syntax**

```
DBMS_TRANSACTION.READ_WRITE;
```

## ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

## ROLLBACK\_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK FORCE <text>
```

### Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (  
  xid VARCHAR2);
```

### Parameters

**Table 152–8** *ROLLBACK\_FORCE Procedure Parameters*

Parameter	Description
<code>xid</code>	Local or global transaction ID.

## ROLLBACK\_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK TO SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (  
    savept VARCHAR2);
```

### Parameters

**Table 152–9 ROLLBACK\_SAVEPOINT Procedure Parameters**

Parameter	Description
savept	Savepoint identifier.

## SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.SAVEPOINT (  
    savept VARCHAR2);
```

### Parameters

**Table 152–10** *SAVEPOINT Procedure Parameters*

Parameter	Description
savept	Savepoint identifier.

## STEP\_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

### Syntax

```
DBMS_TRANSACTION.STEP_ID  
RETURN NUMBER;
```

## USE\_ROLLBACK\_SEGMENT Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>
```

### Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (  
    rb_name VARCHAR2);
```

### Parameters

**Table 152–11** *USE\_ROLLBACK\_SEGMENT Procedure Parameters*

Parameter	Description
rb_name	Name of rollback segment to use.

---

---

## DBMS\_TRANSFORM

The DBMS\_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

**See Also:** *Oracle Streams Advanced Queuing User's Guide* for more on message format transformations.

This chapter contains the following topic:

- [Summary of DBMS\\_TRANSFORM Subprograms](#)

## Summary of DBMS\_TRANSFORM Subprograms

**Table 153–1 DBMS\_TRANSFORM Package Subprograms**

<b>Subprograms</b>	<b>Description</b>
<a href="#">CREATE_TRANSFORMATION Procedure</a> on page 153-3	Creates a transformation that maps an object of the source type to an object of the destination type
<a href="#">DROP_TRANSFORMATION Procedure</a> on page 153-5	Drops the given transformation
<a href="#">MODIFY_TRANSFORMATION Procedure</a> on page 153-6	Modifies an existing transformation

## CREATE\_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

### Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
  schema          VARCHAR2 (30) ,
  name            VARCHAR2 (30) ,
  from_schema     VARCHAR2 (30) ,
  from_type       VARCHAR2 (30) ,
  to_schema       VARCHAR2 (30) ,
  to_type         VARCHAR2 (30) ,
  transformation   VARCHAR2 (4000)) ;
```

### Parameters

**Table 153–2 CREATE\_TRANSFORMATION Procedure Parameters**

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
from_schema	Specifies the schema of the source type.
from_type	Specifies the source type.
to_schema	Specifies the target type schema.
to_type	Specifies the target type.
transformation	Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.

### Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS\_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form *source.user\_data*.

- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

## DROP\_TRANSFORMATION Procedure

This procedure drops the given transformation.

### Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORMATION (
  schema  VARCHAR2(30),
  name    VARCHAR2(30) );
```

### Parameters

**Table 153–3** *DROP\_TRANSFORMATION Procedure Parameters*

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.

## MODIFY\_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

### Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
  schema          VARCHAR2(30),
  name            VARCHAR2(30),
  attribute_number INTEGER,
  transformation  VARCHAR2(4000));
```

### Parameters

**Table 153–4** MODIFY\_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
attribute_number	The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.
transformation	The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.

### Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an `attribute_number` of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

The DBMS\_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view `TRANSPORT_SET_VIOLATIONS`.

**See Also:**

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

This chapter contains the following topics:

- [Using DBMS\\_TTS](#)
  - Security Model
  - Exceptions
  - Operational Notes
- [Summary of DBMS\\_TTS Subprograms](#)

## Using DBMS\_TTS

- [Security Model](#)
- [Exceptions](#)
- [Operational Notes](#)

## Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user `SYS`.

## Exceptions

```
ts_not_found EXCEPTION;  
PRAGMA exception_init(ts_not_found, -29304);  
ts_not_found_num NUMBER := -29304;  
  
invalid_ts_list EXCEPTION;  
PRAGMA exception_init(invalid_ts_list, -29346);  
invalid_ts_list_num NUMBER := -29346;  
  
sys_or_tmp_ts EXCEPTION;  
PRAGMA exception_init(sys_or_tmp_ts, -29351);  
sys_or_tmp_ts_num NUMBER := -29351;
```

## Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently:

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

## Summary of DBMS\_TTS Subprograms

These two procedures are designed to be called by database administrators.

**Table 154–1 DBMS\_TTS Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">DOWNGRADE Procedure</a> on page 154-7	Downgrades transportable tablespace related data
<a href="#">TRANSPORT_SET_CHECK Procedure</a> on page 154-8	Checks if a set of tablespaces (to be transported) is self-contained

## **DOWNGRADE Procedure**

This procedure downgrades transportable tablespace related data.

### **Syntax**

```
DBMS_TTS.DOWNGRADE;
```

## TRANSPORT\_SET\_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

### Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
    ts_list          IN CLOB,
    incl_constraints IN BOOLEAN DEFAULT FALSE,
    full_check       IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 154–2 TRANSPORT\_SET\_CHECK Procedure Parameters**

Parameter	Description
ts_list	List of tablespace, separated by comma.
incl_constraints	TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The incl_constraints parameter is a default so that TRANSPORT_SET_CHECK will work if it is called with only the ts_list argument.)
full_check	Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to false. It will only consider OUT pointers as violations.

### Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

The `DBMS_TYPES` package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- [Using DBMS\\_TYPES](#)
  - Constants
  - Exceptions

## Using DBMS\_TYPES

- [Constants](#)
- [Exceptions](#)

## Constants

The following table lists the constants in the DBMS\_TYPES package.

**Table 155–1 DBMS\_TYPES Constants**

Constant	Description
NO_DATA	Is only relevant if PieceWise is called, for a collection or anydataset. Denotes the end of collection/anydataset when all the elements have been accessed
SUCCESS	The operation succeeded
TYPECODE_BDOUBLE	A NUMBER type
TYPECODE_BFILE	A BFILE type
TYPECODE_BFLOAT	A NUMBER type
TYPECODE_BLOB	A BLOB type
TYPECODE_CFILE	A CFILE type
TYPECODE_CHAR	A CHAR type
TYPECODE_CLOB	A CLOB type
TYPECODE_DATE	A DATE type
TYPECODE_INTERVAL_DS	An INTERVAL_DS type
TYPECODE_INTERVAL_YM	A INTERVAL_YM type
TYPECODE_MLSLABEL	An MLSLABEL type
TYPECODE_NAMEDCOLLECTION	A named collection (VARRAY/nested table) type
TYPECODE_NCHAR	A NCHAR type
TYPECODE_NCLOB	A NCLOB type
TYPECODE_NUMBER	A NUMBER type
TYPECODE_NVARCHAR2	A NVARCHAR2 type
TYPECODE_OBJECT	An OBJECT type
TYPECODE_OPAQUE	An OPAQUE type
TYPECODE_RAW	A RAW type
TYPECODE_REF	A REF type
TYPECODE_TABLE	A nested table collection type
TYPECODE_TIMESTAMP	A TIMESTAMP type
TYPECODE_TIMESTAMP_LTZ	A TIMESTAMP_LTZ type
TYPECODE_TIMESTAMP_TZ	A TIMESTAMP_TZ type
TYPECODE_UROWID	A UROWID type
TYPECODE_VARCHAR2	A VARCHAR2 type
TYPECODE_VARCHAR	A VARCHAR type
TYPECODE_VARRAY	A VARRAY collection type

## Exceptions

- INVALID\_PARAMETERS
- INCORRECT\_USAGE
- TYPE\_MISMATCH

The DBMS\_UTILITY package provides various utility subprograms.

This chapter contains the following topics:

- [Using DBMS\\_UTILITY](#)
  - Security Model
  - Constants
  - Exceptions
- [Data Structures](#)
  - Record Types
  - Table Types
- [Summary of DBMS\\_UTILITY Subprograms](#)

---

## Using DBMS\_UTILITY

- [Security Model](#)
- [Constants](#)
- [Exceptions](#)

## Security Model

DBMS\_UTILITY runs with the privileges of the calling user for the [NAME\\_RESOLVE Procedure](#) and the [COMPILE\\_SCHEMA Procedure](#). This is necessary so that the SQL works correctly.

The package does not run as SYS. The privileges are checked using DBMS\_DDL.

## Constants

The `DBMS_UTILITY` package uses the constants shown in [Table 156-1, "DBMS\\_UTILITY Constants"](#).

**Table 156-1** *DBMS\_UTILITY Constants*

<b>Name</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
<code>INV_ERROR_ON_RESTRICTIONS</code>	<code>PLS_INTEGER</code>	1	This constant is the only legal value for the <code>p_option_flags</code> parameter of the <code>INVALIDATE</code> subprogram

## Exceptions

The following table lists the exceptions raised by DBMS\_UTILITY.

**Table 156–2 Exceptions Raised by DBMS\_UTILITY**

Exception	Error Code	Description
INV_NOT_EXIST_OR_NO_PRIV	-24237	Raised by the INVALIDATE subprogram when the <code>object_id</code> argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	-24238	Raised by the INVALIDATE subprogram if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter
INV_RESTRICTED_OBJECT	-24239	Raised by the INVALIDATE subprogram when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened

## Data Structures

The `DBMS_UTILITY` package defines a single `RECORD` type and `TABLE` types.

### Record Types

- `INSTANCE_RECORD` Record Type

### Table Types

- `DBLINK_ARRAY` TABLE Type
- `INDEX_TABLE_TYPE` Table Type
- `INSTANCE_TABLE` Table Type
- `LNAME_ARRAY` Table Type
- `NAME_ARRAY` Table Type
- `NUMBER_ARRAY` Table Type
- `UNCL_ARRAY` Table Type

## INSTANCE\_RECORD Record Type

This type describes a list of active instance number-name pairs.

### Syntax

```
TYPE INSTANCE_RECORD IS RECORD (  
    inst_number    NUMBER,  
    inst_name      VARCHAR2(60));
```

### Fields

**Table 156-3** *INSTANCE\_RECORD Record Type Fields*

Field	Description
inst_number	Active instance number
inst_name	Instance name

## DBLINK\_ARRAY TABLE Type

This type stores a list of database links.

### Syntax

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

## **INDEX\_TABLE\_TYPE Table Type**

This type describes the order in which generated objects are returned to a user.

### **Syntax**

```
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

## INSTANCE\_TABLE Table Type

This type describes a table of [INSTANCE\\_RECORD Record Type](#).

### Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

### Usage Notes

The starting index of `INSTANCE_TABLE` is 1; `INSTANCE_TABLE` is dense.

## LNAME\_ARRAY Table Type

This type stores lists of LONG NAME including fully qualified attribute names.

### Syntax

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

## NAME\_ARRAY Table Type

This type stores lists of NAME.

### Syntax

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

## NUMBER\_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

### Syntax

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

## UNCL\_ARRAY Table Type

This type stores lists of "user"."name"."column"@link

### Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

## Summary of DBMS\_UTILITY Subprograms

**Table 156–4 DBMS\_UTILITY Package Subprograms**

Subprogram	Description
<a href="#">ACTIVE_INSTANCES Procedure</a> on page 156-17	Returns the active instance
<a href="#">ANALYZE_DATABASE Procedure</a> on page 156-18	Analyzes all the tables, clusters and indexes in a database
<a href="#">ANALYZE_PART_OBJECT Procedure</a> on page 156-19	Analyzes the given tables and indexes
<a href="#">ANALYZE_SCHEMA Procedure</a> on page 156-20	Analyzes all the tables, clusters and indexes in a schema
<a href="#">CANONICALIZE Procedure</a> on page 156-21	Canonicalizes a given string
<a href="#">COMMA_TO_TABLE Procedures</a> on page 156-22	Converts a comma-delimited list of names into a PL/SQL table of names
<a href="#">COMPILE_SCHEMA Procedure</a> on page 156-23	Compiles all procedures, functions, packages, views and triggers in the specified schema
<a href="#">CREATE_ALTER_TYPE_ERROR_TABLE Procedure</a> on page 156-24	Creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement
<a href="#">CURRENT_INSTANCE Function</a> on page 156-25	Returns the current connected instance number
<a href="#">DATA_BLOCK_ADDRESS_BLOCK Function</a> on page 156-26	Gets the block number part of a data block address
<a href="#">DATA_BLOCK_ADDRESS_FILE Function</a> on page 156-27	Gets the file number part of a data block address
<a href="#">DB_VERSION Procedure</a> on page 156-28	Returns version information for the database
<a href="#">EXEC_DDL_STATEMENT Procedure</a> on page 156-29	Executes the DDL statement in <code>parse_string</code>
<a href="#">FORMAT_CALL_STACK Function</a> on page 156-30	Formats the current call stack
<a href="#">FORMAT_ERROR_BACKTRACE Function</a> on page 156-31	Formats the backtrace from the point of the current error to the exception handler where the error has been caught
<a href="#">FORMAT_ERROR_STACK Function</a> on page 156-34	Formats the current error stack
<a href="#">GET_CPU_TIME Function</a> on page 156-35	Returns the current CPU time in 100th's of a second
<a href="#">GET_DEPENDENCY Procedure</a> on page 156-36	Shows the dependencies on the object passed in.
<a href="#">GET_ENDIANNESNESS Function</a> on page 156-36	Gets the endianness of the database platform
<a href="#">GET_HASH_VALUE Function</a> on page 156-38	Computes a hash value for the given string
<a href="#">GET_PARAMETER_VALUE Function</a> on page 156-39	Gets the value of specified init.ora parameter

**Table 156–4 (Cont.) DBMS\_UTILITY Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">GET_SQL_HASH Function</a> on page 156-41	Computes a hash value for the given string using MD5 algorithm
<a href="#">GET_TIME Function</a> on page 156-42	Returns the current time in 100th's of a second
<a href="#">GET_TZ_TRANSITIONS Procedure</a> on page 156-43	Returns timezeone transitions by regionid from the <code>timezone.dat</code> file
<a href="#">INVALIDATE Procedure</a> on page 156-44	Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings
<a href="#">IS_BIT_SET Function</a> on page 156-47	Checks the bit setting for the given bit in the given RAW value
<a href="#">IS_CLUSTER_DATABASE Function</a> on page 156-48	Checks if the database is running in cluster database mode
<a href="#">MAKE_DATA_BLOCK_ADDRESS Function</a> on page 156-49	Creates a data block address given a file number and a block number
<a href="#">NAME_RESOLVE Procedure</a> on page 156-50	Resolves the given name
<a href="#">NAME_TOKENIZE Procedure</a> on page 156-52	Calls the parser to parse the given name
<a href="#">OLD_CURRENT_SCHEMA Function</a> on page 156-53	Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')
<a href="#">OLD_CURRENT_USER Function</a> on page 156-54	Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_USER')
<a href="#">PORT_STRING Function</a> on page 156-55	Returns a string that uniquely identifies the version of Oracle and the operating system
<a href="#">SQLID_TO_SQLHASH Function</a> on page 156-56	Converts a SQL ID into a hash value
<a href="#">TABLE_TO_COMMA Procedures</a> on page 156-57	Converts a PL/SQL table of names into a comma-delimited list of names
<a href="#">VALIDATE Procedure</a> on page 156-58	Makes invalid database objects valid
<a href="#">WAIT_ON_PENDING_DML Function</a> on page 156-60	Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back

## ACTIVE\_INSTANCES Procedure

This procedure returns the active instance.

### Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (  
    instance_table  OUT INSTANCE_TABLE,  
    instance_count  OUT NUMBER);
```

### Parameters

**Table 156-5 ACTIVE\_INSTANCES Procedure Parameters**

Procedure	Description
instance_table	Contains a list of the active instance numbers and names. When no instance is up, the list is empty.
instance_count	Number of active instances

## ANALYZE\_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

### Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
  method          IN  VARCHAR2,
  estimate_rows   IN  NUMBER DEFAULT NULL,
  estimate_percent IN  NUMBER DEFAULT NULL,
  method_opt      IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 156–6 ANALYZE\_DATABASE Procedure Parameters**

Parameter	Description
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [ FOR TABLE ] [ FOR ALL [INDEXED] COLUMNS] [SIZE n] [ FOR ALL INDEXES ]

### Exceptions

Ora-20000: Insufficient privileges for some object in this database

## ANALYZE\_PART\_OBJECT Procedure

This procedure is equivalent to SQL:

```
"ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>]
 [<command_opt>] [<sample_clause>]"
```

### Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
  schema          IN VARCHAR2 DEFAULT NULL,
  object_name     IN VARCHAR2 DEFAULT NULL,
  object_type     IN CHAR      DEFAULT 'T',
  command_type    IN CHAR      DEFAULT 'E',
  command_opt     IN VARCHAR2 DEFAULT NULL,
  sample_clause   IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

### Parameters

**Table 156–7 ANALYZE\_PART\_OBJECT Procedure Parameters**

Parameter	Description
schema	Schema of the object_name
object_name	Name of object to be analyzed, must be partitioned
object_type	Type of object, must be T (table) or I (index)
command_type	Must be V (validate structure)
command_opt	Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.
sample_clause	Sample clause to use when command_type is 'E'

### Usage Notes

For each partition of the object, run in parallel using job queues.

## ANALYZE\_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

### Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
  schema          IN VARCHAR2,
  method          IN VARCHAR2,
  estimate_rows   IN NUMBER DEFAULT NULL,
  estimate_percent IN NUMBER DEFAULT NULL,
  method_opt      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 156–8 ANALYZE\_SCHEMA Procedure Parameters**

Parameter	Description
schema	Name of the schema
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [ FOR TABLE ] [ FOR ALL [INDEXED] COLUMNS] [SIZE n] [ FOR ALL INDEXES ]

### Exceptions

Ora-20000: Insufficient privileges for some object in this schema

## CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

### Syntax

```
DBMS_UTILITY.CANONICALIZE(
  name          IN   VARCHAR2,
  canon_name    OUT  VARCHAR2,
  canon_len     IN   BINARY_INTEGER);
```

### Parameters

**Table 156–9 CANONICALIZE Procedure Parameters**

Parameter	Description
name	String to be canonicalized
canon_name	Canonicalized string
canon_len	Length of the string (in bytes) to canonicalize

### Return Values

Returns the first `canon_len` bytes in `canon_name`.

### Usage Notes

- If `name` is NULL, `canon_name` becomes NULL.
- If `name` is not a dotted name, and if `name` begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with `NLS_UPPER`. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If `name` is a dotted name (such as `a."b".c`), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with `NLS_UPPER` and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after `a[b]*` will be ignored.
- The procedure does not handle cases like 'A B.'

### Examples

- `a` becomes `A`
- `"a"` becomes `a`
- `"a".b` becomes `"a"."B"`
- `"a".b,c.f` becomes `"a"."B"` with `",c.f"` ignored.

## COMMA\_TO\_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

### Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
  list IN VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab OUT uncl_array);
```

```
DBMS_UTILITY.COMMA_TO_TABLE (
  list IN VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab OUT lname_array);
```

### Parameters

**Table 156–10** *COMMA\_TO\_TABLE Procedure Parameters*

Parameter	Description
list	Comma separated list of list of 'names', where a name should have the following format for the first overloading: a [. b [. c ]][ @ d ] and the following format for the second overloading: a [. b]* where a, b, c, d are simple identifiers (quoted or unquoted).
tablen	Number of tables in the PL/SQL table
tab	PL/SQL table which contains list of names

### Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

### Usage Notes

- The list must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.
- The values in tab are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

## COMPILE\_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

### Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
  schema          IN VARCHAR2,
  compile_all     IN BOOLEAN DEFAULT TRUE,
  reuse_settings  IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 156–11** *COMPILE\_SCHEMA Procedure Parameters*

Parameter	Description
schema	Name of the schema
compile_all	If TRUE, will compile everything within the schema regardless of whether it is VALID If FALSE, will compile only INVALID objects
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

### Exceptions

**Table 156–12** *COMPILE\_SCHEMA Procedure Exceptions*

Exception	Description
ORA-20000	Insufficient privileges for some object in this schema
ORA-20001	Cannot recompile SYS objects
ORA-20002	Maximum iterations exceeded. Some objects may not have been recompiled.

### Usage Notes

- Note that this subprogram is a wrapper for the [RECOMP\\_SERIAL Procedure](#) included with the [UTL\\_RECOMP](#) package.
- After calling this procedure, you should select from view `ALL_OBJECTS` for items with status of `INVALID` to see if all objects were successfully compiled.
- To see the errors associated with `INVALID` objects, you may use the Enterprise Manager command:
 

```
SHOW ERRORS <type> <schema>.<name>
```

## CREATE\_ALTER\_TYPE\_ERROR\_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

### Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(  
    schema_name    IN    VARCHAR2,  
    table_name     IN    VARCHAR2);
```

### Parameters

**Table 156–13** *CREATE\_ALTER\_TYPE\_ERROR\_TABLE Procedure Parameters*

Parameter	Description
<code>schema_name</code>	Name of the schema
<code>table_name</code>	Name of the table created

### Exceptions

An error is returned if the table already exists.

## CURRENT\_INSTANCE Function

This function returns the current connected instance number. It returns NULL when connected instance is down.

### Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE  
RETURN NUMBER;
```

## DATA\_BLOCK\_ADDRESS\_BLOCK Function

This function gets the block number part of a data block address.

### Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (  
    dba NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 156–14 DATA\_BLOCK\_ADDRESS\_BLOCK Function Parameters**

Parameter	Description
dba	Data block address

### Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

### Return Values

Block offset of the block.

### Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

## DATA\_BLOCK\_ADDRESS\_FILE Function

This function gets the file number part of a data block address.

### Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (  
    dba NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 156–15 DATA\_BLOCK\_ADDRESS\_FILE Function Parameters**

Parameter	Description
dba	Data block address

### Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

### Return Values

File that contains the block.

### Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

## DB\_VERSION Procedure

This procedure returns version information for the database.

### Syntax

```
DBMS_UTILITY.DB_VERSION (  
    version      OUT VARCHAR2,  
    compatibility OUT VARCHAR2);
```

### Parameters

**Table 156–16** *DB\_VERSION Procedure Parameters*

Parameter	Description
version	A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.
compatibility	The compatibility setting of the database determined by the "compatible" <code>init.ora</code> parameter. If the parameter is not specified in the <code>init.ora</code> file, then NULL is returned.

## EXEC\_DDL\_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

### Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (  
    parse_string IN VARCHAR2);
```

### Parameters

**Table 156–17 EXEC\_DDL\_STATEMENT Procedure Parameters**

Parameter	Description
<code>parse_string</code>	DDL statement to be executed

## FORMAT\_CALL\_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

### Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK  
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

### Return Values

This returns the call stack, up to 2000 bytes.

## FORMAT\_ERROR\_BACKTRACE Function

This procedure displays the call stack at the point where an exception was raised, even if the procedure is called from an exception handler in an outer scope. The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

### Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
RETURN VARCHAR2;
```

### Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

### Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
  g_start_pos integer := 1;
  g_end_pos integer;

  FUNCTION Output_One_Line RETURN BOOLEAN IS
  BEGIN
    g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

    CASE g_end_pos > 0
      WHEN true THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
          g_end_pos-g_start_pos ) );
        g_start_pos := g_end_pos+1;
        RETURN TRUE;

      WHEN FALSE THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
          (Length(i_buff)-g_start_pos)+1 ) );
        RETURN FALSE;
    END CASE;
  END Output_One_Line;

  or database administrator.
*/
```

## FORMAT\_ERROR\_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

### Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK  
RETURN VARCHAR2;
```

### Return Values

This returns the error stack, up to 2000 bytes.

## GET\_CPU\_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

### Syntax

```
DBMS_UTILITY.GET_CPU_TIME  
RETURN NUMBER;
```

### Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

### Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

## GET\_DEPENDENCY Procedure

This procedure shows the dependencies on the object passed in.

### Syntax

```
DBMS_UTILITY.GET_DEPENDENCY  
type          IN      VARCHAR2,  
schema        IN      VARCHAR2,  
name          IN      VARCHAR2);
```

### Parameters

**Table 156–18** GET\_DEPENDENCY Procedure Parameters

Parameter	Description
type	Type of the object, for example if the object is a table give the type as 'TABLE'
schema	Schema name of the object
name	Name of the object

### Usage Notes

This procedure uses the [DBMS\\_OUTPUT](#) package to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

## GET\_ENDIANNES Function

This Function Gets The Endianness Of The Database Platform.

### Syntax

```
DBMS_UTILITY.GET_ENDIANNES  
Return Number;
```

### Return Values

The endianness of the database platform.

## GET\_HASH\_VALUE Function

This function computes a hash value for the given string.

### Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (  
    name      VARCHAR2,  
    base      NUMBER,  
    hash_size NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 156–19** GET\_HASH\_VALUE Function Parameters

Parameter	Description
name	String to be hashed.
base	Base value for the returned hash value at which to start
hash_size	Desired size of the hash table

### Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

### Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash\_size value. Using a power of 2 for the hash\_size parameter works best.

## GET\_PARAMETER\_VALUE Function

This function gets the value of specified `init.ora` parameter.

### Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
    parnam      IN      VARCHAR2,
    intval      IN OUT  BINARY_INTEGER,
    strval      IN OUT  VARCHAR2,
    listno      IN      BINARY_INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 156–20 GET\_PARAMETER\_VALUE Function Parameters**

Parameter	Description
parnam	Parameter name
intval	Value of an integer parameter or the value length of a string parameter
strval	Value of a string parameter
listno	List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.

### Return Values

Parameter type:

- 0 if parameter is an `INTEGER/BOOLEAN` parameter
- 1 if parameter is a string/file parameter

### Usage Notes

When using `DBMS_UTILITY.GET_PARAMETER_VALUE`, only the first parameter setting of `/dir1` is returned when `init.ora` is set as follows:

```
utl_file_dir = /dir1
utl_file_dir = /dir2
```

However, the full comma-delimited string is returned if you are using:

```
utl_file_dir = /dir1, /dir2
```

### Examples

```
DECLARE
    parnam VARCHAR2(256);
    intval BINARY_INTEGER;
    strval VARCHAR2(256);
    partyp BINARY_INTEGER;
BEGIN
    partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                              intval, strval);

    dbms_output.put('parameter value is: ');
    IF partyp = 1 THEN
        dbms_output.put_line(strval);
```

```
ELSE
    dbms_output.put_line(intval);
END IF;
IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
END IF;
dbms_output.put('parameter type is: ');
IF partyp = 1 THEN
    dbms_output.put_line('string');
ELSE
    dbms_output.put_line('integer');
END IF;
END;
```

## GET\_SQL\_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

### Syntax

```
Dbms_utility.get_sql_hash (
    name          IN   VARCHAR2,
    hash          OUT  RAW,
    pre10ishash  OUT  NUMBER)
RETURN NUMBER;
```

### Pragmas

```
Pragma Restrict_references(Get_sql_hash, Wnds, Rnds, Wnps, Rnps);
```

### Parameters

**Table 156–21 GET\_SQL\_HASH Procedure Parameters**

Parameter	Description
name	String to be hashed
hash	Optional field to store all 16 bytes of returned hash value
pre10ishash	Optional field to store the pre 10i database version hash value

### Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. one could use an optional raw parameter to get all 16 bytes and to store the pre 10i hash value of 4 bytes in the pre10i hash optional parameter.

## GET\_TIME Function

This function returns the current time in 100th's of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

### Syntax

```
DBMS_UTILITY.GET_TIME  
RETURN NUMBER;
```

### Return Values

Time is the number of 100th's of a second from the point in time at which the subprogram is invoked.

### Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers, application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

## GET\_TZ\_TRANSITIONS Procedure

This procedure returns timezeone transitions by `regionid` from the `timezone.dat` file.

### Syntax

```
DBMS_UTILITY.GET_TZ_TRANSITIONS
  regionid      IN      NUMBER,
  transitions   OUT    MAXRAW);
```

### Parameters

**Table 156–22 GET\_TZ\_TRANSITIONS Procedure Parameters**

Parameter	Description
<code>regionid</code>	Number corresponding to the region
<code>transitions</code>	Raw bytes from the <code>timezone.dat</code> file

### Exceptions

**Table 156–23 GET\_TZ\_TRANSITIONS Procedure Exceptions**

Exception	Description
ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR	For an invalid <code>regionid</code>

## INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

### Syntax

```
DBMS_UTILITY.INVALIDATE (
    p_object_id          NUMBER,
    p_plsql_object_settings VARCHAR2 DEFAULT NULL,
    p_option_flags       PLS_INTEGER DEFAULT 0);
```

### Parameters

**Table 156–24** *INVALIDATE Procedure Parameters*

Parameter	Description
p_object_id	ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.
p_plsql_object_settings	Optional parameter that ignored if the object specified by p_object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE SETTINGS was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.
p_option_flags	Optional parameter defaults to zero (no flags). Option flags supported by invalidate. <ul style="list-style-type: none"> <li>inv_error_on_restrictions (see <a href="#">Constants</a> on page 156-4): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.</li> </ul>

## Exceptions

**Table 156–25 INVALIDATE Procedure Exceptions**

Exception	Description
INV_NOT_EXIST_OR_NO_PRIV	Raised when the <code>object_id</code> argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	Raised if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter
INV_RESTRICTED_OBJECT	Raised when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened

## Usage Notes

The object type (`object_type` column from ALL\_OBJECTS) of the object specified by `p_object_id` must be a PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, TYPE, TYPE BODY, LIBRARY, VIEW, OPERATOR, SYNONYM, or JAVA CLASS. If the object is not one of these types and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is the package specification of STANDARD, DBMS\_STANDARD, or specification or body of DBMS\_UTILITY and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is an object type specification and there exist tables which depend on the type and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

## Examples

### Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the `object_id` 1232 refers to the procedure `remove_emp` in the HR schema. Then the above call will mark the `remove_emp` procedure invalid and change its `PLSQL_OPTIMIZE_LEVEL` compiler setting to 2. The values of other compiler settings will remain unchanged since `REUSE SETTINGS` is specified.

Objects that depend on `hr.remove_emp` will also get marked invalid. Their compiler parameters will not be changed.

### Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the `object_id` 40775 refers to the type body `leaf_category_typ` in the OE schema. Then the above call will mark the type body invalid and change its `PLSQL_CODE_TYPE` compiler setting to NATIVE. The values of other compiler settings will be picked up from the current session environment since `REUSE SETTINGS` has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

**Example 3**

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the OE schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

## IS\_BIT\_SET Function

This function checks the bit setting for the given bit in the given RAW value.

### Syntax

```
DBMS_UTILITY.IS_BIT_SET (  
    r      IN    RAW,  
    n      IN    NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 156–26 IS\_BET\_SET Function Parameters**

Parameter	Description
r	RAW source
n	Bit in r to check

### Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

## IS\_CLUSTER\_DATABASE Function

This function finds out if this database is running in cluster database mode.

### Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE  
RETURN BOOLEAN;
```

### Return Values

This function returns `TRUE` if this instance was started in cluster database mode;  
`FALSE` otherwise.

## MAKE\_DATA\_BLOCK\_ADDRESS Function

This function creates a data block address given a file number and a block number. A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

### Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (  
    file NUMBER,  
    block NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 156–27 MAKE\_DATA\_BLOCK\_ADDRESS Function Parameters**

Parameter	Description
file	File that contains the block
block	Offset of the block within the file in terms of block increments

### Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

### Return Values

Data block address.

## NAME\_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

### Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
  name          IN  VARCHAR2,
  context       IN  NUMBER,
  schema        OUT VARCHAR2,
  part1         OUT VARCHAR2,
  part2         OUT VARCHAR2,
  dblink        OUT VARCHAR2,
  part1_type    OUT NUMBER,
  object_number OUT NUMBER);
```

### Parameters

**Table 156–28 NAME\_RESOLVE Procedure Parameters**

Parameter	Description
name	<p>Name of the object.</p> <p>This can be of the form <code>[[a.]b.]c[@d]</code>, where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the <code>schema</code>, <code>part1</code>, <code>part2</code> and <code>dblink</code> OUT parameters are filled in.</p> <p>a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</p>
context	<p>Must be an integer between 0 and 9.</p> <ul style="list-style-type: none"> <li>■ 0 - table</li> <li>■ 1 - PL/SQL (for 2 part names)</li> <li>■ 2 - sequences</li> <li>■ 3 - trigger</li> <li>■ 4 - Java Source</li> <li>■ 5 - Java resource</li> <li>■ 6 - Java class</li> <li>■ 7 - type</li> <li>■ 8 - Java shared data</li> <li>■ 9 - index</li> </ul>
schema	<p>Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.</p>
part1	<p>First part of the name. The type of this name is specified <code>part1_type</code> (synonym or package).</p>
part2	<p>If this is non-NULL, then this is a subprogram name. If <code>part1</code> is non-NULL, then the subprogram is within the package indicated by <code>part1</code>. If <code>part1</code> is NULL, then the subprogram is a top-level subprogram.</p>

**Table 156–28 (Cont.) NAME\_RESOLVE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>dblink</code>	If this is non-NULL, then a database link was either specified as part of <code>name</code> or <code>name</code> was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the <code>DBMS_UTILITY.NAME_RESOLVE</code> procedure on this remote node.
<code>part1_type</code>	Type of <code>part1</code> is: <ul style="list-style-type: none"><li>■ 5 - synonym</li><li>■ 7 - procedure (top level)</li><li>■ 8 - function (top level)</li><li>■ 9 - package</li></ul>
<code>object_number</code>	Object identifier

## Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

## NAME\_TOKENIZE Procedure

This procedure calls the parser to parse the given name as "a [. b [. c ]][@ dblink ]". It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

### Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (  
    name      IN  VARCHAR2,  
    a         OUT VARCHAR2,  
    b         OUT VARCHAR2,  
    c         OUT VARCHAR2,  
    dblink   OUT VARCHAR2,  
    nextpos  OUT BINARY_INTEGER);
```

### Parameters

**Table 156–29** *NAME\_RESOLVE Procedure Parameters*

Parameter	Description
name	Input name, consisting of SQL identifiers (for example, scott.foo@dblink)
a	Output for the first token of the name
b	Output for the second token of the name (if applicable)
c	Output for the third token of the name (if applicable)
dblink	Output for the dblink of the name
nextpos	Next position after parsing the input name

## OLD\_CURRENT\_SCHEMA Function

This function returns the session value from `sys_context ('userenv', 'current_schema')`.

### Syntax

```
DBMS_UTILITY.OLD_CURRENT_SCHEMA  
RETURN VARCHAR2;
```

## OLD\_CURRENT\_USER Function

This function returns the session value from `sys_context ('userenv', 'current_user')`.

### Syntax

```
DBMS_UTILITY.OLD_CURRENT_USER  
RETURN VARCHAR2;
```

## PORT\_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

### Syntax

```
DBMS_UTILITY.PORT_STRING  
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```

## SQLID\_TO\_SQLHASH Function

This function converts a SQL ID into a hash value.

### Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (  
    sql_id    IN    VARCHAR2)  
RETURN NUMBER;
```

### Parameters

**Table 156–30** *SQLID\_TO\_SQLHASH Function Parameters*

Parameter	Description
sql_id	SQL ID of a SQL statement. Must be VARCHAR2 (13).

## TABLE\_TO\_COMMA Procedures

These procedures converts a PL/SQL table of names into a comma-delimited list of names. This takes a PL/SQL table, 1 . . n, terminated with n+1 null. The second version supports fully-qualified attribute names.

### Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
  tab    IN UNCL_ARRAY,
  tablen OUT BINARY_INTEGER,
  list   OUT VARCHAR2);
```

```
DBMS_UTILITY.TABLE_TO_COMMA (
  tab    IN lname_array,
  tablen OUT BINARY_INTEGER,
  list   OUT VARCHAR2);
```

### Parameters

**Table 156–31** *TABLE\_TO\_COMMA Procedure Parameters*

Parameter	Description
tab	PL/SQL table which contains list of table names
tablen	Number of tables in the PL/SQL table
list	Comma separated list of tables

### Return Values

A comma-delimited list and the number of elements found in the table.

## VALIDATE Procedure

This procedure makes invalid database objects valid.

### Syntax

```
DBMS_UTILITY.VALIDATE (
    object_id      NUMBER);
```

```
DBMS_UTILITY.VALIDATE (
    owner          VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER,
    edition_name   := SYS_CONTEXT ('USERENV', 'CURRENT_EDITION'));
```

### Parameters

**Table 156–32 VALIDATE Procedure Parameters**

Parameter	Description
owner	Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.
objname	Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.
namespace	Namespace of the object. Same as the namespace field in obj\$. Equivalent numeric values are as follows: <ul style="list-style-type: none"> <li>■ 1 = TABLE/PROCEDURE/TYPE</li> <li>■ 2 = BODY</li> <li>■ 3 = TRIGGER</li> <li>■ 4 = INDEX</li> <li>■ 5 = CLUSTER</li> <li>■ 8 = LOB</li> <li>■ 9 = DIRECTORY</li> <li>■ 10 = QUEUE</li> <li>■ 11 = REPLICATION OBJECT GROUP</li> <li>■ 12 = REPLICATION PROPAGATOR</li> <li>■ 13 = JAVA SOURCE</li> <li>■ 14 = JAVA RESOURCE</li> <li>■ 58 = (Data Mining) MODEL</li> </ul>
edition_name	[Note: Currently not operable. Reserved for future use]

### Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.

- The [INVALIDATE Procedure](#) invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its `object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to `INVALIDATE` will not actualize the object in the current edition.

## WAIT\_ON\_PENDING\_DML Function

This procedure waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified scn have either committed or been rolled back.

### Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
  tables      IN      VARCHAR2,
  timeout     IN      BINARY_INTEGER,
  scn         IN OUT  NUMBER)
RETURN BOOLEAN;
```

### Parameters

**Table 156–33** WAIT\_ON\_PENDING\_DML Function Parameters

Parameter	Description
tables	Comma-separated list of one or more table names. The list must be valid for <a href="#">COMMA_TO_TABLE Procedures</a> , and each item valid to the <a href="#">NAME_RESOLVE Procedure</a> . Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.
timeout	Maximum number of seconds to wait, totalled across all tables/transactions. A NULL or negative value will cause a very long wait.
scn	SCN prior to which transactions must have begun to be considered relevant to this request. If the value is NULL or not recognized as a meaningful scn on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output.

### Return Values

TRUE if all relevant transactions have committed or been rolled back, FALSE if the timeout occurred prior to all relevant transactions committing or being rolled back

---

---

## DBMS\_WARNING

The `DBMS_WARNING` package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the `PLSQL_WARNINGS` initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- [Using DBMS\\_WARNING](#)
  - Security Model
- [Summary of DBMS\\_WARNING Subprograms](#)

## Using DBMS\_WARNING

- [Security Model](#)

## Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

## Summary of DBMS\_WARNING Subprograms

**Table 157–1 DBMS\_WARNING Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">ADD_WARNING_SETTING_CAT Procedure</a> on page 157-5	Modifies the current session or system warning settings of the <code>warning_category</code> previously supplied
<a href="#">ADD_WARNING_SETTING_NUM Procedure</a> on page 157-6	Modifies the current session or system warning settings of the or <code>warning_number</code> previously supplied
<a href="#">GET_CATEGORY Function</a> on page 157-7	Returns the category name, given the message number
<a href="#">GET_WARNING_SETTING_CAT Function</a> on page 157-8	Returns the specific warning category in the session
<a href="#">GET_WARNING_SETTING_NUM Function</a> on page 157-9	Returns the specific warning number in the session
<a href="#">GET_WARNING_SETTING_STRING Function</a> on page 157-10	Returns the entire warning string for the current session
<a href="#">SET_WARNING_SETTING_STRING Procedure</a> on page 157-11	Replaces previous settings with the new value

## ADD\_WARNING\_SETTING\_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value. The effect of calling this function is same as adding the qualifier (ENABLE/DISABLE/ERROR) on the category specified to the end of the current session or system setting.

### Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
  warning_category  IN   VARCHAR2,
  warning_value     IN   VARCHAR2,
  scope             IN   VARCHAR2);
```

### Parameters

**Table 157-2 ADD\_WARNING\_SETTING\_CAT Procedure Parameters**

Parameter	Description
<code>warning_category</code>	Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.
<code>warning_value</code>	Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.
<code>scope</code>	Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.

## ADD\_WARNING\_SETTING\_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied. If the value was already set, you will override the existing value. The effect of calling this function is same as adding the qualifier (`ENABLE` / `DISABLE` / `ERROR`) on the category specified to the end of the current session or system setting.

### Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (  
    warning_number    IN    NUMBER,  
    warning_value     IN    VARCHAR2,  
    scope             IN    VARCHAR2);
```

### Parameters

**Table 157-3 ADD\_WARNING\_SETTING\_NUM Procedure Parameters**

Parameter	Description
<code>warning_number</code>	The warning number. Allowed values are all valid warning numbers.
<code>warning_value</code>	Value for the category. Allowed values are <code>ENABLE</code> , <code>DISABLE</code> , and <code>ERROR</code> .
<code>scope</code>	Specifies if the changes are being performed in the session context or the system context. Allowed values are <code>SESSION</code> or <code>SYSTEM</code> .

## GET\_CATEGORY Function

This function returns the category name, given the message number.

### Syntax

```
DBMS_WARNING.GET_CATEGORY (  
    warning_number IN pls_integer)  
RETURN VARCHAR2;
```

### Parameters

**Table 157-4** GET\_CATEGORY Function Parameters

Parameter	Description
warning_number	The warning message number.

## GET\_WARNING\_SETTING\_CAT Function

This function returns the specific warning category setting for the current session.

### Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (  
    warning_category IN VARCHAR2)  
RETURN warning_value;
```

### Parameters

**Table 157-5** *GET\_WARNING\_SETTING\_CAT Function Parameters*

Parameter	Description
warning_category	Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).

## GET\_WARNING\_SETTING\_NUM Function

This function returns the specific warning number setting for the current session.

### Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (  
    warning_number    IN    NUMBER)  
RETURN warning_value;
```

### Parameters

**Table 157–6** *GET\_WARNING\_SETTING\_NUM Function Parameters*

Parameter	Description
warning_number	Warning number. Allowed values are all valid warning numbers.

## GET\_WARNING\_SETTING\_STRING Function

This function returns the entire warning string for the current session.

### Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING  
RETURN pls_integer;
```

### Usage Notes

Use this function when you do not have `SELECT` privilege on `v$parameter` or `v$parameter2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

## SET\_WARNING\_SETTING\_STRING Procedure

This procedure replaces previous settings with the new value. The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an ALTER SESSION or SYSTEM SET PLSQL\_WARNINGS command. This will have same effect as ALTER SESSION OR ALTER SYSTEM command.

### Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (
    warning_value IN VARCHAR2,
    scope        IN VARCHAR2);
```

### Parameters

**Table 157-7 SET\_WARNING\_SETTING\_STRING Procedure Parameters**

Parameter	Description
warning_value	The new string that will constitute the new value.
scope	This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM.

The DBMS\_WM package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

- [Documentation of DBMS\\_WM](#)

---

## Documentation of DBMS\_WM

For a complete description of this package, see DBMS\_WM in *Oracle Database Workspace Manager Developer's Guide*.

---

---

## DBMS\_WORKLOAD\_CAPTURE

The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data. Replay of this capture is implemented by way of the [DBMS\\_WORKLOAD\\_REPLAY](#) package.

**See Also:** *Oracle Database Real Application Testing User's Guide* for more information about Database Replay

This chapter contains the following topics:

- [Using DBMS\\_WORKLOAD\\_CAPTURE](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_WORKLOAD\\_CAPTURE Subprograms](#)

## Using DBMS\_WORKLOAD\_CAPTURE

- [Overview](#)
- [Security Model](#)

## Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

## Security Model

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the DBMS\_WORKLOAD\_CAPTURE and DBMS\_WORKLOAD\_REPLAY packages
- Act as a replay client user (wrc someuser/somepassword or wrc USER=someuser PASSWORD=somepassword)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

---

## Summary of DBMS\_WORKLOAD\_CAPTURE Subprograms

This table lists the package subprograms in alphabetical order.

**Table 159–1 DBMS\_WORKLOAD\_CAPTURE Package Subprograms**

Subprogram	Description
<a href="#">ADD_FILTER Procedures</a> on page 159-6	Adds a specified filter
<a href="#">DELETE_CAPTURE_INFO Procedure</a> on page 159-7	Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID
<a href="#">DELETE_FILTER Procedure</a> on page 159-8	Deletes a specified filter
<a href="#">EXPORT_AWR Procedure</a> on page 159-9	Exports the AWR snapshots associated with a given capture ID
<a href="#">FINISH_CAPTURE Procedure</a> on page 159-10	Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured
<a href="#">GET_CAPTURE_INFO Function</a> on page 159-11	Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID
<a href="#">IMPORT_AWR Function</a> on page 159-12	Imports the AWR snapshots associated with a given capture ID
<a href="#">REPORT Function</a> on page 159-13	Returns a report on the workload capture under consideration using one or more different sources
<a href="#">START_CAPTURE Procedure</a>	Initiates workload capture on all instances

## ADD\_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
  fname          IN  VARCHAR2 NOT NULL,
  fattribute     IN  VARCHAR2 NOT NULL,
  fvalue        IN  VARCHAR2 NOT NULL);
```

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
  fname          IN  VARCHAR2 NOT NULL,
  fattribute     IN  VARCHAR2 NOT NULL,
  fvalue        IN  NUMBER NOT NULL);
```

### Parameters

**Table 159–2 ADD\_FILTER Procedure Parameters**

Parameter	Description
fname	Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: <ul style="list-style-type: none"> <li>▪ INSTANCE_NUMBER - type NUMBER</li> <li>▪ USER - type STRING</li> <li>▪ MODULE - type STRING</li> <li>▪ ACTION - type STRING</li> <li>▪ PROGRAM - type STRING</li> <li>▪ SERVICE - type STRING</li> </ul>
fvalue	Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory).

### Usage Notes

- The workload capture filters work in either the `DEFAULT INCLUSION` or the `DEFAULT EXCLUSION` mode as determined by the `default_action` input to the [START\\_CAPTURE Procedure](#).
- `ADD_FILTER` adds a new filter that affects the next workload capture, and whether the filters are considered as `INCLUSION` filters or `EXCLUSION` filters depends on the value of the `default_action` input to [START\\_CAPTURE Procedure](#).
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the [START\\_CAPTURE Procedure](#) is executed.
- All the filters are listed in the `DBA_WORKLOAD_FILTERS` view.

## DELETE\_CAPTURE\_INFO Procedure

This procedure deletes the rows in the DBA\_WORKLOAD\_CAPTURES and DBA\_WORKLOAD\_FILTERS views that corresponds to the given workload capture ID.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO  
  (capture_id IN NUMBER);
```

### Parameters

**Table 159–3** DELETE\_CAPTURE\_INFO Procedure Parameters

Parameter	Description
capture_id	ID of the workload capture that needs to be deleted. Corresponds to DBA_WORKLOAD_CAPTURES.ID. (Mandatory)

### Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

## DELETE\_FILTER Procedure

This procedure deletes a specified filter.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (  
    filter_name          IN  VARCHAR2(40) NOT NULL);
```

### Parameters

**Table 159–4** *DELETE\_FILTER Procedure Parameters*

Parameter	Description
filter_name	Filter to be deleted

### Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD\\_FILTER Procedures](#) after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

## EXPORT\_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (  
    capture_id    IN NUMBER);
```

### Parameters

**Table 159–5** EXPORT\_AWR Procedure Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots are to be exported. (Mandatory)

### Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in DBA\_WORKLOAD\_CAPTURES was not created by calling the [GET\\_CAPTURE\\_INFO Function](#)) and the AWR snapshots that correspond to the original capture time period are still available.

## FINISH\_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
  timeout      IN  NUMBER  DEFAULT 30
  reason       IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 159–6 FINISH\_CAPTURE Procedure Parameters**

Parameter	Description
timeout	Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush its capture buffers. Default value: 30 seconds
reason	Specifies a reason for calling the procedure. The reason appears in the column <code>ERROR_MESSAGE</code> of the view <code>DBA_WORKLOAD_CAPTURES</code> .

### Usage Notes

- By default, `FINISH_CAPTURE` waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.
- All sessions that either were in the middle of executing a user request or received a new user request, while `FINISH_CAPTURE` was waiting for acknowledgements, flush their buffers and send back their acknowledgement to `FINISH_CAPTURE`.
- If a database session remains idle (waiting for the next user request) throughout the duration of `FINISH_CAPTURE`, the session might have unflushed capture buffers and does not send its acknowledgement to `FINISH_CAPTURE`.

To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking `FINISH_CAPTURE`. Either close the database session(s) before running `FINISH_CAPTURE` or send new database requests to those sessions during `FINISH_CAPTURE`.

## GET\_CAPTURE\_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the DBA\_WORKLOAD\_CAPTURES and DBA\_WORKLOAD\_FILTERS views, and returns the appropriate DBA\_WORKLOAD\_CAPTURES.ID

### Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
  dir      IN  VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 159–7 GET\_CAPTURE\_INFO Function Parameters**

Parameter	Description
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are located (Mandatory)

### Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in DBA\_WORKLOAD\_CAPTURES, the [GET\\_CAPTURE\\_INFO Function](#) simply returns that row's DBA\_WORKLOAD\_CAPTURES.ID. If no existing row matches the capture present in the stipulated directory a new row is inserted to DBA\_WORKLOAD\_CAPTURES and that row's ID is returned.

## IMPORT\_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the [EXPORT\\_AWR Procedure](#).

### Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
  capture_id      IN   NUMBER,
  staging_schema  IN   VARCHAR2,
  force_cleanup   IN   BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

### Parameters

**Table 159–8** *IMPORT\_AWR Function Parameters*

Parameter	Description
capture_id	ID of the capture whose AWR snapshots should be imported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory, Case sensitive).
force_cleanup	<p>Values:</p> <ul style="list-style-type: none"> <li>TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL: <pre>SELECT table_name FROM dba_tables WHERE owner = staging_schema AND table_name like 'WR_\$%';</pre>           Use this option only if you are sure that there are no important data in any such tables in the staging_schema.         </li> <li>FALSE - (default) no tables dropped from the staging_schema prior to the import operation</li> </ul>

### Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR\_DBID column in the DBA\_WORKLOAD\_CAPTURES view.

### Usage Notes

IMPORT\_AWR fails if the staging\_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$\_SNAPSHOT or WRH\$\_PARAMETER. Please drop any such tables in the staging\_schema before invoking IMPORT\_AWR.

## REPORT Function

This function generates a report on the stipulated workload capture.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
  capture_id      IN  NUMBER,
  format         IN  VARCHAR2)
RETURN CLOB;
```

### Parameters

**Table 159–9** *REPORT Function Parameters*

Parameter	Description
capture_id	ID of the workload capture whose capture report is required. (Mandatory)  This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)

### Return Values

The report body in the desired format returned as a CLOB.

**Table 159–10** *Constants Used by Report Function*

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2 (4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2 (4)	'TEXT'	Used as as input to the format argument to generate the text version of the report

## START\_CAPTURE Procedure

This procedure initiates workload capture on all instances.

---

**Note:** The functionality associated with the `capture_sts` and `sts_cap_interval` parameters is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

### Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
  name          IN  VARCHAR2,
  dir           IN  VARCHAR2,
  duration      IN  NUMBER   DEFAULT NULL,
  default_action IN  VARCHAR2 DEFAULT 'INCLUDE',
  auto_unrestrict IN BOOLEAN DEFAULT TRUE,
  capture_sts   IN  BOOLEAN  DEFAULT FALSE,
  sts_cap_interval IN NUMBER  DEFAULT 300);
```

### Parameters

**Table 159–11** *START\_CAPTURE Procedure Parameters*

Parameter	Description
<code>name</code>	Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)
<code>dir</code>	Name of the <code>DIRECTORY</code> object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)
<code>duration</code>	Optional input to specify the duration (in seconds) for which the workload needs to be captured. <code>DEFAULT</code> is <code>NULL</code> which means that workload capture continues until the user executes <code>DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE</code> .
<code>default_action</code>	Can be either <code>INCLUDE</code> or <code>EXCLUDE</code> . Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as <code>INCLUSION</code> filters or <code>EXCLUSION</code> filters. <ul style="list-style-type: none"> <li>■ If <code>INCLUDE</code>, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the <a href="#">ADD_FILTER Procedures</a> are treated as <code>EXCLUSION</code> filters, determining the workload that is not captured. (<code>DEFAULT</code>, and so all the filters specified are assumed to be <code>EXCLUSION</code> filters.)</li> <li>■ If <code>EXCLUDE</code>, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the <a href="#">ADD_FILTER Procedures</a> are treated as <code>INCLUSION</code> filters, determining the workload that is captured.</li> </ul>

**Table 159–11 (Cont.) START\_CAPTURE Procedure Parameters**

Parameter	Description
auto_unrestrict	<p>Can be either TRUE or FALSE.</p> <ul style="list-style-type: none"> <li>■ If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT)</li> <li>■ If FALSE, no database instance is automatically unrestricted.</li> </ul>
capture_sts	<p>If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the <a href="#">EXPORT_AWR Procedure</a> along with the AWR data.</p> <p>Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context.</p> <p>Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture.</p> <p>The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET').</p> <p>If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE.</p> <p>The default value is FALSE.</p>
sts_cap_interval	<p>Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.</p>

## Usage Notes

- All user requests sent to database after a successful invocation of START\_CAPTURE are recorded in the given dir directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the [FINISH\\_CAPTURE Procedure](#) is executed.
- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until FINISH\_CAPTURE is executed, whichever occurs first.
- One can use workload filters (as described with regard to the [ADD\\_FILTER Procedures](#)) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as SMON, PMON, MMON) and Oracle Database Scheduler Jobs (as detailed in the [DBMS\\_SCHEDULER](#) package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in RESTRICTED mode using STARTUP RESTRICT are UNRESTRICTED upon a successful invocation of START\_CAPTURE Use FALSE for the auto\_unrestrict input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when START\_CAPTURE is executed. If ongoing sessions have ongoing transactions, those

transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` are replayed.

---

---

## DBMS\_WORKLOAD\_REPLAY

The DBMS\_WORKLOAD\_REPLAY package provides an interface to replay a workload capture that was originally created by way of the [DBMS\\_WORKLOAD\\_CAPTURE](#) package. Typically, the DBMS\_WORKLOAD\_CAPTURE package will be used in the production system to capture a production workload, and the DBMS\_WORKLOAD\_REPLAY package will be subsequently used in a test system to replay the captured production workload for testing purposes.

**See Also:** *Oracle Database Real Application Testing User's Guide* for more information about "Database Replay"

This chapter contains the following topics:

- [Using DBMS\\_WORKLOAD\\_REPLAY](#)
  - Security Model
- [Summary of DBMS\\_WORKLOAD\\_REPLAY Subprograms](#)

---

## Using DBMS\_WORKLOAD\_REPLAY

- [Security Model](#)

## Security Model

The following code describes the minimum set of privileges required to

- Create directory objects
- Operate the interface provided by the DBMS\_WORKLOAD\_CAPTURE and DBMS\_WORKLOAD\_REPLAY packages
- Act as a replay client user (wrc someuser/somepassword or wrc USER=someuser PASSWORD=somepassword)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay must be able to execute wrc on hosts that will be used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

## Summary of DBMS\_WORKLOAD\_REPLAY Subprograms

This table lists the package subprograms in alphabetical order.

**Table 160–1 DBMS\_WORKLOAD\_REPLAY Package Subprograms**

Subprogram	Description
<a href="#">ADD_FILTER Procedure</a> on page 160-6	Adds a filter to replay only a subset of the captured workload
<a href="#">CALIBRATE Function</a> on page 160-7	Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload
<a href="#">CANCEL_REPLAY Procedure</a> on page 160-8	Cancels the workload replay in progress
<a href="#">COMPARE_PERIOD_REPORT Procedure</a> on page 160-9	Generates a report comparing a replay to its capture or to another replay of the same capture
<a href="#">COMPARE_SQLSET_Report Function</a> on page 160-10	Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture
<a href="#">CREATE_FILTER_SET Procedure</a> on page 160-11	Uses the replay filters added to create a set of filters to use against the replay in <code>replay_dir</code>
<a href="#">DELETE_FILTER Procedure</a> on page 160-12	Deletes the named filter
<a href="#">DELETE_REPLAY_INFO Procedure</a> on page 160-13	Deletes the rows in <code>DBA_WORKLOAD_REPLAYS</code> that corresponds to the given workload replay ID
<a href="#">EXPORT_AWR Procedure</a> on page 160-14	Exports the AWR snapshots associated with a given replay ID
<a href="#">GET_DIVERGING_STATEMENT Function</a> on page 160-15	Exports the AWR snapshots associated with a given replay ID
<a href="#">GET_REPLAY_INFO Function</a> on page 160-16	Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory
<a href="#">GET_REPLAY_TIMEOUT Procedure</a> on page 160-17	Retrieves the replay timeout setting
<a href="#">IMPORT_AWR Function</a> on page 160-18	Imports the AWR snapshots associated with a given replay ID
<a href="#">INITIALIZE_REPLAY Procedure</a> on page 160-19	Initializes replay, and loads specific data produced during processing into the database
<a href="#">IS_REPLAY_PAUSED Function</a> on page 160-20	Reports whether the replay is currently paused
<a href="#">PAUSE_REPLAY Procedure</a> on page 160-21	Pauses the in-progress workload replay
<a href="#">POPULATE_DIVERGENCE Procedure</a> on page 160-21	Precomputes the divergence information for the given call, stream, or the whole replay so that the <a href="#">GET_DIVERGING_STATEMENT Function</a> returns as quickly as possible for the precomputed calls
<a href="#">PREPARE_REPLAY Procedure</a> on page 160-23	Puts the RDBMS in a special "Prepare" mode

**Table 160-1 (Cont.) DBMS\_WORKLOAD\_REPLAY Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">PROCESS_CAPTURE Procedure</a> on page 160-27	Processes the workload capture found in <code>capture_dir</code> in place
<a href="#">REMAP_CONNECTION Procedure</a> on page 160-28	Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay
<a href="#">REPORT Function</a> on page 160-29	Generates a report on the given workload replay
<a href="#">RESUME_REPLAY Procedure</a> on page 160-30	Resumes a paused workload replay
<a href="#">REUSE_REPLAY_FILTER_SET Procedure</a> on page 160-31	Reuses filters in the specified filter set as if each were added using the <a href="#">ADD_FILTER Procedure</a>
<a href="#">REUSE_REPLAY_FILTER_SET Procedure</a> on page 160-31	Sets an advanced parameter for replay besides the ones used with the <a href="#">PREPARE_REPLAY Procedure</a>
<a href="#">SET_REPLAY_TIMEOUT Procedure</a> on page 160-33	Sets the replay timeout setting
<a href="#">START_REPLAY Procedure</a> on page 160-34	Starts the workload replay
<a href="#">USE_FILTER_SET Procedure</a> on page 160-35	Uses the given filter set that has been created by calling the <a href="#">CREATE_FILTER_SET Procedure</a> to filter the current replay

## ADD\_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the [CREATE\\_FILTER\\_SET Procedure](#). This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to CREATE\_FILTER\_SET when creating the filter set.

### Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute     IN VARCHAR2,
    fvalue        IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute     IN VARCHAR2,
    fvalue        IN NUMBER);
```

### Parameters

**Table 160–2 ADD\_FILTER Procedure Parameters**

Parameter	Description
fname	Name of the filter. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	(Mandatory) Specifies the attribute on which the filter is defined as one of the following values: <ul style="list-style-type: none"> <li>■ USER - type STRING</li> <li>■ MODULE - type STRING</li> <li>■ ACTION - type STRING</li> <li>■ PROGRAM - type STRING</li> <li>■ SERVICE - type STRING</li> <li>■ CONNECTION_STRING - type STRING</li> </ul>
fvalue	Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type STRING. (Mandatory)

## CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

### Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
  capture_dir          IN VARCHAR2,
  process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
  threads_per_process  IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

### Parameters

**Table 160–3 CALIBRATE Function Parameters**

Parameter	Description
capture_dir	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
process_per_cpu	Maximum number of process allowed per CPU (default is 4)
threads_per_process	Maximum number of threads allowed per process (default is 50)

### Return Values

Returns a CLOB formatted as XML, that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

### Usage Notes

- Prerequisite: The input workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

## CANCEL\_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

### Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (  
    error_msg    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 160–4 CANCEL\_REPLAY Procedure Parameters**

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which will be recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE. DEFAULT is NULL

### Usage Notes

Prerequisite: A call to the [INITIALIZE\\_REPLAY Procedure](#), or [PREPARE\\_REPLAY Procedure](#), or [START\\_REPLAY Procedure](#) was already issued.

## COMPARE\_PERIOD\_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

### Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
  replay_id1  IN  NUMBER,
  replay_id2  IN  NUMBER,
  format      IN  VARCHAR2,
  result      OUT CLOB );
```

### Parameters

**Table 160–5 COMPARE\_PERIOD\_REPORT Procedure Parameters**

Parameter	Description
replay_id1	First ID of the workload replay whose report is requested
replay_id2	Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.
result	Output of the report (CLOB)

## COMPARE\_SQLSET\_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
  replay_id1    IN NUMBER,
  replay_id2    IN NUMBER,
  format        IN VARCHAR2,
  r_level       IN VARCHAR2 := 'ALL',
  r_sections    IN VARCHAR2 := 'ALL',
  result        OUT CLOB )
RETURN VARCHAR2;
```

### Parameters

**Table 160–6 COMPARE\_SQLSET\_REPORT Function Parameters**

Parameter	Description
replay_id1	First ID of the workload replay after a change
replay_id2	Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT.
r_level	See level parameter in the <a href="#">REPORT_ANALYSIS_TASK Function</a> in the DBMS_SQLPA package
r_sections	See section parameter in the <a href="#">REPORT_ANALYSIS_TASK Function</a> in the DBMS_SQLPA package
result	Output of the report (CLOB)

## CREATE\_FILTER\_SET Procedure

This procedure uses the replay filters added since the previous successful call to create a set of filters to use against the replay in `replay_dir`. After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the [USE\\_FILTER\\_SET Procedure](#).

### Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
    replay_dir      IN  VARCHAR2,
    filter_set      IN  VARCHAR2,
    default_action  IN  VARCHAR2 DEFAULT 'INCLUDE');
```

### Parameters

**Table 160–7 CREATE\_FILTER\_SET Procedure Parameters**

Parameter	Description
<code>replay_dir</code>	Object directory of the replay to be filtered
<code>filter_set</code>	Name of the filter set to create (to use in <a href="#">USE_FILTER_SET Procedure</a> )
<code>default_action</code>	<p>Can be either <code>INCLUDE</code> or <code>EXCLUDE</code>. Determines whether, by default, every captured call must be replayed or not. Also determines, whether the workload filters specified must be considered as <code>INCLUSION</code> filters or <code>EXCLUSION</code> filters.)</p> <p>If it is <code>INCLUDE</code>, then by default all captured calls will be replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the <a href="#">ADD_FILTER Procedure</a> will be treated as <code>EXCLUSION</code> filters, and will determine the workload that will not be replayed.</p> <p>If it is <code>EXCLUDE</code>, then by default no captured call to the database will be replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the <a href="#">ADD_FILTER Procedure</a> will be treated as <code>INCLUSION</code> filters, and will determine the workload that will be replayed.</p> <p>Default: <code>INCLUDE</code> and all the filters specified will be assumed to be <code>EXCLUSION</code> filters</p>

### Usage Notes

This operation needs to be done when no replay is initialized, prepared, or in progress.

## DELETE\_FILTER Procedure

This procedure deletes the named filter.

### Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(  
    fname    IN  VARCHAR2);
```

### Parameters

**Table 160–8** *DELETE\_FILTER Procedure Parameters*

Parameter	Description
fname	Name of the filter that must be deleted (Mandatory)

## DELETE\_REPLAY\_INFO Procedure

This procedure deletes the rows in DBA\_WORKLOAD\_REPLAYS that correspond to the given workload replay ID.

### Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (  
    replay_id    IN NUMBER);
```

### Parameters

**Table 160–9** *DELETE\_REPLAY\_INFO Procedure Parameters*

Parameter	Description
replay_id	ID of the workload replay that needs to be deleted. Corresponds to DBA_WORKLOAD_REPLAYS.ID (Mandatory)

## EXPORT\_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

### Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (  
    replay_id    IN NUMBER);
```

### Parameters

**Table 160–10** EXPORT\_AWR Function Parameters

Parameter	Description
replay_id	ID of the replay whose AWR snapshots are to be exported (Mandatory)

### Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic EXPORT\_AWR invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in DBA\_WORKLOAD\_REPLAYS was not created by calling the [GET\\_REPLAY\\_INFO Function](#)) and the AWR snapshots that correspond to that replay time period are still available.

## GET\_DIVERGING\_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
    replay_id    IN NUMBER,
    stream_id    IN NUMBER,
    call_counter IN NUMBER)
RETURN CLOB;
```

### Parameters

**Table 160–11** GET\_DIVERGING\_STATEMENT Function Parameters

Parameter	Description
replay_id	ID of the replay in which that call diverged
stream_id	Stream ID of the diverging call
call_counter	Call counter of the diverging call

### Usage Notes

- Returns a CLOB formatted as XML that contains:
  - SQL ID
  - SQL Text
  - Bind information: position, name and value
- This function will silently invoke the [POPULATE\\_DIVERGENCE Procedure](#) to read the information from the capture files. Therefore, if divergence has not been populated, the first call to this function for a particular diverging call might take longer, especially in very large captures.

## GET\_REPLAY\_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (  
    dir    IN VARCHAR2)  
RETURN NUMBER;
```

### Parameters

**Table 160–12** GET\_REPLAY\_INFO Function Parameters

Parameter	Description
dir	Name of the workload replay directory object (case sensitive). (Mandatory)

### Return Values

The procedure returns the `CAPTURE_ID`, which can be associated with both `DBA_WORKLOAD_CAPTURE_ID` and `DBA_WORKLOAD_REPLAYS.CAPTURE.ID` to access the imported information.

### Usage Notes

- The procedure first imports a row into `DBA_WORKLOAD_CAPTURES` which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into `DBA_WORKLOAD_REPLAYS`.
- The procedure will not insert new rows to `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_REPLAYS` if these views already contain rows describing the capture and replay history present in the given directory.

## GET\_REPLAY\_TIMEOUT Procedure

This procedure gets the replay timeout setting.

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
  enabled      OUT  BOOLEAN,
  min_delay    OUT  NUMBER,
  max_delay    OUT  NUMBER,
  delay_factor OUT  NUMBER);
```

### Parameters

**Table 160–13** GET\_REPLAY\_TIMEOUT Function Parameters

Parameter	Description
enabled	TRUE if the timeout action is enabled, FALSE otherwise.
min_delay	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay.
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor.

### Usage Notes

This procedure can be called anytime during replay.

## IMPORT\_AWR Function

This procedure imports the AWR snapshots from a given replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (  
    replay_id      IN  NUMBER,  
    staging_schema IN  VARCHAR2)  
RETURN NUMBER;
```

### Parameters

**Table 160–14** *IMPORT\_AWR Function Parameters*

Parameter	Description
replay_id	ID of the replay whose AWR snapshots must be exported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory)

### Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the `AWR_DBID` column in the `DBA_WORKLOAD_REPLAYS` view.

### Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the [EXPORT\\_AWR Procedure](#).
- `IMPORT_AWR` will fail if the `staging_schema` provided as input contains any tables with the same name as any of the AWR tables, such as `WRM$_SNAPSHOT` or `WRH$_PARAMETER`. Please drop any such tables in the `staging_schema` before invoking `IMPORT_AWR`.

## INITIALIZE\_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the [PAUSE\\_REPLAY Procedure](#)).

### Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
  replay_name      IN  VARCHAR2,
  replay_dir       IN  VARCHAR2);
```

### Parameters

**Table 160–15 INITIALIZE\_REPLAY Procedure Parameters**

Parameter	Description
replay_name	Name of the workload replay. Every replay of a processed workload capture can be given a name. (Mandatory)
replay_dir	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data

### Usage Notes

- Prerequisites:
  - Workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the [PAUSE\\_REPLAY Procedure](#).

For instance, during capture the user may record the connection string each session used to connect to the server. The [INITIALIZE\\_REPLAY Procedure](#) loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the [PROCESS\\_CAPTURE Procedure](#), the user could invoke the following:

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
```

This command will load up the connection map and by default will set all replay time connection strings to be equal to NULL. A NULL replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the [REMAP\\_CONNECTION Procedure](#).

## IS\_REPLAY\_PAUSED Function

This function reports whether the replay is currently paused.

### Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED  
RETURN BOOLEAN;
```

### Return Values

Returns `TRUE` if the [PAUSE\\_REPLAY Procedure](#) has been called successfully and the [RESUME\\_REPLAY Procedure](#) has not been called yet.

### Usage Notes

A call to the [START\\_REPLAY Procedure](#) must have already been issued as a pre-requisite.

## PAUSE\_REPLAY Procedure

This procedure pauses the in-progress workload replay. All subsequent user calls from the replay clients will be stalled until either a call to the [RESUME\\_REPLAY Procedure](#) is issued or the replay is cancelled.

### Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

### Usage Notes

- Prerequisite: A call to the [START\\_REPLAY Procedure](#) must have already been issued.
- User calls that were already in-progress when PAUSE\_REPLAY was issued will be allowed to run to completion. Only subsequent user calls, when issued, will be paused.

## POPULATE\_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the [GET\\_DIVERGING\\_STATEMENT Function](#) returns as quickly as possible for the precomputed calls.

### Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (  
    replay_id    IN    NUMBER,  
    stream_id    IN    NUMBER DEFAULT NULL,  
    call_counter IN    NUMBER DEFAULT NULL);
```

### Parameters

**Table 160–16** *POPULATE\_DIVERGENCE Procedure Parameters*

Parameter	Description
replay_id	ID of the replay
stream_id	Stream ID of the diverging call. If NULL is provided, then divergence information will be precomputed for all diverging calls in the given replay.
call_counter	Call counter of the diverging call. If NULL is provided, then divergence information will be precomputed for all diverging calls in the given stream.

## PREPARE\_REPLAY Procedure

This procedure puts the database state in PREPARE FOR REPLAY mode.

---

**Note:** The functionality associated with the `capture_sts` and `sts_cap_interval` parameters is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

### Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
    synchronization          IN BOOLEAN    DEFAULT TRUE,
    connect_time_scale      IN NUMBER     DEFAULT 100,
    think_time_scale        IN NUMBER     DEFAULT 100,
    think_time_auto_correct IN BOOLEAN    DEFAULT TRUE,
    scale_up_multiplier     IN NUMBER     DEFAULT 1,
    capture_sts             IN BOOLEAN    DEFAULT FALSE,
    sts_cap_interval        IN NUMBER     DEFAULT 300);
```

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
    synchronization          IN VARCHAR2   DEFAULT 'SCN',,
    connect_time_scale      IN NUMBER     DEFAULT 100,
    think_time_scale        IN NUMBER     DEFAULT 100,
    think_time_auto_correct IN BOOLEAN    DEFAULT TRUE,
    scale_up_multiplier     IN NUMBER     DEFAULT 1,
    capture_sts             IN BOOLEAN    DEFAULT FALSE,
    sts_cap_interval        IN NUMBER     DEFAULT 300);
```

### Parameters

**Table 160–17 PREPARE\_REPLAY Procedure Parameters**

Parameter	Description
<code>synchronization</code>	<p>Turns synchronization ON or OFF during workload replay. When synchronization is ON, the COMMIT order observed during the original workload capture will be preserved during replay. Every action that is replayed will be executed ONLY AFTER all of its dependent COMMITs (all COMMITs that were issued before the given action in the original workload capture) have finished execution. DEFAULT is TRUE which preserves commit order.</p> <p>When synchronization is OBJECT_ID, a more advanced synchronization scheme is used. Every action that is replayed will be executed only after the relevant COMMITs have finished executing. The relevant COMMITs are the ones that were issued before the given action in the original workload capture and that had modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This object_id scheme has the same logical property of making sure that any action will see the same data it saw during capture, but will allow more concurrency during replays for the actions that do not touch the same objects/tables. DEFAULT VALUE: SCN, preserve commit order. For legacy reasons, there is a boolean version of this procedure:</p> <ul style="list-style-type: none"> <li>▪ TRUE means 'SCN'</li> <li>▪ FALSE means 'OFF'</li> </ul>

**Table 160–17 (Cont.) PREPARE\_REPLAY Procedure Parameters**

Parameter	Description
<code>connect_time_scale</code>	Scales the time elapsed between the instant the workload capture was started and session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. <b>DEFAULT VALUE</b> is 100. See <a href="#">Application of the connect_time_scale Parameter</a> .
<code>think_time_scale</code>	Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. <b>DEFAULT VALUE</b> is 100. See <a href="#">Application of the think_time_scale Parameter</a> .
<code>think_time_auto_correct</code>	Auto corrects the think time between calls appropriately when user calls takes longer time to complete during replay than how long the same user call took to complete during the original capture. <b>DEFAULT</b> is TRUE which is to reduce think time if replay goes slower than capture. See <a href="#">Application of the think_time_auto_correct Parameter</a>
<code>scale_up_multiplier</code>	Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the <code>scale_up_multiplier</code> . However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.
<code>capture_sts</code>	If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the <a href="#">EXPORT_AWR Procedure</a> along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.
<code>sts_cap_interval</code>	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

## Usage Notes

- Prerequisites:
  - The database has been initialized for replay using the [INITIALIZE\\_REPLAY Procedure](#).
  - Any capture time connection strings that require remapping have been already done using the [REMAP\\_CONNECTION Procedure](#).
- One or more external replay clients (WRC) can be started once the `PREPARE_REPLAY` procedure has been executed.
- With regard to `scale_up_multiplier`:
  - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual
  - The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database will be skipped. `SELECT FOR UPDATE` statements are also skipped.
  - Readonly calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and

think\_time\_auto\_correct. Also, the queries are made to wait for the appropriate commits.

- No replay data or error divergence records will be generated for the scale-up sessions.
- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

## Examples

### Application of the connect\_time\_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect (42m after)
```

If the connect\_time\_scale is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect (21m after)
```

If the connect\_time\_scale is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect (84m after)
```

### Application of the think\_time\_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think\_time\_scale is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
        previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
        call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev
        call
12:35 : Third user call completes in 9m (takes a minute longer)
```

### Application of the think\_time\_auto\_correct Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 100 and the `think_time_auto_correct` is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
       call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
       call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

## PROCESS\_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place.

### Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
    capture_dir          IN  VARCHAR2);
```

### Parameters

**Table 160–18** *PROCESS\_CAPTURE Procedure Parameters*

Parameter	Description
<code>capture_dir</code>	Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files will be added to this directory. (Mandatory)

### Usage Notes

- This subprogram analyzes the workload capture found in the `capture_dir` and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the `capture_dir` can be used as input to the [INITIALIZE\\_REPLAY Procedure](#) in order to replay the captured workload present in `capture_dir`.
- Before a workload capture can be replayed in a particular database version, the capture needs to be "processed" using this `PROCESS_CAPTURE` procedure in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload needs to be processed in version 11.1.0.1. The following procedure needs to be executed in a 11.1.0.1 database in order to process the capture directory `rec_dir`:

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
```

Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.

## REMAP\_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
  connection_id      IN NUMBER,
  replay_connection  IN VARCHAR2);
```

### Parameters

**Table 160–19 REMAP\_CONNECTION Procedure Parameters**

Parameter	Description
connection_id	ID of the connection to be remapped. Corresponds to DBA_WORKLOAD_CONNECTION_MAP.CONN_ID
replay_connection	New connection string to be used during replay

### Usage Notes

- By default, all instances of `replay_connection` will be equal to `NULL`. When `replay_connection` is `NULL` (default), replay sessions will connect to the default host as determined by the replay client's runtime environment. Consequently, if no capture time connect strings are remapped, then all the replay sessions will simply connect to the default host to replay the workload.
- A valid `replay_connection` must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.
- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that will be used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

## REPORT Function

This function generates a report on the stipulated workload replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
    replay_id      IN NUMBER,
    format         IN VARCHAR2 )
RETURN CLOB;
```

### Parameters

**Table 160–20** *REPORT Function Parameters*

Parameter	Description
replay_id	Specifies the ID of the workload replay whose report is requested. (Mandatory)
format	Specifies the report format. Valid values are XML, HTML, or TEXT. (Mandatory)

### Return Values

The report body in the desired format returned as a CLOB

**Table 160–21** *Constants Used by Report Function*

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Use this as input to the <code>format</code> argument to generate the text version of the report.
TYPE_XML	VARCHAR2(3)	'XML'	Generates the XML version of the report

## RESUME\_REPLAY Procedure

This procedure resumes a paused workload replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

### Usage Notes

Prerequisite: A call to the [PAUSE\\_REPLAY Procedure](#) must have already been issued.

## REUSE\_REPLAY\_FILTER\_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the [ADD\\_FILTER Procedure](#). Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and existing filter can be deleted before invoking the [CREATE\\_FILTER\\_SET Procedure](#) to create a new filter set.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(  
    replay_dir IN VARCHAR2,  
    filter_set IN VARCHAR2);
```

### Parameters

**Table 160–22 REUSE\_REPLAY\_FILTER\_SET Procedure Parameters**

Parameter	Description
replay_dir	Capture ID of the existing filter set with which it is associated
filter_set	Name of the filter set to be reused

## SET\_ADVANCED\_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the [PREPARE\\_REPLAY Procedure](#). The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
  pname      IN   VARCHAR2,
  pvalue     IN   VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
  pname      IN   VARCHAR2,
  pvalue     IN   NUMBER);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
  pname      IN   VARCHAR2,
  pvalue     IN   BOOLEAN);
```

### Parameters

**Table 160–23 SET\_ADVANCED\_PARAMETER Procedure Parameters**

Parameter	Description
pname	Name of the parameter (case insensitive)
pvalue	Value of the parameter

### Usage Notes

The current parameters and values that can be used are:

```
'DO_NO_WAIT_COMMITS': (default: FALSE)
```

This parameter controls whether the COMMITs issued by replay sessions will be NOWAIT. The default value for this parameter is FALSE. In this case all the COMMITs are issued with the mode they were captured (wait, no-wait, batch, no-batch). If the parameter is set to TRUE, then all COMMITs are issued in no-wait mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent COMMITs. Setting the parameter to TRUE will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

## SET\_REPLAY\_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
  enabled      OUT  BOOLEAN DEFAULT TRUE,
  min_delay    OUT  NUMBER DEFAULT 10,
  max_delay    OUT  NUMBER DEFAULT 120,
  delay_factor OUT  NUMBER DEFAULT 8);
```

### Parameters

**Table 160–24** SET\_REPLAY\_TIMEOUT Function Parameters

Parameter	Description
enabled	TRUE to enable the timeout action, and FALSE to disable. Default = TRUE.
min_delay	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay. Default = 10.
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8.

### Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference of call elapsed time between replay and capture if replay elapsed time is longer.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error will be reported as error divergence.
- Replay timeout operates as follows:
  - The timeout action has no effect if it is not enabled.
  - If the call delay in minutes is less than a lower bound specified by parameter min\_delay, then the timeout action is non-operational.
  - If the delay in minutes is more than an upper bound specified by parameter max\_delay, the timeout action will abort the user call and throw ORA-15569.
  - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter delay\_factor.

## START\_REPLAY Procedure

This procedure starts the workload replay. All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified and those replay clients (WRC) will begin issuing the captured workload.

### Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

### Usage Notes

- Prerequisites:
  - The call to the [PREPARE\\_REPLAY Procedure](#) was already issued.
  - Enough number of external replay clients (WRC) that can faithfully replay the captured workload have already been started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:  

```
$ wrc mode=calibrate replaydir=.
```

## USE\_FILTER\_SET Procedure

This procedure uses the given filter set that has been created by calling the [CREATE\\_FILTER\\_SET Procedure](#) to filter the current replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(  
    filter_set    IN VARCHAR2);
```

### Parameters

**Table 160–25** *USE\_FILTER\_SET Procedure Parameters*

Parameter	Description
filter_set	Name of the filter set use in this replay

### Usage Notes

This procedure must be called after the replay has been initialized and before it is prepared.

---

---

## DBMS\_WORKLOAD\_REPOSITORY

The DBMS\_WORKLOAD\_REPOSITORY package lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.

**See Also:** *Oracle Database Performance Tuning Guide* for more information about the "Automatic Workload Repository"

The chapter contains the following topics:

- [Using DBMS\\_WORKLOAD\\_REPOSITORY](#)
  - Examples
- [Data Structures](#)
  - Object Types
  - Table Types
- [Summary of DBMS\\_WORKLOAD\\_REPOSITORY Subprograms](#)

---

## Using DBMS\_WORKLOAD\_REPOSITORY

This section contains topics which relate to using the DBMS\_WORKLOAD\_REPOSITORY package.

- [Examples](#)

## Examples

This example shows how to generate an AWR text report with the DBMS\_WORKLOAD\_REPOSITORY package for database identifier 1557521192, instance id 1, snapshot ids 5390 and 5391 and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
  DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    1557521192, 1, 5390, 5392) );
```

You can call the DBMS\_WORKLOAD\_REPOSITORY packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.

## Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

### OBJECT Types

- [AWR\\_BASELINE\\_METRIC\\_TYPE](#) Object Type

### TABLE Types

- [AWR\\_BASELINE\\_METRIC\\_TYPE\\_TABLE](#) Table Type
- [AWRRPT\\_INSTANCE\\_LIST\\_TYPE](#) Table Type

## AWR\_BASELINE\_METRIC\_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

### Syntax

```
TYPE breakpoint_info AS OBJECT (
  baseline_name      VARCHAR2(64),
  dbid               NUMBER NOT NULL,
  instance_number    NUMBER NOT NULL,
  beg_time           DATE NOT NULL,
  end_time           DATE NOT NULL,
  metric_id          NUMBER NOT NULL,
  metric_name        VARCHAR2(64) NOT NULL,
  metric_unit        VARCHAR2(64) NOT NULL,
  num_interval       NUMBER NOT NULL,
  interval_size      NUMBER NOT NULL,
  average            NUMBER NOT NULL,
  minimum            NUMBER NOT NULL,
  maximum            NUMBER NOT NULL);
```

### Fields

**Table 161–1** *RUNTIME\_INFO* Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

## **AWR\_BASELINE\_METRIC\_TYPE\_TABLE Table Type**

This type is used by the [SELECT\\_BASELINE\\_METRICS Function](#).

### **Syntax**

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

## **AWRRPT\_INSTANCE\_LIST\_TYPE Table Type**

This type provides an alternative to a comma-separated list.

### **Syntax**

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

---

## Summary of DBMS\_WORKLOAD\_REPOSITORY Subprograms

**Table 161–2 DBMS\_WORKLOAD\_REPOSITORY Package Subprograms**

Subprogram	Description
<a href="#">ADD_COLORED_SQL Procedure</a> on page 161-10	Adds a colored SQL ID
<a href="#">ASH_GLOBAL_REPORT_HTML Function</a> on page 161-11	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.
<a href="#">ASH_GLOBAL_REPORT_TEXT Function</a> on page 161-13	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.
<a href="#">ASH_REPORT_HTML Function</a> on page 161-15	Displays the ASH report in HTML
<a href="#">ASH_REPORT_TEXT Function</a> on page 161-18	Displays the ASH report in text
<a href="#">AWR_DIFF_REPORT_HTML Function</a> on page 161-21	Displays the AWR Diff-Diff report in HTML
<a href="#">AWR_DIFF_REPORT_TEXT Function</a> on page 161-22	Displays the AWR Diff-Diff report in text
<a href="#">AWR_GLOBAL_DIFF_REPORT_HTML Functions</a> on page 161-23	Displays the Global AWR Compare Periods Report in HTML
<a href="#">AWR_GLOBAL_DIFF_REPORT_TEXT Functions</a> on page 161-24	Displays the Global AWR Compare Periods Report in text
<a href="#">AWR_GLOBAL_REPORT_HTML Functions</a> on page 161-25	Displays the Global AWR report in HTML
<a href="#">AWR_GLOBAL_REPORT_TEXT Functions</a> on page 161-26	Displays the Global AWR report in text
<a href="#">AWR_REPORT_HTML Function</a> on page 161-27	Displays the AWR report in HTML
<a href="#">AWR_REPORT_TEXT Function</a> on page 161-28	Displays the AWR report in text
<a href="#">AWR_SQL_REPORT_HTML Function</a> on page 161-29	Displays the AWR SQL Report in HTML format
<a href="#">AWR_SQL_REPORT_TEXT Function</a> on page 161-30	Displays the AWR SQL Report in text format
<a href="#">CREATE_BASELINE Functions &amp; Procedures</a> on page 161-31	Creates a single baseline
<a href="#">CREATE_BASELINE_TEMPLATE Procedures</a> on page 161-31	Creates a baseline template
<a href="#">CREATE_SNAPSHOT Function and Procedure</a> on page 161-34	Creates a manual snapshot immediately
<a href="#">DROP_BASELINE Procedure</a> on page 161-35	Drops a range of snapshots
<a href="#">DROP_BASELINE_TEMPLATE Procedure</a> on page 161-36	Removes a baseline template that is no longer needed

**Table 161-2 (Cont.) DBMS\_WORKLOAD\_REPOSITORY Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">DROP_SNAPSHOT_RANGE Procedure</a> on page 161-37	Activates service
<a href="#">MODIFY_SNAPSHOT_SETTINGS Procedures</a> on page 161-38	Modifies the snapshot settings
<a href="#">MODIFY_BASELINE_WINDOW_SIZE Procedure</a> on page 161-40	Modifies the window size for the Default Moving Window Baseline
<a href="#">RENAME_BASELINE Procedure</a> on page 161-42	Renames a baseline
<a href="#">SELECT_BASELINE_METRICS Function</a> on page 161-43	Shows the values of the metrics corresponding to a baseline

## ADD\_COLORED\_SQL Procedure

This procedure adds a colored SQL ID. If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a TOP SQL). Capture occurs if the SQL is found in the cursor cache at snapshot time.

To uncolor the SQL, invoke the [REMOVE\\_COLORED\\_SQL Procedure](#).

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(  
    sql_id          IN VARCHAR2,  
    dbid           IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 161–3** ADD\_COLORED\_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional dbid, defaults to Local DBID

## ASH\_GLOBAL\_REPORT\_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML (
  l_dbid          IN NUMBER,
  l_inst_num      IN VARCHAR2((1023),
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER          DEFAULT 0,
  l_slot_width    IN NUMBER          DEFAULT 0,
  l_sid           IN NUMBER          DEFAULT NULL,
  l_sql_id        IN VARCHAR2        DEFAULT NULL,
  l_wait_class    IN VARCHAR2        DEFAULT NULL,
  l_service_hash  IN NUMBER          DEFAULT NULL,
  l_module        IN VARCHAR2        DEFAULT NULL,
  l_action        IN VARCHAR2        DEFAULT NULL,
  l_client_id     IN VARCHAR2        DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2        DEFAULT NULL,
  l_data_src      IN NUMBER          DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

### Parameters

**Table 161–4 ASH\_GLOBAL\_REPORT\_HTML Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1, 2, 3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only

## Return Values

The output will be one column of VARCHAR2 (1500).

## Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

**Table 161–5 ASH\_GLOBAL\_REPORT\_HTML: Wildcards Allowed (or Not) in Arguments**

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code> )	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code> )	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code> )	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code> )	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code> )	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code> )	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code> )	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

## ASH\_GLOBAL\_REPORT\_TEXT Function

This table function Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
  l_dbid          IN VARCHAR2(1023),
  l_inst_num     IN NUMBER,
  l_btime       IN DATE,
  l_etime       IN DATE,
  l_options      IN NUMBER          DEFAULT 0,
  l_slot_width  IN NUMBER          DEFAULT 0,
  l_sid         IN NUMBER          DEFAULT NULL,
  l_sql_id      IN VARCHAR2        DEFAULT NULL,
  l_wait_class  IN VARCHAR2        DEFAULT NULL,
  l_service_hash IN NUMBER          DEFAULT NULL,
  l_module     IN VARCHAR2        DEFAULT NULL,
  l_action     IN VARCHAR2        DEFAULT NULL,
  l_client_id  IN VARCHAR2        DEFAULT NULL,
  l_plsql_entry IN VARCHAR2        DEFAULT NULL,
  l_data_src   IN NUMBER          DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

### Parameters

**Table 161–6 ASH\_GLOBAL\_REPORT\_TEXT Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1, 2, 3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only

## Return Values

The output will be one column of VARCHAR2 (320).

## Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

**Table 161–7 ASH\_GLOBAL\_REPORT\_TEXT: Wildcards Allowed (or Not) in Arguments**

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code> )	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code> )	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code> )	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code> )	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code> )	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code> )	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code> )	Yes
<code>l_plsql_entry</code>	PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code> )	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

## ASH\_REPORT\_HTML Function

This table function displays the ASH Spot report in HTML.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
  l_dbid          IN NUMBER,
  l_inst_num     IN NUMBER,
  l_btime        IN DATE,
  l_etime        IN DATE,
  l_options      IN NUMBER          DEFAULT 0,
  l_slot_width   IN NUMBER          DEFAULT 0,
  l_sid          IN NUMBER          DEFAULT NULL,
  l_sql_id       IN VARCHAR2        DEFAULT NULL,
  l_wait_class   IN VARCHAR2        DEFAULT NULL,
  l_service_hash IN NUMBER          DEFAULT NULL,
  l_module       IN VARCHAR2        DEFAULT NULL,
  l_action       IN VARCHAR2        DEFAULT NULL,
  l_client_id    IN VARCHAR2        DEFAULT NULL,
  l_plsql_entry  IN VARCHAR2        DEFAULT NULL,
  l_data_src     IN NUMBER          DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

### Parameters

**Table 161–8 ASH\_REPORT\_HTML Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

**Table 161–8 (Cont.) ASH\_REPORT\_HTML Parameters**

Parameter	Description
<code>l_data_src</code>	Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> <li>■ 1 =&gt; memory (<code>V\$ACTIVE_SESSON_HISTORY</code>)</li> <li>■ 2 =&gt; disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>)</li> <li>■ 0 =&gt; both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.</li> </ul>

## Return Values

The output will be one column of `VARCHAR2 (500)`.

## Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

**Table 161–9 ASH\_REPORT\_HTML: Wildcards Allowed (or Not) in Arguments**

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code> )	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code> )	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code> )	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code> )	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code> )	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code> )	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code> )	Yes

**Table 161-9 (Cont.) ASH\_REPORT\_HTML: Wildcards Allowed (or Not) in Arguments**

<b>Argument Name</b>	<b>Comment</b>	<b>Wildcard Allowed</b>
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

## ASH\_REPORT\_TEXT Function

This table function displays the ASH Spot report in text.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT(
  l_dbid          IN NUMBER,
  l_inst_num     IN NUMBER,
  l_btime        IN DATE,
  l_etime        IN DATE,
  l_options      IN NUMBER      DEFAULT 0,
  l_slot_width   IN NUMBER      DEFAULT 0,
  l_sid          IN NUMBER      DEFAULT NULL,
  l_sql_id       IN VARCHAR2    DEFAULT NULL,
  l_wait_class   IN VARCHAR2    DEFAULT NULL,
  l_service_hash IN NUMBER      DEFAULT NULL,
  l_module       IN VARCHAR2    DEFAULT NULL,
  l_action       IN VARCHAR2    DEFAULT NULL,
  l_client_id    IN VARCHAR2    DEFAULT NULL,
  l_plsql_entry  IN VARCHAR2    DEFAULT NULL,
  l_data_src     IN NUMBER      DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

### Parameters

**Table 161–10 ASH\_REPORT\_TEXT Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

**Table 161–10 (Cont.) ASH\_REPORT\_TEXT Parameters**

Parameter	Description
<code>l_data_src</code>	Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> <li>■ 1 =&gt; memory (<code>V\$ACTIVE_SESSION_HISTORY</code>)</li> <li>■ 2 =&gt; disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>)</li> <li>■ 0 =&gt; both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.</li> </ul>

## Return Values

The output will be one column of `VARCHAR2 (80)`.

## Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_etime` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

**Table 161–11 ASH\_REPORT\_TEXT: Wildcards Allowed (or Not) in Arguments**

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code> )	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code> )	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code> )	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code> )	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code> )	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code> )	Yes

**Table 161–11 (Cont.) ASH\_REPORT\_TEXT: Wildcards Allowed (or Not) in Arguments**

Argument Name	Comment	Wildcard Allowed
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code> )	Yes
<code>l_plsql_entry</code>	PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code> )	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

## AWR\_DIFF\_REPORT\_HTML Function

This table function displays the AWR Compare Periods report in HTML.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML (
  dbid1      IN NUMBER,
  inst_num1  IN NUMBER,
  bid1       IN NUMBER,
  eid1       IN NUMBER,
  dbid2      IN NUMBER,
  inst_num2  IN NUMBER,
  bid2       IN NUMBER,
  eid2       IN NUMBER)
RETURN awrd rpt_text_type_table PIPELINED;
```

### Parameters

**Table 161–12 AWR\_DIFF\_REPORT\_HTML Parameters**

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

### Return Values

The output will be one column of VARCHAR2 (500).

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrd rpt . sql` script which prompts users for the required information.

## AWR\_DIFF\_REPORT\_TEXT Function

This table function displays the AWR Compare Periods report in text.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT (
  dbid1      IN NUMBER,
  inst_num1  IN NUMBER,
  bid1       IN NUMBER,
  eid1       IN NUMBER,
  dbid2      IN NUMBER,
  inst_num2  IN NUMBER,
  bid2       IN NUMBER,
  eid2       IN NUMBER)
RETURN awrd rpt_text_type_table PIPELINED;
```

### Parameters

**Table 161–13 AWR\_DIFF\_REPORT\_TEXT Parameters**

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

### Return Values

The output will be one column of VARCHAR2 (500).

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrd rpt . sql` script which prompts users for the required information.

## AWR\_GLOBAL\_DIFF\_REPORT\_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
  dbid1      IN      NUMBER,
  inst_num1  IN      AWRRTPT_INSTANCE_LIST_TYPE,
  bid1       IN      NUMBER,
  eid1       IN      NUMBER,
  dbid2      IN      NUMBER,
  inst_num2  IN      AWRRTPT_INSTANCE_LIST_TYPE,
  bid2       IN      NUMBER,
  eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
  dbid1      IN      NUMBER,
  inst_num1  IN      VARCHAR2,
  bid1       IN      NUMBER,
  eid1       IN      NUMBER,
  dbid2      IN      NUMBER,
  inst_num2  IN      VARCHAR2,
  bid2       IN      NUMBER,
  eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

### Parameters

**Table 161–14 AWR\_GLOBAL\_DIFF\_REPORT\_HTML Function Parameters**

Parameter	Description
<code>dbid1</code>	1st database identifier
<code>inst_num1</code>	1st list of instance numbers. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>bid1</code>	1st Begin Snap ID
<code>eid1</code>	1st End Snapshot ID
<code>dbid2</code>	2nd database identifier
<code>inst_num2</code>	2nd list of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>bid2</code>	2nd Begin Snap ID
<code>eid2</code>	2nd End Snapshot ID

### Return Values

The output will be one column of `VARCHAR2 (1500)`.

## AWR\_GLOBAL\_DIFF\_REPORT\_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
  dbid1      IN      NUMBER,
  inst_num1  IN      AWRRTPT_INSTANCE_LIST_TYPE,
  bid1       IN      NUMBER,
  eid1       IN      NUMBER,
  dbid2      IN      NUMBER,
  inst_num2  IN      AWRRTPT_INSTANCE_LIST_TYPE,
  bid2       IN      NUMBER,
  eid2       IN      NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
  dbid1      IN      NUMBER,
  inst_num1  IN      VARCHAR2,
  bid1       IN      NUMBER,
  eid1       IN      NUMBER,
  dbid2      IN      NUMBER,
  inst_num2  IN      VARCHAR2,
  bid2       IN      NUMBER,
  eid2       IN      NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

### Parameters

**Table 161–15 AWR\_GLOBAL\_DIFF\_REPORT\_TEXT Functions Parameters**

Parameter	Description
<code>dbid1</code>	1st database identifier
<code>inst_num1</code>	1st list of instance numbers. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>bid1</code>	1st Begin Snap ID
<code>eid1</code>	1st End Snapshot ID
<code>dbid2</code>	2nd database identifier
<code>inst_num2</code>	2nd list of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>bid2</code>	2nd Begin Snap ID
<code>eid2</code>	2nd End Snapshot ID

### Return Values

The output will be one column of `VARCHAR2 (320)`.

## AWR\_GLOBAL\_REPORT\_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
  l_dbid      IN    NUMBER,
  l_inst_num  IN    AWRPT_INSTANCE_LIST_TYPE,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
  l_dbid      IN    NUMBER,
  l_inst_num  IN    VARCHAR2,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

### Parameters

**Table 161–16 AWR\_GLOBAL\_REPORT\_HTML Function Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
l_bid	Begin Snap ID
l_eid	End Snapshot ID
l_options	

### Return Values

The output will be one column of VARCHAR2 (1500).

## AWR\_GLOBAL\_REPORT\_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT (
  l_dbid      IN      NUMBER,
  l_inst_num  IN      AWRRPT_INSTANCE_LIST_TYPE,
  l_bid       IN      NUMBER,
  l_eid       IN      NUMBER,
  l_options   IN      NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT (
  l_dbid      IN      NUMBER,
  l_inst_num  IN      VARCHAR2,
  l_bid       IN      NUMBER,
  l_eid       IN      NUMBER,
  l_options   IN      NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

### Parameters

**Table 161–17 AWR\_GLOBAL\_REPORT\_TEXT Function Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
l_bid	Begin Snap ID
l_eid	End Snapshot ID
l_options	A flag to specify to control the output of the report. Currently, not used.

### Return Values

The output will be one column of VARCHAR2 (320).

## AWR\_REPORT\_HTML Function

This table function displays the AWR report in HTML.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

### Parameters

**Table 161–18 AWR\_REPORT\_HTML Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> <li>▪ l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</li> </ul>

### Return Values

The output will be one column of VARCHAR2 (1500).

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

## AWR\_REPORT\_TEXT Function

This table function displays the AWR report in text.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

### Parameters

**Table 161–19 AWR\_REPORT\_TEXT Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> <li>▪ l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</li> </ul>

### Return Values

The output will be one column of VARCHAR2 (80).

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

## AWR\_SQL\_REPORT\_HTML Function

This table function displays the AWR SQL Report in HTML format.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_sqlid     IN    VARCHAR2,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

### Parameters

**Table 161–20 AWR\_SQL\_REPORT\_HTML Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_sqlid	SQL ID of statement to be analyzed
l_options	A flag to specify to control the output of the report. Currently, not used.

### Return Values

The output will be one column of VARCHAR2 (500).

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

## AWR\_SQL\_REPORT\_TEXT Function

This table function displays the AWR SQL Report in text format.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_sqlid     IN    VARCHAR2,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

### Parameters

**Table 161–21 AWR\_SQL\_REPORT\_TEXT Parameters**

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	Instance number
<code>l_bid</code>	The 'Begin Snapshot' ID
<code>l_eid</code>	The 'End Snapshot' ID
<code>l_sqlid</code>	SQL ID of statement to be analyzed
<code>l_options</code>	Flag to specify to control the output of the report. Currently, not used.

### Return Values

The output will be one column of VARCHAR2 (120).

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

## CREATE\_BASELINE Functions & Procedures

This function and procedure creates a baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_snap_id   IN NUMBER,
  end_snap_id     IN NUMBER,
  baseline_name   IN VARCHAR2,
  dbid            IN NUMBER DEFAULT NULL,
  expiration      IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_snap_id   IN NUMBER,
  end_snap_id     IN NUMBER,
  baseline_name   IN VARCHAR2,
  dbid            IN NUMBER DEFAULT NULL,
  expiration      IN NUMBER DEFAULT NULL)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_time      IN DATE,
  end_time        IN DATE,
  baseline_name   IN VARCHAR2,
  dbid            IN NUMBER DEFAULT NULL,
  expiration      IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_time      IN DATE,
  end_time        IN DATE,
  baseline_name   IN VARCHAR2,
  dbid            IN NUMBER DEFAULT NULL,
  expiration      IN NUMBER DEFAULT NULL);
RETURN NUMBER;
```

### Parameters

**Table 161–22 CREATE\_BASELINE Function & Procedure Parameters**

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline'
end_snap_id	End snapshot sequence number for the baseline
start_time	Start time for the baseline'
end_time	End time for the baseline
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

### Exceptions

- An error will be returned if this baseline name already exists in the system.

- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

## Examples

This example creates a baseline (named 'oltp\_peakload\_bl') between snapshots 105 and 107 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,  
end_snap_id => 107,  
baseline_name => 'oltp_peakload_bl');
```

If you query the DBA\_HIST\_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

## CREATE\_BASELINE\_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

### Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
  start_time          IN DATE,
  end_time            IN DATE,
  baseline_name       IN VARCHAR2,
  template_name       IN VARCHAR2,
  expiration          IN NUMBER,
  dbid                IN NUMBER DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
  day_of_week         IN VARCHAR2,
  hour_in_day         IN NUMBER,
  duration            IN NUMBER,
  start_time          IN DATE,
  end_time            IN DATE,
  baseline_name_prefix IN VARCHAR2,
  template_name       IN VARCHAR2,
  expiration          IN NUMBER,
  dbid                IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 161–23 CREATE\_BASELINE\_TEMPLATE Procedure Parameters**

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start
duration	Duration (in number of hours) after hour in the day that the baseline should last
baseline_name_prefix	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

## CREATE\_SNAPSHOT Function and Procedure

This function and procedure create snapshots. In the case of the function, the snapshot ID is returned.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(  
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL');  
  
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(  
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL')  
    RETURN NUMBER;
```

### Parameters

**Table 161–24** CREATE\_SNAPSHOT Parameters

Parameter	Description
flush_level	Flush level for the snapshot is either 'TYPICAL' or 'ALL'

### Examples

This example creates a manual snapshot at the TYPICAL level:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT();
```

If you query the DBA\_HIST\_SNAPSHOT view after the CREATE\_SNAPSHOT action, you will see one more snapshot ID added to the Workload Repository.

## DROP\_BASELINE Procedure

This procedure drops a baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
  baseline_name IN VARCHAR2,
  cascade       IN BOOLEAN DEFAULT FALSE,
  dbid          IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 161–25 DROP\_BASELINE Parameters**

Parameter	Description
baseline_name	Name of baseline to drop from the system
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.

### Examples

This example drops the baseline 'oltp\_peakload\_b1' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
  baseline_name => 'oltp_peakload_b1');
```

If you query the DBA\_HIST\_BASELINE view after the DROP\_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA\_HIST\_SNAPSHOT view to find that the underlying snapshots are left intact.

## DROP\_BASELINE\_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(  
  template_name      IN VARCHAR2,  
  dbid               IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 161–26** *DROP\_BASELINE\_TEMPLATE Procedure Parameters*

Parameter	Description
template_name	Name of the template to remove
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.

## DROP\_SNAPSHOT\_RANGE Procedure

This procedure drops a range of snapshots.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE (
  low_snap_id   IN  NUMBER,
  high_snap_id  IN  NUMBER
  dbid          IN  NUMBER DEFAULT NULL);
```

### Parameters

**Table 161–27 DROP\_SNAPSHOT\_RANGE Procedure Parameters**

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (default to local DBID).

### Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

## MODIFY\_SNAPSHOT\_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    retention    IN    NUMBER    DEFAULT NULL,
    interval     IN    NUMBER    DEFAULT NULL,
    topnsql      IN    NUMBER    DEFAULT NULL,
    dbid         IN    NUMBER    DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    retention    IN    NUMBER    DEFAULT NULL,
    interval     IN    NUMBER    DEFAULT NULL,
    topnsql      IN    VARCHAR2,
    dbid         IN    NUMBER    DEFAULT NULL);
```

### Parameters

**Table 161–28** *MODIFY\_SNAPSHOT\_SETTINGS Procedure Parameters*

Parameter	Description
<code>retention</code>	<p>New retention time (in minutes). The specified value must be in the range of <code>MIN_RETENTION</code> (1 day) to <code>MAX_RETENTION</code> (100 years).</p> <p>If <code>ZERO</code> is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the old value for retention is preserved.</p> <p>NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the <a href="#">MODIFY_BASELINE_WINDOW_SIZE Procedure</a> can be used to adjust the window size.</p>
<code>interval</code>	<p>New interval setting between each snapshot, in units of minutes. The specified value must be in the range <code>MIN_INTERVAL</code> (10 minutes) to <code>MAX_INTERVAL</code> (1 year).</p> <p>If <code>ZERO</code> is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the current value is preserved.</p>

**Table 161–28 (Cont.) MODIFY\_SNAPSHOT\_SETTINGS Procedure Parameters**

Parameter	Description
topnsql	<ul style="list-style-type: none"> <li>■ If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting.</li> <li>■ If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.</li> </ul>
dbid	Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.

## Examples

This example changes the `interval` setting to one hour and the `retention` setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    interval => 60,
    retention => 20160);
```

If you query the `DBA_HIST_WR_CONTROL` table after this procedure is executed, you will see the changes to these settings.

## MODIFY\_BASELINE\_WINDOW\_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(  
    window_size    IN    NUMBER,  
    dbid           IN    NUMBER DEFAULT NULL);
```

### Parameters

**Table 161–29** *MODIFY\_BASELINE\_WINDOW\_SIZE Procedure Parameters*

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (default to local DBID)

### Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the [MODIFY\\_SNAPSHOT\\_SETTINGS Procedures](#) can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

## REMOVE\_COLORED\_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(  
    sql_id      IN VARCHAR2,  
    dbid        IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 161–30 REMOVE\_COLORED\_SQL Procedure Parameters**

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional dbid, defaults to Local DBID

## RENAME\_BASELINE Procedure

This procedure renames a baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
  old_baseline_name  IN  VARCHAR2,
  new_baseline_name  IN  VARCHAR2,
  dbid               IN  NUMBER DEFAULT NULL);
```

### Parameters

**Table 161–31** *RENAME\_BASELINE Procedure Parameters*

Parameter	Description
old_baseline_name	Old baseline name
new_baseline_name	New baseline name
dbid	Database ID (default to local DBID)

## SELECT\_BASELINE\_METRICS Function

This table function shows the values of the metrics corresponding to a baseline. The table function will return an object of the [AWR\\_BASELINE\\_METRIC\\_TYPE Object Type](#).

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRICS(
  baseline_name      IN VARCHAR2,
  dbid               IN NUMBER DEFAULT NULL,
  instance_num       IN NUMBER DEFAULT NULL)
RETURN awr_baseline_metric_type_table PIPELINED;
```

### Parameters

**Table 161–32** *SELECT\_BASELINE\_METRICS Function Parameters*

Parameter	Description
baseline_name	Name of the baseline for which we would like to view metrics
dbid	Database Identifier for baseline. If NULL, then use the database identifier for the local database. Defaults to NULL.
instance_num	Instance for which number the user wants to see statistics. If NULL, show statistics for the local instance. Defaults to NULL.

The DBMS\_XA package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL\*Plus sessions or processes using PL/SQL.

**See Also:** *Oracle Database Advanced Application Developer's Guide* for more information about "Developing Applications with Oracle XA"

The chapter contains the following topics:

- [Using DBMS\\_XA](#)
  - Overview
  - Security Model
  - Constants
  - Operational Notes
- [Data Structures](#)
  - OBJECT Types
  - TABLE Types
- [Summary of DBMS\\_XA Subprograms](#)

## Using DBMS\_XA

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)

## Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (XID) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

## Security Model

This package is created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

Any `DBMS_XA` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_XA` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

`SELECT` privilege on `SYS.DBA_PENDING_TRANSACTIONS` is required for users who need to execute `XA_RECOVER` subprogram.

`FORCE ANY TRANSACTION` privilege is required for users who need to manipulate XA transactions created by other users.

## Constants

The DBMS\_XA package uses the constants shown in [Table 162–1](#) for use in the flag field of the [XA\\_START Function](#) and the [XA\\_END Function](#).

**Table 162–1 DBMS\_XA Constants for Flag Field of XA\_START & XA\_END Functions**

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('08000000')	Caller is resuming association with suspended transaction branch.

The DBMS\_XA package uses the constants shown in [Table 162–2](#) for Possible Return Values

**Table 162–2 DBMS\_XA Constants for Possible Return Values**

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed

**Table 162–2 (Cont.) DBMS\_XA Constants for Possible Return Values**

<b>Name</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVALID	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

## Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, `XA_PREPARE/COMMIT/ROLLBACK/FORGET` may not be called when the transaction is still associated with the current session. Only after `XA_END` has been called so that there is not any transaction associated with the current session, the application may call `XA_PREPARE/COMMIT/ROLLBACK/FORGET`.

`XAER_PROTO` error is returned from `XA_PREPARE/COMMIT/ROLLBACK/FORGET` if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

## Data Structures

The DBMS\_XA package uses the following OBJECT type and associated TABLE type.

### OBJECT Types

- [DBMS\\_XA\\_XID Object Type](#)

### TABLE Types

- [DBMS\\_XA\\_XID\\_ARRAY Table Type](#)

## DBMS\_XA\_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

---

---

**See Also:** For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

---

---

### Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual         RAW(64),
  constructor function DBMS_XA_XID(
    gtrid       IN NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
    gtrid       IN RAW,
    bqual       IN RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
    formatid    IN NUMBER,
    gtrid       IN RAW,
    bqual       IN RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
    RETURN SELF AS RESULT)
```

### Attributes

**Table 162–3 DBMS\_XA\_XID Object Type**

Attribute	Description
formatid	Format identifier, a number identifying different transaction managers (TM)
gtrid	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
bqual	Branch qualifier, of which the maximum size is 64 bytes

## DBMS\_XA\_XID\_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

### Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

---

## Summary of DBMS\_XA Subprograms

**Table 162–4 DBMS\_Xa Package Subprograms**

Subprogram	Description
<a href="#">DIST_TXN_SYNC Procedure</a> on page 162-12	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)
<a href="#">XA_COMMIT Function</a> on page 162-13	Commits the global transaction specified by <code>xid</code>
<a href="#">XA_END Function</a> on page 162-14	Disassociates the current session from the transaction branch specified by <code>xid</code>
<a href="#">XA_FORGET Function</a> on page 162-15	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
<a href="#">XA_GETLASTOER Function</a> on page 162-16	Obtains the last Oracle error code, in case of failure of previous XA calls.
<a href="#">XA_PREPARE Function</a> on page 162-17	Prepares the transaction branch specified in <code>xid</code> for committing the transaction subsequently if possible
<a href="#">XA_RECOVER Function</a> on page 162-18	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
<a href="#">XA_ROLLBACK Function</a> on page 162-19	Informs the resource manager to roll back work done on behalf of a transaction branch
<a href="#">XA_SETTIMEOUT Function</a> on page 162-20	Sets the transaction timeout in seconds for the current session
<a href="#">XA_START Function</a> on page 162-21	Associates the current session with the transaction branch specified by <code>xid</code>

## **DIST\_TXN\_SYNC Procedure**

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

### **Syntax**

```
DBMS_XA.DIST_TXN_SYNC;
```

## XA\_COMMIT Function

This function commits the global transaction specified by `xid`.

### Syntax

```
DBMS_XA.XA_COMMIT (
  xid          IN DBMS_XA_XID,
  onePhase     IN BOOLEAN)
RETURN PLS_INTEGER;
```

### Parameters

**Table 162-5 XA\_COMMIT Function Parameters**

Parameter	Description
<code>xid</code>	See <a href="#">DBMS_XA_XID Object Type</a> on page 162-9
<code>onePhase</code>	If <code>TRUE</code> , apply single phase commit

### Return Values

See [Table 162-2, "DBMS\\_XA Constants for Possible Return Values"](#). Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

### Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

## XA\_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists.

### Syntax

```
DBMS_XA.XA_END (
    xid    IN  DBMS_XA_XID,
    flag   IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 162–6 XA\_END Function Parameters**

Parameter	Description
<code>xid</code>	See <a href="#">DBMS_XA_XID Object Type</a> on page 162-9
<code>flag</code>	See <a href="#">Table 162–1, "DBMS_XA Constants for Flag Field of XA_START &amp; XA_END Functions"</a> .

### Return Values

See [Table 162–2, "DBMS\\_XA Constants for Possible Return Values"](#). Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

### Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by `xid` from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089: COMMIT is not allowed in a subordinate session`.
- Executing a `COMMIT` or a `ROLLBACK` statement after `XA_END` has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session. To commit the transaction ID or the [XA\\_ROLLBACK Function](#) to commit/rollback the transaction specified by the `xid`.

## XA\_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

### Syntax

```
DBMS_XA.XA_FORGET (  
    xid          IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 162-7 XA\_FORGET Function Parameters**

Parameter	Description
xid	See <a href="#">DBMS_XA_XID Object Type</a> on page 162-9

### Return Values

See [Table 162-2, "DBMS\\_XA Constants for Possible Return Values"](#). Possible return values are XA\_OK, XAER\_RMERR, XAER\_RMFAIL, XAER\_NOTA, XAER\_INVAL, or XAER\_PROTO.

## XA\_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

### Syntax

```
DBMS_XA.XA_GETLASTOER  
RETURN PLS_INTEGER;
```

### Return Values

The return value carries the last Oracle error code.

## XA\_PREPARE Function

This function prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible.

### Syntax

```
DBMS_XA.XA_PREPARE (
    xid IN DBMS_XA_XID)
RETURN PLS_INTEGER;
```

### Parameters

**Table 162–8 XA\_PREPARE Function Parameters**

Parameter	Description
<code>xid</code>	See <a href="#">DBMS_XA_XID Object Type</a> on page 162-9

### Return Values

See [Table 162–2, "DBMS\\_XA Constants for Possible Return Values"](#). Possible return codes include: `XA_OK`, `XA_RDONLY`, `XA_RB*`, `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVALID`, or `XAER_PROTO`.

### Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

## XA\_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

### Syntax

```
DBMS_XA.XA_RECOVER  
RETURN DBMS_XA_XID_ARRAY;
```

### Return Values

See [DBMS\\_XA\\_XID\\_ARRAY Table Type](#)

### Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

## XA\_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

### Syntax

```
DBMS_XA.XA_ROLLBACK (
    xid          IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

### Parameters

**Table 162–9 XA\_ROLLBACK Function Parameters**

Parameter	Description
xid	See <a href="#">DBMS_XA_XID Object Type</a> on page 162-9

### Return Values

See [Table 162–2, "DBMS\\_XA Constants for Possible Return Values"](#). Possible return values are: XA\_OK, XA\_RB\*, XA\_HEURHAZ, XA\_HEURCOM, XA\_HEURRB, or XA\_HEURMIX.

### Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege FORCE ANY TRANSACTION must be granted to the user.

## XA\_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

### Syntax

```
DBMS_XA.XA_SETTIMEOUT (  
    seconds IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 162–10 XA\_SETTIMEOUT Function Parameters**

Parameter	Description
seconds	The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.

### Return Values

See [Table 162–2, "DBMS\\_XA Constants for Possible Return Values"](#). Possible return values are XA\_OK, XAER\_RMERR, XAER\_RMFAIL, or XAER\_INVALID.

### Usage Notes

Only if return value is XA\_OK, is the timeout value successfully set.

## XA\_START Function

This function associates the current session with a transaction branch specified by the `xid`.

### Syntax

```
DBMS_XA.XA_START (
  xid IN DBMS_XA_XID,
  flag IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 162–11 XA\_START Function Parameters**

Parameter	Description
<code>xid</code>	See <a href="#">DBMS_XA_XID Object Type</a> on page 162-9
<code>flag</code>	See <a href="#">Table 162–1, "DBMS_XA Constants for Flag Field of XA_START &amp; XA_END Functions"</a> .

### Return Values

See [Table 162–2, "DBMS\\_XA Constants for Possible Return Values"](#)

### Usage Notes

- If `TMJOIN` or `TMRESUME` is specified in `flag`, the start is for joining an existing transaction branch identified by the `xid`. `TMJOIN` flag should be used when the transaction is detached with `TMSUCCESS` flag. `TMRESUME` should be used when the transaction branch is detached with `TMSUSPEND` flag. `XA_START` may be called with either flag to join an existing transaction branch.
- If `TMNOFLAGS` is specified in `flag`, and neither `TMJOIN` nor `TMRESUME` is specified, a new transaction branch is to be started. If the transaction branch specified in `xid` already exists, `XA_START` returns an `XAER_DUPID` error code.
- Possible return values in error include: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_DUPID`, `XAER_OUTSIDE`, `XAER_NOTA`, `XAER_INVALID`, and `XAER_PROTO`.
- `XA_OK` is returned if `XA_START` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the PL/SQL application should proceed for other normal operations.
- Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. `XAER_PROTO` will be returned if `XA_START` is called with an active global transaction branch associated with the session. `XAER_OUTSIDE` will be returned if `XA_START` is called with a local transaction associated with the current session.

The DBMS\_XDB package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

**See Also:**

- [Summary of DBMS\\_XDB Subprograms](#)

## Using DBMS\_XDB

---

This section contains topics which relate to using the DBMS\_XDB package.

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)

## Overview

The DBMS\_XDB package supports the following features:

- The Resource Management functionality provides [LINK Procedure](#), [EXISTSRESOURCE Function](#), [LOCKRESOURCE Function](#), [GETLOCKTOKEN Procedure](#), [UNLOCKRESOURCE Function](#), [CREATERESOURCE Functions](#), [RENAMERESOURCE Procedure](#), [DELETERESOURCE Procedure](#), [GETRESOID Function](#), [CREATEOIDPATH Function](#), [REBUILDHIERARCHICALINDEX Procedure](#) and [CREATEFOLDER Function](#) subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use [CHECKPRIVILEGES Function](#), [GETACLDOCUMENT Function](#), [CHANGEPRIVILEGES Function](#) and [GETCHILDRESPATHS Function](#) for Oracle Resources. [ACLCHECKPRIVILEGES Function](#) provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.
- Configuration Session Management is supported by [CFG\\_REFRESH Procedure](#), [CFG\\_GET Function](#) and [CFG\\_UPDATE Procedure](#). methods.
- The XDB username is created during XDB installation. This user owns a set of default tables and packages. [GETXDB\\_TABLESPACE Function](#) and [MOVEXDB\\_TABLESPACE Procedure](#) enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction

## Deprecated Subprograms

---

---

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

---

---

The following subprograms are deprecated with Oracle Database 11g:

- [MOVEXDB\\_TABLESPACE Procedure](#)
- [REBUILDHIERARCHICALINDEX Procedure](#)

This functionality is replaced by the subprograms of the same name in the [DBMS\\_XDB\\_ADMIN](#) package:

- [MOVEXDB\\_TABLESPACE Procedure](#)
- [REBUILDHIERARCHICALINDEX Procedure](#)

## Security Model

Owned by XDB, the DBMS\_XDB package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC . Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.

## Constants

**Table 163–1** *Defined Constants for DBMS\_XDB*

<b>Constant</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid.
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid.

## Summary of DBMS\_XDB Subprograms

**Table 163–2 DBMS\_XDB Package Subprograms**

Subprogram	Description
<a href="#">ACLCHECKPRIVILEGES Function</a> on page 163-10	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
<a href="#">ADDHTTPEXPIREMAPPING Procedure</a> on page 163-11	Adds to <code>xdb\$config</code> a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.
<a href="#">ADDMIMEMAPPING Procedure</a> on page 163-12	Adds a mime mapping to the XDB configuration
<a href="#">ADDSCHEMALOCMAPPING Procedure</a> on page 163-13	Adds a schema location mapping to the XDB configuration
<a href="#">ADDSERVLET Procedure</a> on page 163-14	Adds a servlet to XDB configuration
<a href="#">ADDSERVLETMAPPING Procedure</a> on page 163-15	Adds a servlet mapping to XDB configuration
<a href="#">ADDSERVLETSECROLE Procedure</a> on page 163-16	Adds a security role REF to a specified servlet in the XDB configuration
<a href="#">ADDXMLEXTENSION Procedure</a> on page 163-17	Adds adds an XML extension to the XDB configuration
<a href="#">APPENDPATH Procedure</a> on page 163-18	Appends a childpath to a parentpath
<a href="#">APPENDPATH Procedure</a> on page 163-18	Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource
<a href="#">CFG_GET Function</a> on page 163-20	Retrieves the session's configuration information
<a href="#">CFG_REFRESH Procedure</a> on page 163-21	Refreshes the session's configuration information to the latest configuration
<a href="#">CFG_UPDATE Procedure</a> on page 163-22	Updates the configuration information
<a href="#">CHANGEOWNER Procedure</a> on page 163-23	Changes the owner of the resource/s to the specified owner.
<a href="#">CHANGEPRIVILEGES Function</a> on page 163-24	Adds a specified ACE to a specified resource's ACL
<a href="#">CHECKPRIVILEGES Function</a> on page 163-25	Checks access privileges granted to the current user on the specified resource
<a href="#">CREATEFOLDER Function</a> on page 163-26	Creates a new folder resource in the hierarchy
<a href="#">CREATEOIDPATH Function</a> on page 163-27	Creates a virtual path to the resource based on object ID
<a href="#">CREATERESOURCE Functions</a> on page 163-28	Creates a new resource
<a href="#">DELETEHTTPEXPIREMAPPING Procedure</a> on page 163-30	Deletes from <code>xdb\$config</code> all mappings of the URL pattern to an expiration date
<a href="#">DELETEMIMEMAPPING Procedure</a> on page 163-31	Deletes the mime mapping from the XDB configuration

**Table 163–2 (Cont.) DBMS\_XDB Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">DELETERESOURCE Procedure</a> on page 163-32	Deletes a resource from the hierarchy
<a href="#">DELETERESOURCEMETADATA Procedures</a> on page 163-33	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
<a href="#">DELETESCHEMALOCMAPPING Procedure</a> on page 163-34	Deletes the schema location mapping for the specified schema URL from the XDB configuration.
<a href="#">DELETESERVLET Procedure</a> on page 163-35	Deletes a servlet from XDB configuration
<a href="#">DELETESERVLETMAPPING Procedure</a> on page 163-36	Deletes the servlet mapping for the specified servlet name from the XDB configuration
<a href="#">DELETESERVLETSECROLE Procedure</a> on page 163-37	Deletes the specified role from a servlet in the XDB configuration
<a href="#">DELETXMLEXTENSION Procedure</a> on page 163-38	Deletes the specified XML extension from the XDB configuration
<a href="#">EXISTSRESOURCE Function</a> on page 163-39	Determines if a resource is the hierarchy, based on its absolute path
<a href="#">GETACLDOCUMENT Function</a> on page 163-40	Retrieves ACL document that protects resource given its path name
<a href="#">GETCHILDRESPATHS Function</a> on page 163-41	Returns a cursor over the absolute paths of all the child resources
<a href="#">GETCONTENTBLOB Function</a> on page 163-42	Retrieves the contents of a resource returned as a BLOB
<a href="#">GETCONTENTCLOB Function</a> on page 163-43	Retrieves the contents of a resource returned as a CLOB
<a href="#">GETCONTENTVARCHAR2 Function</a> on page 163-44	Retrieves the contents of a resource returned as a string
<a href="#">GETCONTENTXMLREF Function</a> on page 163-45	Retrieves the contents of a resource returned as a REF to an XMLTYPE
<a href="#">GETCONTENTXMLTYPE Function</a> on page 163-46	Retrieves the contents of a resource returned as an XMLTYPE
<a href="#">GETFTPSPORT Function</a> on page 163-47	Gets the value of the current FTP port
<a href="#">GETHTTPSPORT Function</a> on page 163-48	Gets the value of the current HTTP port
<a href="#">GETLOCKTOKEN Procedure</a> on page 163-50	Returns that resource's lock token for the current user given a path to a resource
<a href="#">GETLISTENERENDPOINT Procedure</a> on page 163-49	Retrieves the parameters of a listener end point corresponding to the XML DB HTTP server
<a href="#">GETRESOID Function</a> on page 163-52	Returns the object ID of the resource from its absolute path
<a href="#">GETXDB_TABLESPACE Function</a> on page 163-53	Returns the current tablespace of the XDB (user)
<a href="#">HASBLOBCONTENT Function</a> on page 163-54	Returns TRUE if the resource has BLOB content
<a href="#">HASCHARCONTENT Function</a> on page 163-55	Returns TRUE if the resource has character content

**Table 163–2 (Cont.) DBMS\_XDB Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">HASXMLCONTENT Function</a> on page 163-56	Returns TRUE if the resource has XML content
<a href="#">HASXMLREFERENCE Function</a> on page 163-57	Returns TRUE if the resource has REF to XML content
<a href="#">ISFOLDER Function</a> on page 163-58	Returns TRUE if the resource is a folder or container
<a href="#">LINK Procedures</a> on page 163-59	Creates a link to an existing resource
<a href="#">LOCKRESOURCE Function</a> on page 163-60	Gets a WebDAV-style lock on that resource given a path to that resource
<a href="#">MOVEXDB_TABLESPACE Procedure</a> on page 163-61	[Deprecated] Moves the XDB (user) to the specified tablespace
<a href="#">PROCESSLINKS Procedure</a> on page 163-62	Processes document links in the specified resource
<a href="#">PURGERESOURCEMETADATA Procedure</a> on page 163-63	Deletes all user metadata from a resource
<a href="#">REBUILDHIERARCHICALINDEX Procedure</a> on page 163-64	[Deprecated] Rebuilds the hierarchical index after import or export operations
<a href="#">RENAMERESOURCE Procedure</a> on page 163-65	Renames the XDB resource
<a href="#">SETACL Procedure</a> on page 163-66	Sets the ACL on a specified resource
<a href="#">SETCONTENT Procedures</a> on page 163-67	Replaces the contents of a specified resource with specified datatype
<a href="#">SETFTPSPORT Procedure</a> on page 163-69	Sets the FTP port to a new value
<a href="#">SETHHTTPSPORT Procedure</a> on page 163-70	Sets the HTTP port to a new value
<a href="#">SETLISTENERENDPOINT Procedure</a> on page 163-71	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
<a href="#">SETLISTENERLOCALACCESS Procedure</a> on page 163-72	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface or on both localhost and non-localhost interfaces
<a href="#">SPLITPATH Procedure</a> on page 163-73	Splits the path into a parentpath and childpath
<a href="#">TOUCHRESOURCE Procedure</a> on page 163-74	Changes the modification time of the resource to the current time
<a href="#">UPDATERESOURCEMETADATA Procedures</a> on page 163-75	Updates metadata for a resource
<a href="#">UNLOCKRESOURCE Function</a> on page 163-77	Unlocks the resource given a lock token and resource path

## ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the OWNER of the resource. Returns positive integer if all privileges are granted.

### Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(  
    acl_path IN VARCHAR2,  
    owner    IN VARCHAR2,  
    privs   IN xmltype)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 163–3** ACLCHECKPRIVILEGES Function Parameters

Parameter	Description
acl_path	Absolute path in the Hierarchy for ACL document
owner	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
privs	An XMLType instance of the privilege element specifying the requested set of access privileges. See description for <a href="#">CHECKPRIVILEGES Function</a> .

## ADDHTTPEXPIREMAPPING Procedure

This procedure adds to `xdb$config` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

### Syntax

```
DBMS_XDB.ADDHTTPEXPIREMAPPING (
    pattern    IN    VARCHAR2,
    expire     IN    VARCHAR2);
```

### Parameters

**Table 163–4** ADDHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
pattern	URL pattern (only * accepted as wildcards)
expire	Expiration directive, follows the ExpireDefault in Apache's mod_expires: base [plus] (num type)* -- base: now   modification -- type: year years month months week weeks day days minute minutess second seconds

### Examples

```
DBMS_XDB.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB.ADDHTTPEXPIREMAPPING ('/public/test2/*', 'modification plus 1 day 30 seconds');
```

## ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mime-type</mime-type>
</mime-mapping>
```

### Syntax

```
DBMS_XDB.ADDMIMEMAPPING (
    extension    IN    VARCHAR2,
    mime-type    IN    VARCHAR2);
```

### Parameters

**Table 163–5** *ADDMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is being added
mime-type	Mime type

## ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

### Syntax

```
DBMS_XDB.ADDSCHEMALOCMAPPING (
  namespace    IN   VARCHAR2,
  element      IN   VARCHAR2,
  schemaURL    IN   VARCHAR2);
```

### Parameters

**Table 163–6** *ADDSCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
namespace	Namespace
element	Element
schemaURL	Schema URL

## ADDSERVLET Procedure

This procedure adds the following servlet to XDB configuration:

```
<servlet>
  <servlet-name>name</servlet-name>
  <servlet-language>language</servlet-language>
  <display-name>dispname</display-name>
  <description>descript</description>
  <servlet-class>class</servlet-class>
  <servlet-schema>schema</servlet-schema>
</servlet>
```

### Syntax

```
DBMS_XDB.ADDSERVLET (
  name          IN   VARCHAR2,
  language      IN   VARCHAR2,
  dispname      IN   VARCHAR2,
  icon          IN   VARCHAR2 := NULL,
  descript      IN   VARCHAR2 := NULL,
  class         IN   VARCHAR2 := NULL,
  jspfile       IN   VARCHAR2 := NULL,
  plsqli        IN   VARCHAR2 := NULL);
```

### Parameters

**Table 163–7** *ADDSERVLET Procedure Parameters*

Parameter	Description
name	Servlet name
language	Must be one of "C", "Java", "PL/SQL"
dispname	Display name
icon	Icon
descript	Description
class	The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
jspfile	The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
plsqli	The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
schema	Schema

## ADDSERVLETMAPPING Procedure

This procedure adds the following servlet mapping to XDB configuration:

```
<servlet-mapping>
  <servlet-pattern>pattern</servlet-pattern>
  <servlet-name>name</servlet-name>
</servlet-mapping>
```

### Syntax

```
DBMS_XDB.ADDSERVLETMAPPING (
  pattern  IN  VARCHAR2,
  name     IN  VARCHAR2);
```

### Parameters

**Table 163–8** *ADDSERVLETMAPPING Procedure Parameters*

Parameter	Description
pattern	Servlet pattern
name	Servlet name

## ADDSERVLETSECROLE Procedure

This procedure adds the following security role REF to a specified servlet in XDB configuration:

```
<security-role-ref>
  <role-name>rolename</role-name>
  <role-link>rolelink</role-link>
  <description>descript</description>
</security-role-ref>
```

### Syntax

```
DBMS_XDB.ADDSERVLETSECROLE (
  servname    IN   VARCHAR2,
  rolename    IN   VARCHAR2,
  rolelink    IN   VARCHAR2,
  descript    IN   VARCHAR2 := NULL);
```

### Parameters

**Table 163–9** *ADDSERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Sservlet name
rolename	Role name
rolelink	Role link
descript	Description

## ADDXML\_EXTENSION Procedure

This procedure adds the following XML extension to the XDB configuration under `<xml-extensions>`:

```
<extension>extension</extension>
```

### Syntax

```
DBMS_XDB.ADDXML_EXTENSION(  
    extension IN VARCHAR2);
```

### Parameters

**Table 163–10** ADDXML\_EXTENSION Procedure Parameters

Parameter	Description
extension	XML extension to be added

## APPENDPATH Procedure

This procedure appends a childpath to a parentpath.

### Syntax

```
DBMS_XDB.APPENDPATH (  
    abspath      OUT  VARCHAR2,  
    parentpath  IN   VARCHAR2,  
    childpath   IN   VARCHAR2);
```

### Parameters

**Table 163–11** APPENDPATH Procedure

Parameter	Description
abspath	Absolute path of the resource
parentpath	Parentpath
childpath	Childpath

## APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

### Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
  abspath IN VARCHAR2,
  metadata IN XMLTYPE);
```

```
DBMS_XDB.APPENDRESOURCEMETADATA (
  abspath IN VARCHAR2,
  metadata IN REF SYS.XMLTYPE);
```

### Parameters

**Table 163–12** APPENDRESOURCEMETADATA Procedure

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

### Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

## CFG\_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

### Syntax

```
DBMS_XDB.CFG_GET  
RETURN SYS.XMLType;
```

## CFG\_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

### Syntax

```
DBMS_XDB.CFG_REFRESH;
```

## CFG\_UPDATE Procedure

This procedure updates the configuration information and commits the change.

### Syntax

```
DBMS_XDB.CFG_UPDATE(  
    xdbconfig IN SYS.XMLTYPE);
```

### Parameters

**Table 163–13** *CFG\_UPDATE Procedure Parameters*

Parameter	Description
<code>xdbconfig</code>	The new configuration data

## CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

### Syntax

```
DBMS_XDB.CHANGEOWNER(  
    abspath    IN    VARCHAR2,  
    owner      IN    VARCHAR2,  
    recurse    IN    BOOLEAN := FALSE);
```

### Parameters

**Table 163–14** *CHANGEOWNER Procedure Parameters*

Parameter	Description
abspath	Absolute path of the resource
owner	New owner for the resource
recurse	If TRUE, recursively change owner of all resources in the folder tree

## CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

### Syntax

```
DBMS_XDB.CHANGEPRIVILEGES (  
    res_path IN VARCHAR2,  
    ace      IN XMLType)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 163–15** *CHANGEPRIVILEGES Function Parameters*

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

### Return Values

A positive integer if the ACL was successfully modified.

### Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.

## CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

### Syntax

```
DBMS_XDB.CHECKPRIVILEGES (  
    res_path  IN VARCHAR2,  
    privs     IN xmltype)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 163–16** CHECKPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
privs	An XMLType instance of the privilege element specifying the requested set of access privileges

### Return Values

A positive integer if all requested privileges granted.

## CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

### Syntax

```
DBMS_XDB.CREATEFOLDER(  
    path IN VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 163–17 CREATEFOLDER Function Parameters**

Parameter	Description
path	Path name for the new folder

### Return Values

TRUE if operation successful; FALSE, otherwise.

### Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

## CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

### Syntax

```
DBMS_XDB.CREATEOIDPATH(  
    oid IN RAW)  
RETURN VARCHAR2;
```

### Parameters

**Table 163–18** *CREATEOIDPATH Function Parameters*

Parameter	Description
oid	Object ID of the resource

## CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

### Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB.CREATERESOURCE (
    abspath          IN  VARCHAR2,
    data             IN  VARCHAR2,
    createfolders    IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB.CREATERESOURCE (
    abspath          IN  VARCHAR2,
    data             IN  SYS.XMLTYPE,
    createfolders    IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE (
    abspath          IN  VARCHAR2,
    datarow          IN  REF SYS.XMLTYPE,
    createfolders    IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB.CREATERESOURCE (
    abspath          IN  VARCHAR2,
    data             IN  BLOB,
    csid             IN  NUMBER :=0,
    createfolders    IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB.CREATERESOURCE (
    abspath          IN  VARCHAR2,
    data             IN  BFILE,
    csid             IN  NUMBER :=0,
    createfolders    IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB.CREATERESOURCE (
    abspath          IN  VARCHAR2,
    data             IN  CLOB,
    createfolders    IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```

DBMS_XDB.CREATERESOURCE (
  abspath      IN  VARCHAR2,
  data         IN  VARCHAR2,
  schemaurl    IN  VARCHAR2 := NULL,
  elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;

```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```

DBMS_XDB.CREATERESOURCE (
  abspath      IN  VARCHAR2,
  data         IN  SYS.XMLTYPE,
  schemaurl    IN  VARCHAR2 := NULL,
  elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;

```

## Parameters

**Table 163–19** CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.
data	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
datarow	REF to an XMLType row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error.  If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> <li>■ From the abspath extension, determine the resource's MIME type.</li> <li>■ If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at <a href="http://www.w3.org/TR/2000/REC-xml-20001006">http://www.w3.org/TR/2000/REC-xml-20001006</a>;</li> <li>■ Otherwise, it is defaulted to the database character set.</li> </ul>
createfolders	If TRUE, create the parent folders if they do not exist
schemaurl	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

## Return Values

TRUE if operation successful; FALSE, otherwise.

## DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from `xdb$config` all mappings of the URL pattern to an expiration date.

### Syntax

```
DBMS_XDB.DELETEHTTPEXPIREMAPPING(  
    pattern IN VARCHAR2);
```

### Parameters

**Table 163–20** *DELETEHTTPEXPIREMAPPING Procedure Parameters*

Parameter	Description
<code>pattern</code>	URL pattern (only * accepted as wildcards)

## DELETMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

### Syntax

```
DBMS_XDB.DELETMIMEMAPPING(  
    extension IN VARCHAR2);
```

### Parameters

**Table 163–21** *DELETMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is to be deleted

## DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

### Syntax

```
DBMS_XDB.DELETERESOURCE(  
  path          IN          VARCHAR2,  
  delete_option IN          PLS_INTEGER);
```

### Parameters

**Table 163–22 DELETERESOURCE Procedure Parameters**

Parameter	Description
path	Path name of the resource to delete
delete_option	The option that controls how a resource is deleted; defined in <a href="#">Table 163–1</a> on page 163-6: <ul style="list-style-type: none"><li>▪ DELETE_RESOURCE</li><li>▪ DELETE_RECURSIVE</li><li>▪ DELETE_FORCE</li><li>▪ DELETE_RECURSIVE_FORCE</li></ul>

## DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

### Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
    abspath          IN VARCHAR2,
    metadata         IN REF SYS.XMLTYPE,
    delete_option   IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
    abspath          IN VARCHAR2,
    metadatans       IN VARCHAR2,
    metadataname     IN VARCHAR2,
    delete_option   IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

### Parameters

**Table 163–23 DELETERESOURCEMETADATA Procedure Parameters**

Parameter	Description
abspath	Absolute path of the resource
metadata	REF to the piece of metadata (schema based) to be deleted
metadatans	Namespace of the metadata fragment to be removed
metadataname	Local name of the metadata fragment to be removed
delete_option	Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> <li>▪ DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</li> <li>▪ DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</li> </ul>

## DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

### Syntax

```
DBMS_XDB.DELETESCHEMALOCMAPPING(  
    schemaURL IN VARCHAR2);
```

### Parameters

**Table 163–24 DELETESCHEMALOCMAPPING Procedure Parameters**

Parameter	Description
schemaURL	Schema URL

## DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

### Syntax

```
DBMS_XDB.DELETESERVLET(  
    name          IN  VARCHAR2);
```

### Parameters

**Table 163–25** *DELETESERVLET Procedure Parameters*

Parameter	Description
name	Servlet name

## DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

### Syntax

```
DBMS_XDB.DELETESERVLETMAPPING(  
    name      IN  VARCHAR2);
```

### Parameters

**Table 163–26** *DELETESERVLETMAPPING Procedure Parameters*

Parameter	Description
name	Servlet name

## DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

### Syntax

```
DBMS_XDB.DELETESERVLETSECROLE(  
    servname    IN    VARCHAR2,  
    rolename    IN    VARCHAR2);
```

### Parameters

**Table 163–27** *DELETESERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

## DELETXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

### Syntax

```
DBMS_XMLEXTENSION.DELETEXMLEXTENSION(  
    extension IN VARCHAR2);
```

### Parameters

**Table 163–28 DELETXMLEXTENSION Procedure Parameters**

Parameter	Description
extension	XML extension to be deleted

## EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

### Syntax

```
DBMS_XDB.EXISTSRESOURCE(  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 163–29** *EXISTSRESOURCE Function Parameters*

Parameter	Description
abspath	Path name of the resource whose ACL document is required

### Return Values

TRUE if the resource is found.

## GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

### Syntax

```
DBMS_XDB.GETACLDOCUMENT(  
  abspath IN VARCHAR2)  
RETURN sys.xmltype;
```

### Parameters

**Table 163–30** *GETACLDOCUMENT Function Parameters*

Parameter	Description
abspath	Path name of the resource whose ACL document is required

### Return Values

The XMLType for ACL document.

## GETCHILDRESPATHS Function

This function returns a cursor over the absolute paths of all the child resources.

### Syntax

```
DBMS_XDB.GETCHILDRESPATHS (  
    abspath    IN    VARCHAR2);  
RETURN SYS_REFCURSOR;
```

### Parameters

**Table 163–31** *GETCHILDRESPATHS Function Parameters*

Parameter	Description
abspath	Absolute path of the resource

### Return Values

A cursor over the absolute paths of all the child resources.

## GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

### Syntax

```
DBMS_XDB.GETCONTENTBLOB(  
    abspath    IN    VARCHAR2,  
    csid       OUT   PLS_INTEGER,  
    locksrc    IN    BOOLEAN := FALSE)  
RETURN BLOB;
```

### Parameters

**Table 163–32** *GETCONTENTBLOB Function Parameters*

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

### Return Values

The contents of the resource as a BLOB.

## GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

### Syntax

```
DBMS_XDB.GETCONTENTCLOB(  
    abspath    IN    VARCHAR2,  
    RETURN CLOB;
```

### Parameters

**Table 163–33** *GETCONTENTCLOB Function Parameters*

Parameter	Description
abspath	Absolute path of the resource

### Return Values

The contents of the resource as a CLOB.

## GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

### Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2 (  
    abspath    IN    VARCHAR2,  
    RETURN BLOB;
```

### Parameters

**Table 163–34** *GETCONTENTVARCHAR2 Function Parameters*

Parameter	Description
abspath	Absolute path of the resource

### Return Values

The contents of the resource as a string.

## GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a REF to an XMLTYPE.

### Syntax

```
DBMS_XDB.GETCONTENTXMLREF (  
    abspath    IN    VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

### Parameters

**Table 163–35** *GETCONTENTXMLREF Function Parameters*

Parameter	Description
abspath	Absolute path of the resource

### Return Values

The contents of the resource as a REF to an XMLTYPE.

## GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an `XMLTYPE`.

### Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(  
    abspath IN VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

### Parameters

**Table 163–36** *GETCONTENTXMLTYPE Function Parameters*

Parameter	Description
<code>abspath</code>	Absolute path of the resource

### Return Values

The contents of the resource as an `XMLTYPE`.

## GETFTPPORT Function

This procedure gets the value of the current FTP port.

### Syntax

```
DBMS_XDB.GETFTPPORT  
RETURN NUMBER;
```

## GETHTTPPORT Function

This procedure gets the value of the current HTTP port.

### Syntax

```
DBMS_XDB.GETHTTPPORT  
RETURN NUMBER;
```

## GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

### Syntax

```
DBMS_XDB.GETLISTENERENDPOINT (
  endpoint IN NUMBER,
  host     OUT VARCHAR2,
  port    OUT NUMBER,
  protocol OUT NUMBER);
```

### Parameters

**Table 163–37** *GETLISTENERENDPOINT Procedure Parameters*

Parameter	Description
endpoint	End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point listens
port	Port on which the listener end point listens
protocol	Transport protocol accepted by the listener end point

## GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

### Syntax

```
DBMS_XDB.GETLOCKTOKEN(  
  path          IN      VARCHAR2,  
  locktoken     OUT     VARCHAR2);
```

### Parameters

**Table 163–38** *GETLOCKTOKEN Procedure Parameters*

Parameter	Description
path	Path name to the resource
locktoken	Logged-in user's lock token for the resource

### Usage Notes

The user must have READPROPERTIES privilege on the resource.

## GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

### Syntax

```
DBMS_XDB.GETPRIVILEGES (  
    res_path    IN    VARCHAR2)  
RETURN sys.xmltype;
```

### Parameters

**Table 163–39** *GETPRIVILEGES Function Parameters*

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

### Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

## GETRESOID Function

Returns the object ID of the resource from its absolute path.

### Syntax

```
DBMS_XDB.GETRESOID(  
    abspath IN VARCHAR2)  
RETURN RAW;
```

### Parameters

**Table 163–40** *GETRESOID Function Parameters*

Parameter	Description
abspath_path	Absolute path of the resource

### Return Values

NULL if the resource is not present.

## GETXDB\_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

### Syntax

```
DBMS_XDB.GETXDB_TABLESPACE  
RETURN VARCHAR2;
```

## HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

### Syntax

```
DBMS_XDB.DBMS_XDB.HASBLOBCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

### Parameters

**Table 163–41 HASBLOBCONTENT Function Parameters**

Parameter	Description
abspath_path	Absolute path of the resource

### Return Values

TRUE if the resource has BOB content.

## HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

### Syntax

```
DBMS_XDB.DBMS_XDB.HASCHARCONTENT  
  abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 163–42 HASCHARCONTENT Function Parameters**

Parameter	Description
abspath_path	Absolute path of the resource

### Return Values

TRUE if the resource has character content.

## HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

### Syntax

```
DBMS_XDB.DBMS_XDB.HASXMLCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

### Parameters

**Table 163–43 HASXMLCONTENT Function Parameters**

Parameter	Description
abspath_path	Absolute path of the resource

### Return Values

TRUE if the resource has XML content.

## HASXMLREFERENCE Function

This function returns TRUE if the resource has a REF to XML content.

### Syntax

```
DBMS_XDB.DBMS_XDB.HASXMLREFERENCE  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

### Parameters

**Table 163–44 HASXMLREFERENCE Function Parameters**

Parameter	Description
abspath_path	Absolute path of the resource

### Return Values

TRUE resource has a REF to XML content.

## ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

### Syntax

```
DBMS_XDB.DBMS_XDB.ISFOLDER  
    (abspath IN VARCHAR2)  
    RETURN BOOLEAN;
```

### Parameters

**Table 163–45** DBMS\_XDB.ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

### Return Values

TRUE if the resource is a folder or container.

## LINK Procedures

This procedure creates from a specified folder to a specified resource.

### Syntax

```
DBMS_XDB.LINK(
  srcpath      IN  VARCHAR2,
  linkfolder   IN  VARCHAR2,
  linkname     IN  VARCHAR2);

DBMS_XDB.LINK(
  srcpath      IN  VARCHAR2,
  linkfolder   IN  VARCHAR2,
  linkname     IN  VARCHAR2,
  linktype     IN  PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

### Parameters

**Table 163–46 LINK Procedure Parameters**

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: <ul style="list-style-type: none"> <li>■ DBMS_XDB.LINK_TYPE_HARD (default)</li> <li>■ DBMS_XDB.LINK_TYPE_WEAK</li> <li>■ DBMS_XDB.LINK_TYPE_SYMBOLIC</li> </ul>

## LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

### Syntax

```
DBMS_XDB.LOCKRESOURCE(  
    path      IN  VARCHAR2,  
    depthzero IN  BOOLEAN,  
    shared    IN  boolean)  
RETURN BOOLEAN;
```

### Parameters

**Table 163–47** LOCKRESOURCE Function Parameters

Parameter	Description
path	Path name of the resource to lock.
depthzero	Currently not supported
shared	Passing TRUE obtains a shared write lock

### Return Values

TRUE if successful.

### Usage Notes

The user must have UPDATE privileges on the resource.

## MOVEXDB\_TABLESPACE Procedure

---

---

**Note:** This procedure is deprecated in Release 11g. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_ADMIN](#) package - the [MOVEXDB\\_TABLESPACE Procedure](#).

---

---

This procedure moves the XDB (user) to the specified tablespace.

### Syntax

```
DBMS_XDB.MOVEXDB_TABLESPACE(
    new_tablespace IN VARCHAR2);
```

### Parameters

**Table 163–48** *MOVEXDB\_TABLESPACE Procedure Parameters*

Parameter	Description
<code>new_tablespace</code>	Name of the tablespace to where the XDB is moved

### Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If `MOVEXDB_TABLESPACE` fails, the user should restart the database before issuing any further command. Failure to do so will produce indeterminable results.

## PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

### Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(  
  abspath IN VARCHAR2,  
  recurse IN BOOLEAN := FALSE);
```

### Parameters

**Table 163–49** *PROCESSLINKS Procedure Parameters*

Parameter	Description
abspath	Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag.
recurse	Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only.

## PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

### Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA (  
  
  abspath IN VARCHAR2);
```

### Parameters

**Table 163–50** *PURGERESOURCEMETADATA Procedure Parameters*

Parameter	Description
abspath	Absolute path of the resource

## REBUILDHIERARCHICALINDEX Procedure

---

---

**Note:** This procedure is deprecated in Release 11g. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_ADMIN](#) package - the [REBUILDHIERARCHICALINDEX Procedure](#).

---

---

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

### Syntax

```
DBMS_XDB.REBUILDHIERARCHICALINDEX;
```

## RENAMERESOURCE Procedure

This procedure renames the XDB resource.

### Syntax

```
DBMS_XDB.RENAMERESOURCE(  
    srcpath    IN  VARCHAR2,  
    destfolder IN  CARCHAR2,  
    newname    IN  VARCHAR2);
```

### Parameters

**Table 163–51** *RENAMERESOURCE Procedure Parameters*

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

## SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

### Syntax

```
DBMS_XDB.SETACL(  
    res_path IN VARCHAR2,  
    acl_path IN VARCHAR2);
```

### Parameters

**Table 163–52 SETACL Procedure Parameters**

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

### Usage Notes

The user must have `<write-acl>` privileges on the resource.

## SETCONTENT Procedures

This procedure replaces the contents of a resource with a specified datatype.

### Syntax

Replaces the contents of the a resource with a specified CLOB:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   CLOB);
```

Replaces the contents of a resource with a specified BLOB:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   BLOB,
    csid       IN   PLS_INTEGER);
```

Replaces the contents of a resource with a specified XMLTYPE:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   SYS.XMLTYPE);
```

Replaces the contents of a resource with a specified string:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   VARCHAR2);
```

Replaces the contents of a resource with a specified REF to an XMLTYPE

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   CLOB,
    sticky     IN   BOOLEAN := TRUE);
```

Replaces the contents of a resource with a specified BFILE:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   CLOB,
    csid       IN   PLS_INTEGER);
```

### Parameters

**Table 163–53** *SETCONTENT Procedure Parameters*

Parameter	Description
abspath	Absolute path in the Hierarchy for resource
data	Input varying with overload: <ul style="list-style-type: none"> <li>■ CLOB data</li> <li>■ BLOB data</li> <li>■ XMLTYPE data</li> <li>■ string data</li> <li>■ REF to XMLTYPE data</li> <li>■ a BFILE</li> </ul>

**Table 163–53 (Cont.) SETCONTENT Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>csid</code>	Character set id of the BLOB or BFILE
<code>sticky</code>	Whether or not the REF is sticky

## SETFTPPOINT Procedure

This procedure sets the FTP port to a new value.

### Syntax

```
DBMS_XDB.SETFTPPOINT(  
    new_port IN NUMBER);
```

### Parameters

**Table 163–54** *SETFTPPOINT Procedure Parameters*

Parameter	Description
new_port	Value to which the FTP port is set

## SETHHTPPORT Procedure

This procedure sets the HTTP port to a new value.

### Syntax

```
DBMS_XDB.SETHHTPPORT(
    new_port IN NUMBER);
```

### Parameters

**Table 163–55** *SETHHTPPORT Procedure Parameters*

Parameter	Description
new_port	Value to which the HTTP port is set

## SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

### Syntax

```
DBMS_XDB.SETLISTENERENDPOINT (
  endpoint IN NUMBER,
  host      IN VARCHAR2,
  port     IN NUMBER,
  protocol  IN NUMBER);
```

### Parameters

**Table 163–56** *SETLISTENERENDPOINT Procedure Parameters*

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

## SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

### Syntax

```
DBMS_XDB.SETLISTENERLOCALACCESS (  
    l_access    BOOLEAN);
```

### Parameters

**Table 163–57** *SETLISTENERLOCALACCESS Procedure Parameters*

Parameter	Description
<code>l_access.</code>	<code>TRUE</code> or <code>FALSE</code> .

## SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

### Syntax

```
DBMS_XDB.SPLITPATH(  
    abspath      IN  VARCHAR2,  
    parentpath  OUT VARCHAR2,  
    childpath   OUT VARCHAR2);
```

### Parameters

**Table 163–58** *SPLITPATH Procedure Parameters*

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

## TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

### Syntax

```
DBMS_XDB.DBMS_XDB.TOUCHRESOURCE  
  (abspath IN VARCHAR2);
```

### Parameters

**Table 163–59** *DBMS\_XDB.TOUCHRESOURCE Procedure Parameters*

Parameter	Description
abspath_path	Absolute path of the resource

## UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource. The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

### Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
  abspath  IN VARCHAR2,
  oldmetadata  IN REF SYS.XMLTYPE,
  newmetadata  IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
  abspath      IN VARCHAR2,
  oldmetadata  IN REF SYS.XMLTYPE,
  newmetadata  IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
  abspath      IN VARCHAR2,
  oldns        IN VARCHAR2,
  oldname      IN VARCHAR,
  newmetadata  IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
  abspath      IN VARCHAR2,
  oldns        IN VARCHAR2,
  oldname      IN VARCHAR,
  newmetadata  IN REF SYS.XMLTYPE);
```

### Parameters

**Table 163–60** UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
oldmetadata	REF to the old of metadata
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

**Usage Notes**

In the case of `REF`, it stores the `REF` in the resource and the metadata is stored in a separate table. Uniqueness of `REF`s is enforced. In the case where the `XMLTYPE` is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

## UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

### Syntax

```
DBMS_XDB.UNLOCKRESOURCE(  
    path      IN VARCHAR2,  
    deltoken IN VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 163–61 UNLOCKRESOURCE Function Parameters**

Parameter	Description
path	Path name to the resource
deltoken	Lock token to be removed

### Return Values

TRUE if operation successful.

### Usage Notes

The user must have UPDATE privileges on the resource.

---

---

## DBMS\_XDB\_ADMIN

The DBMS\_XDB\_ADMIN package provides an interface to manage the Oracle XML DB repository.

**See Also:** *Oracle XML DB Developer's Guide* for information about the Oracle XML DB Repository

This chapter contains the following topics:

- [Using DBMS\\_XDB\\_ADMIN](#)
  - Deprecated Subprograms
  - Security Model
- [Summary of DBMS\\_XDB\\_ADMIN Subprograms](#)

---

## Using DBMS\_XDB\_ADMIN

- [Deprecated Subprograms](#)
- [Security Model](#)

## Deprecated Subprograms

---

---

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

---

---

The following subprograms are deprecated with Oracle Database 11g:

- [CREATEREPOSITORYXMLINDEX Procedure](#)
- [DROPREPOSITORYXMLINDEX Procedure](#)
- [XMLINDEXADDPATH Procedure](#)
- [XMLINDEXREMOVEPATH Procedure](#)

## Security Model

Owned by XDB, the DBMS\_XDB\_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.

---

## Summary of DBMS\_XDB\_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

**Table 164–1 DBMS\_XDB\_ADM Package Subprograms**

Subprogram	Description
<a href="#">CREATEREPOSITORYXMLINDEX Procedure</a> on page 164-6	[Deprecated] Creates an XMLIndex on the XML DB repository
<a href="#">DROPREPOSITORYXMLINDEX Procedure</a> on page 164-7	[Deprecated] Drops the XMLIndex on the XML DB repository
<a href="#">MOVEXDB_TABLESPACE Procedure</a> on page 164-8	Moves the XDB (user) to the specified tablespace
<a href="#">REBUILDHIERARCHICALINDEX Procedure</a> on page 164-9	Rebuilds the hierarchical index after import or export operations
<a href="#">XMLINDEXADDPATH Procedure</a> on page 164-10	[Deprecated] Takes a path in XML DB repository as an input and index all the resources under this given path
<a href="#">XMLINDEXREMOVEPATH Procedure</a> on page 164-11	[Deprecated] Removes the index for the given path

## CREATEREPOSITORYXMLINDEX Procedure

---

---

**Note:** This procedure is deprecated in Release 11g.

---

---

This procedure creates an XMLIndex on the XML DB repository.

### Syntax

```
DBMS_XDB_ADMIN.CREATEREPOSITORYXMLINDEX;
```

## DROPREPOSITORYXMLINDEX Procedure

---

---

**Note:** This procedure is deprecated in Release 11g.

---

---

This procedure drops the XMLIndex on the XML DB repository.

### Syntax

```
DBMS_XDB_ADMIN.DROPREPOSITORYXMLINDEX;
```

## MOVEXDB\_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

### Syntax

```
DBMS_XDB.MOVEXDB_TABLESPACE(  
    new_tablespace IN VARCHAR2);
```

### Parameters

**Table 164–2** *MOVEXDB\_TABLESPACE Procedure Parameters*

Parameter	Description
<code>new_tablespace</code>	Name of the tablespace to where the XDB is moved

### Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If `MOVEXDB_TABLESPACE` fails, the user should restart the database before issuing any further command. Failure to do so will result into unexpected behavior from the database.

## REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

### Syntax

```
DBMS_XDB.REBUILDHIERARCHICALINDEX;
```

## XMLINDEXADDPATH Procedure

---

---

**Note:** This procedure is deprecated in Release 11g.

---

---

This procedure adds to the repository xmlindex the resource identified by path (when `recurse` is `FALSE`) or adds to the repository xmlindex the sub-tree of resources rooted at path (when `recurse` is `TRUE`). The default value for `recurse` is `TRUE`.

### Syntax

```
DBMS_XDB_ADMIN.XMLINDEXADDPATH(  
    path          IN VARCHAR2,  
    recurse       IN BOOLEAN);
```

### Parameters

**Table 164–3** XMLINDEXADDPATH Procedure Parameters

Parameter	Description
path	Path to a resource
recurse	TRUE or FALSE

## XMLINDEXREMOVEPATH Procedure

---

---

**Note:** This procedure is deprecated in Release 11g.

---

---

This procedure removes from the repository `xmlindex` the resource identified by `path` (when `recurse` is `FALSE`) or removes from the repository `xmlindex` the sub-tree of resources rooted at `path` (when `recurse` is `TRUE`). The default value for `recurse` is `TRUE`.

### Syntax

```
DBMS_XDB_ADMIN.XMLINDEXREMOVEPATH (
  path          IN VARCHAR2,
  isrecursive   IN BOOLEAN);
```

### Parameters

**Table 164–4 XMLINDEXREMOVEPATH Procedure Parameters**

Parameter	Description
<code>path</code>	Path to a resource
<code>recurse</code>	TRUE or FALSE

---

---

## DBMS\_XDB\_VERSION

Oracle XML DB versioning interfaces are found in the `DBMS_XDB_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- [Using DBMS\\_XDB\\_VERSION](#)
  - Security Model
- [Summary of DBMS\\_XDB\\_VERSION Subprograms](#)

**See Also:** *Oracle XML DB Developer's Guide*

---

## Using DBMS\_XDB\_VERSION

- [Security Model](#)

## Security Model

Owned by XDB, the DBMS\_XDB\_VERSION package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

---

## Summary of DBMS\_XDB\_VERSION Subprograms

**Table 165–1 DBMS\_XDB\_VERSION Package Subprograms**

Method	Description
<a href="#">CHECKIN Function</a> on page 165-5	Checks in a checked-out VCR and returns the resource id of the newly-created version
<a href="#">CHECKOUT Procedure</a> on page 165-6	Checks out a VCR before updating or deleting it
<a href="#">GETCONTENTSBOBBYRES ID Function</a> on page 165-7	Obtain contents as a BLOB
<a href="#">GETCONTENTSCLOB BYRES ID Function</a> on page 165-8	Obtain contents as a CLOB
<a href="#">GETCONTENTSXMLBYRES ID Function</a> on page 165-9	Obtain contents as an XMLType
<a href="#">GETPREDECESSORS Function</a> on page 165-10	Retrieves the list of predecessors by path name
<a href="#">GETPREDSBYRESID Function</a> on page 165-11	Retrieves the list of predecessors by resource id
<a href="#">GETRESOURCEBYRESID Function</a> on page 165-12	Obtains the resource as an XMLType, given the resource object ID
<a href="#">GETSUCCESSORS Function</a> on page 165-13	Retrieves the list of successors by path name
<a href="#">GETSUCCSBYRESID Function</a> on page 165-14	Retrieves the list of successors by resource id
<a href="#">MAKEVERSIONED Function</a> on page 165-15	Turns a regular resource whose path name is given into a version-controlled resource
<a href="#">UNCHECKOUT Function</a> on page 165-16	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

## CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

### Syntax

```
DBMS_XDB_VERSION.CHECKIN(  
    pathname VARCHAR2)  
RETURN DBMS_XDB.resid_type;
```

### Parameters

**Table 165–2** CHECKIN Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

### Usage Notes

This is not an auto-commit SQL operation. [CHECKIN Function](#) doesn't have to take the same path name that was passed to [CHECKOUT Procedure](#) operation. However, the [CHECKIN Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [CHECKIN Function](#) because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to [CHECKIN Function](#) the resource.

## CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

### Syntax

```
DBMS_XDB_VERSION.Checkout (  
    pathname    VARCHAR2);
```

### Parameters

**Table 165–3** CHECKOUT Procedure Parameters

Parameter	Description
pathname	The path name of the VCR to be checked out.

### Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot [CHECKOUT Procedure](#) the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the [CHECKOUT Procedure](#) operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

## GETCONTENTSBLOBBYRESID Function

This function obtain contents as a BLOB.

### Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLOBBYRESID(  
    resid      DBMS_XDB.resid_type)  
RETURN BLOB;
```

### Parameters

**Table 165–4** *GETCONTENTSBLOBBYRESID Function Parameters*

Parameter	Description
resid	The resource id.

## GETCONTENTSCLobbyRESID Function

This function obtains contents as a CLOB.

### Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLobbyRESID(  
    resid      DBMS_XDB.resid_type)  
RETURN CLOB;
```

### Parameters

**Table 165–5** *GETCONTENTSCLobbyRESID Function Parameters*

Parameter	Description
resid	The resource id.

## GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

### Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(  
    resid      DBMS_XDB.resid_type)  
RETURN XMLType;
```

### Parameters

**Table 165–6** *GETCONTENTSXMLBYRESID Function Parameters*

Parameter	Description
resid	The resource id.

### Return Values

If the contents are not valid XML, returns NULL.

## GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

### Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS (  
    pathname          VARCHAR2)  
RETURN resid_list_type;
```

### Parameters

**Table 165–7** *GETPREDECESSORS Function Parameters*

Parameter	Description
pathname	The path name of the resource.

### Return Values

An exception is raised if `pathname` is illegal.

## GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

### Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(  
    resid      resid_type)  
RETURN resid_list_type;
```

### Parameters

**Table 165–8** *GETPREDSBYRESID Function Parameters*

Parameter	Description
resid	The resource id.

### Usage Notes

Getting predecessors by RESID is more efficient than by pathname.

### Exceptions

An exception is raised if the RESID is illegal.

## GETRESOURCEBYRESID Function

This function obtains the resource as an `XMLType`, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

### Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(  
    resid      resid_type)  
RETURN XMLType;
```

### Parameters

**Table 165–9** *GETRESOURCEBYRESID Function Parameters*

Parameter	Description
resid	The resource id.

## GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

### Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS(  
    pathname VARCHAR2)  
RETURN resid_list_type;
```

### Parameters

**Table 165–10** *GETSUCCESSORS Function Parameters*

Parameter	Description
pathname	The path name of the resource.

### Usage Notes

Getting successors by RESID is more efficient than by pathname.

### Exceptions

An exception is raised if the pathname is illegal.

## GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

### Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(  
    resid    resid_type)  
RETURN resid_list_type;
```

### Parameters

**Table 165–11** *GETSUCCSBYRESID Function Parameters*

Parameter	Description
resid	The resource id.

### Usage Notes

Getting successors by RESID is more efficient than by pathname.

### Exceptions

An exception is raised if the pathname is illegal.

## MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

### Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
    pathname  VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

### Parameters

**Table 165–12** MAKEVERSIONED Function Parameters

Parameter	Description
pathname	The path name of the resource to be put under version control.

### Return Values

This function returns the resource ID of the first version, or root, of the VCR.

### Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

## UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

### Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(  
    pathname    VARCHAR2)  
RETURN DBMS_XDB.resid_type;
```

### Parameters

**Table 165–13** *UNCHECKOUT Function Parameters*

Parameter	Description
pathname	The path name of the checked-out resource.

### Usage Notes

This is not an auto-commit SQL operation. The [UNCHECKOUT Function](#) does not have to take the same path name that was passed to the operation by the [CHECKOUT Procedure](#). However, the [UNCHECKOUT Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [UNCHECKOUT Function](#), because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to [UNCHECKOUT Function](#) the resource.

### Exceptions

An exception is raised if the path name doesn't exist.

---

---

## DBMS\_XDBRESOURCE

The DBMS\_XDBRESOURCE package provides the interface to operate on the resource's metadata and contents.

**See Also:** Oracle XML DB Developer's Guide for examples of "Using DBMS\_XDBRESOURCE"

This chapter contains the following topics:

- [Using DBMS\\_XDBRESOURCE](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_XDBRESOURCE Subprograms](#)

## Using DBMS\_XDBRESOURCE

- [Overview](#)
- [Security Model](#)

## Overview

The `DBMS_XDBRESOURCE` package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in `DBMS_XMLDOM` package, an `XDBResource` instance could be converted to a `DOMDocument` type by using `DBMS_XDBRESOURCE.MAKEDOCUMENT` routine.

## Security Model

Owned by XDB, the DBMS\_XDBRESOURCE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

---

## Summary of DBMS\_XDBRESOURCE Subprograms

**Table 166–1 DBMS\_XDBRESOURCE Package Subprograms**

Subprogram	Description
<a href="#">FREERESOURCE Procedure</a> on page 166-8	Frees any memory associated with an XDBResource
<a href="#">GETACL Function</a> on page 166-9	Given an XDBResource, returns its ACL as string
<a href="#">GETACLDOKFROMRES Function</a> on page 166-10	Returns the ACL Document for the given resource as XMLType
<a href="#">GETAUTHOR Function</a> on page 166-11	Given an XDBResource, returns its author
<a href="#">GETCHARACTERSET Function</a> on page 166-12	Given an XDBResource, returns its character set
<a href="#">GETCOMMENT Function</a> on page 166-13	Given an XDBResource, returns its comment
<a href="#">GETCONTENTBLOB Function</a> on page 166-14	Returns the contents of the resource as a BLOB
<a href="#">GETCONTENTCLOB Function</a> on page 166-15	Returns the contents of the resource as a CLOB
<a href="#">GETCONTENTREF Function</a> on page 166-16	Returns the contents of the resource as an XMLTypeRef
<a href="#">GETCONTENTTYPE Function</a> on page 166-17	Given an XDBResource, returns its content-type
<a href="#">GETCONTENTXML Function</a> on page 166-18	Returns the contents of the resource as XML
<a href="#">GETCONTENTVARCHAR2 Function</a> on page 166-19	Returns the contents of the resource as a string
<a href="#">GETCREATIONDATE Function</a> on page 166-20	Given an XDBResource, returns its creation date
<a href="#">GETCREATOR Function</a> on page 166-21	Given an XDBResource, returns its creator
<a href="#">GETCUSTOMMETADATA Function</a> on page 166-22	Returns the requested custom metadata given the xpath and namespace to the metadata
<a href="#">GETDISPLAYNAME Function</a> on page 166-23	Given an XDBResource, returns its display name
<a href="#">GETLANGUAGE Function</a> on page 166-24	Given an XDBResource, returns its language
<a href="#">GETLASTMODIFIER Function</a> on page 166-25	Given an XDBResource, returns its last modifier
<a href="#">GETMODIFICATIONDATE Function</a> on page 166-26	Given an XDBResource, returns its modification date
<a href="#">GETOWNER Function</a> on page 166-27	Given an XDBResource, returns its owner.
<a href="#">GETREFCOUNT Function</a> on page 166-28	Given an XDBResource, returns its reference count
<a href="#">GETVERSIONID Function</a> on page 166-29	Given an XDBResource, returns its version ID.
<a href="#">HASACLCHANGED Function</a> on page 166-30	Returns TRUE if the ACL of the given resource has changed, FALSE otherwise

**Table 166–1 (Cont.) DBMS\_XDBRESOURCE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">HASAUTHORCHANGED Function</a> on page 166-31	Returns <code>TRUE</code> if the ACL of the given resource has changed <code>FALSE</code> otherwise
<a href="#">HASCHANGED Function</a> on page 166-32	Returns <code>TRUE</code> if the element or attribute represented by the given XPath has changed, <code>FALSE</code> otherwise
<a href="#">HASCHARACTERSETCHANGED Function</a> on page 166-33	Returns <code>TRUE</code> if the character set of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASCOMMENTCHANGED Function</a> on page 166-34	Returns <code>TRUE</code> if the comment of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASCONTENTCHANGED Function</a> on page 166-35	Returns <code>TRUE</code> if the contents of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASCONTENTTYPECHANGED Function</a> on page 166-36	Returns <code>TRUE</code> if the content-type of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASCREATIONDATECHANGED Function</a> on page 166-37	Returns <code>TRUE</code> if the creation date of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASCREATORCHANGED Function</a> on page 166-38	Returns <code>TRUE</code> if the creator of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASCUSTOMMETADATACHANGED Function</a> on page 166-39	Returns <code>TRUE</code> if custom-metadata for this XPath has changed, <code>FALSE</code> otherwise
<a href="#">HASDISPLAYNAMECHANGED Function</a> on page 166-40	Returns <code>TRUE</code> if the display name of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASLANGUAGECHANGED Function</a> on page 166-41	Returns <code>TRUE</code> if the language of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASLASTMODIFIERCHANGED Function</a> on page 166-42	Returns <code>TRUE</code> if the last modifier of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASMODIFICATIONDATECHANGED Function</a> on page 166-43	Returns <code>TRUE</code> if the modification date of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASOWNERCHANGED Function</a> on page 166-44	Returns <code>TRUE</code> if the owner of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASREFCOUNTCHANGED Function</a> on page 166-45	Returns <code>TRUE</code> if the reference count of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">HASVERSIONIDCHANGED Function</a> on page 166-46	Returns <code>TRUE</code> if the version ID of the given resource has changed, <code>FALSE</code> otherwise
<a href="#">ISFOLDER Function</a> on page 166-47	Returns <code>TRUE</code> if the given resource is a folder, <code>FALSE</code> otherwise
<a href="#">ISNULL Function</a> on page 166-48	Returns <code>TRUE</code> if input resource is <code>NULL</code> , <code>FALSE</code> otherwise
<a href="#">MAKEDOCUMENT Function</a> on page 166-49	Converts the XDBResource to a <code>DOMDocument</code> which can be operated on using the <code>XMLDOM</code> interface
<a href="#">SAVE Procedure</a> on page 166-50	Updates the resource with any modifications
<a href="#">SETACL Procedure</a> on page 166-51	Sets the ACL of the given XDBResource to the path specified
<a href="#">SETAUTHOR Procedure</a> on page 166-52	Sets the author of the given XDBResource to the specified string
<a href="#">SETCHARACTERSET Procedure</a> on page 166-53	Sets the character set of the given XDBResource to a specified character set

**Table 166-1 (Cont.) DBMS\_XDBRESOURCE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">SETCOMMENT Procedure</a> on page 166-54	Sets a comment associated with the given XDBResource
<a href="#">SETCONTENT Procedures</a> on page 166-55	Replaces the contents of the given resource with the given CLOB
<a href="#">SETCONTENTTYPE Procedure</a> on page 166-56	Sets the content-type of the given XDBResource
<a href="#">SETCUSTOMMETADATA Procedure</a> on page 166-57	Sets the custom metadata specified by the XPath and namespace to new data
<a href="#">SETDISPLAYNAME Procedure</a> on page 166-58	Sets the display name of the given XDBResource
<a href="#">SETLANGUAGE Procedure</a> on page 166-59	Sets the language of the given XDBResource
<a href="#">SETOWNER Procedure</a> on page 166-60	Sets the owner of the given XDBResource

## FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

### Syntax

```
DBMS_XDBRESEROUCE.FREERESOURCE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–2** *FREERESOURCE Procedure Parameters*

Parameter	Description
res	XDBResource to free

## GETACL Function

Given an XDBResource, this function returns its ACL as string.

### Syntax

```
DBMS_XDBRESEROUCE.GETACL (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–3** *GETACL Function Parameters*

Parameter	Description
res	XDBResource

## GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

### Syntax

```
DBMS_XDBRESEROUCE.GETACLDOCFROMRES (  
    res IN XDBResource)  
RETURN SYS.XMLTYPE;
```

### Parameters

**Table 166–4** *GETACL Function Parameters*

Parameter	Description
res	XDBResource

## GETAUTHOR Function

Given an XDBResource, this function returns its author.

### Syntax

```
DBMS_XDBRESEROUCE.GETAUTHOR (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–5** *GETAUTHOR Function Parameters*

Parameter	Description
res	XDBResource

## GETCHARACTERSET Function

Given an XDBResource, this function returns its character set.

### Syntax

```
DBMS_XDBRESEROUCE.GETCHARACTERSET (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–6** *GETCHARACTERSET Function Parameters*

Parameter	Description
res	XDBResource

## GETCOMMENT Function

Given an XDBResource, this function returns its comment.

### Syntax

```
DBMS_XDBRESEROUCE.GETCOMMENT (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–7** *GETCOMMENT Function Parameters*

Parameter	Description
res	XDBResource

## GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

### Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTBLOB (  
    res    IN    XDBResource,  
    csid   OUT   PLS_INTEGER)  
RETURN BLOB;
```

### Parameters

**Table 166–8** *GETCONTENTBLOB Function Parameters*

Parameter	Description
res	XDBResource
csid	Character set ID of the BLOB returned

## GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

### Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTCLOB (  
    res IN XDBResource)  
RETURN CLOB;
```

### Parameters

**Table 166–9** *GETCONTENTCLOB Function Parameters*

Parameter	Description
res	XDBResource

## GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

### Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTREF (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–10** *GETCONTENTREF Function Parameters*

Parameter	Description
res	XDBResource

## GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

### Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTTYPE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–11** *GETCONTENTTYPE Function Parameters*

Parameter	Description
res	XDBResource

## GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

### Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTXML (  
    res IN XDBResource)  
RETURN XMLType;
```

### Parameters

**Table 166–12** *GETCONTENTXML Function Parameters*

Parameter	Description
res	XDBResource

## GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

### Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTVARCHAR2 (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–13** *GETCONTENTVARCHAR2 Function Parameters*

Parameter	Description
res	XDBResource

## GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

### Syntax

```
DBMS_XDBRESEROUCE.GETCREATIONDATE (  
    res IN XDBResource)  
RETURN TIMESTAMP;
```

### Parameters

**Table 166–14** *GETCREATIONDATE Function Parameters*

Parameter	Description
res	XDBResource

## GETCREATOR Function

Given an XDBResource, this function returns its creator.

### Syntax

```
DBMS_XDBRESEROUCE.GETCREATOR (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–15** *GETCREATOR Function Parameters*

Parameter	Description
res	XDBResource

## GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

### Syntax

```
DBMS_XDBRESEROUCE.GETCUSTOMMETADATA (  
    res          IN    XDBResource,  
    xpath        IN    VARCHAR2,  
    namespace    IN    VARCHAR2)  
RETURN XMLType;
```

### Parameters

**Table 166–16** *GETCUSTOMMETADATA Function Parameters*

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

### Usage Notes

The first component of the XPath expression must be "Resource".

## GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

### Syntax

```
DBMS_XDBRESEROUCE.GETDISPLAYNAME (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–17** *GETDISPLAYNAME Function Parameters*

Parameter	Description
res	XDBResource

## GETLANGUAGE Function

Given an XDBResource, this function returns its language.

### Syntax

```
DBMS_XDBRESEROUCE.GETLANGUAGE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–18** *GETLANGUAGE Function Parameters*

Parameter	Description
res	XDBResource

## GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

### Syntax

```
DBMS_XDBRESEROUCE.GETLASTMODIFIER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–19** *GETLASTMODIFIER Function Parameters*

Parameter	Description
res	XDBResource

## GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

### Syntax

```
DBMS_XDBRESEROUCE.GETMODIFICATIONDATE (  
    res IN XDBResource)  
RETURN TIMESTAMP;
```

### Parameters

**Table 166–20** *GETMODIFICATIONDATE Function Parameters*

Parameter	Description
res	XDBResource

## GETOWNER Function

Given an XDBResource, this function returns its owner.

### Syntax

```
DBMS_XDBRESOURCE.GETOWNER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 166–21** *GETOWNER Function Parameters*

Parameter	Description
res	XDBResource

## GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

### Syntax

```
DBMS_XDBRESEROUCE.GETREFCOUNT (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 166–22** *GETREFCOUNT Function Parameters*

Parameter	Description
res	XDBResource

## GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

### Syntax

```
DBMS_XDBRESEROUCE.GETVERSIONID (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 166–23** *GETVERSIONID Function Parameters*

Parameter	Description
res	XDBResource

## HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESEROUCE.HASACLCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–24** *GETACL Function Parameters*

Parameter	Description
<code>res</code>	XDBResource

## HASAUTHORCHANGED Function

This function returns TRUE if the author of the given resource has changed, FALSE otherwise.

### Syntax

```
DBMS_XDBRESEROUCE.HASAUTHORCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–25 HASAUTHORCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

### Syntax

```
DBMS_XDBRESEROUCE.HASCHANGED (  
    res          IN    XDBResource,  
    xpath        IN    VARCHAR2,  
    namespace    IN    VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–26** *HASCHANGED Function Parameters*

Parameter	Description
res	XDBResource
xpath	XPath to check
bnamespace	Namespace to use

## HASCHARACTERSETCHANGED Function

This function returns TRUE if the character set of the given resource has changed, FALSE otherwise.

### Syntax

```
DBMS_XDBRESEROUCE.HASCHARACTERSETCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–27 HASCHARACTERSETCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASCOMMENTCHANGED Function

This function returns `TRUE` if the comment of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESEROUCE.HASCOMMENTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–28 HASCOMMENTCHANGED Function Parameters**

Parameter	Description
<code>res</code>	XDBResource

## HASCONTENTCHANGED Function

This function returns TRUE if the contents of the given resource has changed, FALSE otherwise.

### Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–29 HASCONTENTCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASCONTENTTYPECHANGED Function

This function returns TRUE if the content-type of the given resource has changed, FALSE otherwise

### Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTTYPECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–30 HASCONTENTTYPECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASCREATIONDATECHANGED Function

This function returns TRUE if the creation date of the given resource has changed, FALSE otherwise

### Syntax

```
DBMS_XDBRESEROUCE.HASCREATIONDATECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–31 HASCREATIONDATECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASCREATORCHANGED Function

This function returns TRUE if the creator of the given resource has changed, FALSE otherwise

### Syntax

```
DBMS_XDBRESEROUCE.HASCREATORCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–32 HASCREATORCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

### Syntax

```
DBMS_XDBRESEROUCE.HASCUSTOMMETADATACHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–33** *HASCUSTOMMETADATACHANGED Function Parameters*

Parameter	Description
res	XDBResource

## HASDISPLAYNAMECHANGED Function

This function returns TRUE if the display name of the given resource has changed, FALSE otherwise

### Syntax

```
DBMS_XDBRESEROUCE.HASDISPLAYNAMECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–34 HASDISPLAYNAMECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASLANGUAGECHANGED Function

This function returns TRUE if the language of the given resource has changed, FALSE otherwise

### Syntax

```
DBMS_XDBRESEROUCE.HASLANGUAGECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–35 HASLANGUAGECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASLASTMODIFIERCHANGED Function

This function returns TRUE if the last modifier of the given resource has changed, FALSE otherwise

### Syntax

```
DBMS_XDBRESEROUCE.HASLASTMODIFIERCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–36 HASLASTMODIFIERCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASMODIFICATIONDATECHANGED Function

This function returns TRUE if the modification date of the given resource has changed, FALSE otherwise

### Syntax

```
DBMS_XDBRESEROUCE.HASMODIFICATIONDATECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–37 HASMODIFICATIONDATECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASOWNERCHANGED Function

This function returns TRUE if the owner of the given resource has changed, FALSE otherwise.

### Syntax

```
DBMS_XDBRESEROUCE.HASOWNERCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–38 HASOWNERCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASREFCOUNTCHANGED Function

This function returns TRUE if the reference count of the given resource has changed, FALSE otherwise.

### Syntax

```
DBMS_XDBRESEROUCE.HASREFCOUNTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–39 HASREFCOUNTCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## HASVERSIONIDCHANGED Function

This function returns `TRUE` if the version ID of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESEROUCE.HASVERSIONIDCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–40 HASVERSIONIDCHANGED Function Parameters**

Parameter	Description
<code>res</code>	XDBResource

## ISFOLDER Function

This function returns TRUE if the given resource is a folder, FALSE otherwise.

### Syntax

```
DBMS_XDBRESEROUCE.ISFOLDER (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–41** *ISFOLDER Function Parameters*

Parameter	Description
res	XDBResource

## ISNULL Function

This function returns TRUE if input resource is NULL.

### Syntax

```
DBMS_XDBRESEROUCE.ISNULL (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 166–42 ISNULL Function Parameters**

Parameter	Description
res	Input resource

## MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

**See Also:** The [DBMS\\_XMLDOM](#) package

### Syntax

```
DBMS_XDBRESOURCE.MAKEDOCUMENT (  
    res IN XDBResource)  
RETURN DBMS_XMLDOM.DOMDocument;
```

### Parameters

**Table 166-43** *MAKEDOCUMENT Function Parameters*

Parameter	Description
res	XDBResource

## SAVE Procedure

This procedure updates the resource with any modifications.

### Syntax

```
DBMS_XDBRESEROUCE.SAVE (  
    res IN XDBResource);
```

### Parameters

**Table 166–44** *SAVE Procedure Parameters*

Parameter	Description
res	XDBResource

## SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

### Syntax

```
DBMS_XDBRESOURCE.SETACL (  
    res      IN OUT  XDBResource,  
    ACLPath  IN      VARCHAR2);
```

### Parameters

**Table 166–45** SETACL Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	Absolute path of the new ACL

## SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

### Syntax

```
DBMS_XDBRESEROUCE.SETAUTHOR (  
    res      IN OUT  XDBResource,  
    author   IN      VARCHAR2);
```

### Parameters

**Table 166–46** *SETAUTHOR Procedure Parameters*

Parameter	Description
res	XDBResource
author	Author

## SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

### Syntax

```
DBMS_XDBRESEROUCE.SETCHARACTERSET (  
    res      IN OUT  XDBResource,  
    charSet  IN      VARCHAR2);
```

### Parameters

**Table 166–47** *SETCHARACTERSET Procedure Parameters*

Parameter	Description
res	XDBResource
charset	New character set

## SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

### Syntax

```
DBMS_XDBRESEROUCE.SETCOMMENT (  
    res      IN OUT  XDBResource,  
    comment IN      VARCHAR2);
```

### Parameters

**Table 166–48** *SETCOMMENT Procedure Parameters*

Parameter	Description
res	XDBResource
comment	New comment

## SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

### Syntax

```
DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      BFILE,
  csid     IN      NUMBER);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      BLOB,
  csid     IN      PLS_INTEGER);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      CLOB);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      REF SYS.XMLType,
  sticky   IN      BOOLEAN := TRUE);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      VARCHAR2);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      SYS.XMLType);
```

### Parameters

**Table 166–49** *SETCONTENT Procedure Parameters*

Parameter	Description
res	XDBResource
data	Data input as BFILE, BLOB, CLOB, string, XMLType
csid	Character set ID of the BFILE, BLOB
sticky	If TRUE creates a sticky REF, otherwise non-sticky

## SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

### Syntax

```
DBMS_XDBRESEROUCE.SETCONTENTTYPE (  
    res          IN OUT  XDBResource,  
    conttype     IN      VARCHAR2);
```

### Parameters

**Table 166–50** *SETCONTENTTYPE Procedure Parameters*

Parameter	Description
res	XDBResource
conttype	New content-type

## SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

### Syntax

```
DBMS_XDBRESOURCE.SETCUSTOMMETADATA (
  res          IN OUT  XDBResource,
  xpath        IN      VARCHAR2,
  namespace    IN      VARCHAR2,
  newMetadata  IN      XMLType);
```

### Parameters

**Table 166–51** SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use
newMetadata	New data that should replace the metadata at the given XPath

### Usage Notes

The first component of the XPath expression must be "Resource".

## SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

### Syntax

```
DBMS_XDBRESEROUCE.SETDISPLAYNAME (  
    res      IN OUT  XDBResource,  
    name     IN     VARCHAR2);
```

### Parameters

**Table 166–52** *SETDISPLAYNAME Procedure Parameters*

Parameter	Description
res	XDBResource
name	New display name

## SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.SETLANGUAGE (  
    res      IN OUT  XDBResource,  
    ACLPath  IN      VARCHAR2);
```

### Parameters

**Table 166–53** *SETLANGUAGE Procedure Parameters*

Parameter	Description
res	XDBResource
ACLPath	New path

## SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

### Syntax

```
DBMS_XDBRESEROUCE.SETOWNER (  
    res      IN OUT  XDBResource,  
    owner    IN      VARCHAR2);
```

### Parameters

**Table 166–54** *SETOWNER Procedure Parameters*

Parameter	Description
res	XDBResource
owner	New owner

### Usage Notes

The user must have the XDBADMIN privilege to call this subprogram.

The `DBMS_XDBT` package provides a convenient mechanism for administrators to set up a `CONTEXT` index on the Oracle XML DB hierarchy. The package contains procedures to create default preferences, create the index and set up automatic synchronization of the `CONTEXT` index

The `DBMS_XDBT` package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

**See Also:** *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- [Using DBMS\\_XDBT](#)
  - Overview
  - Security Model
  - Operational Notes
- [Summary of DBMS\\_XDBT Subprograms](#)

## Using DBMS\_XDBT

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

## Overview

The DBMS\_XDBT package can be used in the following fashion:

- Customize the package to set up the appropriate configuration.
- Use the [DROPPREFERENCES Procedure](#) to drop any existing index preferences
- Create new index preferences using the [CREATEPREFERENCES Procedure](#) procedure
- Create the CONTEXT index using the [CREATEINDEX Procedure](#) procedure
- Set up automatic synchronization of the index using the [CONFIGUREAUTOSYNC Procedure](#)

## Security Model

Owned by XDB, the DBMS\_XDBT package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB. Subprograms in this package are executed using the privileges of the current user.

## Operational Notes

The DBMS\_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER\_JOBS catalog views. This section describes the configuration settings, or package variables, available to customize the DBMS\_XDBT package.

**Table 167–1 General Indexing Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
IndexName	XDB\$CI	Name of the CONTEXT index.
IndexTablespace	XDB\$RESINFO	Tablespace used by tables and indexes comprising the CONTEXT index.
IndexMemory	128M	Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).
LogFile	'XdbCtxLog'	The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.

**Table 167–2 Filtering Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
SkipFilter_Types	image/%, audio/%, video/%, model/%	List of mime types that should not be indexed.
NullFilter_Types	text/plain, text/html, text/xml	List of mime types that do not need to use the INSO filter. Use this for text-based documents.
FilterPref	XDB\$CI_FILTER	Name of the filter preference.

**Table 167–3 Stoplist Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
StoplistPref	XDB\$CI_STOPLIST	Name of the stoplist.
StopWords	0..9; 'a'..'z'; 'A'..'Z'	List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST.

**Table 167–4 Sectioning and Section Group Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
SectionGroup	HTML_SECTION_GROUP	Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents.
Sectiongroupref	XDB\$CI_SECTIONGROUP	Name of the section group.

**Table 167–5 Other Index Preference Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
DatastorePref	XDB\$CI_DATASTORE	Name of the datastore preference
StoragePref	XDB\$CI_STORAGE	Name of the storage preference.
WordlistPref	XDB\$CI_WORDLIST	Name of the wordlist preference.
DefaultLexerPreference	XDB\$CI_DEFAULT_LEXER	Name of the default lexer preference.

**Table 167–6 SYNC (CONTEXT Synchronization) Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
AutoSyncPolicy	SYNC_BY_PENDING_COUNT	Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.
MaxPendingCount	2	Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
CheckPendingCountInterval	10 minutes	How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
SyncInterval	60 minutes	Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME.

---

## Summary of DBMS\_XDBT Subprograms

**Table 167–7 DBMS\_XDBT Package Subprograms**

Subprogram	Description
<a href="#">CONFIGUREAUTOSYNC Procedure</a> on page 167-8	Configures the CONTEXT index for automatic maintenance, SYNC
<a href="#">CREATEDATASTOREPREF Procedure</a> on page 167-9	Creates a USER datastore preference for the CONTEXT index
<a href="#">CREATEFILTERPREF Procedure</a> on page 167-10	Creates a filter preference for the CONTEXT index
<a href="#">CREATEINDEX Procedure</a> on page 167-11	Creates the CONTEXT index on the XML DB hierarchy
<a href="#">CREATELEXERPREF Procedure</a> on page 167-12	Creates a lexer preference for the CONTEXT index
<a href="#">CREATEPREFERENCES Procedure</a> on page 167-13	Creates preferences required for the CONTEXT index on the XML DB hierarchy
<a href="#">CREATESECTIONGROUPPREF Procedure</a> on page 167-14	Creates a storage preference for the CONTEXT index
<a href="#">CREATESTOPLISTPREF Procedure</a> on page 167-15	Creates a section group for the CONTEXT index
<a href="#">CREATESTORAGEPREF Procedure</a> on page 167-16	Creates a wordlist preference for the CONTEXT index
<a href="#">CREATEWORLDSLIPREF Procedure</a> on page 167-17	Creates a stoplist for the CONTEXT index
<a href="#">DROPPREFERENCES Procedure</a> on page 167-18	Drops any existing preferences

## CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the CONTEXT index.

### Syntax

```
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

### Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the USER\_JOBS catalog views
- The configuration parameter `AutoSyncPolicy` can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

Sync Basis	Description
SYNC_BY_PENDING_COUNT	The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the <a href="#">MaxPendingCount</a> configuration setting on page 167-6). The pending queue is polled at regular intervals (See the <a href="#">CheckPendingCountInterval</a> configuration parameter on page 167-6) to determine if the number of documents exceeds the threshold.
SYNC_BY_TIME	The SYNC is triggered at regular intervals. (See the <a href="#">SyncInterval</a> configuration parameter on page 167-6).
SYNC_BY_PENDING_COUNT_AND_TIME	A combination of both of the preceding options.

## CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEDATASTOREPREF;
```

### Usage Notes

- The name of the datastore preference can be modified; see the `DatastorePref` configuration setting.
- The default `USER` datastore procedure also filters the incoming document. The `DBMS_XDBT` package provides a set of configuration settings that control the filtering process.
- The `SkipFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
  - The `NullFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
  - All other documents use the `INSO` filter through the `IFILTER` API.

## CREATEFILTERPREF Procedure

This procedure creates a `NULL` filter preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEFILTERPREF;
```

### Usage Notes

- The name of the filter preference can be modified; see `FilterPref` configuration setting.
- The `USER` datastore procedure filters the incoming document; see [CREATEDATASTOREPREF Procedure](#) for more details.

## CREATEINDEX Procedure

This procedure creates the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEINDEX;
```

### Usage Notes

- The name of the index can be changed; see the `IndexName` configuration setting.
- Set the `LogFile` configuration parameter to enable `ROWID` logging during index creation.
- Set the `IndexMemory` configuration parameter to determine the amount of memory that index creation, and later `SYNCs`, will use.

## CREATELEXERPREF Procedure

This procedure creates a BASIC `lexer` preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

### Usage Notes

- The name of the `lexer` preference can be modified; see `LexerPref` configuration setting. No other configuration settings are provided.
- `MultiLexer` preferences are not supported.
- Base letter translation is turned on by default.

## **CREATEPREFERENCES Procedure**

This procedure creates a set of default preferences based on the configuration settings.

### **Syntax**

```
DBMS_XDBT.CREATEPREFERENCES;
```

## CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the CONTEXT index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

### Usage Notes

- The name of the section group can be changed; see the `SectiongroupPref` configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the `AUTO_SECTION_GROUP` or the `PATH_SECTION_GROUP`; see the `SectionGroup` configuration setting.

## CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```

### Usage Notes

- The name of the stoplist can be modified; see the `StoplistPref` configuration setting.
- Numbers are not indexed.
- The `StopWords` array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in `CTXSYS.DEFAULT_STOPLIST`.

## CREATESTORAGEPREF Procedure

This procedure creates a `BASIC_STORAGE` preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATESTORAGEPREF;
```

### Usage Notes

- The name of the storage preference can be modified; see the `StoragePref` configuration setting.
- A tablespace can be specified for the tables and indexes comprising the `CONTEXT` index; see the `IndexTablespace` configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The `I_INDEX_CLAUSE` uses key compression.

## CREATEWORLDPREF Procedure

This procedure creates a word list preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEWORLDPREF;
```

### Usage Notes

- The name of the word list preference can be modified; see the `WordlistPref` configuration setting. No other configuration settings are provided.
- `FUZZY_MATCH` and `STEMMER` attributes are set to `AUTO` (auto-language detection)

## DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XMLDB.DROPPREFERENCES;
```

The DBMS\_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- [Using DBMS\\_XDBZ](#)
  - Security Model
  - Constants
- [Summary of DBMS\\_XDBZ Subprograms](#)

**See Also:** *Oracle XML DB Developer's Guide*

---

## Using DBMS\_XDBZ

This section contains topics which relate to using the DBMS\_XDBZ package.

- [Security Model](#)
- [Constants](#)

## Security Model

Owned by XDB, the DBMS\_XDBZ package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## Constants

The DBMS\_XDBZ package uses the constants shown in following tables.

- [DBMS\\_XDBZ Constants - Name Format](#) on page 168-4
- [DBMS\\_XDBZ Constants - Enable Option](#) on page 168-4
- [DBMS\\_XDBZ Constants - Enable Option Exercised](#) on page 168-4

**Table 168–1 DBMS\_XDBZ Constants - Name Format**

Constant	Type	Value	Description
NAME_FORMAT_SHORT	PLS_INTEGER	1	DB user name or LDAP nickname
NAME_FORMAT_DISTINGUISHED	PLS_INTEGER	2	LDAP distinguished name

**Table 168–2 DBMS\_XDBZ Constants - Enable Option**

Constant	Type	Value	Description
ENABLE_CONTENTS	PLS_INTEGER	1	Enables hierarchy for contents and is used by users when calling the <a href="#">ENABLE_HIERARCHY Procedure</a>
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

**Table 168–3 DBMS\_XDBZ Constants - Enable Option Exercised**

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code>
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code>

---

## Summary of DBMS\_XDBZ Subprograms

**Table 168–4** *DBMS\_XDBZ Package Subprograms*

Method	Description
<a href="#">DISABLE_HIERARCHY Procedure</a> on page 168-6	Disables repository support for the specified XMLTYPE table or view
<a href="#">ENABLE_HIERARCHY Procedure</a> on page 168-7	Enables repository support for the specified XMLType table or view
<a href="#">GET_ACLOID Function</a> on page 168-8	Retrieves the ACL Object ID for the specified resource
<a href="#">GET_USERID Function</a> on page 168-9	Retrieves the user ID for the specified user
<a href="#">IS_HIERARCHY_ENABLED Function</a> on page 168-10	Determines if repository support for the specified XMLType table or view is enabled
<a href="#">PURGELDAPCACHE Function</a> on page 168-11	Purges the LDAP nickname cache

## DISABLE\_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

### Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(  
    object_schema IN VARCHAR2,  
    object_name   IN VARCHAR2);
```

### Parameters

**Table 168–5** *DISABLE\_HIERARCHY Procedure Parameters*

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view

## ENABLE\_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

**See Also:** *Oracle XML DB Developer's Guide* for more information about

### Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY (
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  hierarchy_type IN PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

### Parameters

**Table 168–6** *ENABLE\_HIERARCHY Procedure Parameters*

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view
hierarchy_type	How to enable the hierarchy. <ul style="list-style-type: none"> <li>▪ ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository</li> <li>▪ ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources</li> </ul> <p>If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.</p>

## GET\_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

### Syntax

```
DBMS_XDBZ.GET_ACLOID(  
    aclpath IN VARCHAR2,  
    acloid  OUT RAW)  
RETURN BOOLEAN;
```

### Parameters

**Table 168–7** GET\_ACLOID Function Parameters

Parameter	Description
aclpath	ACL resource path for the repository
acloid	The returned Object ID

### Return Values

Returns TRUE if successful.

## GET\_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the `USERID` is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the `USERID` is returned in 4-byte database format.

### Syntax

```
DBMS_XDBZ.GET_USERID(
  username IN VARCHAR2,
  userid   OUT RAW,
  format   IN BINARY_INTEGER := NAME_FORMAT_SHORT)
RETURN BOOLEAN;
```

### Parameters

**Table 168–8** *GET\_USERID Function Parameters*

Parameter	Description
<code>username</code>	Name of the database or LDAP user.
<code>userid</code>	Return parameter for the matching user id.
<code>format</code>	Format of the specified user name; valid options are: <ul style="list-style-type: none"> <li>▪ <code>DBMS_XDBZ.NAME_FORMAT_SHORT</code> (default) -- DB user name or LDAP nickname</li> <li>▪ <code>DBMS_XDBZ.NAME_FORMAT_DISTINGUISHED</code> -- LDAP distinguished name.</li> </ul>

### Return Values

Returns `TRUE` if successful.

## IS\_HIERARCHY\_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

### Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(  
  object_schema IN VARCHAR2,  
  object_name   IN VARCHAR2,  
  hierarchy_type IN PLS_INTEGER := IS_ENABLED_CONTENTS)  
RETURN BOOLEAN;
```

### Parameters

**Table 168–9 IS\_HIERARCHY\_ENABLED Function Parameters**

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view
hierarchy_type	The type of hierarchy to check for. <ul style="list-style-type: none"><li>■ IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code></li><li>■ IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code></li></ul>

### Return Values

Returns `TRUE` if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.

## PURGELDAPCACHE Function

This function purges the LDAP nickname cache. Returns `TRUE` if successful.

### Syntax

```
DBMS_XDBZ.PURGELDAPCACHE  
RETURN BOOLEAN;
```

The DBMS\_XEVENT package provides event-related types and supporting subprograms.

**See Also:** *Oracle XML DB Developer's Guide* for more information about "Oracle XML DB Repository Events"

This chapter contains the following topics:

- [Using DBMS\\_XEVENT](#)
  - Security Model
  - Constants
- [Subprogram Groups](#)
  - XDBEvent Type Subprograms
  - XDBRepositoryEvent Type Subprograms
  - XDBHandlerList Type Subprograms
  - XDBHandler Type Subprograms
  - XDBPath Type Subprograms
  - XDBLink Type Subprograms
- [Summary of DBMS\\_XEVENT Subprograms](#)

---

## Using DBMS\_XEVENT

- [Security Model](#)
- [Constants](#)

## Security Model

Owned by XDB, the DBMS\_XEVENT package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## Constants

The DBMS\_XEVENT package uses the constants shown in [Table 169-1](#):

**Table 169-1 DBMS\_XEVENT Constants**

Name	Type	Value	Description
RENDER_EVENT	PLS_INTEGER	1	
PRE_CREATE_EVENT	PLS_INTEGER	2	
POST_CREATE_EVENT	PLS_INTEGER	3	
PRE_DELETE_EVENT	PLS_INTEGER	4	
POST_DELETE_EVENT	PLS_INTEGER	5	
PRE_UPDATE_EVENT	PLS_INTEGER	6	
POST_UPDATE_EVENT	PLS_INTEGER	7	
PRE_LOCK_EVENT	PLS_INTEGER	8	
POST_LOCK_EVENT	PLS_INTEGER	9	
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

## Subprogram Groups

- [XDBEvent Type Subprograms](#)
- [XDBRepositoryEvent Type Subprograms](#)
- [XDBHandlerList Type Subprograms](#)
- [XDBHandler Type Subprograms](#)
- [XDBPath Type Subprograms](#)
- [XDBLink Type Subprograms](#)

## XDBEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBEvent type.

**Table 169–2 XDBEvent Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">GETCURRENTUSER Function</a> on page 169-18	Returns the name of the user executing the operation that triggers the event
<a href="#">GETEVENT Function</a> on page 169-19	Returns a value identifying the triggering event
<a href="#">ISNULL Functions</a> on page 169-46	Returns TRUE if input argument is NULL

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

**Table 169–3 XDBRepositoryEvent Subprograms**

Subprogram	Description
<a href="#">GETAPPLICATIONDATA Function</a> on page 169-16	Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler
<a href="#">GETHANDLERLIST Function</a> on page 169-21	Returns an XDBHandlerList object containing the list of handlers that will be executed after the currently executing handler
<a href="#">GETINTERFACE Function</a> on page 169-22	Returns the top-level interface used to initiate the operation that triggered the event
<a href="#">GETLINK Function</a> on page 169-24	Returns an XDBLink object for the target resource
<a href="#">GETLOCK Function</a> on page 169-26	Returns the lock object corresponding to the current operation
<a href="#">GETOLDRESOURCE Function</a> on page 169-30	Returns the original XDBResource object before the operation was executed
<a href="#">GETOPENACCESSMODE Function</a> on page 169-31	Returns the access mode for the open operation
<a href="#">GETOPENDENYMODE Function</a> on page 169-32	Returns the deny mode for the open operation
<a href="#">GETOUTPUTSTREAM Function</a> on page 169-33	Returns the output BLOB in which the handler can write the rendered data
<a href="#">GETPARAMETER Function</a> on page 169-34	Returns the value of a request or session-specific parameter
<a href="#">GETPARENT Function</a> on page 169-35	Returns the resource object corresponding to a parent folder of the target resource
<a href="#">GETPATH Function</a> on page 169-39	Returns the XDBPath object representing the path of the resource for which the event was fired
<a href="#">GETRESOURCE Function</a> on page 169-40	Returns an XDBResource object that provides methods to access and modify the contents and metadata of the target resource
<a href="#">GETUPDATEBYTECOUNT Function</a> on page 169-43	If the current operation is a byte-range write, returns the byte count
<a href="#">GETUPDATEBYTEOFFSET Function</a> on page 169-44	If the current operation is a byte-range write, function returns the byte offset at which the range begins
<a href="#">GETXDBEVENT Function</a> on page 169-45	Converts an XDBRepositoryEvent object to an XDBEvent type
<a href="#">ISNULL Functions</a> on page 169-46	Returns TRUE if input argument is NULL
<a href="#">SETRENDERPATH Procedure</a> on page 169-49	Specifies the path of the resource that contains the rendered contents
<a href="#">SETRENDERSTREAM Procedure</a> on page 169-50	sets the BLOB from which the rendered contents can be read

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

**Table 169–4 XDBHandlerList Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CLEAR Procedure</a> on page 169-15	Clears the handler list
<a href="#">GETFIRST Function</a> on page 169-20	Returns the first handler in the list
<a href="#">GETNAME Function</a> on page 169-28	Returns the next handler in the list
<a href="#">ISNULL Functions</a> on page 169-46	Returns TRUE if input argument is NULL
<a href="#">REMOVE Procedure</a> on page 169-48	Removes the specified handler from the handler list

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

**Table 169–5 XDBHandler Type Subprograms**

Subprogram	Description
<a href="#">GETLANGUAGE Function</a> on page 169-23	Returns the implementation language of the handler
<a href="#">GETSCHEMA Function</a> on page 169-41	Returns the schema of the handler's source
<a href="#">GETSOURCE Function</a> on page 169-42	Returns the name of the Java class, PL/SQL package or object type implementing the handler
<a href="#">ISNULL Functions</a> on page 169-46	Returns TRUE if input argument is NULL

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

**Table 169–6** XDBPath Type Subprograms

Subprogram	Description
<a href="#">GETNAME Function</a> on page 169-28	Returns the string representation of the path
<a href="#">GETPARENTPATH Function</a> on page 169-38	Returns the parent's path
<a href="#">ISNULL Functions</a> on page 169-46	Returns TRUE if input argument is NULL

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

**Table 169–7 XDBLink Type Subprograms**

Subprogram	Description
<a href="#">GETCHILDROID Function</a> on page 169-17	Returns the OID of the resource to which the link is pointing
<a href="#">GETPARENTNAME Function</a> on page 169-36	Returns the link's parent folder's name
<a href="#">GETPARENTOID Function</a> on page 169-37	Returns the link's parent folder's OID
<a href="#">ISNULL Functions</a> on page 169-46	Returns TRUE if input argument is NULL

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## Summary of DBMS\_XEVENT Subprograms

**Table 169–8 DBMS\_XEVENT Package Subprograms**

Subprogram	Description	Group
<a href="#">CLEAR Procedure</a> on page 169-15	Clears the handler list	<a href="#">XDBHandlerList Type Subprograms</a> on page 169-8
<a href="#">GETAPPLICATIONDATA Function</a> on page 169-16	Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-7
<a href="#">GETCHILDROID Function</a> on page 169-17	Returns the OID of the resource to which the link is pointing	<a href="#">XDBLink Type Subprograms</a> on page 169-11
<a href="#">GETCURRENTUSER Function</a> on page 169-18	Returns the name of the user executing the operation that triggers the event	<a href="#">XDBEvent Type Subprograms</a> on page 169-6
<a href="#">GETEVENT Function</a> on page 169-19	Returns a value identifying the triggering event	<a href="#">XDBEvent Type Subprograms</a> on page 169-6
<a href="#">GETFIRST Function</a> on page 169-20	Returns the first handler in the list	<a href="#">XDBHandlerList Type Subprograms</a> on page 169-8
<a href="#">GETHANDLERLIST Function</a> on page 169-21	Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-7
<a href="#">GETINTERFACE Function</a> on page 169-22	Returns the top-level interface used to initiate the operation that triggered the event	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-7
<a href="#">GETLANGUAGE Function</a> on page 169-23	Returns the implementation language of the handler	<a href="#">XDBHandler Type Subprograms</a> on page 169-9
<a href="#">GETLINK Function</a> on page 169-24	Returns an <code>XDBLink</code> object for the target resource	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-7
<a href="#">GETLOCK Function</a> on page 169-26	Returns the lock object corresponding to the current operation	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETNAME Function</a> on page 169-28	Returns the string representation of the path	<a href="#">XDBPath Type Subprograms</a> on page 169-10
<a href="#">GETNAME Function</a> on page 169-28	Returns the next handler in the list	<a href="#">XDBHandlerList Type Subprograms</a> on page 169-8
<a href="#">GETOLDRESOURCE Function</a> on page 169-30	Returns the original <code>XDBResource</code> object before the operation was executed	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETOPENACCESSMODE Function</a> on page 169-31	Returns the access mode for the open operation	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6

**Table 169–8 (Cont.) DBMS\_XEVENT Package Subprograms**

<b>Subprogram</b>	<b>Description</b>	<b>Group</b>
<a href="#">GETOPENDENYMODE Function</a> on page 169-32	Returns the deny mode for the open operation	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETOUTPUTSTREAM Function</a> on page 169-33	Returns the output BLOB in which the handler can write the rendered data	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETPARAMETER Function</a> on page 169-34	Returns the value of a request or session-specific parameter	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETPARENT Function</a> on page 169-35	Returns the resource object corresponding to a parent folder of the target resource	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETPARENTNAME Function</a> on page 169-36	Returns the link's parent folder's name	<a href="#">XDBLink Type Subprograms</a> on page 169-11
<a href="#">GETPARENTOID Function</a> on page 169-37	Returns the link's parent folder's OID	<a href="#">XDBLink Type Subprograms</a> on page 169-11
<a href="#">GETPARENTNAME Function</a> on page 169-36	Returns the parent's path	<a href="#">XDBPath Type Subprograms</a> on page 169-10
<a href="#">GETPATH Function</a> on page 169-39	Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETRESOURCE Function</a> on page 169-40	Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETSCHEMA Function</a> on page 169-41	Returns the schema of the handler's source	<a href="#">XDBHandler Type Subprograms</a> on page 169-9
<a href="#">GETSOURCE Function</a> on page 169-42	Returns the name of the Java class, PL/SQL package or object type implementing the handler	<a href="#">XDBHandler Type Subprograms</a> on page 169-9
<a href="#">GETUPDATEBYTECOUNT Function</a> on page 169-43	If the current operation is a byte-range write, returns the byte count	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETUPDATEBYTEOFFSET Function</a> on page 169-44	If the current operation is a byte-range write, function returns the byte offset at which the range begins	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">GETXDBEVENT Function</a> on page 169-45	Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6

**Table 169–8 (Cont.) DBMS\_XEVENT Package Subprograms**

<b>Subprogram</b>	<b>Description</b>	<b>Group</b>
<a href="#">ISNULL Functions</a> on page 169-46	Returns TRUE if input argument is NULL	<a href="#">XDBEvent Type Subprograms</a> on page 169-6 <a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-7 <a href="#">XDBHandlerList Type Subprograms</a> on page 169-8 <a href="#">XDBHandler Type Subprograms</a> on page 169-9 <a href="#">XDBPath Type Subprograms</a> on page 169-10
<a href="#">REMOVE Procedure</a> on page 169-48	Removes the specified handler from the handler list	<a href="#">XDBHandlerList Type Subprograms</a> on page 169-8
<a href="#">SETRENDERPATH Procedure</a> on page 169-49	Specifies the path of the resource that contains the rendered contents	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6
<a href="#">SETRENDERSTREAM Procedure</a> on page 169-50	sets the BLOB from which the rendered contents can be read	<a href="#">XDBRepositoryEvent Type Subprograms</a> on page 169-6

## CLEAR Procedure

this procedure clears the handler list.

**See Also:** [XDBHandlerList Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.CLEAR (  
    hl          IN OUT  XDBHandlerList);
```

### Parameters

**Table 169–9** *CLEAR Procedure Parameters*

Parameter	Description
hl	Handler list

## GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (  
    ev IN XDBRepositoryEvent)  
    RETURN XMLType;
```

### Parameters

**Table 169–10** *GETAPPLICATIONDATA Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

## GETCHILDROID Function

This function returns the OID of the resource to which the link is pointing.

**See Also:** [XDBLink Type Subprograms](#) on page 169-11 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETCHILDROID (  
    link IN XDBLink)  
RETURN RAW;
```

### Parameters

**Table 169–11** *GETCHILDROID Function Parameters*

Parameter	Description
link	Link

## GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

**See Also:** [XDBEvent Type Subprograms](#) on page 169-6 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETCURRENTUSER (  
    ev IN XDBEvent)  
    RETURN VARCHAR2;
```

### Parameters

**Table 169–12** *GETCURRENTUSER Function Parameters*

Parameter	Description
ev	Event of XDBEvent type

## GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

**See Also:** [XDBEvent Type Subprograms](#) on page 169-6 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETEVENT (  
    ev IN XDBEvent)  
RETURN XDBEventID;
```

### Parameters

**Table 169–13** *GETEVENT Function Parameters*

Parameter	Description
ev	Event of XDBEvent type

## GETFIRST Function

This function returns the first handler in the list.

**See Also:** [XDBHandlerList Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETFIRST (  
    hl IN XDBHandlerList)  
RETURN XDBHandler;
```

### Parameters

**Table 169–14** *GETFIRST Function Parameters*

Parameter	Description
hl	Handler list

## GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler. The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETHANDLERLIST (  
    ev IN XDBRepositoryEvent)  
RETURN XDBHandlerList;
```

### Parameters

**Table 169–15** *GETHANDLERLIST Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

## GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETINTERFACE (  
    ev IN XDBRepositoryEvent)  
    RETURN VARCHAR2;
```

### Parameters

**Table 169–16** *GETINTERFACE Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

## GETLANGUAGE Function

This function returns the implementation language of the handler.

**See Also:** [XDBHandler Type Subprograms](#) on page 169-9 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLANGUAGE (  
    handler IN XDBHandler)  
RETURN VARCHAR2;
```

### Parameters

**Table 169–17** GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

## GETLINK Function

This function returns an `XDBLink` object for the target resource. For a `link*` or `unlink*` event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLINK (  
    ev IN XDBRepositoryEvent)  
    RETURN XDBLink;
```

### Parameters

**Table 169–18** *GETLINK Function Parameters*

Parameter	Description
ev	Event of <code>XDBRepositoryEvent</code> type

## GETLINKNAME Function

This function returns the name of the link.

**See Also:** [XDBLink Type Subprograms](#) on page 169-11 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLINKNAME (  
    link IN XDBLink)  
RETURN VARCHAR2;
```

### Parameters

**Table 169–19** GETLINKNAME Function Parameters

Parameter	Description
link	Link

## GETLOCK Function

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLOCK (  
    ev IN XDBRepositoryEvent)  
    RETURN XDBLock;
```

### Parameters

**Table 169–20** *GETLOCK Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

## GETLANGUAGE Function

This function returns the implementation language of the handler.

**See Also:** [XDBHandler Type Subprograms](#) on page 169-9 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLANGUAGE (  
    handler IN XDBHandler)  
RETURN VARCHAR2;
```

### Parameters

**Table 169–21** GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

## GETNAME Function

This function returns the string representation of the path.

**See Also:** [XDBPath Type Subprograms](#) on page 169-10 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETNAME (  
    path IN XDBPath)  
RETURN VARCHAR2;
```

### Parameters

**Table 169–22** *GETNAME Function Parameters*

Parameter	Description
path	Path

## GETNEXT Function

This function returns the next handler in the list.

**See Also:** [XDBHandlerList Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETNEXT (  
    hl IN XDBHandlerList)  
RETURN XDBHandler;
```

### Parameters

**Table 169–23** GETNEXT Function Parameters

Parameter	Description
hl	Handler list

## GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed. This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (  
    ev IN XDBRepositoryEvent)  
RETURN XDBResource;
```

### Parameters

**Table 169–24** *GETOLDRESOURCE Function Parameters*

Parameter	Description
ev	Event of <code>XDBRepositoryEvent</code> type

## GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (  
    ev IN XDBRepositoryEvent)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 169–25** *GETOPENACCESSMODE Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

### Return Values

- XDBRepositoryEvent.OPEN\_ACCESS\_READ (value 1)
- XDBRepositoryEvent.OPEN\_ACCESS\_WRITE (value 2)
- XDBRepositoryEvent.OPEN\_ACCESS\_READ\_WRITE (value 3)

## GETOPENENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOPENENYMODE (  
    ev IN XDBRepositoryEvent)  
    RETURN PLS_INTEGER;
```

### Parameters

**Table 169–26** *GETOPENENYMODE Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

### Return Values

- XDBRepositoryEvent.OPEN\_DENY\_NONE (value 0)
- XDBRepositoryEvent.OPEN\_DENY\_READ (value 1)
- XDBRepositoryEvent.OPEN\_DENY\_READ\_WRITE (value 2)

## GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (  
    ev IN XDBRepositoryEvent)  
RETURN BLOB;
```

### Parameters

**Table 169–27** *GETOUTPUTSTREAM Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

## GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARAMETER (  
    ev    IN    XDBRepositoryEvent,  
    key   IN    VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 169–28** *GETPARAMETER Function Parameters*

Parameter	Description
<code>ev</code>	Event of <code>XDBRepositoryEvent</code> type
<code>key</code>	Supported parameters: <ul style="list-style-type: none"><li>▪ <code>ACCEPT</code></li><li>▪ <code>ACCEPT-LANGUAGE</code></li><li>▪ <code>ACCEPT-CHARSET</code></li><li>▪ <code>ACCEPT_ENCODING</code></li></ul>

## GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link\* or unlink\* event, this method returns the link's parent folder.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENT (  
    ev IN XDBRepositoryEvent)  
RETURN XDBResource;
```

### Parameters

**Table 169–29** GETPARENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## GETPARENTNAME Function

This function returns the link's parent folder's name.

**See Also:** [XDBLink Type Subprograms](#) on page 169-11 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENTNAME (  
    link IN XDBLink)  
RETURN VARCHAR2;
```

### Parameters

**Table 169–30** GETPARENTNAME Function Parameters

Parameter	Description
link	Link

## GETPARENTOID Function

This function returns the link's parent folder's OID.

**See Also:** [XDBLink Type Subprograms](#) on page 169-11 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENTOID (  
    link IN XDBLink)  
RETURN RAW;
```

### Parameters

**Table 169–31** *GETPARENTOID Function Parameters*

Parameter	Description
link	Link

## GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a NULL is returned.

**See Also:** [XDBPath Type Subprograms](#) on page 169-10 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENTPATH (  
    path    IN    XDBPath,  
    level   IN    INTEGER)  
RETURN XDBPath;
```

### Parameters

**Table 169–32** *GETPARENTPATH Function Parameters*

Parameter	Description
path	Path
level	Number of levels up the hierarchy

## GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPATH (  
    ev IN XDBRepositoryEvent)  
RETURN XDBPath;
```

### Parameters

**Table 169–33** *GETPATH Function Parameters*

Parameter	Description
ev	Event of <code>XDBRepositoryEvent</code> type

## GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a `link*` or `unlink*` event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETRESOURCE (
    ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

### Parameters

**Table 169–34** *GETRESOURCE Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

## GETSCHEMA Function

This function returns the schema of the handler's source.

**See Also:** [XDBHandler Type Subprograms](#) on page 169-9 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETSCHEMA (  
    handler IN XDBHandler)  
RETURN VARCHAR2;
```

### Parameters

**Table 169–35** GETSCHEMA Function Parameters

Parameter	Description
handler	Handler

## GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

**See Also:** [XDBHandler Type Subprograms](#) on page 169-9 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETSOURCE (  
    handler IN XDBHandler)  
RETURN VARCHAR2;
```

### Parameters

**Table 169–36** *GETSOURCE Function Parameters*

Parameter	Description
handler	Handler

## GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the function returns the byte count. It is only valid for the inconsistent-update event.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (  
    ev IN XDBRepositoryEvent)  
RETURN NUMBER;
```

### Parameters

**Table 169–37** *GETUPDATEBYTECOUNT Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

## GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (  
    ev IN XDBRepositoryEvent)  
RETURN NUMBER;
```

### Parameters

**Table 169–38** *GETUPDATEBYTEOFFSET Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

## GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETXDBEVENT (
    ev IN XDBRepositoryEvent)
RETURN XDBEvent;
```

### Parameters

**Table 169–39** *GETXDBEVENT Function Parameters*

Parameter	Description
ev	Event of <code>XDBRepositoryEvent</code> type

## ISNULL Functions

This function returns TRUE if input argument is NULL.

### See Also:

- [XDBEvent Type Subprograms](#) on page 169-6 for other subprograms in this group
- [XDBRepositoryEvent Type Subprograms](#) on page 169-7 for other subprograms in this group
- [XDBHandlerList Type Subprograms](#) on page 169-8 for other subprograms in this group
- [XDBHandler Type Subprograms](#) on page 169-9 for other subprograms in this group
- [XDBPath Type Subprograms](#) on page 169-10 for other subprograms in this group
- [XDBLink Type Subprograms](#) on page 169-11 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.ISNULL (
  ev          IN  XDBEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
  ev          IN  XDBRepositoryEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
  hl          IN  XDBHandlerList)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
  handler     IN  XDBHandler)
RETURN BOOLEAN;
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
  path       IN  XDBPath)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
  link       IN  XDBLink)
RETURN BOOLEAN;
```

### Parameters

**Table 169–40 ISNULL Function Parameters**

Parameter	Description
ev	Event of specified type
hl	Handler list
handler	Handler

**Table 169-40 (Cont.) ISNULL Function Parameters**

<b>Parameter</b>	<b>Description</b>
path	Path

## REMOVE Procedure

This procedure removes the specified handler from the handler list.

**See Also:** [XDBHandlerList Type Subprograms](#) on page 169-7 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.REMOVE (  
    hl          IN OUT  XDBHandlerList,  
    handler    IN      XDBHandler);
```

### Parameters

**Table 169–41 REMOVE Procedure Parameters**

Parameter	Description
hl	Handler list
handler	Handler

## SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents. This should not be called after the stream returned by [GETOUTPUTSTREAM Function](#) is written to or after the [SETRENDERSTREAM Procedure](#) is called; doing so will result in an error. This is only valid for the render event.

### Syntax

```
DBMS_XEVENT.SETRENDERPATH (  
    ev      IN    XDBRepositoryEvent,  
    path   IN    VARCHAR2);
```

### Parameters

**Table 169–42** *SETRENDERPATH Procedure Parameters*

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

## SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read. This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

### Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (  
    ev    IN    XDBRepositoryEvent,  
    istr  IN    BLOB);
```

### Parameters

**Table 169–43** SETRENDERSTREAM Procedure Parameters

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

The DBMS\_XMLDOM package is used to access XMLType objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

**See Also:** *Oracle XML Developer's Kit Programmer's Guide*

## Using DBMS\_XMLDOM

---

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Exceptions](#)
- [Subprogram Groups](#)

## Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated. In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

**Note:**

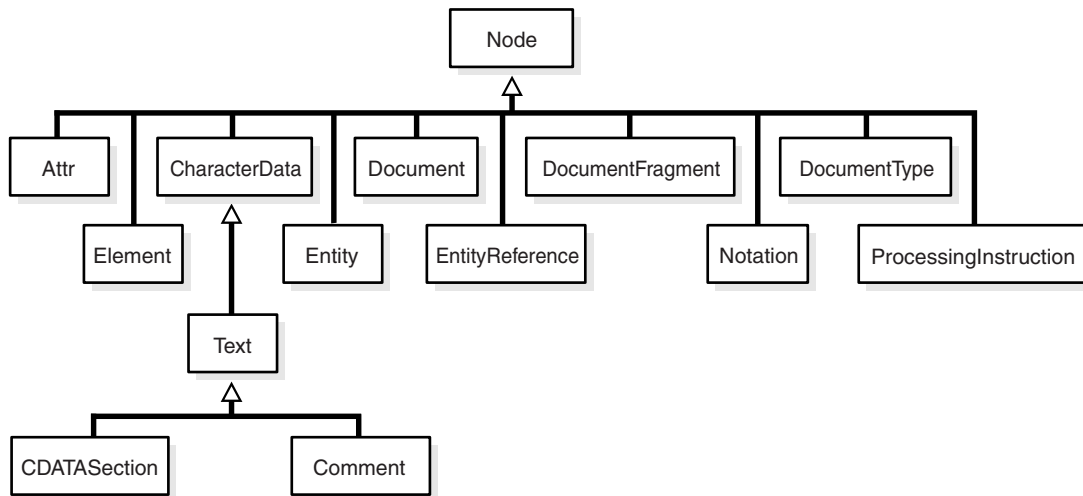

- Before database startup, the read-from and write-to directories in the `init.ORA` file must be specified; for example: `UTL_FILE_DIR=/mypath/insidemypath`.
- Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM `Node` type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform [APPENDCHILD Function](#) on a `DOMNode n`, the [APPENDCHILD Function](#) PL/SQL function on page 170-42 is provided.
- To perform `setAttribute` on a `DOMElement elem` [SETATTRIBUTE Procedures](#), use PL/SQL procedure on page 170-142.

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see [Figure 170-1](#)). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `makeXXX` functions, where `DOMXXX` is the desired DOM type.

**Figure 170–1 Inheritance Diagram for DOM Types**

This is a text description of arpls010.gif. This figure provides a graphical representation of inheritance-type relationship between DOM types; methods defined on the supertype should be available on the subtype. Description of the inheritance structure follows:

1. Attr, CharacterData, Document, DocumentFragment, DocumentType, Element, Entity, EntityReference, Notation, and ProcessingInstruction are all subtypes of Node
2. Text is a subtype of CharacterData
3. CDATASection and Comment are subtypes of Text

\*\*\*\*\*

The implementation of this interface follows the REC-DOM-Level-1-19981001.

## Security Model

Owned by XDB, the DBMS\_XMLDOM package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## Constants

Defined constants of DBMS\_XMLDOM are listed in [Table 170-1](#).

**Table 170-1** *Defined Constants for DBMS\_XMLDOM*

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDATA section.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

## Types

The following types for `DBMS_XMLDOM.DOMTYPE` are defined in [Table 170–2](#):

**Table 170–2 XDB\_XMLDOM Types**

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDATASection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.
DOMDOCUMENT	Implements the DOM Document interface.
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

## Exceptions

The exceptions listed in [Table 170–3](#) are defined for DBMS\_XMLDOM:

**Table 170–3** *Exceptions for DBMS\_XMLDOM*

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

---

## Subprogram Groups

DBMS\_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- [DOMNode Subprograms](#) on page 170-11
- [DOMAttr Subprograms](#) on page 170-13
- [DOMCDATASection Subprograms](#) on page 170-14
- [DOMCharacterData Subprograms](#) on page 170-15
- [DOMComment Subprograms](#) on page 170-16
- [DOMDocument Subprograms](#) on page 170-17
- [DOMDocumentFragment Subprograms](#) on page 170-19
- [DOMDocumentType Subprograms](#) on page 170-20
- [DOMElement Subprograms](#) on page 170-21
- [DOMEntity Subprograms](#) on page 170-22
- [DOMEntityReference Subprograms](#) on page 170-23
- [DOMImplementation Subprograms](#) on page 170-24
- [DOMNamedNodeMap Subprograms](#) on page 170-25
- [DOMNodeList Subprograms](#) on page 170-26
- [DOMNotation Subprograms](#) on page 170-27
- [DOMProcessingInstruction Subprograms](#) on page 170-28
- [DOMText Subprograms](#) on page 170-29

## DOMNode Subprograms

**Table 170–4 Summary of DOMNode Subprograms; DBMS\_XMLDOM**

Subprogram	Description
<a href="#">ADOPTNODE Function</a> on page 170-41	Adopts a node from another document
<a href="#">APPENDCHILD Function</a> on page 170-42	Appends a new child to the node
<a href="#">CLONENODE Function</a> on page 170-44	Clones the node
<a href="#">FREENODE Procedure</a> on page 170-60	Frees all resources associated with the node
<a href="#">GETATTRIBUTES Function</a> on page 170-64	Retrieves the attributes of the node
<a href="#">GETCHILDNODES Function</a> on page 170-66	Retrieves the children of the node
<a href="#">GETEXPANDEDNAME Procedure and Functions</a> on page 170-73	Retrieves the expanded name of the node
<a href="#">GETFIRSTCHILD Function</a> on page 170-74	Retrieves the first child of the node
<a href="#">GETLASTCHILD Function</a> on page 170-76	Retrieves the last child of the node
<a href="#">GETLOCALNAME Procedure and Functions</a> on page 170-78	Retrieves the local part of the qualified name
<a href="#">GETNAMESPACE Procedure and Functions</a> on page 170-81	Retrieves the node's namespace URI
<a href="#">GETNEXTSIBLING Function</a> on page 170-82	Retrieves the next sibling of the node
<a href="#">GETNODENAME Function</a> on page 170-84	Retrieves the Name of the Node
<a href="#">GETNODETYPE Function</a> on page 170-83	Retrieves the Type of the node
<a href="#">GETNODEVALUE Function</a> on page 170-85	Retrieves the Value of the Node
<a href="#">GETNODEVALUEASBINARYSTREAM Function &amp; Procedure</a> on page 170-86	Retrieves Node Value as binary stream
<a href="#">GETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</a> on page 170-87	Retrieves Node Value as character stream
<a href="#">GETOWNERDOCUMENT Function</a> on page 170-91	Retrieves the owner document of the node
<a href="#">GETPARENTNODE Function</a> on page 170-93	Retrieves the parent of this node
<a href="#">GETPREFIX Function</a> on page 170-94	Retrieves the namespace prefix
<a href="#">GETPREVIOUSIBLING Function</a> on page 170-95	Retrieves the previous sibling of the node
<a href="#">GETSCHEMANODE Function</a> on page 170-98	Retrieves the associated schema URI
<a href="#">HASATTRIBUTES Function</a> on page 170-107	Tests if the node has attributes
<a href="#">HASCHILDNODES Function</a> on page 170-108	Tests if the node has child nodes
<a href="#">IMPORTNODE Function</a> on page 170-110	Imports a node from another document
<a href="#">INSERTBEFORE Function</a> on page 170-111	Inserts a child before the reference child
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the node is NULL
<a href="#">MAKEATTR Function</a> on page 170-117	Casts the node to an Attribute
<a href="#">MAKECDATASECTION Function</a> on page 170-118	Casts the node to a CData Section

**Table 170–4 (Cont.) Summary of DOMNode Subprograms; DBMS\_XMLDOM**

<b>Subprogram</b>	<b>Description</b>
<a href="#">MAKECHARACTERDATA Function</a> on page 170-119	Casts the node to Character Data
<a href="#">MAKECOMMENT Function</a> on page 170-120	Casts the node to a Comment
<a href="#">MAKEDOCUMENT Function</a> on page 170-121	Casts the node to a DOM Document
<a href="#">MAKEDOCUMENTFRAGMENT Function</a> on page 170-122	Casts the node to a DOM Document Fragment
<a href="#">MAKEDOCUMENTTYPE Function</a> on page 170-123	Casts the node to a DOM Document Type
<a href="#">MAKEELEMENT Function</a> on page 170-124	Casts the node to a DOM Element
<a href="#">MAKEENTITY Function</a> on page 170-125	Casts the node to a DOM Entity
<a href="#">MAKEENTITYREFERENCE Function</a> on page 170-126	Casts the node to a DOM Entity Reference
<a href="#">MAKENOTATION Function</a> on page 170-130	Casts the node to a DOM Notation
<a href="#">MAKEPROCESSINGINSTRUCTION Function</a> on page 170-131	Casts the node to a DOM Processing Instruction
<a href="#">MAKETEXT Function</a> on page 170-132	Casts the node to a DOM Text
<a href="#">REMOVECHILD Function</a> on page 170-137	Removes a specified child from a node
<a href="#">REPLACECHILD Function</a> on page 170-139	Replaces the old child with a new child
<a href="#">SETNODEVALUE Procedure</a> on page 170-148	Sets the Value of the node
<a href="#">SETNODEVALUEASBINARYSTREAM Function &amp; Procedure</a> on page 170-149	Sets the Node Value as binary stream
<a href="#">SETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</a> on page 170-150	Sets the Node Value as a character stream
<a href="#">SETPREFIX Procedure</a> on page 170-151	Sets the namespace prefix
<a href="#">USEBINARYSTREAM Function</a> on page 170-157	Establishes that the stream is valid
<a href="#">WRITETOBUFFER Procedures</a> on page 170-158	Writes the contents of the node to a buffer
<a href="#">WRITETOCLOB Procedures</a> on page 170-159	Writes the contents of the node to a CLOB
<a href="#">WRITETOFILE Procedures</a> on page 170-160	Writes the contents of the node to a file

## DOMAttr Subprograms

**Table 170–5 Summary of DOMAttr Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">GETEXPANDEDNAME Procedure and Functions</a> on page 170-73	Retrieves the expanded name of the attribute
<a href="#">GETLOCALNAME Procedure and Functions</a> on page 170-78	Retrieves the local name of the attribute
<a href="#">GETNAME Functions</a> on page 170-79	Retrieves the name of the attribute
<a href="#">GETNAMESPACE Procedure and Functions</a> on page 170-81	Retrieves the NS URI of the attribute
<a href="#">GETOWNERELEMENT Function</a> on page 170-92	Retrieves the Element node, parent of the attribute
<a href="#">GETQUALIFIEDNAME Functions</a> on page 170-97	Retrieves the Qualified Name of the attribute
<a href="#">GETSPECIFIED Function</a> on page 170-99	Tests if attribute was specified in the element
<a href="#">GETVALUE Function</a> on page 170-103	Retrieves the value of the attribute
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the Attribute node is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the Attribute to a node
<a href="#">SETVALUE Procedure</a> on page 170-153	Sets the value of the attribute

## DOMCDataSection Subprograms

**Table 170–6 Summary of DOMCdata Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the CDataSection is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the CDataSection to a node

## DOMCharacterData Subprograms

**Table 170–7 Summary of DOMCharacterData Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">APPENDDATA Procedure</a> on page 170-43	Appends the specified data to the node data
<a href="#">DELETEDATA Procedure</a> on page 170-54	Deletes the data from the specified offSets
<a href="#">GETDATA Functions</a> on page 170-68	Retrieves the data of the node
<a href="#">GETLENGTH Functions</a> on page 170-77	Retrieves the length of the data
<a href="#">INSERTDATA Procedure</a> on page 170-112	Inserts the data in the node at the specified offSets
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the CharacterData is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the CharacterData to a node
<a href="#">REPLACEDATA Procedure</a> on page 170-140	Changes a range of characters in the node
<a href="#">SETDATA Procedures</a> on page 170-145	Sets the data to the node
<a href="#">SUBSTRINGDATA Function</a> on page 170-156	Retrieves the substring of the data

## DOMComment Subprograms

**Table 170–8 Summary of DOMComment Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the comment is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the Comment to a node

## DOMDocument Subprograms

**Table 170–9 Summary of DOMDocument Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">CREATEATTRIBUTE Functions</a> on page 170-45	Creates an Attribute
<a href="#">CREATEDATASECTION Function</a> on page 170-46	Creates a <code>CDataSection</code> node
<a href="#">CREATECOMMENT Function</a> on page 170-47	Creates a Comment node
<a href="#">CREATEDOCUMENT Function</a> on page 170-48	Creates a new Document
<a href="#">CREATEDOCUMENTFRAGMENT Function</a> on page 170-49	Creates a new Document Fragment
<a href="#">CREATEELEMENT Functions</a> on page 170-50	Creates a new Element
<a href="#">CREATEENTITYREFERENCE Function</a> on page 170-51	Creates an Entity reference
<a href="#">CREATEPROCESSINGINSTRUCTION Function</a> on page 170-52	Creates a Processing Instruction
<a href="#">CREATETEXTNODE Function</a> on page 170-53	Creates a Text node
<a href="#">FREEDOCFRAG Procedure</a> on page 170-57	Frees the document fragment
<a href="#">FREEDOCUMENT Procedure</a> on page 170-58	Frees the document
<a href="#">GETCHARSET Function</a> on page 170-65	Retrieves the character set of the DOM document
<a href="#">GETDOCTYPE Function</a> on page 170-69	Retrieves the DTD of the document
<a href="#">GETDOCUMENTELEMENT Function</a> on page 170-70	Retrieves the root element of the document
<a href="#">GETELEMENTSBYTAGNAME Functions</a> on page 170-71	Retrieves <ul style="list-style-type: none"> <li>■ the elements in the DOMNODELIST by tag name</li> <li>■ elements in the subtree of a DOMNODELIST by tagname</li> </ul>
<a href="#">GETIMPLEMENTATION Function</a> on page 170-75	Retrieves the DOM implementation
<a href="#">GETSTANDALONE Function</a> on page 170-100	Retrieves the standalone property of the document
<a href="#">GETVERSION Function</a> on page 170-104	Retrieves the version of the document
<a href="#">GETXMLTYPE Function</a> on page 170-105	Retrieves the <code>XMLType</code> associated with the DOM Document
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the document is <code>NULL</code>
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the document to a node
<a href="#">NEWDOMDOCUMENT Functions</a> on page 170-133	Creates a new document
<a href="#">SETCHARSET Procedure</a> on page 170-144	Sets the character set of the DOM document
<a href="#">SETDOCTYPE Procedure</a> on page 170-146	Sets the DTD of the document

**Table 170–9 (Cont.) Summary of DOMDocument Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">SETSTANDALONE Procedure</a> on page 170-152	Sets the standalone property of the document
<a href="#">SETVERSION Procedure</a> on page 170-154	Sets the version of the document
<a href="#">WRITETOBUFFER Procedures</a> on page 170-158	Writes the document to a buffer
<a href="#">WRITETOCLOB Procedures</a> on page 170-159	Writes the document to a CLOB
<a href="#">WRITETOFILE Procedures</a> on page 170-160	Writes the document to a file

## DOMDocumentFragment Subprograms

**Table 170–10 Summary of DOMDocumentFragment Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">FREEDOCFRAG Procedure</a> on page 170-57	Frees the specified document fragment
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the DocumentFragment is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the Document Fragment to a node
<a href="#">WRITETOBUFFER Procedures</a> on page 170-158	Writes the contents of a document fragment into a buffer

## DOMDocumentType Subprograms

**Table 170–11 Summary of DOMDocumentType Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">FINDENTITY Function</a> on page 170-55	Finds the specified entity in the document type
<a href="#">FINDNOTATION Function</a> on page 170-56	Finds the specified notation in the document type
<a href="#">GETENTITIES Function</a> on page 170-72	Retrieves the nodemap of entities in the Document type
<a href="#">GETNAME Functions</a> on page 170-79	Retrieves the name of the Document type
<a href="#">GETNOTATIONS Function</a> on page 170-89	Retrieves the nodemap of the notations in the Document type
<a href="#">GETPUBLICID Functions</a> on page 170-96	Retrieves the public ID of the document type
<a href="#">GETSYSTEMID Functions</a> on page 170-101	Retrieves the system ID of the document type
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the Document Type is <code>NULL</code>
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the document type to a node

## DOMElement Subprograms

**Table 170–12 Summary of DOMElement Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">FREEELEMENT Procedure</a> on page 170-59	Frees memory allocated to a DOMElement handle
<a href="#">GETATTRIBUTE Functions</a> on page 170-62	Retrieves the attribute node by name
<a href="#">GETATTRIBUTENODE Functions</a> on page 170-63	Retrieves the attribute node by name
<a href="#">GETCHILDRENBYTAGNAME Functions</a> on page 170-67	Retrieves children of the element by tag name
<a href="#">GETELEMENTSBYTAGNAME Functions</a> on page 170-71	Retrieves <ul style="list-style-type: none"> <li>▪ the elements in the DOMNODELIST by tag name</li> <li>▪ elements in the subtree of a DOMNODELIST by tagname</li> </ul>
<a href="#">GETEXPANDEDNAME Procedure and Functions</a> on page 170-73	Retrieves the expanded name of the element
<a href="#">GETLOCALNAME Procedure and Functions</a> on page 170-78	Retrieves the local name of the element
<a href="#">GETNAMESPACE Procedure and Functions</a> on page 170-81	Retrieves the NS URI of the element
<a href="#">GETQUALIFIEDNAME Functions</a> on page 170-97	Retrieves the qualified name of the element
<a href="#">GETTAGNAME Function</a> on page 170-102	Retrieves the Tag name of the element
<a href="#">HASATTRIBUTE Functions</a> on page 170-106	Tests if an attribute exists
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the Element is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the Element to a node
<a href="#">NORMALIZE Procedure</a> on page 170-134	Normalizes the text children of the element
<a href="#">REMOVEATTRIBUTE Procedures</a> on page 170-135	Removes the attribute specified by the name
<a href="#">REMOVEATTRIBUTENODE Function</a> on page 170-136	Removes the attribute node in the element
<a href="#">RESOLVENAMESPACEPREFIX Function</a> on page 170-141	Resolve the prefix to a namespace URI
<a href="#">SETATTRIBUTE Procedures</a> on page 170-142	Sets the attribute specified by the name
<a href="#">SETATTRIBUTENODE Functions</a> on page 170-143	Sets the attribute node in the element

## DOMEntity Subprograms

**Table 170–13 Summary of DOMEntity Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">GETNOTATIONNAME Function</a> on page 170-88	Retrieves the notation name of the entity
<a href="#">GETPUBLICID Functions</a> on page 170-96	Retrieves the public Id of the entity
<a href="#">GETSYSTEMID Functions</a> on page 170-101	Retrieves the system Id of the entity
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the Entity is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the Entity to a node

## DOMEntityReference Subprograms

**Table 170–14 Summary of DOMEntityReference Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the DOMEntityReference is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the DOMEntityReference to NULL

## DOMImplementation Subprograms

**Table 170–15** Summary of DOMImplementation Subprograms; DBMS\_XMLDOM

Method	Description
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the DOMImplementation node is NULL
<a href="#">HASFEATURE Function</a> on page 170-109	Tests if the DOMImplementation implements a feature

## DOMNamedNodeMap Subprograms

**Table 170–16** Summary of DOMNamedNodeMap Subprograms; DBMS\_XMLDOM

Method	Description
<a href="#">GETLENGTH Functions</a> on page 170-77	Retrieves the number of items in the map
<a href="#">GETNAMEDITEM Function</a> on page 170-80	Retrieves the item specified by the name
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the NamedNodeMap is NULL
<a href="#">ITEM Functions</a> on page 170-116	Retrieves the item given the index in the map
<a href="#">REMOVENAMEDITEM Function</a> on page 170-138	Removes the item specified by name
<a href="#">SETNAMEDITEM Function</a> on page 170-147	Sets the item in the map specified by the name

## DOMNodeList Subprograms

**Table 170–17 Summary of DOMNodeList Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">FREENODELIST Procedure</a> on page 170-61	Frees all resources associated with a nodelist
<a href="#">GETLENGTH Functions</a> on page 170-77	Retrieves the number of items in the list
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the <code>NodeList</code> is <code>NULL</code>
<a href="#">ITEM Functions</a> on page 170-116	Retrieves the item given the index in the list

## DOMNotation Subprograms

**Table 170–18 Summary of DOMNotation Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">GETPUBLICID Functions</a> on page 170-96	Retrieves the public Id of the notation
<a href="#">GETSYSTEMID Functions</a> on page 170-101	Retrieves the system Id of the notation
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the Notation is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the notation to a node

## DOMProcessingInstruction Subprograms

**Table 170–19 Summary of DOMProcessingInstruction Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">GETDATA Functions</a> on page 170-68	Retrieves the data of the processing instruction
<a href="#">GETTARGET Function</a> on page 170-90	Retrieves the target of the processing instruction
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the Processing Instruction is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the Processing Instruction to a node
<a href="#">SETDATA Procedures</a> on page 170-145	Sets the data of the processing instruction

## DOMText Subprograms

**Table 170–20 Summary of DOMText Subprograms; DBMS\_XMLDOM**

<b>Method</b>	<b>Description</b>
<a href="#">ISNULL Functions</a> on page 170-113	Tests if the text is NULL
<a href="#">MAKENODE Functions</a> on page 170-127	Casts the text to a node
<a href="#">SPLITTEXT Function</a> on page 170-155	Splits the contents of the text node into 2 text nodes

## Summary of DBMS\_XMLDOM Subprograms

**Table 170–21 Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">ADOPTNODE Function</a> on page 170-41	Adopts a node from another document	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">APPENDCHILD Function</a> on page 170-42	Appends a new child to the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">APPENDDATA Procedure</a> on page 170-43	Appends the specified data to the node data	<a href="#">DOMCharacterData Subprograms</a> on page 170-15
<a href="#">CLONENODE Function</a> on page 170-44	Clones the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">CREATEATTRIBUTE Functions</a> on page 170-45	Creates an Attribute	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">CREATECDATASECTION Function</a> on page 170-46	Creates a CDataSection node	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">CREATECOMMENT Function</a> on page 170-47	Creates a Comment node	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">CREATEDOCUMENT Function</a> on page 170-48	Creates a new Document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">CREATEDOCUMENTFRAGMENT Function</a> on page 170-49	Creates a new Document Fragment	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">CREATEELEMENT Functions</a> on page 170-50	Creates a new Element	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">CREATEENTITYREFERENCE Function</a> on page 170-51	Creates an Entity reference	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">CREATEPROCESSINGINSTRUCTION Function</a> on page 170-52	Creates a Processing Instruction	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">CREATETEXTNODE Function</a> on page 170-53	Creates a Text node	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">DELETEDATA Procedure</a> on page 170-54	Deletes the data from the specified offSets	<a href="#">DOMCharacterData Subprograms</a> on page 170-15
<a href="#">FINDENTITY Function</a> on page 170-55	Finds the specified entity in the document type	<a href="#">DOMDocumentType Subprograms</a> on page 170-20
<a href="#">FINDNOTATION Function</a> on page 170-56	Finds the specified notation in the document type	<a href="#">DOMDocumentType Subprograms</a> on page 170-20

**Table 170–21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

<b>Subprogram</b>	<b>Description</b>	<b>Group</b>
<a href="#">FREEDOCFRAG Procedure</a> on page 170-57	Frees the document fragment	<a href="#">DOMDocument Subprograms</a> on page 170-17 and <a href="#">DOMDocumentFragment Subprograms</a> on page 170-19
<a href="#">FREEDOCUMENT Procedure</a> on page 170-58	Frees the document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">FREEELEMENT Procedure</a> on page 170-59	Frees memory allocated to a DOMELEMENT handle	<a href="#">DOMELEMENT Subprograms</a> on page 170-21
<a href="#">FREENODE Procedure</a> on page 170-60	Frees all resources associated with the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">FREENODELIST Procedure</a> on page 170-61	Frees all resources associated with a nodelist	<a href="#">DOMNodeList Subprograms</a> on page 170-26
<a href="#">GETATTRIBUTE Functions</a> on page 170-62	Retrieves the attribute node by name	<a href="#">DOMELEMENT Subprograms</a> on page 170-21
<a href="#">GETATTRIBUTENODE Functions</a> on page 170-63	Retrieves the attribute node by name	<a href="#">DOMELEMENT Subprograms</a> on page 170-21
<a href="#">GETATTRIBUTES Function</a> on page 170-64	Retrieves the attributes of the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETCHARSET Function</a> on page 170-65	Retrieves the charset of the DOM document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">GETCHILDNODES Function</a> on page 170-66	Retrieves the children of the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETCHILDRENBYTAGNAME Functions</a> on page 170-67	Retrieves children of the element by tag name	<a href="#">DOMCharacterData Subprograms</a> on page 170-15
<a href="#">GETDATA Functions</a> on page 170-68	Retrieves <ul style="list-style-type: none"> <li>■ the data of the node</li> <li>■ the data of the processing instruction</li> </ul>	<ul style="list-style-type: none"> <li>■ <a href="#">DOMCharacterData Subprograms</a> on page 170-15</li> <li>■ <a href="#">DOMProcessingInstruction Subprograms</a> on page 170-28</li> </ul>
<a href="#">GETDOCTYPE Function</a> on page 170-69	Retrieves the DTD of the document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">GETDOCUMENTELEMENT Function</a> on page 170-70	Retrieves the root element of the document	<a href="#">DOMDocument Subprograms</a> on page 170-17

**Table 170–21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">GETELEMENTSBYTAGNAME Functions</a> on page 170-71	Retrieves <ul style="list-style-type: none"> <li>the elements in the DOMNODELIST by tag name</li> <li>elements in the subtree of a DOMNODELIST by tagname</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMDocument Subprograms</a> on page 170-17</li> <li><a href="#">DOMEElement Subprograms</a> on page 170-21</li> </ul>
<a href="#">GETENTITIES Function</a> on page 170-72	Retrieves the nodemap of entities in the Document type	<a href="#">DOMDocumentType Subprograms</a> on page 170-20
<a href="#">GETEXPANDEDNAME Procedure and Functions</a> on page 170-73	Retrieves <ul style="list-style-type: none"> <li>the expanded name of the node</li> <li>the expanded name of the attribute</li> <li>the expanded name of the element</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a> on page 170-11</li> <li><a href="#">DOMAttr Subprograms</a> on page 170-13</li> <li><a href="#">DOMEElement Subprograms</a> on page 170-21</li> </ul>
<a href="#">GETFIRSTCHILD Function</a> on page 170-74	Retrieves the first child of the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETIMPLEMENTATION Function</a> on page 170-75	Retrieves the DOM implementation	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">GETLASTCHILD Function</a> on page 170-76	Retrieves the last child of the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETLENGTH Functions</a> on page 170-77	Retrieves <ul style="list-style-type: none"> <li>the length of the data</li> <li>the number of items in the map</li> <li>the number of items in the list</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMCharacterData Subprograms</a> on page 170-15</li> <li><a href="#">DOMNamedNodeMap Subprograms</a> on page 170-25</li> <li><a href="#">DOMNodeList Subprograms</a> on page 170-26</li> </ul>
<a href="#">GETLOCALNAME Procedure and Functions</a> on page 170-78	Retrieves <ul style="list-style-type: none"> <li>the local part of the qualified name</li> <li>the local name of the attribute</li> <li>the local name of the element</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a> on page 170-11</li> <li><a href="#">DOMAttr Subprograms</a> on page 170-13</li> <li><a href="#">DOMEElement Subprograms</a> on page 170-21</li> </ul>
<a href="#">GETNAME Functions</a> on page 170-79	Retrieves <ul style="list-style-type: none"> <li>the name of the attribute</li> <li>the name of the Document type</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMAttr Subprograms</a> on page 170-13</li> <li><a href="#">DOMDocumentType Subprograms</a> on page 170-20</li> </ul>

**Table 170–21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">GETNAMEDITEM Function</a> on page 170-80	Retrieves <ul style="list-style-type: none"> <li>▪ an item specified by name</li> <li>▪ and namespace URI on page 170-25)</li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">DOMNamedNodeMap Subprograms</a> on page 170-25</li> <li>▪ <a href="#">DOMNamedNodeMap Subprograms</a></li> </ul>
<a href="#">GETNAMESPACE Procedure and Functions</a> on page 170-81	Retrieves <ul style="list-style-type: none"> <li>▪ the node's namespace URI</li> <li>▪ the NS URI of the attribute</li> <li>▪ the NS URI of the element</li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">DOMNode Subprograms</a> on page 170-11</li> <li>▪ <a href="#">DOMAttr Subprograms</a> on page 170-13</li> <li>▪ <a href="#">DOMELEMENT Subprograms</a> on page 170-21</li> </ul>
<a href="#">GETNEXTSIBLING Function</a> on page 170-82	Retrieves the next sibling of the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETNODENAME Function</a> on page 170-84	Retrieves the Name of the Node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETNODETYPE Function</a> on page 170-83	Retrieves the Type of the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETNODEVALUE Function</a> on page 170-85	Retrieves the Value of the Node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETNODEVALUEASBINARY STREAM Function &amp; Procedure</a> on page 170-86	Retrieves the Node Value as binary stream	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</a> on page 170-87	Retrieves the Node Value as character stream	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETNOTATIONNAME Function</a> on page 170-88	Retrieves the notation name of the entity	<a href="#">DOMEntity Subprograms</a> on page 170-22
<a href="#">GETNOTATIONS Function</a> on page 170-89	Retrieves the nodemap of the notations in the Document type	<a href="#">DOMDocumentType Subprograms</a> on page 170-20
<a href="#">GETTARGET Function</a> on page 170-90	Retrieves the target of the processing instruction	<a href="#">DOMProcessingInstruction Subprograms</a> on page 170-28
<a href="#">GETOWNERDOCUMENT Function</a> on page 170-91	Retrieves the owner document of the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETOWNERELEMENT Function</a> on page 170-92	Retrieves the Element node, parent of the attribute	<a href="#">DOMAttr Subprograms</a> on page 170-13
<a href="#">GETPARENTNODE Function</a> on page 170-93	Retrieves the parent of this node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETPREFIX Function</a> on page 170-94	Retrieves the namespace prefix )	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETPREVIOUSIBLING Function</a> on page 170-95	Retrieves the previous sibling of the node	<a href="#">DOMNode Subprograms</a> on page 170-11

**Table 170–21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">GETPUBLICID Functions</a> on page 170-96	Retrieves <ul style="list-style-type: none"> <li>▪ the public ID of the document type</li> <li>▪ the public Id of the entity</li> <li>▪ the public Id of the notation</li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">DOMDocumentType Subprograms</a> on page 170-20</li> <li>▪ <a href="#">DOMEntity Subprograms</a> on page 170-22</li> <li>▪ <a href="#">DOMNotation Subprograms</a> on page 170-27</li> </ul>
<a href="#">GETQUALIFIEDNAME Functions</a> on page 170-97	Retrieves <ul style="list-style-type: none"> <li>▪ the Qualified Name of the attribute</li> <li>▪ the qualified name of the element</li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">DOMAttr Subprograms</a> on page 170-13</li> <li>▪ <a href="#">DOMElement Subprograms</a> on page 170-21</li> </ul>
<a href="#">GETSCHEMANODE Function</a> on page 170-98	Retrieves the associated schema URI	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">GETSPECIFIED Function</a> on page 170-99	Tests if attribute was specified in the element.	<a href="#">DOMAttr Subprograms</a> on page 170-13
<a href="#">GETSTANDALONE Function</a> on page 170-100	Retrieves the standalone property of the document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">GETSYSTEMID Functions</a> on page 170-101	Retrieves <ul style="list-style-type: none"> <li>▪ the system ID of the document type</li> <li>▪ the system Id of the entity</li> <li>▪ the system Id of the notation</li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">DOMDocumentType Subprograms</a> on page 170-20</li> <li>▪ <a href="#">DOMEntity Subprograms</a> on page 170-22</li> <li>▪ <a href="#">DOMNotation Subprograms</a> on page 170-27</li> </ul>
<a href="#">GETTAGNAME Function</a> on page 170-102	Retrieves the Tag name of the element	<a href="#">DOMElement Subprograms</a> on page 170-21
<a href="#">GETVALUE Function</a> on page 170-103	Retrieves the value of the attribute	<a href="#">DOMAttr Subprograms</a> on page 170-13
<a href="#">GETVERSION Function</a> on page 170-104	Retrieves the version of the document	<a href="#">DOMDocument Subprograms</a> on page 170-17)
<a href="#">GETXMLTYPE Function</a> on page 170-105	Retrieves the XMLType associated with the DOM Document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">HASATTRIBUTES Function</a> on page 170-107	Tests if the node has attributes	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">HASATTRIBUTE Functions</a> on page 170-106	Tests if an attribute exists	<a href="#">DOMElement Subprograms</a> on page 170-21
<a href="#">HASCHILDNODES Function</a> on page 170-108	Tests if the node has child nodes	<a href="#">DOMNode Subprograms</a> on page 170-11

**Table 170–21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

<b>Subprogram</b>	<b>Description</b>	<b>Group</b>
<a href="#">HASFEATURE Function</a> on page 170-109	Tests if the DOMImplementation implements a feature	<a href="#">DOMImplementation Subprograms</a> on page 170-24
<a href="#">IMPORTNODE Function</a> on page 170-110	Imports a node from another document	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">INSERTBEFORE Function</a> on page 170-111	Inserts a child before the reference child	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">INSERTDATA Procedure</a> on page 170-112	Inserts the data in the node at the specified offSets	<a href="#">DOMCharacterData Subprograms</a> on page 170-15

<a href="#">MAKETEXT Function</a> on page 170-132	Casts the node to a DOM Text	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">NEWDOMDOCUMENT Functions</a> on page 170-133	Creates a new document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">NORMALIZE Procedure</a> on page 170-134	Normalizes the text children of the element	<a href="#">DOMElement Subprograms</a> on page 170-21

**Table 170–21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">REMOVEATTRIBUTE Procedures</a> on page 170-135	Removes the attribute specified by the name	<a href="#">DOMElement Subprograms</a> on page 170-21
<a href="#">REMOVEATTRIBUTENODE Function</a> on page 170-136	Removes the attribute node in the element	<a href="#">DOMElement Subprograms</a> on page 170-21
<a href="#">REMOVECHILD Function</a> on page 170-137	Removes a specified child from a node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">REMOVENAMEDITEM Function</a> on page 170-138	Removes the item specified by name	<a href="#">DOMNamedNodeMap Subprograms</a> on page 170-25
<a href="#">REPLACECHILD Function</a> on page 170-139	Replaces the old child with a new child	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">REPLACEDATA Procedure</a> on page 170-140	Changes a range of characters in the node	<a href="#">DOMCharacterData Subprograms</a> on page 170-15
<a href="#">RESOLVENAMESPACEPREFIX Function</a> on page 170-141	Resolve the prefix to a namespace URI	<a href="#">DOMElement Subprograms</a> on page 170-21
<a href="#">SETATTRIBUTE Procedures</a> on page 170-142	Sets the attribute specified by the name	<a href="#">DOMElement Subprograms</a> on page 170-21
<a href="#">SETATTRIBUTENODE Functions</a> on page 170-143	Sets the attribute node in the element	<a href="#">DOMElement Subprograms</a> on page 170-21
<a href="#">SETCHARSET Procedure</a> on page 170-144	Sets the character set of the DOM document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">SETDATA Procedures</a> on page 170-145	Sets <ul style="list-style-type: none"> <li>■ the data to the node</li> <li>■ the data of the processing instruction</li> </ul>	<ul style="list-style-type: none"> <li>■ <a href="#">DOMCharacterData Subprograms</a> on page 170-15</li> <li>■ <a href="#">DOMProcessingInstruction Subprograms</a> on page 170-28</li> </ul>
<a href="#">SETDOCTYPE Procedure</a> on page 170-146	Sets the DTD of the document.	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">SETNAMEDITEM Function</a> on page 170-147	Sets the item in the map specified by the name	<a href="#">DOMNamedNodeMap Subprograms</a> on page 170-25
<a href="#">SETNODEVALUE Procedure</a> on page 170-148	Sets the Value of the node	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">SETNODEVALUEASBINARYSTREAM Function &amp; Procedure</a> on page 170-149	Sets the Node Value as a binary stream	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">SETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</a> on page 170-150	Sets the Node Value as a character stream	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">SETPREFIX Procedure</a> on page 170-151	Sets the namespace prefix	<a href="#">DOMNode Subprograms</a> on page 170-11

**Table 170–21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

<b>Subprogram</b>	<b>Description</b>	<b>Group</b>
<a href="#">SETSTANDALONE Procedure</a> on page 170-152	Sets the standalone property of the document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">SETVALUE Procedure</a> on page 170-153	Sets the value of the attribute	<a href="#">DOMAttr Subprograms</a> on page 170-13
<a href="#">SETVERSION Procedure</a> on page 170-154	Sets the version of the document	<a href="#">DOMDocument Subprograms</a> on page 170-17
<a href="#">SPLITTEXT Function</a> on page 170-155	Splits the contents of the text node into 2 text nodes	<a href="#">DOMText Subprograms</a> on page 170-29
<a href="#">SUBSTRINGDATA Function</a> on page 170-156	Retrieves the substring of the data	<a href="#">DOMCharacterData Subprograms</a> on page 170-15
<a href="#">USEBINARYSTREAM Function</a> on page 170-157	Strabismus that the stream is valid for use	<a href="#">DOMNode Subprograms</a> on page 170-11
<a href="#">WRITETOBUFFER Procedures</a> on page 170-158	Writes <ul style="list-style-type: none"> <li>▪ the contents of the node to a buffer</li> <li>▪ the document to a buffer</li> <li>▪ the contents of a document fragment into a buffer</li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">DOMNode Subprograms</a> on page 170-11</li> <li>▪ <a href="#">DOMDocument Subprograms</a> on page 170-17</li> <li>▪ <a href="#">DOMDocumentFragment Subprograms</a> on page 170-19</li> </ul>
<a href="#">WRITETOCLOB Procedures</a> on page 170-159	Writes <ul style="list-style-type: none"> <li>▪ the contents of the node to a CLOB</li> <li>▪ the document to a CLOB</li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">DOMNode Subprograms</a> on page 170-11</li> <li>▪ <a href="#">DOMDocument Subprograms</a> on page 170-17</li> </ul>
<a href="#">WRITETOFILE Procedures</a> on page 170-160	Writes <ul style="list-style-type: none"> <li>▪ the contents of the node to a file</li> <li>▪ the document to a file</li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">DOMNode Subprograms</a> on page 170-11</li> <li>▪ <a href="#">DOMDocument Subprograms</a> on page 170-17</li> </ul>

## ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

**See Also:** [DOMNode Subprograms](#) on page 170-11 for other subprograms in this group

### Syntax

```
DBMS_XMLDOM.ADOPTNODE(  
    doc          IN  DOMDocument,  
    importedNode IN  DOMNode)  
RETURN DOMNODE;
```

### Parameters

**Table 170–22** *ADOPTNODE Function Parameters*

Parameter	Description
doc	Document that is adopting the node
importedNode	Node to adopt

### Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

## APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.APPENDCHILD(  
    n           IN      DOMNode,  
    newchild   IN      DOMNode)  
RETURN DOMNODE;
```

### Parameters

**Table 170–23** *APPENDCHILD Function Parameters*

Parameter	Description
<code>n</code>	DOMNode
<code>newchild</code>	The child to be appended to the list of children of node <code>n</code>

## APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

**See Also:** [DOMCharacterData Subprograms](#) on page 170-15

### Syntax

```
DBMS_XMLDOM.APPENDDATA (  
  cd      IN      DOMCHARACTERDATA,  
  arg     IN      VARCHAR2);
```

### Parameters

**Table 170–24** APPENDDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
arg	The data to append to the existing data

## CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.CLONENODE (  
    n          IN    DOMNODE,  
    deep       IN    BOOLEAN)  
RETURN DOMNODE;
```

### Parameters

**Table 170–25** CLONENODE Function Parameters

Parameter	Description
n	DOMNODE
deep	Determines if children are to be cloned

### Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.

## CREATEATTRIBUTE Functions

This function creates a DOMATTR node.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

Creates a DOMATTR with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN   DOMDOCUMENT,
  name     IN   VARCHAR2)
RETURN DOMATTR;
```

Creates a DOMATTR with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN   DOMDOCUMENT,
  qname    IN   VARCHAR2,
  ns       IN   VARCHAR2)
RETURN DOMATTR;
```

### Parameters

**Table 170–26 CREATEATTRIBUTE Function Parameters**

Parameter	Description
doc	DOMDOCUMENT
qname	New attribute qualified name
ns	Namespace

## CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(  
  doc      IN      DOMDOCUMENT,  
  data     IN      VARCHAR2)  
RETURN DOMCDATASECTION;
```

### Parameters

**Table 170–27** CREATECDATASECTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMCDATASECTION node

## CREATECOMMENT Function

This function creates a DOMCOMMENT node.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.CREATECOMMENT (  
    doc      IN      DOMDOCUMENT,  
    data     IN      VARCHAR2)  
RETURN DOMCOMMENT;
```

### Parameters

**Table 170–28** *CREATECOMMENT Function Parameters*

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMComment node

## CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(  
  namespaceURI      IN      VARCHAR2,  
  qualifiedName     IN      VARCHAR2,  
  doctype           IN      DOMTYPE := NULL)  
RETURN DOMDOCUMENT;
```

### Parameters

**Table 170–29** *CREATEDOCUMENT Function Parameters*

Parameter	Description
namespaceURI	Namespace URI
qualifiedName	Root element name
doctype	Document type

## CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT (  
    doc      IN      DOMDOCUMENT)  
RETURN DOMDOCUMENTFRAGMENT;
```

### Parameters

**Table 170–30** *CREATEDOCUMENTFRAGMENT Function Parameters*

Parameter	Description
doc	DOMDocument

## CREATEELEMENT Functions

This function creates a DOMELEMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

Creates a DOMELEMENT with specified name:

```
DBMS_XMLDOM.CREATEELEMENT (  
    doc          IN      DOMDOCUMENT,  
    tagName     IN      VARCHAR2)  
RETURN DOMELEMENT;
```

Creates a DOMELEMENT with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT (  
    doc          IN      DOMDOCUMENT,  
    tagName     IN      VARCHAR2,  
    ns          IN      VARCHAR2)  
RETURN DOMELEMENT;
```

### Parameters

**Table 170–31 CREATEELEMENT Function Parameters**

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

## CREATEENTITYREFERENCE Function

This function creates a DOENTITYREFERENCE node.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE (  
    doc          IN      DOMDOCUMENT,  
    name         IN      VARCHAR2)  
RETURN DOENTITYREFERENCE;
```

### Parameters

**Table 170–32** *CREATEENTITYREFERENCE Function Parameters*

Parameter	Description
doc	DOMDOCUMENT
name	New entity reference name

## CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(  
  doc      IN      DOMDocument,  
  target   IN      VARCHAR2,  
  data     IN      VARCHAR2)  
RETURN DOMPROCESSINGINSTRUCTION;
```

### Parameters

**Table 170–33** *CREATEPROCESSINGINSTRUCTION Function Parameters*

Parameter	Description
doc	DOMDOCUMENT
target	Target of the new processing instruction
data	Content data of the new processing instruction

## CREATETEXTNODE Function

This function creates a DOMTEXT node.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.CREATETEXTNODE (  
    doc      IN      DOMDocument,  
    data     IN      VARCHAR2)  
RETURN DOMTEXT;
```

### Parameters

**Table 170–34** *CREATETEXTNODE Function Parameters*

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMText node

## DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

**See Also:** [DOMCharacterData Subprograms](#) on page 170-15

### Syntax

```
DBMS_XMLDOM.DELETEDATA (  
  cd          IN      DOMCHARACTERDATA,  
  offset      IN      NUMBER,  
  cnt         IN      NUMBER);
```

### Parameters

**Table 170–35 DELETEDATA PROCEDURE Parameters**

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

## FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

**See Also:** [DOMDocumentType Subprograms](#) on page 170-20

### Syntax

```
DBMS_XMLDOM.FINDENTITY (  
    dt      IN      DOMDOCUMENTTYPE,  
    name    IN      VARCHAR2,  
    par     IN      BOOLEAN)  
RETURN DUMENTITY;
```

### Parameters

**Table 170–36** *FINDENTITY Function Parameters*

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

## FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

**See Also:** [DOMDocumentType Subprograms](#) on page 170-20

### Syntax

```
DBMS_XMLDOM.FINDNOTATION(  
    dt          IN      DOMDocumentType,  
    name       IN      VARCHAR2)  
RETURN DOMNOTATION;
```

### Parameters

**Table 170–37** *FINDNOTATION Function Parameters*

Parameter	Description
dt	The DTD
name	The notation to find

## FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

**See Also:** [DOMDocument Subprograms](#) on page 170-17 and [DOMDocumentFragment Subprograms](#) on page 170-19

### Syntax

```
DBMS_XMLDOM.FREEDOCFRAG (  
    df      IN      DOMDOCUMENTFRAGMENT) ;
```

### Parameters

**Table 170–38** *FREEDOCFRAG Procedure Parameters*

Parameter	Description
df	DOM document fragment

## FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.FREEDOCUMENT (  
    doc      IN      DOMDOCUMENT) ;
```

### Parameters

**Table 170–39** *FREEDOCUMENT Procedure Parameters*

Parameter	Description
doc	DOMDOCUMENT

## FREEELEMENT Procedure

This procedure frees memory allocated to a DOMELEMENT handle.

**See Also:** [DOMELEMENT Subprograms](#) on page 170-21

### Syntax

```
DBMS_XMLDOM.FREENODE (  
    elem      IN      DOMELEMENT);
```

### Parameters

**Table 170–40** *FREENODE Procedure Parameters*

Parameter	Description
elem	Of type DOMELEMENT

## FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.FREENODE (  
    n          IN      DOMNODE);
```

### Parameters

**Table 170–41** *FREENODE Procedure Parameters*

Parameter	Description
n	DOMNODE

## FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

**See Also:** [DOMNodeList Subprograms](#) on page 170-26

### Syntax

```
DBMS_XMLDOM.FREENODE(  
    nl    IN    DOMNodeList);
```

### Parameters

**Table 170–42** *FREENODE Procedure Parameters*

Parameter	Description
nl	Of type DOMNODELIST

## GETATTRIBUTE Functions

This function returns the value of an attribute of an `DOMELEMENT` by name.

**See Also:** [DOMElement Subprograms](#) on page 170-21

### Syntax

Returns the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE (  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2)  
RETURN VARCHAR2;
```

Returns the value of a `DOMELEMENT`'s attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE (  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2,  
    ns        IN      VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–43** *GETATTRIBUTE Function Parameters*

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Attribute name
<code>ns</code>	Namespace

## GETATTRIBUTENODE Functions

This function returns an attribute node from the `DOMELEMENT` by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

**See Also:** [DOMElement Subprograms](#) on page 170-21

### Syntax

Returns an attribute node from the `DOMELEMENT` by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2)
RETURN DOMATTR;
```

Returns an attribute node from the `DOMELEMENT` by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2,
    ns        IN      VARCHAR2)
RETURN DOMATTR;
```

### Parameters

**Table 170–44** *GETATTRIBUTENODE Function Parameters*

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Attribute name; * matches any attribute
<code>ns</code>	Namespace

## GETATTRIBUTES Function

This function retrieves a NAMEDNODEMAP containing the attributes of this node (if it is an Element) or NULL otherwise.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETATTRIBUTES(  
    n          IN          DOMNode)  
RETURN DOMNAMEDNODEMAP;
```

### Parameters

**Table 170–45** GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNode

## GETCHARSET Function

This function retrieves the character set of the DOM document.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.GETCHARSET(  
    doc IN    DOMDocument)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–46** *GETCHARSET Function Parameters*

Parameter	Description
doc	DOM document

### Usage Notes

For a newly parsed document, we return the database character set. Once the SETCHARSET Procedure is called with a non-NULL value for charset, that charset is returned.

## GETCHILDNODES Function

This function retrieves a DOMNODELIST that contains all children of this node. If there are no children, this is a DOMNODELIST containing no nodes.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETCHILDNODES(  
    n          IN      DOMNode)  
RETURN DOMNodeList;
```

### Parameters

**Table 170–47** *GETCHILDNODES Function Parameters*

Parameter	Description
n	DOMNode

## GETCHILDRENBYTAGNAME Functions

This function returns the children of the `DOMELEMENT`.

**See Also:** [DOMElement Subprograms](#) on page 170-21

### Syntax

Returns children of the `DOMELEMENT` given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
  elem      IN      DOMElement,
  name      IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns children of the `DOMELEMENT` given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
  elem      IN      DOMElement,
  name      IN      VARCHAR2,
  ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

### Parameters

**Table 170–48** *GETCHILDRENBYTAGNAME Function Parameters*

Parameter	Description
elem	DOMELEMENT
name	Tag name
ns	Namespace

## GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Gets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#) on page 170-15):

```
DBMS_XMLDOM.GETDATA (  
    cd      IN    DOMCHARACTERDATA)  
RETURN VARCHAR2;
```

Returns the content data of the DOMProcessingInstruction (See Also: [DOMProcessingInstruction Subprograms](#) on page 170-28):

```
DBMS_XMLDOM.GETDATA (  
    pi      IN    DOMPROCESSINGINSTRUCTION)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–49** *GETDATA Function Parameters*

Parameter	Description
cd	DOMCHARACTERDATA
pi	The DOMPROCESSINGINSTRUCTION

## GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.GETDOCTYPE(  
    doc      IN      DOMDOCUMENT)  
RETURN DOMDOCUMENTTYPE;
```

### Parameters

**Table 170–50** *GETDOCTYPE Function Parameters*

Parameter	Description
doc	DOMDOCUMENT

## GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT (  
    doc      IN      DOMDOCUMENT)  
RETURN DOMELEMENT;
```

### Parameters

**Table 170–51** *GETDOCUMENTELEMENT Function Parameters*

Parameter	Description
doc	DOMDOCUMENT

## GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns a DOMNODELIST of all the elements with a specified tagname (See Also: [DOMDocument Subprograms](#) on page 170-17):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    doc          IN      DOMDOCUMENT,
    tagname      IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name (See Also: [DOMELEMENT Subprograms](#) on page 170-21):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    elem        IN      DOMELEMENT,
    name        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name and namespace (See Also: [DOMELEMENT Subprograms](#) on page 170-21):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    elem        IN      DOMELEMENT,
    name        IN      VARCHAR2,
    ns          IN      VARCHAR2)
RETURN DOMNODELIST;
```

### Parameters

**Table 170-52** *GETELEMENTSBYTAGNAME Function Parameters*

Parameter	Description
doc	DOMDOCUMENT
tagname	Name of the tag to match on
elem	The DOMELEMENT
name	Tag name; using a wildcard(*) would match any tag
ns	Namespace

## GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

**See Also:** [DOMDocumentType Subprograms](#) on page 170-20

### Syntax

```
DBMS_XMLDOM.GETENTITIES(  
    dt          IN      DOMDocumentType)  
RETURN DOMNAMEDNODEMAP;
```

### Parameters

**Table 170–53** *GETENTITIES Function Parameters*

Parameter	Description
dt	DOMDOCUMENTTYPE

## GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Retrieves the expanded name of the `Node` if it is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: [DOMNode Subprograms](#) on page 170-11)

```
DBMS_XMLDOM.GETEXPANDEDNAME (
  n          IN          DOMNODE
  data      OUT          VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#) on page 170-13):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
  a          IN          DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: [DOMElement Subprograms](#) on page 170-21):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
  elem      IN          DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 170–54** *GETEXPANDEDNAME Procedure and Function Parameters*

Parameter	Description
n	DOMNODE
data	Returned expanded name of the <code>Node</code>
a	DOMATTR
elem	DOMELEMENT

## GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD(  
    n          IN          DOMNODE)  
RETURN DOMNODE;
```

### Parameters

**Table 170–55** *GETFIRSTCHILD Function Parameters*

Parameter	Description
n	DOMNODE

## GETIMPLEMENTATION Function

This function returns the DOMIMPLEMENTATION object that handles this DOMDOCUMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(  
    doc      IN      DOMDOCUMENT)  
RETURN DOMIMPLEMENTATION;
```

### Parameters

**Table 170–56** *GETIMPLEMENTATION Function Parameters*

Parameter	Description
doc	DOMDOCUMENT

## GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns NULL.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETLASTCHILD(  
    n      IN  DOMNODE)  
RETURN DOMNODE;
```

### Parameters

**Table 170–57** GETLASTCHILD Function Parameters

Parameter	Description
n	DOMNODE

## GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: [DOMCharacterData Subprograms](#) on page 170-15):

```
DBMS_XMLDOM.GETLENGTH (
    cd      IN      DOMCHARACTERDATA)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to length-1, inclusive (See Also: [DOMNamedNodeMap Subprograms](#) on page 170-25):

```
DBMS_XMLDOM.GETLENGTH (
    nnm     IN      DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to length-1, inclusive (See Also: [DOMNodeList Subprograms](#) on page 170-26):

```
DBMS_XMLDOM.GETLENGTH (
    nl      IN      DOMNODELIST)
RETURN NUMBER;
```

### Parameters

**Table 170–58** GETLENGTH Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
nnm	DOMNAMEDNODEMAP
nl	DOMNODELIST

## GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

### Syntax

Retrieves the local part of the node's qualified name (See Also: [DOMNode Subprograms](#) on page 170-11):

```
DBMS_XMLDOM.GETLOCALNAME (
    n          IN    DOMNODE,
    data      OUT   VARCHAR2);
```

Returns the local name of the DOMAttr (See Also: [DOMAttr Subprograms](#) on page 170-13):

```
DBMS_XMLDOM.GETLOCALNAME (
    a          IN    DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#) on page 170-21)

```
DBMS_XMLDOM.GETLOCALNAME (
    elem      IN    DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 170–59 GETLOCALNAME Procedure and Function Parameters**

Parameter	Description
n	DOMNode
data	Returned local name.
a	DOMAttr.
elem	DOMELEMENT.

## GETNAME Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

### Syntax

Returns the name of this attribute (See Also: [DOMAttr Subprograms](#) on page 170-13):

```
DBMS_XMLDOM.GETNAME (  
    a          IN      DOMATTR)  
RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the DOCTYPE keyword (See Also: [DOMDocumentType Subprograms](#) on page 170-20):

```
DBMS_XMLDOM.GETNAME (  
    dt          IN      DOMDOCUMENTTYPE)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–60** GETNAME Function Parameters

Parameter	Description
a	DOMATTR
dt	DOMDOCUMENTTYPE

## GETNAMEDITEM Function

This function retrieves a node specified by name.

**See Also:** [DOMNamedNodeMap Subprograms](#) on page 170-25

### Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(  
  nnm    IN  DOMNAMEDNODEMAP,  
  name   IN  VARCHAR2)  
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(  
  nnm    IN  DOMNAMEDNODEMAP,  
  name   IN  VARCHAR2,  
  ns     IN  VARCHAR2)  
RETURN DOMNODE;
```

### Parameters

**Table 170–61** *GETNAMEDITEM Function Parameters*

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

## GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

### Syntax

Retrieves the namespace URI associated with the node (See Also: [DOMNode Subprograms](#) on page 170-11):

```
DBMS_XMLDOM.GETNAMESPACE (
    n          IN    DOMNODE,
    data      OUT   VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: [DOMAttr Subprograms](#) on page 170-13):

```
DBMS_XMLDOM.GETNAMESPACE (
    a          IN    DOMATTR)
RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#) on page 170-21):

```
DBMS_XMLDOM.GETNAMESPACE (
    elem      IN    DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 170–62** *GETNAMESPACE Procedure and Function Parameters*

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

## GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns `NULL`.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(  
    n          IN      DOMNODE)  
RETURN DOMNode;
```

### Parameters

**Table 170–63** *GETNEXTSIBLING Function Parameters*

Parameter	Description
n	DOMNODE

## GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETNODETYPE (  
    n          IN      DOMNODE)  
RETURN NUMBER;
```

### Parameters

**Table 170–64** *GETNODETYPE Function Parameters*

Parameter	Description
n	DOMNODE

## GETNODENAME Function

This function gets the name of the node depending on its type.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETNODENAME (  
    n          IN      DOMNODE)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–65** *GETNODENAME Function Parameters*

Parameter	Description
n	DOMNODE

## GETNODEVALUE Function

This function gets the value of this node, depending on its type.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETNODEVALUE (  
    n          IN      DOMNODE)  
RETURN VARCHAR2;*
```

### Parameters

**Table 170–66** *GETNODEVALUE Function Parameters*

Parameter	Description
n	DOMNODE

## GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node data type must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The data type of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n          in      DOMNODE,
    value      in      SYS.UTL_BINARYOUTPUTSTREAM);
```

### Parameters

**Table 170–67** *GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters*

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

## GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE,
    value      IN      SYS.UTL_CHARACTEROUTPUTSTREAM);
```

### Parameters

**Table 170–68** *GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters*

Parameter	Description
n	DOMNODE
value	CHARACTEROUTPUTSTREAM

## GETNOTATIONNAME Function

This function returns the notation name of the `DOENTITY`.

**See Also:** [DOMEntity Subprograms](#) on page 170-22

### Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(  
    ent          IN      DOENTITY)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–69** *GETNOTATIONNAME Function Parameters*

Parameter	Description
ent	DOENTITY

## GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

**See Also:** [DOMDocumentType Subprograms](#) on page 170-20

### Syntax

```
DBMS_XMLDOM.GETNOTATIONS (  
    dt          IN      DOMDOCUMENTTYPE)  
RETURN DOMNAMEDNODEMAP;
```

### Parameters

**Table 170–70** *GETNOTATIONS Function Parameters*

Parameter	Description
dt	DOMDOCUMENTTYPE

## GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

**See Also:** [DOMProcessingInstruction Subprograms](#) on page 170-28

### Syntax

```
DBMS_XMLDOM.GETTARGET(  
    pi          IN      DOMPROCESSINGINSTRUCTION)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–71** *GETTARGET Function Parameters*

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

## GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is NULL.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENT;
```

### Parameters

**Table 170–72** *GETOWNERDOCUMENT Function Parameters*

Parameter	Description
n	DOMNODE

## GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

**See Also:** [DOMAttr Subprograms](#) on page 170-13

### Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT(  
    a          IN      DOMATTR)  
RETURN DOMELEMENT;
```

### Parameters

**Table 170–73** *GETOWNERELEMENT Function Parameters*

Parameter	Description
a	Attribute

## GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETPARENTNODE (  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

### Parameters

**Table 170–74** *GETPARENTNODE Function Parameters*

Parameter	Description
n	DOMNODE

## GETPREFIX Function

This function retrieves the namespace prefix of the node.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETPREFIX(  
    n          IN      DOMNODE)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–75** *GETPREFIX Function Parameters*

Parameter	Description
n	DOMNODE

## GETPREVIOUSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns NULL.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETPREVIOUSIBLING (  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

### Parameters

**Table 170–76** *GETPREVIOUSIBLING Function Parameters*

Parameter	Description
n	DOMNODE

## GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the public identifier of the specified DTD (See Also: [DOMDocumentType Subprograms](#) on page 170-20):

```
DBMS_XMLDOM.GETPUBLICID (
    dt          IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the public identifier of the DOENTITY (See Also: [DOMEntity Subprograms](#) on page 170-22):

```
DBMS_XMLDOM.GETPUBLICID (
    ent        IN      DOENTITY)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMNOTATION (See Also: [DOMNotation Subprograms](#) on page 170-27):

```
DBMS_XMLDOM.GETPUBLICID (
    n          IN      DOMNOTATION)
RETURN VARCHAR2;
```

### Parameters

**Table 170–77** *GETPUBLICID Function Parameters*

Parameter	Description
dt	The DTD
ent	DOENTITY
n	DOMNOTATION

## GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the qualified name of the DOMATTR (See Also: [DOMAttr Subprograms](#) on page 170-13):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (  
    a          IN      DOMATTR)  
RETURN VARCHAR2;
```

Returns the qualified name of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#) on page 170-21):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (  
    elem      IN      DOMELEMENT)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–78** GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

## GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.GETSCHEMANODE(  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

### Parameters

**Table 170–79** GETSCHEMANODE Function Parameters

Parameter	Description
n	DOMNODE

## GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

**See Also:** [DOMAttr Subprograms](#) on page 170-13

### Syntax

```
DBMS_XMLDOM.GETSPECIFIED(  
    a          IN      DOMATTR)  
RETURN BOOLEAN;
```

### Parameters

**Table 170–80** *GETSPECIFIED Function Parameters*

Parameter	Description
a	DOMATTR

## GETSTANDALONE Function

This function returns the standalone property associated with the DOMDOCUMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.GETSTANDALONE (  
    doc          IN      DOMDOCUMENT)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–81** *GETSTANDALONE Function Parameters*

Parameter	Description
doc	DOMDOCUMENT.

## GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the system id of the specified DTD (See Also: [DOMDocumentType Subprograms](#) on page 170-20):

```
DBMS_XMLDOM.GETSYSTEMID(
    dt          IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the system identifier of the DUMENTITY (See Also: [DOMEntity Subprograms](#) on page 170-22):

```
DBMS_XMLDOM.GETSYSTEMID(
    ent        IN      DUMENTITY)
RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: [DOMNotation Subprograms](#) on page 170-27):

```
DBMS_XMLDOM.GETSYSTEMID(
    n          IN      DOMNOTATION)
RETURN VARCHAR2;
```

### Parameters

**Table 170–82 GETSYSTEMID Function Parameters**

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

## GETTAGNAME Function

This function returns the name of the DOMELEMENT.

**See Also:** [DOMELEMENT Subprograms](#) on page 170-21

### Syntax

```
DBMS_XMLDOM.GETTAGNAME(  
    elem          IN      DOMELEMENT)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–83** *GETTAGNAME Function Parameters*

Parameter	Description
elem	The DOMELEMENT

## GETVALUE Function

This function retrieves the value of the attribute.

**See Also:** [DOMAttr Subprograms](#) on page 170-13

### Syntax

```
DBMS_XMLDOM.GETVALUE (  
    a          IN      DOMATTR)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–84** GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

## GETVERSION Function

This function returns the version of the DOMDOCUMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.GETVERSION(  
    doc          IN      DOMDOCUMENT)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–85** *GETVERSION Function Parameters*

Parameter	Description
doc	DOMDOCUMENT

## GETXMLTYPE Function

This function returns the XMLType associated with the DOMDOCUMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.GETXMLTYPE(  
    doc          IN      DOMDOCUMENT)  
RETURN SYS.XMLTYPE;
```

### Parameters

**Table 170–86** GETXMLTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

## HASATTRIBUTE Functions

Verifies whether an attribute has been defined for `DOMELEMENT`, or has a default value.

**See Also:** [DOMElement Subprograms](#) on page 170-21

### Syntax

Verifies whether an attribute with the specified name has been defined for `DOMElement`:

```
DBMS_XMLDOM.HASATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2)
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for `DOMELEMENT`; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2,
    ns        IN  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 170–87 HASATTRIBUTE Function Parameters**

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Attribute name; * matches any attribute
<code>ns</code>	Namespace

## HASATTRIBUTES Function

This function returns whether this node has any attributes.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.HASATTRIBUTES (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

### Parameters

**Table 170–88** *HASATTRIBUTES Function Parameters*

Parameter	Description
n	DOMNODE

## HASCHILDNODES Function

This function determines whether this node has any children.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.HASCHILDNODES (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

### Parameters

**Table 170–89** HASCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

## HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

**See Also:** [DOMImplementation Subprograms](#) on page 170-24

### Syntax

```
DBMS_XMLDOM.HASFEATURE (  
    di          IN      DOMIMPLEMENTATION,  
    feature     IN      VARCHAR2,  
    version     IN      VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 170–90 HASFEATURE Function Parameters**

Parameter	Description
di	DOMIMPLEMENTATION
feature	The feature to check for
version	The version of the DOM to check in

## IMPORTNODE Function

This function imports a node from an external document and returns this new node.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.IMPORTNODE(  
    doc           IN  DOMDOCUMENT,  
    importedNode IN  DOMNODE,  
    deep          IN  BOOLEAN)  
RETURN DOMNODE;
```

### Parameters

**Table 170–91** *IMPORTNODE Function Parameters*

Parameter	Description
doc	Document from which the node is imported
importedNode	Node to import
deep	Setting for recursive import. <ul style="list-style-type: none"><li>■ If this value is <code>TRUE</code>, the entire subtree of the node will be imported with the node.</li><li>■ If this value is <code>FALSE</code>, only the node itself will be imported.</li></ul>

### Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

## INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.INSERTBEFORE (
  n          IN      DOMNODE,
  newchild  IN      DOMNODE,
  refchild  IN      DOMNODE)
RETURN DOMNode;
```

### Parameters

**Table 170–92** *INSERTBEFORE Function Parameters*

Parameter	Description
<code>n</code>	DOMNODE
<code>newChild</code>	The child to be inserted in the DOMNODE
<code>refChild</code>	The reference node before which the <code>newchild</code> is to be inserted

## INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

**See Also:** [DOMCharacterData Subprograms](#) on page 170-15

### Syntax

```
DBMS_XMLDOM.INSERTDATA(  
  cd      IN      DOMCHARACTERDATA,  
  offset  IN      NUMBER,  
  arg     IN      VARCHAR2);
```

### Parameters

**Table 170–93** *INSERTDATA Procedure Parameters*

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to insert the data
arg	The value to be inserted

## ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNode Subprograms](#) on page 170-11):

```
DBMS_XMLDOM.ISNULL (
    n          IN      DOMNODE)
RETURN BOOLEAN;
```

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMAttr Subprograms](#) on page 170-13):

```
DBMS_XMLDOM.ISNULL (
    a          IN      DOMATTR)
RETURN BOOLEAN;
```

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCDATASection Subprograms](#) on page 170-14):

```
DBMS_XMLDOM.ISNULL (
    cds       IN      DOMCDATASECTION)
RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCharacterData Subprograms](#) on page 170-15):

```
DBMS_XMLDOM.ISNULL (
    cd        IN      DOMCHARACTERDATA)
RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMComment Subprograms](#) on page 170-16):

```
DBMS_XMLDOM.ISNULL (
    com       IN      DOMCOMMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocument Subprograms](#) on page 170-17):

```
DBMS_XMLDOM.ISNULL (
    doc       IN      DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentFragment Subprograms](#) on page 170-19):

```
DBMS_XMLDOM.ISNULL (
    df        IN      DOMDOCUMENTFRAGMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentType Subprograms](#) on page 170-20):

```
DBMS_XMLDOM.ISNULL (
    dt        IN      DOMDOCUMENTTYPE)
RETURN BOOLEAN;
```

```
RETURN BOOLEAN;
```

Checks that the specified `DOMELEMENT` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMElement Subprograms](#) on page 170-21):

```
DBMS_XMLDOM.ISNULL (
    elem      IN      DOMELEMENT)
RETURN BOOLEAN;
```

Checks that the specified `DOMENTITY` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntity Subprograms](#) on page 170-22):

```
DBMS_XMLDOM.ISNULL (
    ent       IN      DUMENTITY)
RETURN BOOLEAN;
```

Checks that the specified `DOMENTITYREFERENCE` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntityReference Subprograms](#) on page 170-23):

```
DBMS_XMLDOM.ISNULL (
    EREF      IN      DUMENTITYREFERENCE)
RETURN BOOLEAN;
```

Checks that the specified `DOMIMPLEMENTATION` is NULL; returns TRUE if it is NULL (See Also: [DOMImplementation Subprograms](#) on page 170-24):

```
DBMS_XMLDOM.ISNULL (
    di        IN      DOMIMPLEMENTATION)
RETURN BOOLEAN;
```

Checks that the specified `DOMNAMEDNODEMAP` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNamedNodeMap Subprograms](#) on page 170-25):

```
DBMS_XMLDOM.ISNULL (
    nnm       IN      DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks that the specified `DOMNODELIST` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNodeList Subprograms](#) on page 170-26):

```
DBMS_XMLDOM.ISNULL (
    nl        IN      DOMNODELIST)
RETURN BOOLEAN;
```

Checks that the specified `DOMNOTATION` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNotation Subprograms](#) on page 170-27):

```
DBMS_XMLDOM.ISNULL (
    n         IN      DOMNOTATION)
RETURN BOOLEAN;
```

Checks that the specified `DOMPROCESSINGINSTRUCTION` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMProcessingInstruction Subprograms](#) on page 170-28):

```
DBMS_XMLDOM.ISNULL (
    pi        IN      DOMPROCESSINGINSTRUCTION)
RETURN BOOLEAN;
```

Checks that the specified `DOMTEXT` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMText Subprograms](#) on page 170-29):

```
DBMS_XMLDOM.ISNULL (
```

```

t      IN      DOMTEXT)
RETURN BOOLEAN;

```

## Parameters

**Table 170–94 ISNULL Function Parameters**

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check
ent	DOMENTITY to check
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

## ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: [DOMNamedNodeMap Subprograms](#) on page 170-25):

```
DBMS_XMLDOM.ITEM(
    nnm      IN      DOMNAMEDNODEMAP,
    index    IN      NUMBER)
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If `index` is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: [DOMNodeList Subprograms](#) on page 170-26):

```
DBMS_XMLDOM.ITEM(
    nl       IN      DOMNODELIST,
    index    IN      NUMBER)
RETURN DOMNODE;
```

### Parameters

**Table 170–95** *ITEM Function Parameters*

Parameter	Description
<code>nnm</code>	<code>DOMNAMEDNODEMAP</code>
<code>index</code>	The index in the node map at which the item is to be retrieved
<code>nl</code>	<code>DOMNODELIST</code>
<code>index</code>	The index in the <code>NodeList</code> used to retrieve the item

## MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKEATTR (  
    n          IN      DOMNODE)  
RETURN DOMATTR;
```

### Parameters

**Table 170–96** MAKEATTR Function Parameters

Parameter	Description
n	DOMNODE to cast

## MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKECDATASECTION (  
    n          IN      DOMNODE)  
RETURN DOMCDATASECTION;
```

### Parameters

**Table 170–97 MAKECDATASECTION Function Parameters**

Parameter	Description
n	DOMNODE to cast

## MAKECHARACTERDATA Function

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA (  
    n          IN          DOMNode)  
RETURN DOMCharacterData;
```

### Parameters

**Table 170–98** MAKECHARACTERDATA Function Parameters

Parameter	Description
n	DOMNODE to cast

## MAKECOMMENT Function

This function casts a specified DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKECOMMENT (  
    n          IN      DOMNODE)  
RETURN DOMCOMMENT;
```

### Parameters

**Table 170–99** MAKECOMMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

## MAKEDOCUMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENT, and returns the DOMDOCUMENT.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT (  
    n          IN      DOMNODE)  
RETURN DOMDocument;
```

### Parameters

**Table 170–100** *MAKEDOCUMENT Function Parameters*

Parameter	Description
n	DOMNODE to cast

## MAKEDOCUMENTFRAGMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENTFRAGMENT, and returns the DOMDOCUMENTFRAGMENT.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTFRAGMENT;
```

### Parameters

**Table 170–101** *MAKEDOCUMENTFRAGMENT Function Parameters*

Parameter	Description
n	DOMNODE to cast

## MAKEDOCUMENTTYPE Function

This function casts a specified DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTTYPE;
```

### Parameters

**Table 170–102** *MAKEDOCUMENTTYPE Function Parameters*

Parameter	Description
n	DOMNODE to cast.

## MAKEELEMENT Function

This function casts a specified DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKEELEMENT (  
    n          IN      DOMNODE)  
RETURN DOMELEMENT;
```

### Parameters

**Table 170–103** MAKEELEMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

## MAKEENTITY Function

This function casts a specified DOMNODE to a DUMENTITY, and returns the DUMENTITY.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKEENTITY (  
    n          IN      DOMNODE)  
RETURN DUMENTITY;
```

### Parameters

**Table 170–104** MAKEENTITY Function Parameters

Parameter	Description
n	DOMNODE to cast

## MAKEENTITYREFERENCE Function

This function casts a specified DOMNODE to a DUMENTITYREFERENCE, and returns the DUMENTITYREFERENCE.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE(  
    n          IN      DOMNODE)  
RETURN DUMENTITYREFERENCE;
```

### Parameters

**Table 170–105** MAKEENTITYREFERENCE Function Parameters

Parameter	Description
n	DOMNODE to cast

## MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Casts specified `DOMATTR` to a `DOMNODE`, and returns the `DOMNODE` (See Also: [DOMAttr Subprograms](#) on page 170-13):

```
DBMS_XMLDOM.MAKENODE (
    a          IN      DOMATTR)
RETURN DOMNODE;
```

Casts the `DOMCDATASECTION` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMCDATASection Subprograms](#) on page 170-14):

```
DBMS_XMLDOM.MAKENODE (
    cds        IN      DOMCDATASECTION)
RETURN DOMNODE;
```

Casts the specified `DOMCHARACTERDATA` as a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMCharacterData Subprograms](#) on page 170-15):

```
DBMS_XMLDOM.MAKENODE (
    cd         IN      DOMCHARACTERDATA)
RETURN DOMNODE;
```

Casts the specified `DOMCOMMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMComment Subprograms](#) on page 170-16):

```
DBMS_XMLDOM.MAKENODE (
    com        IN      DOMCOMMENT)
RETURN DOMNODE;
```

Casts the `DOMDOCUMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMDocument Subprograms](#) on page 170-17):

```
DBMS_XMLDOM.MAKENODE (
    doc        IN      DOMDOCUMENT)
RETURN DOMNODE;
```

Casts the specified `DOMDOCUMENTFRAGMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMDocumentFragment Subprograms](#) on page 170-19):

```
DBMS_XMLDOM.MAKENODE (
    df         IN      DOMDOCUMENTFRAGMENT)
RETURN DOMNode;
```

Casts the specified `DOMDOCUMENTTYPE` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMDocumentType Subprograms](#) on page 170-20):

```
DBMS_XMLDOM.MAKENODE (
    dt         IN      DOMDOCUMENTTYPE)
RETURN DOMNODE;
```

Casts the specified `DOMELEMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMElement Subprograms](#) on page 170-21):

```
DBMS_XMLDOM.MAKENODE (
    elem       IN      DOMELEMENT)
```

```
RETURN DOMNODE;
```

Casts specified `DOMENTITY` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntity Subprograms](#) on page 170-22):

```
DBMS_XMLDOM.MAKENODE (
    ent      IN      DOMENTITY)
RETURN DOMNODE;
```

Casts the `DOMENTITYREFERENCE` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntityReference Subprograms](#) on page 170-23):

```
DBMS_XMLDOM.MAKENODE (
   eref     IN      DOMENTITYREFERENCE)
RETURN DOMNODE;
```

Casts the `DOMNOTATION` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMNotation Subprograms](#) on page 170-27):

```
DBMS_XMLDOM.MAKENODE (
    n       IN      DOMNOTATION)
RETURN DOMNODE;
```

Casts the `DOMPROCESSINGINSTRUCTION` to a `DOMNODE`, and returns the `DOMNODE` (See Also: [DOMProcessingInstruction Subprograms](#) on page 170-28):

```
DBMS_XMLDOM.MAKENODE (
    pi      IN      DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;
```

Casts the `DOMTEXT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMText Subprograms](#) on page 170-29):

```
DBMS_XMLDOM.MAKENODE (
    t       IN      DOMTEXT)
RETURN DOMNODE;
```

## Parameters

**Table 170–106** *MAKENODE Function Parameters*

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast
n	DOMNOTATION to cast
pi	DOMPROCESSINGINSTRUCTION to cast

**Table 170–106 (Cont.) MAKENODE Function Parameters**

<b>Parameter</b>	<b>Description</b>
t	DOMTEXT to cast

## MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKENOTATION(  
    n          IN      DOMNODE)  
RETURN DOMNOTATION;
```

### Parameters

**Table 170–107** *MAKENOTATION Function Parameters*

Parameter	Description
n	DOMNODE to cast

## MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION (  
    n          IN      DOMNODE)  
RETURN DOMPROCESSINGINSTRUCTION;
```

### Parameters

**Table 170–108** MAKEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
n	DOMNODE to cast

## MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.MAKETEXT (  
    n          IN      DOMNODE)  
RETURN DOMTEXT;
```

### Parameters

**Table 170–109** *MAKETEXT Function Parameters*

Parameter	Description
n	DOMNODE to cast

## NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (
xmlDoc    IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (
c1        IN CLOB)
RETURN DOMDOCUMENT;
```

### Parameters

**Table 170–110** *NEWDOMDOCUMENT Function Parameters*

Parameter	Description
xmlDoc	XMLType source for the DOMDOCUMENT
c1	CLOB source for the DOMDOCUMENT

## NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

**See Also:** [DOMELEMENT Subprograms](#) on page 170-21

### Syntax

```
DBMS_XMLDOM.NORMALIZE(  
    elem          IN      DOMELEMENT);
```

### Parameters

**Table 170–111** *NORMALIZE Procedure Parameters*

Parameter	Description
elem	The DOMELEMENT

## REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the `DOMELEMENT` by name.

**See Also:** [DOMElement Subprograms](#) on page 170-21

### Syntax

Removes the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE (
  elem      IN   DOMELEMENT,
  name      IN   VARCHAR2);
```

Removes the value of a `DOMELEMENT`'s attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE (
  elem      IN   DOMELEMENT,
  name      IN   VARCHAR2,
  ns        IN   VARCHAR2);
```

### Parameters

**Table 170–112 REMOVEATTRIBUTE Procedure Parameters**

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Attribute name
<code>ns</code>	Namespace

## REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the `DOMELEMENT`. The method returns the removed node.

**See Also:** [DOMElement Subprograms](#) on page 170-21

### Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(  
    elem      IN      DOMELEMENT,  
    oldAttr   IN      DOMATTR)  
RETURN DOMAttr;
```

### Parameters

**Table 170–113 REMOVEATTRIBUTENODE Function Parameters**

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code> .
<code>oldAttr</code>	The old <code>DOMATTR</code> .

## REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.REMOVECHILD(  
    n           IN      DOMNode,  
    oldchild   IN      DOMNode)  
RETURN DOMNODE;
```

### Parameters

**Table 170–114 REMOVECHILD Function Parameters**

Parameter	Description
<code>n</code>	DOMNode
<code>oldChild</code>	The child of the node <code>n</code> to be removed

## REMOVENAMEDITEM Function

This function removes from the map a node specified by name, and returns this node. When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

**See Also:** [DOMNamedNodeMap Subprograms](#) on page 170-25

### Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM (
  nnm      IN      DOMNamedNodeMap,
  name     IN      VARCHAR2)
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM (
  nnm      IN      DOMNamedNodeMap,
  name     IN      VARCHAR2,
  ns       IN      VARCHAR2)
RETURN DOMNode;
```

### Parameters

**Table 170–115** *REMOVENAMEDITEM Function Parameters*

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

## REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node. If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.REPLACECHILD(
    n           IN      DOMNode,
    newchild   IN      DOMNode,
    oldchild   IN      DOMNode)
RETURN DOMNode;
```

### Parameters

**Table 170–116** *REPLACECHILD Function Parameters*

Parameter	Description
<code>n</code>	DOMNode
<code>newchild</code>	The new child which is to replace the old child
<code>oldchild</code>	The child of the node <code>n</code> which is to be replaced

## REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

**See Also:** [DOMCharacterData Subprograms](#) on page 170-15

### Syntax

```
DBMS_XMLDOM.REPLACEDATA (  
  cd          IN      DOMCHARACTERDATA,  
  offset      IN      NUMBER,  
  cnt         IN      NUMBER,  
  arg         IN      VARCHAR2);
```

### Parameters

**Table 170–117** *REPLACEDATA Procedure Parameters*

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

## RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

**See Also:** [DOMELEMENT Subprograms](#) on page 170-21

### Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(  
    elem      IN      DOMELEMENT,  
    prefix    IN      VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–118** *RESOLVENAMESPACEPREFIX Function Parameters*

Parameter	Description
elem	The DOMELEMENT
prefix	Namespace prefix

## SETATTRIBUTE Procedures

Sets the value of a DOMELEMENT's attribute by name.

**See Also:** [DOMELEMENT Subprograms](#) on page 170-21

### Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE (  
    elem      IN  DOMELEMENT,  
    name      IN  VARCHAR2,  
    newvalue  IN  VARCHAR2);
```

Sets the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE (  
    elem      IN  DOMELEMENT,  
    name      IN  VARCHAR2,  
    newvalue  IN  VARCHAR2,  
    ns        IN  VARCHAR2);
```

### Parameters

**Table 170–119** SETATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
newvalue	Attribute value
ns	Namespace

## SETATTRIBUTENODE Functions

Adds a new attribute node to the DOMELEMENT.

**See Also:** [DOMELEMENT Subprograms](#) on page 170-21

### Syntax

Adds a new attribute node to the DOMELEMENT:

```
DBMS_XMLDOM.SETATTRIBUTENODE (
    elem      IN  DOMELEMENT,
    newAttr   IN  DOMATTR)
RETURN DOMATTR;
```

Adds a new attribute node to the DOMELEMENT; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE (
    elem      IN  DOMELEMENT,
    newAttr   IN  DOMATTR,
    ns        IN  VARCHAR2)
RETURN DOMATTR;
```

### Parameters

**Table 170–120 SETATTRIBUTENODE Function Parameters**

Parameter	Description
elem	The DOMELEMENT
newAttr	The new DOMATTR
ns	The namespace

## SETCHARSET Procedure

This function sets the character set of the DOM document.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.SETCHARSET(  
  doc      IN      DOMDocument,  
  charset  IN      VARCHAR2);
```

### Parameters

**Table 170–121** SETCHARSET Procedure Parameters

Parameter	Description
doc	DOM document
charset	Character set

### Usage Notes

This is used for [WRITETOFILE Procedures](#) if not explicitly specified at that time.

## SETDATA Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Sets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#) on page 170-15):

```
DBMS_XMLDOM.SETDATA (
  cd      IN      DOMCHARACTERDATA,
  data    IN      VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: [DOMProcessingInstruction Subprograms](#) on page 170-15):

```
DBMS_XMLDOM.SETDATA (
  pi      IN      DOMPROCESSINGINSTRUCTION,
  data    IN      VARCHAR2);
```

### Parameters

**Table 170–122 SETDATA Procedure Parameters**

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

## SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document. This DTD can later be retrieved using the [GETDOCTYPE Function](#).

### Syntax

```
DBMS_XMLDOM.SETDOCTYPE(  
  doc      IN   DOMDocument,  
  name     IN   VARCHAR2,  
  sysid   IN   VARCHAR2,  
  pubid   IN   VARCHAR2);
```

### Parameters

**Table 170–123** *SETDOCTYPE Procedure Parameters*

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

## SETNAMEDITEM Function

This function adds a node using its `nodeName` attribute. If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, `NULL` is returned.

As the `nodeName` attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

**See Also:** [DOMNamedNodeMap Subprograms](#) on page 170-25

### Syntax

Adds a node using its `nodeName` attribute:

```
DBMS_XMLDOM.SETNAMEDITEM (
    nnm      IN      DOMNAMEDNODEMAP,
    arg      IN      DOMNODE)
RETURN DOMNode;
```

Adds a node using its `nodeName` attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM (
    nnm      IN      DOMNAMEDNODEMAP,
    arg      IN      DOMNODE,
    ns       IN      VARCHAR2)
RETURN DOMNode;
```

### Parameters

**Table 170–124 SETNAMEDITEM Function Parameters**

Parameter	Description
<code>nnm</code>	<code>DOMNAMEDNODEMAP</code>
<code>arg</code>	The Node to be added using its <code>nodeName</code> attribute
<code>ns</code>	Namespace

## SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.SETNODEVALUE (  
    n          IN      DOMNODE,  
    nodeValue IN      VARCHAR2);
```

### Parameters

**Table 170–125** SETNODEVALUE Procedure Parameters

Parameter	Description
n	DOMNode
nodeValue	The value to which node is set

## SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

This function returns an instance of the PL/SQL XMLBINARYOUTPUTSTREAM into which the caller can write the node value. The data type of the node must be RAW or BLOB – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
    n      IN      DOMNODE)
RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The data type of the node must be RAW or BLOB – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
    n      in      DOMNODE,
    value  in      SYS.UTL_BINARYINPUTSTREAM);
```

### Parameters

**Table 170–126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters**

Parameter	Description
n	DOMNODE
value	BINARYINPUTSTREAM

## SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

This function returns an instance of the PL/SQL XMLCHARACTEROUTPUTSTREAM type into which the caller can write the node value. The data type of the node can be any valid XDB data type. If the type is not character or CLOB, the character data written to the stream is converted to the node data type. If the data type of the node is character or CLOB, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of SYS.UTL\_CHARACTERINPUTSTREAM from which XDB reads to populate the node. The data type of the node may be any valid type supported by XDB. If a non-character data type, the character data read from the stream is converted to the data type of the node. If the data type of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE,
    value      IN      SYS.UTL_CHARACTERINPUTSTREAM);
```

### Parameters

**Table 170–127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters**

Parameter	Description
n	DOMNODE
value	CHARACTERINPUTSTREAM

## SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.SETPREFIX(  
    n          IN      DOMNODE,  
    prefix     IN      VARCHAR2);
```

### Parameters

**Table 170–128** *SETPREFIX Procedure Parameters*

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

## SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.SETSTANDALONE(  
    doc          IN      DOMDOCUMENT,  
    newvalue     IN      VARCHAR2);
```

### Parameters

**Table 170–129** SETSTANDALONE Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

## SETVALUE Procedure

This procedure sets the value of the attribute.

**See Also:** [DOMAttr Subprograms](#) on page 170-13

### Syntax

```
DBMS_XMLDOM.SETVALUE (  
  a          IN      DOMATTR,  
  value     IN      VARCHAR2);
```

### Parameters

**Table 170–130 SETVALUE Procedure Parameters**

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

## SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

**See Also:** [DOMDocument Subprograms](#) on page 170-17

### Syntax

```
DBMS_XMLDOM.SETVERSION(  
    doc          IN      DOMDOCUMENT,  
    version     IN      VARCHAR2);
```

### Parameters

**Table 170–131** SETVERSION Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

## SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

**See Also:** [DOMText Subprograms](#) on page 170-29

### Syntax

```
DBMS_XMLDOM.SPLITTEXT(  
    t          IN      DOMTEXT,  
    offset     IN      NUMBER)  
RETURN DOMText;
```

### Parameters

**Table 170–132** *SPLITTEXT Function Parameters*

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

## SUBSTRINGDATA Function

This function extracts a range of data from the node.

**See Also:** [DOMCharacterData Subprograms](#) on page 170-15

### Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA (  
    cd          IN      DOMCHARACTERDATA,  
    offset     IN      NUMBER,  
    cnt        IN      NUMBER)  
RETURN VARCHAR2;
```

### Parameters

**Table 170–133 SUBSTRINGDATA Function Parameters**

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

## USEBINARYSTREAM Function

This function returns TRUE if the data type of the node is RAW or BLOB so that the node value may be read or written using an UTL\_BINARYINPUTSTREAM or UTL\_BINARYOUTPUTSTREAM. If a value of FALSE is returned, the node value may only be accessed through an UTL\_CHARACTERINPUTSTREAM or UTL\_CHARACTEROUTPUTSTREAM.

**See Also:** [DOMNode Subprograms](#) on page 170-11

### Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM (
    n          IN      DOMNODE)
RETURN BOOLEAN;
```

### Parameters

**Table 170–134** *USEBINARYSTREAM Function Parameters*

Parameter	Description
n	DOMNODE

## WRITETOBUFFER Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Writes XML node to specified buffer using the database character set (See Also: [DOMNode Subprograms](#) on page 170-11):

```
DBMS_XMLDOM.WRITETOBUFFER (
    n          IN          DOMNODE,
    buffer     IN OUT     VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: [DOMDocument Subprograms](#) on page 170-17):

```
DBMS_XMLDOM.WRITETOBUFFER (
    doc        IN          DOMDOCUMENT,
    buffer     IN OUT     VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: [DOMDocumentFragment Subprograms](#) on page 170-19):

```
DBMS_XMLDOM.WRITETOBUFFER (
    df         IN          DOMDOCUMENTFRAGMENT,
    buffer     IN OUT     VARCHAR2);
```

### Parameters

**Table 170–135** *WRITETOBUFFER Procedure Parameters*

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

## WRITETOCLOB Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Writes XML node to specified CLOB using the database character set (See Also: [DOMNode Subprograms](#) on page 170-11):

```
DBMS_XMLDOM.WRITETOCLOB (
  n          IN          DOMNODE,
  c1         IN OUT     CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: [DOMDocument Subprograms](#) on page 170-17):

```
DBMS_XMLDOM.WRITETOCLOB (
  doc       IN          DOMDOCUMENT,
  c1        IN OUT     CLOB);
```

### Parameters

**Table 170–136** *WRITETOCLOB Procedure Parameters*

Parameter	Description
n	DOMNODE
c1	CLOB to which to write
doc	DOMDOCUMENT

## WRITETOFILE Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Writes XML node to specified file using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  n          IN      DOMNODE,
  fileName   IN      VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  n          IN      DOMNODE,
  fileName   IN      VARCHAR2,
  charset    IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  doc        IN      DOMDOCUMENT,
  filename   IN      VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  doc        IN      DOMDOCUMENT,
  fileName   IN      VARCHAR2,
  charset    IN      VARCHAR2);
```

### Parameters

**Table 170–137 WRITETOFILE Procedure Parameters**

Parameter	Description
n	DOMNODE
fileName	File to which to write
charset	specified character set
doc	DOMDOCUMENT
charset	Character set

The `DBMS_XMLGEN` package converts the results of a SQL query to a canonical XML format. The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a `CLOB`. This package is similar to the `DBMS_XMLQUERY` package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- [Using DBMS\\_XMLGEN](#)
- [Summary of DBMS\\_XMLGEN Subprograms](#)

**See Also:** *Oracle XML DB Developer's Guide*, for more information on XML support and on examples of using `DBMS_XMLGEN`

---

## Using DBMS\_XMLGEN

- [Security Model](#)

## Security Model

Owned by XDB, the DBMS\_XMLGEN package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

---

## Summary of DBMS\_XMLGEN Subprograms

**Table 171–1 Summary of DBMS\_XMLGEN Package Subprograms**

Subprogram	Description
<a href="#">CLOSECONTEXT Procedure</a> on page 171-5	Closes the context and releases all resources
<a href="#">CONVERT Functions</a> on page 171-6	Converts the XML into the escaped or unescaped XML equivalent
<a href="#">GETNUMROWSPROCESSED Function</a> on page 171-7	Gets the number of SQL rows that were processed in the last call to <a href="#">GETXML Functions</a>
<a href="#">GETXML Functions</a> on page 171-8	Gets the XML document
<a href="#">GETXMLTYPE Functions</a> on page 171-9	Gets the XML document and returns it as XMLType
<a href="#">NEWCONTEXT Functions</a> on page 171-10	Creates a new context handle
<a href="#">NEWCONTEXTFROMHIERARCHY Function</a> on page 171-11	Obtains a handle to use in the <a href="#">GETXML Functions</a> and other functions to get a hierarchical XML with recursive elements from the result
<a href="#">RESTARTQUERY Procedure</a> on page 171-12	Restarts the query to start fetching from the beginning
<a href="#">SETCONVERTSPECIALCHARS Procedure</a> on page 171-13	Sets whether special characters such as \$, which are non-XML characters, should be converted or not to their escaped representation
<a href="#">SETMAXROWS Procedure</a> on page 171-14	Sets the maximum number of rows to be fetched each time
<a href="#">SETNULLHANDLING Procedure</a> on page 171-15	Sets NULL handling options
<a href="#">SETROWSETTAG Procedure</a> on page 171-16	Sets the name of the element enclosing the entire result
<a href="#">SETROWTAG Procedure</a> on page 171-17	Sets the name of the element enclosing each row of the result
<a href="#">SETSKIPROWS Procedure</a> on page 171-18	Sets the number of rows to skip every time before generating the XML.
<a href="#">USEITEMTAGSFORCOLL Procedure</a> on page 171-19	Forces the use of the collection column name appended with the tag <code>_ITEM</code> for collection elements
<a href="#">USENULLATTRIBUTEINDICATOR Procedure</a> on page 171-20	Specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document.

## CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

### Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (  
    ctx IN ctxHandle);
```

### Parameters

**Table 171–2** *CLOSECONTEXT Procedure Parameters*

Parameter	Description
ctx	The context handle to close.

## CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

### Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
    xmlData IN VARCHAR2,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
    xmlData IN CLOB,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN CLOB;
```

### Parameters

**Table 171–3** *CONVERT Function Parameters*

Parameter	Description
xmlData	The XML CLOB data to be encoded or decoded.
flag	The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.

### Usage Notes

This function escapes the XML data if the ENTITY\_ENCODE is specified. For example, the escaped form of the character < is &lt; ;. Unescaping is the reverse transformation.

## GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the [GETXML Functions](#) call. This count does not include the number of rows skipped before generating the XML. Note that [GETXML Functions](#) always generates an XML document, even if there are no rows present.

### Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (  
    ctx      IN      ctxHandle)  
RETURN NUMBER;
```

### Parameters

**Table 171-4** *GETNUMROWSPROCESSED Function Parameters*

Parameter	Description
ctx	The context handle obtained from the <a href="#">NEWCONTEXT Functions</a> call on page 171-10.

### Usage Notes

This function is used to determine the terminating condition if calling [GETXML Functions](#) in a loop.

## GETXML Functions

This function gets the XML document. The function is overloaded.

### Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of [GETXML Functions](#) to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this [GETXML Functions](#) call is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    tmpclob      IN OUT NCOPY CLOB,
    dtdOrSchema IN number := NONE)
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the `DBMS_LOB.FREETEMPORARY` call:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    dtdOrSchema IN number := NONE)
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the `DBMS_LOB.FREETEMPORARY` call:

```
DBMS_XMLGEN.GETXML (
    sqlQuery     IN VARCHAR2,
    dtdOrSchema  IN number := NONE)
RETURN CLOB;
```

### Parameters

**Table 171–5** GETXML Function Parameters

Parameter	Description
<code>ctx</code>	The context handle obtained from the <code>newContext</code> call.
<code>tmpclob</code>	The CLOB to which the XML document is appended.
<code>sqlQuery</code>	The SQL query string.
<code>dtdOrSchema</code>	Generate a DTD or a schema? Only <code>NONE</code> is supported.

### Usage Notes

When the rows indicated by the [SETSKIPROWS Procedure](#) call are skipped, the maximum number of rows as specified by the [SETMAXROWS Procedure](#) call (or the entire result if not specified) is fetched and converted to XML. Use the [GETNUMROWSPROCESSED Function](#) to check if any rows were retrieved.

## GETXMLTYPE Functions

This function gets the XML document and returns it as an `XMLTYPE`. `XMLTYPE` operations can be performed on the results.

This function is overloaded.

### Syntax

Generates the XML document and returns it as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
  ctx          IN ctxhandle,
  dtdOrSchema IN number := NONE)
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
  sqlQuery     IN VARCHAR2,
  dtdOrSchema IN number := NONE)
RETURN sys.XMLType
```

### Parameters

**Table 171–6** *GETXMLTYPE Function Parameters*

Parameter	Description
<code>ctx</code>	The context handle obtained from the <code>newContext</code> call.
<code>sqlQuery</code>	The SQL query string.
<code>dtdOrSchema</code>	Generate a DTD or a schema? Only <code>NONE</code> is supported.

## NEWCONTEXT Functions

This function generates and returns a new context handle. This context handle is used in [GETXML Functions](#) and other functions to get XML back from the result. There are several version of the function.

### Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (  
    query      IN VARCHAR2)  
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (  
    queryString IN SYS_REFCURSOR)  
RETURN ctxHandle;
```

### Parameters

**Table 171–7** NEWCONTEXT Function Parameters

Parameter	Description
query	The query, in the form of a VARCHAR, the result of which must be converted to XML.
queryString	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

## NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the [GETXML Functions](#) and other functions to get a hierarchical XML with recursive elements from the result.

### Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (  
    queryString IN VARCHAR2)  
RETURN ctxHandle;
```

### Parameters

**Table 171–8** *NEWCONTEXTFROMHIERARCHY Function Parameters*

Parameter	Description
queryString	The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a <code>CONNECT BY</code> clause, and the result must have the same property as the result set generated by a <code>CONNECT BY</code> query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document.

## RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row. It can be used to start executing the query again, without having to create a new context.

### Syntax

```
DBMS_XMLGEN.RESTARTQUERY (  
  ctx IN ctxHandle);
```

### Parameters

**Table 171–9** *RESTARTQUERY Procedure Parameters*

Parameter	Description
ctx	The context handle corresponding to the current query.

## SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to &lt;. The default is to perform conversions. This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, " , ' , which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

### Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (  
  ctx   IN ctxHandle,  
  conv  IN BOOLEAN);
```

### Parameters

**Table 171–10** SETCONVERTSPECIALCHARS Procedure Parameters

Parameter	Description
ctx	The context handle obtained from one of the <a href="#">NEWCONTEXT Functions</a> call on page 171-10.
conv	TRUE indicates that conversion is needed.

## SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the [GETXML Functions](#) call. It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxrows` parameter.

### Syntax

```
DBMS_XMLGEN.SETMAXROWS (  
  ctx      IN ctxHandle,  
  maxRows  IN NUMBER);
```

### Parameters

**Table 171–11** *SETMAXROWS Procedure Parameters*

Parameter	Description
<code>ctx</code>	The context handle corresponding to the query executed.
<code>maxRows</code>	The maximum number of rows to get for each call to <a href="#">GETXML Functions</a>

## SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the `flag` parameter setting.

### Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(  
  ctx IN ctx,  
  flag IN NUMBER);
```

### Parameters

**Table 171–12** *SETNULLHANDLING Procedure Parameters*

Parameter	Description
<code>ctx</code>	The context handle corresponding to the query executed.
<code>flag</code>	The NULL handling option set. <ul style="list-style-type: none"><li>■ <code>DROP_NULLS CONSTANT NUMBER := 0;</code> (Default) Leaves out the tag for NULL elements.</li><li>■ <code>NULL_ATTR CONSTANT NUMBER := 1;</code> Sets <code>xsi:nil="true"</code>.</li><li>■ <code>EMPTY_TAG CONSTANT NUMBER := 2;</code> Sets, for example, <code>&lt;foo/&gt;</code>.</li></ul>

## SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is ROWSET .

### Syntax

```
DBMS_XMLGEN.SETROWSETTAG (  
  ctx          IN ctxHandle,  
  rowSetTagName IN VARCHAR2);
```

### Parameters

**Table 171–13 SETROWSETTAG Procedure Parameters**

Parameter	Description
ctx	The context handle obtained from the <a href="#">NEWCONTEXT Functions</a> call on page 171-10.
rowSetTagName	The name of the document element. Passing NULL indicates that you do not want the ROWSET element present.

### Usage Notes

The user can set the rowSetTag to NULL to suppress the printing of this element. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output . This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

## SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

### Syntax

```
DBMS_XMLGEN.SETROWTAG (  
  ctx          IN ctxHandle,  
  rowTagName  IN VARCHAR2);
```

### Parameters

**Table 171–14** *SETROWTAG Procedure Parameters*

Parameter	Description
ctx	The context handle obtained from the <a href="#">NEWCONTEXT Functions</a> call on page 171-10.
rowTagName	The name of the ROW element. Passing NULL indicates that you do not want the ROW element present.

### Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

## SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the [GETXML Functions](#). It is used when generating paginated results for stateless Web pages using this utility. For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See [GETNUMROWSPROCESSED Function](#) on page 171-7.

### Syntax

```
DBMS_XMLGEN.SETSKIPROWS (  
  ctx          IN ctxHandle,  
  skipRows    IN NUMBER);
```

### Parameters

**Table 171–15** *SETSKIPROWS Procedure Parameters*

Parameter	Description
<code>ctx</code>	The context handle corresponding to the query executed.
<code>skipRows</code>	The number of rows to skip for each call to <code>getXML</code> .

## USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

### Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (  
    ctx IN ctxHandle);
```

### Parameters

**Table 171–16** *USEITEMTAGSFORCOLL Procedure Parameters*

Parameter	Description
ctx	The context handle.

### Usage Notes

Using this procedure, you can override the default to use the name of the column with the `_ITEM` tag appended to it. If there is a collection of `NUMBER`, the default tag name for the collection elements is `NUMBER`.

## USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. It is used as a shortcut for the [SETNULLHANDLING Procedure](#).

### Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(  
  ctx          IN   ctxType,  
  attrind     IN   BOOLEAN := TRUE);
```

### Parameters

**Table 171–17** *USENULLATTRIBUTEINDICATOR Procedure Parameters*

Parameter	Description
ctx	Context handle.
attrind	Use attribute to indicate NULL?

The DBMS\_XMLINDEX package provides an interface to implement asynchronous indexing.

**See Also:** *Oracle XML DB Developer's Guide* for more information about "XMLIndex"

This chapter contains the following topics:

- [Using DBMS\\_XMLINDEX](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_XMLINDEX Subprograms](#)

## Using DBMS\_XMLINDEX

- [Overview](#)
- [Security Model](#)

## Overview

### **Asynchronous Index Maintenance**

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a convenient time, for example to a time when the load on the database is low. Thus a mechanism for asynchronous index maintenance is provided.

## Security Model

Owned by XDB, the DBMS\_XMLINDEX package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

---

## Summary of DBMS\_XMLINDEX Subprograms

This table lists the package subprograms in alphabetical order.

**Table 172-1 DBMS\_XMLINDEX Package Subprograms**

Subprogram	Description
<a href="#">CREATEDATEINDEX Procedure</a> on page 172-6	Creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex
<a href="#">CREATENUMBERINDEX Procedure</a> on page 172-7	Creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex
<a href="#">DROPPARAMETER Procedure</a> on page 172-8	Drops the XMLIndex parameter string that is associated with a given parameter identifier.
<a href="#">MODIFYPARAMETER Procedure</a> on page 172-9	Modifies the XMLIndex parameter string that is associated with a given parameter name
<a href="#">REGISTERPARAMETER Procedure</a> on page 172-10	Registers a parameter string and XMLIndex parameter string pair in XDB
<a href="#">SYNCINDEX Procedure</a> on page 172-11	Synchronizes the index manually

## CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date\_index\_clause to be set to an empty string.

### Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2,
  date_index_clause IN VARCHAR2);
```

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2);
```

### Parameters

**Table 172–2** *CREATEDATEINDEX Procedure Parameters*

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
date_index_name	Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

## CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`.

### Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  num_index_name   IN VARCHAR2,
  num_index_clause IN VARCHAR2,
  xmltypename     IN VARCHAR2);
```

### Parameters

**Table 172–3** *CREATENUMBERINDEX Procedure Parameters*

Parameter	Description
<code>xml_index_schema</code>	Name of the owner of the <code>XMLIndex</code>
<code>xml_index_name</code>	Name of the <code>XMLIndex</code>
<code>num_index_name</code>	Name of the secondary index to be created for number values in the <code>VALUE</code> column of the <code>PATH TABLE</code> of <code>XMLIndex</code> named <code>xml_index_name</code> and owned by <code>xml_index_schema</code>
<code>num_index_clause</code>	Storage clause to be applied to the number index during its creation. This is a string argument appended to the <code>CREATE INDEX</code> statement for creating the number index.
<code>xmltypename</code>	The type to which values in the <code>VALUE</code> column of the path table are to be cast. Acceptable values are the following strings: <code>FLOAT</code> , <code>DOUBLE</code> , <code>DECIMAL</code> , <code>INTEGER</code> , <code>NONPOSITIVEINTEGER</code> , <code>NEGATIVEINTEGER</code> , <code>LONG</code> , <code>INT</code> , <code>SHORT</code> , <code>BYTE</code> , <code>NONNEGATIVEINTEGER</code> , <code>UNSIGNEDLONG</code> , <code>UNSIGNEDINT</code> , <code>UNSIGNEDSHORT</code> , <code>UNSIGNEDBYTE</code> , <code>POSITIVEINTEGER</code> .

## DROPPARAMETER Procedure

This procedure drops the XMLIndex parameter string that is associated with a given parameter identifier.

### Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (  
    name          IN          VARCHAR2);
```

### Parameters

**Table 172–4** DROPPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string

### Examples

```
DBMS_XMLINDEX.DROPPARAMETER (  
    'myIndexParam');
```

## MODIFYPARAMETER Procedure

This procedure modifies the XMLIndex parameter string that is associated with a given parameter identifier.

### Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
  name          IN      VARCHAR2,
  parameter     IN      CLOB);
```

### Parameters

**Table 172–5** *MODIFYPARAMETER Procedure Parameters*

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

### Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
  'myIndexParam',
  'PATH TABLE po_ptab
  PATH ID INDEX po_pidx
  ORDER KEY INDEX po_oidx
  VALUE INDEX po_vidx');
```

## REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

### Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (
  name          IN          VARCHAR2,
  parameter     IN          CLOB);
```

### Parameters

**Table 172–6 REGISTERPARAMETER Procedure Parameters**

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

### Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (
  'myIndexParam',
  'PATH TABLE po_ptab
  PATH ID INDEX po_pidx
  ORDER KEY INDEX po_oidx
  VALUE INDEX po_vidx
  PATHS (NAMESPACE MAPPING (xmlns:p="http://www.example.com/IPO"))
  GROUP MASTERGROUP XMLTABLE PO_TAB
  ('/p:PurchaseOrder'
   COLUMNS
     REFERENCE VARCHAR2(30) PATH 'p:Reference',
     REQUESTOR VARCHAR2(30) PATH 'p:Requestor' )
  GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
  ('/p:PurchaseOrder/p:LineItems/p:LineItem'
   COLUMNS
     LINENUMBER NUMBER(38) PATH '@p:ItemNumber',
     QUANTITY NUMBER(38) PATH '@p:Quantity',
     DESCRIPTION VARCHAR2(256) PATH 'p:Description' ));
```

## SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex. It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

### Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
  xml_index_schema    IN VARCHAR2,
  xml_index_name      IN VARCHAR2,
  partition_name      IN VARCHAR2 DEFAULT NULL,
  reindex             IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 172–7 SYNCINDEX Procedure Parameters**

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_schema_name	Name of the XMLIndex
partition_name	[Currently not supported]
reindex	Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulkloaded.

### Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

---

---

## DBMS\_XMLPARSER

Using `DBMS_XMLPARSER`, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- [Using DBMS\\_XMLPARSER](#)
- [Summary of DBMS\\_XMLPARSER Subprograms](#)

**See Also:** *Oracle XML DB Developer's Guide*

## Using DBMS\_XMLPARSER

- [Security Model](#)

## Security Model

Owned by XDB, the DBMS\_XDB\_XMLPARSER package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

---

## Summary of DBMS\_XMLPARSER Subprograms

**Table 173–1 DBMS\_XMLPARSER Package Subprograms**

<b>Method</b>	<b>Description</b>
<a href="#">FREEPARSER</a> on page 173-5	Frees a parser object.
<a href="#">GETDOCTYPE</a> on page 173-6	Gets parsed DTD.
<a href="#">GETDOCUMENT</a> on page 173-7	Gets DOM document.
<a href="#">GETRELEASEVERSION</a> on page 173-7	Returns the release version of Oracle XML Parser for PL/SQL.
<a href="#">GETVALIDATIONMODE</a> on page 173-9	Returns validation mode.
<a href="#">NEWPARSER</a> on page 173-10	Returns a new parser instance
<a href="#">PARSE</a> on page 173-11	Parses XML stored in the given url/file.
<a href="#">PARSEBUFFER</a> on page 173-12	Parses XML stored in the given buffer
<a href="#">PARSECLOB</a> on page 173-12	Parses XML stored in the given clob
<a href="#">PARSEDTD</a> on page 173-14	Parses DTD stored in the given url/file
<a href="#">PARSEDTDBUFFER</a> on page 173-15	Parses DTD stored in the given buffer
<a href="#">PARSEDTDCLOB</a> on page 173-16	Parses DTD stored in the given clob
<a href="#">SETBASEDIR</a> on page 173-17	Sets base directory used to resolve relative URLs.
<a href="#">SETDOCTYPE</a> on page 173-18	Sets DTD.
<a href="#">SETERRORLOG</a> on page 173-19	Sets errors to be sent to the specified file
<a href="#">SETPRESERVEWHITESPACE</a> on page 173-20	Sets white space preserve mode
<a href="#">SETVALIDATIONMODE</a> on page 173-21	Sets validation mode.
<a href="#">SHOWWARNINGS</a> on page 173-22	Turns warnings on or off.

## FREEPARSER

Frees a parser object.

### Syntax

```
PROCEDURE freeParser(  
    p Parser);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

## GETDOCTYPE

Returns the parsed DTD; this function must be called only after a DTD is parsed.

### Syntax

```
FUNCTION getDoctype(  
  p Parser)  
RETURN DOMDocumentType;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

## GETDOCUMENT

Returns the document node of a DOM tree document built by the parser; this function must be called only after a document is parsed.

### Syntax

```
FUNCTION GETDOCUMENT (  
  p Parser)  
RETURN DOMDocument;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

## GETRELEASEVERSION

Returns the release version of the Oracle XML parser for PL/SQL.

### Syntax

```
FUNCTION getReleaseVersion  
RETURN VARCHAR2;
```

## GETVALIDATIONMODE

Retrieves validation mode; TRUE for validating, FALSE otherwise.

### Syntax

```
FUNCTION GETVALIDATIONMODE(  
  p Parser)  
RETURN BOOLEAN;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

## NEWPARSER

Returns a new parser instance. This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

### **Syntax**

```
FUNCTION newParser  
RETURN Parser;
```

## PARSE

Parses XML stored in the given URL or file. An application error is raised if parsing fails. There are several versions of this method.

Syntax	Description
<pre>FUNCTION parse(     url VARCHAR2) RETURN DOMDocument;  PROCEDURE parse(     p    Parser,     url VARCHAR2);</pre>	<p>Returns the built DOM Document.</p> <p>This is meant to be used when the default parser behavior is acceptable and just a url/file needs to be parsed.</p> <p>Any changes to the default parser behavior should be effected before calling this procedure.</p>

Parameter	IN / OUT	Description
url	(IN)	Complete path of the url/file to be parsed.
p	(IN)	Parser instance.

## PARSEBUFFER

Parses XML stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEBUFFER(  
  p Parser,  
  doc VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

## PARSECLOB

Parses XML stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSECLOB(  
  p  Parser,  
  doc CLOB);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

## PARSEDTD

Parses the DTD stored in the given URL or file. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEDTD(  
  p      Parser,  
  url    VARCHAR2,  
  root   VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

## PARSEDTDBUFFER

Parses the DTD stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEDTDBUFFER(  
  p    Parser,  
  dtd  VARCHAR2,  
  root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

## PARSEDTCLOB

Parses the DTD stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEDTCLOB(  
  p    Parser,  
  dtd  CLOB,  
  root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

## SETBASEDIR

Sets base directory used to resolve relative URLs. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE setBaseDir(  
  p Parser,  
  dir VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

## SETDOCTYPE

Sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

### Syntax

```
PROCEDURE setDoctype(  
  p Parser,  
  dtd DOMDocumentType);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

## SETERRORLOG

Sets errors to be sent to the specified file.

### Syntax

```
PROCEDURE setErrorLog(  
p          Parser,  
fileName VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

## SETPRESERVEWHITESPACE

Sets whitespace preserving mode.

### Syntax

```
PROCEDURE setPreserveWhitespace(  
  p Parser,  
  yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

## SETVALIDATIONMODE

Sets validation mode.

### Syntax

```
PROCEDURE setValidationMode(  
  p  Parser,  
  yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

## SHOWWARNINGS

Turns warnings on or off.

### Syntax

```
PROCEDURE showWarnings(  
  p Parser,  
  yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

---

## DBMS\_XMLQUERY

DBMS\_XMLQUERY provides database-to-XMLType functionality. Whenever possible, use DBMS\_XMLGEN, a built-in package in C, instead of DBMS\_XMLQUERY.

**See Also:** *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- [Using DBMS\\_XMLQUERY](#)
  - Security Model
  - Constants
  - Types
- [Summary of DBMS\\_XMLQUERY Subprograms](#)

## Using DBMS\_XMLQUERY

- [Security Model](#)
- [Constants](#)
- [Types](#)

## Security Model

Owned by XDB, the DBMS\_XMLQUERY package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## Constants

**Table 174–1 Constants of DBMS\_XMLQUERY**

Constant	Description
DB_ENCODING	Used to signal that the DB character encoding is to be used.
DEFAULT_ROWSETTAG	The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.
DEFAULT_ERRORTAG	The default tag to enclose raised errors -- ERROR.
DEFAULT_ROWIDATTR	The default name for the cardinality attribute of XML elements corresponding to <code>db.records</code> -- NUM
DEFAULT_ROWTAG	The default tag name for the element corresponding to <code>db.records</code> -- ROW
DEFAULT_DATE_FORMAT	Default date mask -- 'MM/dd/yyyy HH:mm:ss'
ALL_ROWS	Indicates that all rows are needed in the output.
NONE	Used to specifies that the output should not contain any XML metadata (for example, no DTD).
DTD	Used to specify that the generation of the DTD is desired.
SCHEMA	Used to specify that the generation of the XML Schema is desired.
LOWER_CASE	Use lower case tag names.
UPPER_CASE	Use upper case tag names.

## Types

**Table 174–2** *Types of DBMS\_XMLQUERY*

Type	Description
ctxType	The type of the query context handle. This is the return type of <a href="#">NEWCONTEXT</a>

---

## Summary of DBMS\_XMLQUERY Subprograms

**Table 174–3 DBMS\_XMLQUERY Package Subprograms**

Method	Description
<a href="#">CLOSECONTEXT</a> on page 174-8	Closes or deallocates a particular query context.
<a href="#">GETDTD</a> on page 174-9	Generates the DTD.
<a href="#">GETEXCEPTIONCONTENT</a> on page 174-10	Returns the thrown exception's error code and error message.
<a href="#">GETNUMROWSPROCESSED</a> on page 174-11	Returns the number of rows processed for the query.
<a href="#">GETVERSION</a> on page 174-12	Prints the version of the XSU in use.
<a href="#">GETXML</a> on page 174-13	Generates the XML document.
<a href="#">NEWCONTEXT</a> on page 174-14	Creates a query context and it returns the context handle.
<a href="#">PROPAGATEORIGINALEXCEPTION</a> on page 174-15	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an <code>OracleXMLSQLException</code> .
<a href="#">REMOVEXSLTPARAM</a> on page 174-16	Removes a particular top-level stylesheet parameter.
<a href="#">SETBINDVALUE</a> on page 174-17	Sets a value for a particular bind name.
<a href="#">SETCOLLIDATTRNAME</a> on page 174-18	Sets the name of the id attribute of the collection element's separator tag.
<a href="#">SETDATAHEADER</a> on page 174-18	Sets the XML data header.
<a href="#">SETDATEFORMAT</a> on page 174-20	Sets the format of the generated dates in the XML document.
<a href="#">SETENCODINGTAG</a> on page 174-21	Sets the encoding processing instruction in the XML document.
<a href="#">SETERRORTAG</a> on page 174-22	Sets the tag to be used to enclose the XML error documents.
<a href="#">SETMAXROWS</a> on page 174-23	Sets the maximum number of rows to be converted to XML.
<a href="#">SETMETAHEADER</a> on page 174-24	Sets the XML meta header.
<a href="#">SETRAISEEXCEPTION</a> on page 174-25	Tells the XSU to throw the raised exceptions.
<a href="#">SETRAISENOROWSEXCEPTION</a> on page 174-26	Tells the XSU to throw or not to throw an <code>OracleXMLNoRowsException</code> in the case when for one reason or another, the XML document generated is empty.
<a href="#">SETROWIDATTRNAME</a> on page 174-27	Sets the name of the id attribute of the row enclosing tag.
<a href="#">SETROWIDATTRVALUE</a> on page 174-28	Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.
<a href="#">SETROWSETTAG</a> on page 174-29	Sets the tag to be used to enclose the XML dataset.
<a href="#">SETROWTAG</a> on page 174-30	Sets the tag to be used to enclose the XML element.

**Table 174-3 (Cont.) DBMS\_XMLQUERY Package Subprograms**

<b>Method</b>	<b>Description</b>
<a href="#">SETSKIPROWS</a> on page 174-31	Sets the number of rows to skip.
<a href="#">SETSQLTOXMLNAMEESCAPING</a> on page 174-32	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
<a href="#">SETSTYLESHEETHEADER</a> on page 174-33	Sets the stylesheet header.
<a href="#">SETTAGCASE</a> on page 174-34	Specifies the case of the generated XML tags.
<a href="#">SETXSLT</a> on page 174-35	Registers a stylesheet to be applied to generated XML.
<a href="#">SETXSLTPARAM</a> on page 174-36	Sets the value of a top-level stylesheet parameter.
<a href="#">USENULLATTRIBUTEINDICATOR</a> on page 174-37	Specifies whether to use an XML attribute to indicate NULLness.
<a href="#">USETYPEFORCOLLELEMTAG</a> on page 174-38	Tells the XSU to use the collection element's type name as the collection element tag name.

## CLOSECONTEXT

Closes or deallocates a particular query context

### Syntax

```
PROCEDURE CLOSECONTEXT(  
  ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## GETDTD

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

Syntax	Description
<pre>FUNCTION GETDTD(     ctxHdl IN ctxType,     withVer IN BOOLEAN := false) RETURN CLOB;</pre>	Function that generates the DTD based on the SQL query used to initialize the context.
<pre>PROCEDURE GETDTD(     ctxHdl IN ctxType,     xDoc IN CLOB,     withVer IN BOOLEAN := false);</pre>	Procedure that generates the DTD based on the SQL query used to initialize the context; specifies the output CLOB for XML document result.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
withVer	(IN)	Generate the version information? TRUE for yes.
xDoc	(IN)	CLOB into which to write the generated XML document.

## GETEXCEPTIONCONTENT

Returns the thrown exception's SQL error code and error message through the procedure's OUT parameters. This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

### Syntax

```
PROCEDURE GETEXCEPTIONCONTENT(  
  ctxHdl IN ctxType,  
  errNo OUT NUMBER,  
  errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(OUT)	Error number.
errMsg	(OUT)	Error message.

## GETNUMROWSPROCESSED

Return the number of rows processed for the query.

### Syntax

```
FUNCTION GETNUMROWSPROCESSED(  
  ctxHdl IN ctxType)  
RETURN NUMBER;
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## GETVERSION

Prints the version of the XSU in use.

### **Syntax**

```
PROCEDURE GETVERSION();
```

## GETXML

Creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context doesn't have to be explicitly opened or closed. The options are described in the following table.

Syntax	Description
<pre>FUNCTION GETXML(     sqlQuery IN VARCHAR2,     metaType IN NUMBER := NONE) RETURN CLOB;</pre>	This function uses a SQL query in string form.
<pre>FUNCTION GETXML(     sqlQuery IN CLOB,     metaType IN NUMBER := NONE) RETURN CLOB;</pre>	This function uses a SQL query in CLOB form.
<pre>FUNCTION GETXML(     ctxHdl IN ctxType,     metaType IN NUMBER := NONE) RETURN CLOB;</pre>	This function generates the XML document based on a SQL query used to initialize the context.
<pre>PROCEDURE GETXML(     ctxHdl IN ctxType,     xDoc IN CLOB,     metaType IN NUMBER := NONE);</pre>	This procedure generates the XML document based on the SQL query used to initialize the context.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
metaType	(IN)	XML metadata type (NONE, DTD, or SCHEMA).
sqlQuery	(IN)	SQL query.
xDoc	(IN)	CLOB into which to write the generated XML document.

## NEWCONTEXT

Creates a query context and it returns the context handle. The options are described in the following table.

<b>Syntax</b>	<b>Description</b>
<pre>FUNCTION NEWCONTEXT(     sqlQuery IN VARCHAR2) RETURN ctxType;  FUNCTION NEWCONTEXT(     sqlQuery IN CLOB) RETURN ctxType;</pre>	<p>Creates a query context from a string.</p> <p>Creates a query context from a CLOB.</p>

<b>Parameter</b>	<b>IN / OUT</b>	<b>Description</b>
<code>sqlQuery</code>	(IN)	SQL query, the results of which to convert to XML.

## PROPAGATEORIGINALEXCEPTION

Specifies whether to throw every original exception raised or to wrap it in an OracleXMLSQLException.

### Syntax

```
PROCEDURE PROPAGATEORIGINALEXCEPTION(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	TRUE if want to propagate original exception, FALSE to wrap in OracleXMLException.

## REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

### Syntax

```
PROCEDURE REMOVEXSLTPARAM(  
  ctxHdl IN ctxType,  
  name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.

## SETBINDVALUE

Sets a value for a particular bind name.

### Syntax

```
PROCEDURE SETBINDVALUE(  
  ctxHdl IN ctxType,  
  bindName IN VARCHAR2,  
  bindValue IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
bindName	(IN)	Bind name.
bindValue	(IN)	Bind value.

## SETCOLLIDATTRNAME

Sets the name of the id attribute of the collection element's separator tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

### Syntax

```
PROCEDURE SETCOLLIDATTRNAME(  
  ctxHdl IN ctxType,  
  attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
attrName	(IN)	Attribute name.

## SETDATAHEADER

Sets the XML data header. The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the rowset. The two entities are enclosed by the docTag argument. The last data header specified is used. Passing in NULL for the header parameter unsets the data header.

### Syntax

```
PROCEDURE SETDATAHEADER(  
  ctxHdl IN ctxType,  
  header IN CLOB := null,  
  tag IN VARCHAR2 := null);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
header	(IN)	Header.
tag	(IN)	Tag used to enclose the data header and the rowset.

## SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the `java.text.SimpleDateFormat` class. Setting the mask to `NULL` or an empty string sets the default mask -- `DEFAULT_DATE_FORMAT`.

### Syntax

```
PROCEDURE SETDATEFORMAT(  
  ctxHdl IN ctxType,  
  mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>mask</code>	(IN)	The date mask.

## SETENCODINGTAG

Sets the encoding processing instruction in the XML document.

### Syntax

```
PROCEDURE SETENCODINGTAG(  
  ctxHdl IN ctxType,  
  enc IN VARCHAR2 := DB_ENCODING);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
enc	(IN)	The encoding to use.

## SETERRORTAG

Sets the tag to be used to enclose the XML error documents.

### Syntax

```
PROCEDURE SETERRORTAG(  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

## SETMAXROWS

Sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

### Syntax

```
PROCEDURE SETMAXROWS (  
  ctxHdl IN ctxType,  
  rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to generate.

## SETMETAHEADER

Sets the XML meta header. When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in `NULL` for the `header` parameter unsets the meta header.

### Syntax

```
PROCEDURE SETMETAHEADER(  
  ctxHdl IN ctxType,  
  header IN CLOB := null);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>Header</code>	(IN)	Header.

## SETRAISEEXCEPTION

Specifies whether to throw raised exceptions. If this call isn't made or if `FALSE` is passed to the `flag` argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

### Syntax

```
PROCEDURE SETRAISEEXCEPTION(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN:=true);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>flag</code>	(IN)	Throw raised exceptions? <code>TRUE</code> for yes, otherwise <code>FALSE</code> .

## SETRAISENOROWSEXCEPTION

Specifies whether to throw an `OracleXMLNoRowsException` when the generated XML document is empty. By default, the exception is not thrown.

### Syntax

```
PROCEDURE SETRAISENOROWSEXCEPTION(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN:=false);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Throws an <code>OracleXMLNoRowsException</code> if set to <code>TRUE</code> .

## SETROWIDATTRNAME

Sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

### Syntax

```
PROCEDURE SETROWIDATTRNAME(  
  ctxHdl IN ctxType,  
  attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
attrName	(IN)	Attribute name.

## SETROWIDATTRVALUE

Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

### Syntax

```
PROCEDURE SETROWIDATTRVALUE(  
  ctxHdl IN ctxType,  
  colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>colName</code>	(IN)	Column whose value is to be assigned to the row id attribute.

## SETROWSETTAG

Sets the tag to be used to enclose the XML dataset.

### Syntax

```
PROCEDURE SETROWSETTAG(  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

## SETROWTAG

Sets the tag to be used to enclose the XML element corresponding to a `db.record`.

### Syntax

```
PROCEDURE SETROWTAG (  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>tag</code>	(IN)	Tag name.

## SETSKIPROWS

Sets the number of rows to skip. By default, 0 rows are skipped.

### Syntax

```
PROCEDURE SETSKIPROWS(  
  ctxHdl IN ctxType,  
  rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to skip.

## SETSQLTOXMLNAMEESCAPING

This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

### Syntax

```
PROCEDURE SETSQLTOXMLNAMEESCAPING (  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping? TRUE for yes, otherwise FALSE.

## SETSTYLESHEETHEADER

Sets the stylesheet header (the stylesheet processing instructions) in the generated XML document. Passing `NULL` for the `uri` argument will unset the stylesheet header and the stylesheet type.

### Syntax

```
PROCEDURE SETSTYLESHEETHEADER(  
  ctxHdl IN ctxType,  
  uri IN VARCHAR2,  
  type IN VARCHAR2 := 'text/xsl');
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>uri</code>	(IN)	Stylesheet URI.
<code>type</code>	(IN)	Stylesheet type; defaults to "text/xsl".

## SETTAGCASE

Specifies the case of the generated XML tags.

### Syntax

```
PROCEDURE SETTAGCASE (  
  ctxHdl IN ctxType,  
  tCase IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tCase	(IN)	The tag's case: <ul style="list-style-type: none"><li>■ 0 for as are</li><li>■ 1 for lower case</li><li>■ 2 for upper case</li></ul>

## SETXSLT

Registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. The options are described in the following table. Passing `NULL` for the `uri` argument or an empty string for the `stylesheet` argument will unset the stylesheet header and type.

Syntax	Description
<pre>PROCEDURE SETXSLT(   ctxHdl IN ctxType,   uri IN VARCHAR2,   ref IN VARCHAR2 := null);</pre>	To un-register the stylesheet pass in a null for the uri.
<pre>PROCEDURE SETXSLT(   ctxHdl IN ctxType,   stylesheet CLOB,   ref IN VARCHAR2 := null);</pre>	To un-register the stylesheet pass in a null or an empty string for the stylesheet.

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>uri</code>	(IN)	Stylesheet URI.
<code>stylesheet</code>	(IN)	Stylesheet.
<code>ref</code>	(IN)	URL to include, imported and external entities.

## SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

### Syntax

```
PROCEDURE SETXSLTPARAM(  
  ctxHdl IN ctxType,  
  name IN VARCHAR2,  
  value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.
value	(IN)	Value to be assigned to the stylesheet parameter.

## USENULLATTRIBUTEINDICATOR

Specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

### Syntax

```
PROCEDURE SETNULLATTRIBUTEINDICATOR(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Sets attribute to NULL if TRUE, omits from XML document if FALSE.

## USETYPEFORCOLLELEMTAG

Specifies whether to use the collection element's type name as its element tag name. By default, the tag name for elements of a collection is the collection's tag name followed by `_item`.

### Syntax

```
PROCEDURE USETYPEFORCOLLELEMTAG(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>flag</code>	(IN)	Turn on use of the type name?

DBMS\_XMLSAVE provides XML to database-type functionality.

  - Security Model
  - Constants
  - Types
- [Summary of DBMS\\_XMLSAVE Subprograms](#)

## Using DBMS\_XMLSAVE

- [Security Model](#)
- [Constants](#)
- [Types](#)

## Security Model

Owned by XDB, the DBMS\_XMLSAVE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## Constants

**Table 175–1 Constants of DBMS\_XMLSAVE**

<b>Constant</b>	<b>Description</b>
DEFAULT_ROWTAG	The default tag name for the element corresponding to database records -- ROW
DEFAULT_DATE_FORMAT	Default date mask: 'MM/dd/yyyy HH:mm:ss'
MATCH_CASE	Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.
IGNORE_CASE	Used to specify that when mapping XML elements to database entities the XSU should be case insensitive.

## Types

**Table 175–2** *Types of DBMS\_XMLSAVE*

Type	Description
ctxType	The type of the query context handle. The type of the query context handle. This the return type of <a href="#">NEWCONTEXT</a> .

---

## Summary of DBMS\_XMLSAVE Subprograms

**Table 175-3 DBMS\_XMLSAVE Package Subprograms**

Method	Description
<a href="#">CLEARKEYCOLUMNLIST</a> on page 175-7	Clears the key column list.
<a href="#">CLEARUPDATECOLUMNLIST</a> on page 175-8	Clears the update column list.
<a href="#">CLOSECONTEXT</a> on page 175-9	It closes/deallocates a particular save context.
<a href="#">DELETEXML</a> on page 175-10	Deletes records specified by data from the XML document, from the table specified at the context creation time.
<a href="#">GETEXCEPTIONCONTENT</a> on page 175-11	Returns the thrown exception's error code and error message.
<a href="#">INSERTXML</a> on page 175-12	Inserts the XML document into the table specified at the context creation time.
<a href="#">NEWCONTEXT</a> on page 175-13	Creates a save context, and returns the context handle.
<a href="#">PROPAGATEORIGINALEXCEPTION</a> on page 175-14	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an <code>OracleXMLSQLException</code> .
<a href="#">REMOVEXSLTPARAM</a> on page 175-15	Removes the value of a top-level stylesheet parameter
<a href="#">SETBATCHSIZE</a> on page 175-16	Changes the batch size used during DML operations.
<a href="#">SETCOMMITBATCH</a> on page 175-18	Sets the commit batch size.
<a href="#">SETDATEFORMAT</a> on page 175-18	Sets the format of the generated dates in the XML document.
<a href="#">SETIGNORECASE</a> on page 175-19	The XSU does mapping of XML elements to database.
<a href="#">SETKEYCOLUMN</a> on page 175-20	This methods adds a column to the key column list.
<a href="#">SETPRESERVEWHITESPACE</a> on page 175-21	Tells the XSU whether to preserve whitespace or not.
<a href="#">SETROWTAG</a> on page 175-22	Names the tag used in the XML document to enclose the XML elements corresponding to database.
<a href="#">SETSQLTOXMLNAMEESCAPING</a> on page 175-23	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
<a href="#">SETUPDATECOLUMN</a> on page 175-24	Adds a column to the update column list.
<a href="#">SETXSLT</a> on page 175-25	Registers a XSL transform to be applied to the XML to be saved.
<a href="#">SETXSLTPARAM</a> on page 175-26	Sets the value of a top-level stylesheet parameter.
<a href="#">UPDATEXML</a> on page 175-27	Updates the table given the XML document.

## CLEARKEYCOLUMNLIST

Clears the key column list.

### Syntax

```
PROCEDURE clearKeyColumnList(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## CLEARUPDATECOLUMNLIST

Clears the update column list.

### Syntax

```
PROCEDURE clearUpdateColumnList(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## CLOSECONTEXT

Closes/deallocates a particular save context.

### Syntax

```
PROCEDURE closeContext(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## DELETXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted. The options are described in the following table.

Syntax	Description
<pre>FUNCTION deleteXML(     ctxHdl IN ctxPType,     xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Uses a VARCHAR2 type for the xDoc parameter.
<pre>FUNCTION deleteXML(     ctxHdl IN ctxType,     xDoc IN CLOB) RETURN NUMBER;</pre>	Uses a CLOB type for the xDoc parameter.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

## GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code. This is to get around the fact that the JVM throws an exception on top of whatever exception was raised; thus, rendering PL/SQL unable to access the original exception.

### Syntax

```
PROCEDURE getExceptionContent(  
    ctxHdl IN ctxType,  
    errNo OUT NUMBER,  
    errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(IN)	Error number.
errMsg	(IN)	Error message.

## INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

<b>Syntax</b>	<b>Description</b>
<pre>FUNCTION insertXML(     ctxHdl IN ctxType,     xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION insertXML(     ctxHdl IN ctxType,     xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.

<b>Parameter</b>	<b>IN / OUT</b>	<b>Description</b>
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

## NEWCONTEXT

Creates a save context, and returns the context handle.

### Syntax

```
FUNCTION newContext(  
    targetTable IN VARCHAR2)  
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

## PROPAGATEORIGINALEXCEPTION

Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an `OracleXMLSQLException`.

### Syntax

```
PROCEDURE propagateOriginalException(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Propagate the original exception? 0=FALSE, 1=TRUE.

## REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter.

### Syntax

```
PROCEDURE removeXSLTParam(  
    ctxHdl IN ctxType,  
    name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.

## SETBATCHSIZE

Changes the batch size used during DML operations. When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

### Syntax

```
PROCEDURE setBatchSize(  
    ctxHdl IN ctxType,  
    batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
batchSize	(IN)	Batch size.

## SETCOMMITBATCH

Sets the commit batch size. The commit batch size refers to the number of records inserted after which a commit should follow. If `batchSize` is less than 1 or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, `commitBatch` is 0.

### Syntax

```
PROCEDURE setCommitBatch(  
    ctxHdl IN ctxType,  
    batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>batchSize</code>	(IN)	Commit batch size.

## SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the class `java.text.SimpleDateFormat`. Setting the mask to `<code>null</code>` or an empty string unsets the date mask.

### Syntax

```
PROCEDURE setDateFormat(  
    ctxHdl IN ctxType,  
    mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
mask	(IN)	Syntax of the date format pattern..

## SETIGNORECASE

The XSU does mapping of XML elements to db columns/attributes based on the element names (XML tags). This function tells the XSU to do this match case insensitive.

### Syntax

```
PROCEDURE setIgnoreCase(  
    ctxHdl IN ctxType,  
    flag IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.

## SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be `NULL`. In case of update or delete, the columns in the key column list make up the `WHERE` clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

### Syntax

```
PROCEDURE setKeyColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be <code>NULL</code> .

## SETPRESERVEWHITESPACE

Tells the XSU whether or not to preserve whitespace.

### Syntax

```
PROCEDURE setPreserveWhitespace(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Should XSU preserve whitespace?

## SETROWTAG

Names the tag used in the XML document to enclose the XML elements corresponding to db. records.

### Syntax

```
PROCEDURE setRowTag(  
    ctxHdl IN ctxType,  
    tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

## SETSQLTOXMLNAMEESCAPING

Turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

### Syntax

```
PROCEDURE setSQLToXMLNameEscaping(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping?

## SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

### Syntax

```
PROCEDURE setUpdateColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

## SETXSLT

Registers an XSL transform to be applied to the XML to be saved. If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

Syntax	Description
<pre>PROCEDURE setXSLT(     ctxHdl IN ctxType,     uri IN VARCHAR2,     ref IN VARCHAR2 := null);</pre>	Passes in the stylesheet through a URI.
<pre>PROCEDURE setXSLT(     ctxHdl IN ctxType,     stylesheet IN CLOB,     ref IN VARCHAR2 := null);</pre>	Passes in the stylesheet through a CLOB.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
uri	(IN)	URI to the stylesheet to register.
ref	(IN)	URL for include, import, and external entities.
stylesheet	(IN)	CLOB containing the stylesheet to register

## SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

### Syntax

```
PROCEDURE setXSLTParam(  
    ctxHdl IN ctxType,  
    name IN VARCHAR2,  
    value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.
value	(IN)	Parameter value as an XPath expression

## UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description
<pre>FUNCTION updateXML(     ctxHdl IN ctxType,     xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION updateXML(     ctxHdl IN ctxType,     xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

---

## DBMS\_XMLSCHEMA

DBMS\_XMLSCHEMA package provides procedures to manage XML schemas. It is created by script `dbmsxsch.sql` during Oracle database installation.

**See Also:** *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- [Using DBMS\\_XMLSCHEMA](#)
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- [Summary of DBMS\\_XMLSCHEMA Subprograms](#)

---

## Using DBMS\_XMLSCHEMA

This section contains topics which relate to using the DBMS\_XMLSCHEMA package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)

## Overview

This package provides subprograms to

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

## Security Model

Owned by XDB, the DBMS\_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## Constants

The DBMS\_XMLSCHEMA package uses the constants shown in following tables.

- [DBMS\\_XMLSCHEMA Constants - Delete Option](#)
- [DBMS\\_XMLSCHEMA Constants - Enable Hierarchy](#)
- [DBMS\\_XMLSCHEMA Constants - Register CSID](#)

**Table 176–1 DBMS\_XMLSCHEMA Constants - Delete Option**

Constant	Type	Value	Description
DELETE_RESTRICT	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
DELETE_INVALIDATE	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
DELETE_CASCADE	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if <code>gentypes</code> argument was set to <code>TRUE</code> during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
DELETE_CASCADE_FORCE	NUMBER	4	This option is similar to <code>DELETE_CASCADE</code> except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

**Table 176–2 DBMS\_XMLSCHEMA Constants - Enable Hierarchy**

Constant	Type	Value	Description
ENABLE_HIERARCHY_NONE	PLS_INTEGER	1	The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will not be called on any tables created while registering that schema
ENABLE_HIERARCHY_CONTENTS	PLS_INTEGER	2	The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will be called for all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_CONTENTS</code>

**Table 176–2 (Cont.) DBMS\_XMLSCHEMA Constants - Enable Hierarchy**

Constant	Type	Value	Description
ENABLE_HIERARCHY_ RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

**Table 176–3 DBMS\_XMLSCHEMA Constants - Register CSID**

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter

## Views

The DBMS\_XMLSCHEMA package uses the views shown in [Table 176–4](#). The columns of these views are described in detail in the *Oracle Database Reference*.

**Table 176–4 Summary of Views used by DBMS\_XMLSCHEMA**

Schema	Description
USER_XML_SCHEMAS	All registered XML Schemas owned by the user
ALL_XML_SCHEMAS	All registered XML Schemas usable by the current user
DBA_XML_SCHEMAS	All registered XML Schemas in the database
DBA_XML_TABLES	All XMLType tables in the system
USER_XML_TABLES	All XMLType tables owned by the current user
ALL_XML_TABLES	All XMLType tables usable by the current user
DBA_XML_TAB_COLS	All XMLType table columns in the system
USER_XML_TAB_COLS	All XMLType table columns in tables owned by the current user
ALL_XML_TAB_COLS	All XMLType table columns in tables usable by the current user
DBA_XML_VIEWS	All XMLType views in the system
USER_XML_VIEWS	All XMLType views owned by the current user
ALL_XML_VIEWS	All XMLType views usable by the current user
DBA_XML_VIEW_COLS	All XMLType view columns in the system
USER_XML_VIEW_COLS	All XMLType view columns in views owned by the current user
ALL_XML_VIEW_COLS	All XMLType view columns in views usable by the current user

## Operational Notes

### **Guidelines for Using In-Place XML Schema Evolution**

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

---

## Summary of DBMS\_XMLSCHEMA Subprograms

**Table 176–5 DBMS\_XMLSCHEMA Package Subprograms**

Method	Description
<a href="#">COMPILESHEMA Procedure</a> on page 176-10	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
<a href="#">COPYEVOLVE Procedure</a> on page 176-11	Evolves registered schemas so that existing XML instances remain valid
<a href="#">DELETESHEMA Procedure</a> on page 176-13	Removes the schema from the database
<a href="#">GENERATESHEMA Function</a> on page 176-14	Generates an XML schema from an oracle type name
<a href="#">GENERATESHEMAS Function</a> on page 176-15	Generates several XML schemas from an oracle type name
<a href="#">INPLACEEVOLVE Procedure</a> on page 176-16	Evolves registered schemas by propagating schema changes to object types and tables
<a href="#">PURGESHEMA Procedure</a> on page 176-18	Removes the XML schema
<a href="#">REGISTERSHEMA Procedures</a> on page 176-19	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.
<a href="#">REGISTERURI Procedure</a> on page 176-23	Registers an XML schema specified by a URI name

## COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

### Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(  
    schemaur1 IN VARCHAR2);
```

### Parameters

**Table 176–6** *COMPILESCHEMA Procedure Parameters*

Parameter	Description
<code>schemaur1</code>	URL identifying the schema

## COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based XMLType tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new XMLType tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

### See Also:

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

## Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE(
  schemaurls      IN  XDB$STRUBG_LIST_T,
  newschemas      IN  XMLSequenceType,
  transforms      IN  XMLSequenceType :=NULL,
  preserveolddocs IN  BOOLEAN :=FALSE,
  maptablename    IN  VARCHAR2 :=NULL,
  generatetables IN  BOOLEAN :=TRUE,
  force           IN  BOOLEAN :=FALSE,
  schemaowners    IN  XDB$STRING_LIST_T :=NULL,
  parallelDegree  IN  PLS_INTEGER := 0,
  options         IN  PLS_INTEGER := 0);
```

## Parameters

**Table 176–7 COPYEVOLVE Procedure Parameters**

Parameter	Description
schemaurls	VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency.
newschemas	VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.
transforms	VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.

**Table 176–7 (Cont.) COPYEVOLVE Procedure Parameters**

Parameter	Description
preserveolddocs	Default is <code>FALSE</code> , and temporary tables with old data are dropped. If <code>TRUE</code> , these table are still available after schema evolution is complete.
maptabname	Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are: <ul style="list-style-type: none"> <li>▪ <code>SCHEMA_URL</code> - <code>VARCHAR2 (700)</code> - URL of schema to which this table conforms</li> <li>▪ <code>SCHEMA_OWNER</code> - <code>VARCHAR2 (30)</code> - Owner of the schema</li> <li>▪ <code>ELEMENT_NAME</code> - <code>VARCHAR2 (256)</code> - Element to which this table conforms</li> <li>▪ <code>TAB_NAME</code> - <code>VARCHAR2 (65)</code> - Qualified table name: <code>&lt;owner_name&gt;.&lt;table_name&gt;</code></li> <li>▪ <code>COL_NAME</code> - <code>VARCHAR2 (4000)</code> - Name of the column (NULL for XMLType tables)</li> <li>▪ <code>TEMP_TABNAME</code> - <code>VARCHAR2 (30)</code> - Name of temporary tables which holds data for this table.</li> </ul>
generatetables	Default is <code>TRUE</code> , and new tables will be generated. If <code>FALSE</code> : <ul style="list-style-type: none"> <li>▪ new tables will not be generated after registration of new schemas</li> <li>▪ <code>preserveolddocs</code> must be <code>TRUE</code></li> <li>▪ <code>maptabname</code> must be non-NULL</li> </ul>
force	Default is <code>FALSE</code> . If <code>TRUE</code> , ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.
schemaowners	VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is <code>NULL</code> , assuming that all schemas are owned by the current user.
paralleldegree	Specifies the degree of parallelism to be used in a <code>PARALLEL</code> hint during the data copy stage of the evolution. If this is 0 (default), the <code>PARALLEL</code> hint will not be given in the data copy statements.
options	Currently, the only supported option is <code>COPYEVOLVE_BINARY_XML</code> which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.

## Usage Notes

You should back up all schemas and documents prior to invocation because [COPYEVOLVE Procedure](#) deletes all conforming documents prior to implementing the schema evolution.

## DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

### Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA (
  schemaur1      IN  VARCHAR2,
  delete_option  IN  PLS_INTEGER := DELETE_RESTRICT);
```

**See Also:** "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

### Parameters

**Table 176–8 DELETESCHEMA Procedure Parameters**

Parameter	Description
schemaur1	URL identifying the schema to be deleted
delete_option	Delete options: <ul style="list-style-type: none"> <li>▪ DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema</li> <li>▪ DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects.</li> <li>▪ DELETE_CASCADE - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema.</li> <li>▪ DELETE_CASCADE_FORCE - Similar to DELETE_CASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.</li> </ul>

### Exceptions

**Table 176–9 DELETESCHEMA Procedure Exceptions**

Exception	Description
ORA-31001	Invalid resource handle or path name

## GENERATESCHEMA Function

This function generates XML schema(s) from an Oracle type name. It inlines all in one schema (XMLType).

**See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

### Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMA (
  schemaname      IN  VARCHAR2,
  typename        IN  VARCHAR2,
  elementname     IN  VARCHAR2 := NULL,
  recurse         IN  BOOLEAN  := TRUE,
  annotate        IN  BOOLEAN  := TRUE,
  embedcoll       IN  BOOLEAN  := TRUE)
RETURN SYS.XMLTYPE;
```

### Parameters

**Table 176–10 GENERATESCHEMA Function Parameters**

Parameter	Description
schemaname	Name of the database schema containing the type
typename	Name of the Oracle type
elementname	The name of the top level element in the XML Schema. Defaults to typename.
recurse	Whether or not to also generate schema for all types referred to by the type specified
annotate	Whether or not to put the SQL annotations in the XML Schema
embedcoll	Determines whether the collections should be embedded in the type which refers to them, or create a complextype. Cannot be FALSE if annotations are turned on

### Exceptions

**Table 176–11 GENERATESCHEMA Function Exceptions**

Exception	Description
ORA-31001	Invalid resource handle or path name

## GENERATESCHEMAS Function

This function generates XML schema(s) from an Oracle type name. It returns a collection of `XMLTypes`, one XML Schema document for each database schema.

**See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

### Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMAS (
  schemaname   IN  VARCHAR2,
  typename     IN  VARCHAR2,
  elementname  IN  VARCHAR2 := NULL,
  schemaurl    IN  VARCHAR2 := NULL,
  annotate     IN  BOOLEAN := TRUE,
  embedcoll   IN  BOOLEAN := TRUE )
RETURN SYS.XMLTYPE;
```

### Parameters

**Table 176–12** *GENERATESCHEMAS Function Parameters*

Parameter	Description
schemaname	Name of the database schema containing the type
typename	Name of the Oracle type
elementname	The name of the top level element in the XML Schema defaults to <code>typeName</code>
schemaurl	Specifies base URL where schemas will be stored, needed by top level schema for import statement
annotate	Whether or not to put the SQL annotations in the XML Schema
embedcoll	Determines whether the collections be embedded in the type which refers to them, or create a <code>complextype</code> . Cannot be <code>FALSE</code> if annotations are turned on

### Exceptions

**Table 176–13** *GENERATESCHEMAS Function Exceptions*

Exception	Description
ORA-31001	Invalid resource handle or path name

## INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

### Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE (
  schemaURL    IN   VARCHAR2,
  diffXML      IN   XMLType,
  flags        IN   NUMBER);
```

### Parameters

**Table 176–14** *INPLACEEVOLVE Procedure Parameters*

Parameter	Description
schemaurl	URL of the schema to evolve
diffXML	Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.
flags	<p>The following bits may be set in this parameter to control the behavior of this procedure:</p> <ul style="list-style-type: none"> <li>▪ INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new.</li> <li>▪ INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file.</li> </ul> <p>That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:</p> <ul style="list-style-type: none"> <li>▪ Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new.</li> <li>▪ Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)</li> </ul>

### Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPATH expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.

- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

### Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the [REGISTERSHEMA Procedures](#) and the [REGISTERURI Procedure](#) at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

## PURGESCHEMA Procedure

This procedure removes the XML schema.

**See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

### Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(  
    schemaid IN RAW);
```

### Parameters

**Table 176–15** *PURGESCHEMA Procedure Parameters*

Parameter	Description
schemaid	ID of the schema to be purged

### Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

## REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

---

---

**Note:** As of release 11.2.0.2 the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

---

---

**See Also:** "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

### Syntax

Registers a schema specified as a `VARCHAR2`:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1      IN  VARCHAR2,
  schemadoc      IN  VARCHAR2,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1      IN  VARCHAR2,
  schemadoc      IN  BFILE,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE` and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1      IN  VARCHAR2,
  schemadoc      IN  BFILE,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := TRUE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := TRUE,
  owner          IN  VARCHAR2 := '',
  csid           IN  NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
```

```
options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1      IN  VARCHAR2,
  schemadoc      IN  BLOB,
  local          IN  BOOLEAN := TRUE,
  genTypes       IN  BOOLEAN := TRUE,
  genBean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1      IN  VARCHAR2,
  schemadoc      IN  BLOB,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := TRUE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := TRUE,
  owner          IN  VARCHAR2 := '',
  csid           IN  NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a CLOB

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1      IN  VARCHAR2,
  schemadoc      IN  CLOB,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as an XMLTYPE.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1      IN  VARCHAR2,
  schemadoc      IN  SYS.XMLTYPE,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1      IN  VARCHAR2,
```

```

schemadoc      IN SYS.URIType,
local          IN BOOLEAN := TRUE,
gentypes      IN BOOLEAN := TRUE,
genbean       IN BOOLEAN := FALSE,
force         IN BOOLEAN := FALSE,
owner         IN VARCHAR2 := NULL,
enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
options       IN PLS_INTEGER := 0);

```

## Parameters

**Table 176–16 REGSITERSchema Procedure Parameters**

Parameter	Description
schemaur1	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside <code>schemalocation</code> attribute of XML Schema import element.
schemadoc	A valid XML schema document
local	Is this a local or global schema? <ul style="list-style-type: none"> <li>■ By default, all schemas are registered as local schemas, under <code>/sys/schemas/&lt;username&gt;/...</code></li> <li>■ If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code></li> </ul> <p>You need write privileges on the directory to be able to register a schema as global.</p>
gentypes	Determines whether the schema compiler generates object types. By default, <code>TRUE</code> . If you use binary XML, you must be set <code>gentypes</code> to <code>FALSE</code> .
genbean	Determines whether the schema compiler generates Java beans. By default, <code>FALSE</code> . Oracle recommends that this parameter always be set to <code>FALSE</code> .
gentables	Determines whether the schema compiler generates default tables. By default, <code>TRUE</code>
force	If this parameter is set to <code>TRUE</code> , the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> .
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.

**Table 176–16 (Cont.) REGSITERSchema Procedure Parameters**

Parameter	Description
enablehierarchy	<ul style="list-style-type: none"> <li>■ <code>ENABLE_HIERARCHY_NONE</code> - enable hierarchy will not be called on any tables created while registering that schema</li> <li>■ <code>ENABLE_HIERARCHY_CONTENTS</code> - enable hierarchy will be called for all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_CONTENTS</code>. This is the default.</li> <li>■ <code>ENABLE_HIERARCHY_RESMETADATA</code> - enable hierarchy will be called on all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_RESMETADATA</code>. Users should pass in <code>DBMS_XMLSCHEMA.ENABLE_RESMETADATA</code> for schemas they intend to use as resource metadata tables.</li> </ul>
options	<p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a <code>BITOR</code> of the desired bits. Possible bits:</p> <ul style="list-style-type: none"> <li>■ <code>REGISTER_NODOCID</code> - this will suppress the creation of the <code>DOCID</code> column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the <code>DOCID</code> column)</li> <li>■ <code>REGISTER_BINARYXML</code> - Register the schema for Binary XML</li> <li>■ <code>REGISTER_NT_AS_IOT</code> - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables</li> </ul>

## REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

---

**Note:** As of release 11.2.0.2 the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

---

### Syntax

```
DBMS_XMLSCHEMA.REGISTERURI (
  schemaur1      IN  VARCHAR2,
  schemadocuri   IN  VARCHAR2,
  local          IN  BOOLEAN := TRUE,
  gentypes      IN  BOOLEAN := TRUE,
  genbean       IN  BOOLEAN := FALSE,
  gentables     IN  BOOLEAN := TRUE,
  force         IN  BOOLEAN := FALSE,
  owner         IN  VARCHAR2 := NULL,
  options       IN  PLS_INTEGER := 0);
```

### Parameters

**Table 176–17 REGISTERURI Procedure Parameters**

Parameter	Description
<code>schemaur1</code>	Uniquely identifies the schema document. Can be used inside <code>schemaLocation</code> attribute of XML Schema import element.
<code>schemadocuri</code>	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a <code>URIType</code> instance using the <code>urifactory</code> , and invokes the <a href="#">REGISTERSchema Procedures</a> .
<code>local</code>	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under <code>/sys/schemas/&lt;username&gt;/...</code> . If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> . The user needs write privileges on the directory to register a global schema.
<code>gentypes</code>	Determines whether the compiler generate object types. By default, <code>TRUE</code> .
<code>genbean</code>	Determines whether the compiler generate Java beans. By default, <code>FALSE</code> .
<code>gentables</code>	Determines whether the compiler generate default tables. <code>TRUE</code> by default.
<code>force</code>	<code>TRUE</code> : schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> .
<code>owner</code>	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.

**Table 176–17 (Cont.) REGISTERURI Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
options	<p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:</p> <ul style="list-style-type: none"><li>REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)</li></ul>

DBMS\_XMLSTORE provides the ability to store XML data in relational tables.

**See Also:** *Oracle XML DB Developer's Guide*

This chapter contains the following sections:

- [Using DBMS\\_XMLSTORE](#)
  - Security Model
  - Types
- [Summary of DBMS\\_XMLSTORE Subprograms](#)

## Using DBMS\_XMLSTORE

- [Security Model](#)
- [Types](#)

## Security Model

Owned by XDB, the DBMS\_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## Types

**Table 177-1** *Types of DBMS\_XMLSTORE*

Type	Description
ctxType	The type of the query context handle. This is the return type of <a href="#">NEWCONTEXT</a> .

---

## Summary of DBMS\_XMLSTORE Subprograms

**Table 177-2 DBMS\_XMLSTORE Package Subprograms**

Method	Description
<a href="#">CLEARKEYCOLUMNLIST</a> on page 177-6	Clears the key column list.
<a href="#">CLEARUPDATECOLUMNLIST</a> on page 177-7	Clears the update column list.
<a href="#">CLOSECONTEXT</a> on page 177-8	It closes/deallocates a particular save context.
<a href="#">DELETEXML</a> on page 177-9	Deletes records specified by data from the XML document, from the table specified at the context creation time.
<a href="#">INSERTXML</a> on page 177-10	Inserts the XML document into the table specified at the context creation time.
<a href="#">NEWCONTEXT</a> on page 177-11	Creates a save context, and returns the context handle.
<a href="#">SETKEYCOLUMN</a> on page 177-12	This method adds a column to the key column list.
<a href="#">SETROWTAG</a> on page 177-13	Names the tag used in the XML document., to enclose the XML elements corresponding to the database.
<a href="#">SETUPDATECOLUMN</a> on page 177-14	Adds a column to the "update column list".
<a href="#">UPDATEXML</a> on page 177-15	Updates the table given the XML document.

## CLEARKEYCOLUMNLIST

Clears the key column list.

### Syntax

```
PROCEDURE clearKeyColumnList(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## CLEARUPDATECOLUMNLIST

Clears the update column list.

### Syntax

```
PROCEDURE clearUpdateColumnList(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## CLOSECONTEXT

Closes/deallocates a particular save context.

### Syntax

```
PROCEDURE closeContext(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## DELETXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax	Description
<pre>FUNCTION deleteXML(     ctxHdl IN ctxPType,     xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Uses a VARCHAR2 type for the xDoc parameter.
<pre>FUNCTION deleteXML(     ctxHdl IN ctxType,     xDoc IN CLOB) RETURN NUMBER;</pre>	Uses a CLOB type for the xDoc parameter.
<pre>FUNCTION deleteXML(     ctxHdl IN ctxType,     xDoc IN XMLType) RETURN NUMBER;</pre>	Uses an XMLType type for the xDoc parameter.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

## INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for insertXML to DBMS\_XMLSTORE which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless [SETUPDATECOLUMN](#) is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax	Description
<pre>FUNCTION insertXML(   ctxHdl IN ctxType,   xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION insertXML(   ctxHdl IN ctxType,   xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.
<pre>FUNCTION insertXML(   ctxHdl IN ctxType,   xDoc IN XMLType) RETURN NUMBER;</pre>	Passes in the xDoc parameter as an XMLType.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

## NEWCONTEXT

Creates a save context, and returns the context handle.

### Syntax

```
FUNCTION newContext(  
    targetTable IN VARCHAR2)  
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

## SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be `NULL`. In case of update or delete, the columns in the key column list make up the `WHERE` clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

### Syntax

```
PROCEDURE setKeyColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be <code>NULL</code> .

## SETROWTAG

Names the tag used in the XML document, to enclose the XML elements corresponding to database records.

### Syntax

```
PROCEDURE setRowTag(  
    ctxHdl IN ctxType,  
    tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

## SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for [INSERTXML](#) to `DEMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless `setUpdateColumn` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

### Syntax

```
PROCEDURE setUpdateColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>colName</code>	(IN)	Column to be added to the update column list.

## UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description
<pre>FUNCTION updateXML(     ctxHdl IN ctxType,     xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION updateXML(     ctxHdl IN ctxType,     xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.
<pre>FUNCTION updateXML(     ctxHdl IN ctxType,     xDoc IN XMLType) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a XMLType.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

---

---

## DBMS\_XMLTRANSLATIONS

The DBMS\_XMLTRANSLATIONS package provides an interface to perform translations so that strings can be searched or displayed in various languages.

**See Also:** For more information, see the *Oracle XML DB Developer's Guide*

This chapter contains the following sections:

- [Using DBMS\\_XMLTRANSLATIONS](#)
  - Security Model
- [Summary of DBMS\\_XMLTRANSLATIONS Subprograms](#)

---

## Using DBMS\_XMLTRANSLATIONS

- [Security Model](#)

## Security Model

Owned by XDB, the DBMS\_XMLTRANSLATIONS package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## Summary of DBMS\_XMLTRANSLATIONS Subprograms

**Table 178–1 DBMS\_XMLSTORE Package Subprograms**

<b>Method</b>	<b>Description</b>
<a href="#">DISABLETRANSLATION Procedure</a> on page 178-5	Disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values
<a href="#">ENABLETRANSLATION Procedure</a> on page 178-6	Enables translations in the current session
<a href="#">EXTRACTXLIFF Function &amp; Procedure</a> on page 178-7	Extracts the translations in XLIFF format from either an XMLTYPE or a resource in the XDB Repository
<a href="#">GETBASEDOCUMENT Function</a> on page 178-10	Returns the base document with all the translations
<a href="#">MERGEXLIFF Functions</a> on page 178-11	Merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository
<a href="#">SETSOURCELANG Function</a> on page 178-14	Sets the source language to a particular language at the specified XPATH
<a href="#">TRANSLATEXML Function</a> on page 178-16	Returns the document in the specified language
<a href="#">UPDATETRANSLATION Function</a> on page 178-5	Updates the translation in a particular language at the specified XPATH

## **DISABLETRANSLATION Procedure**

This procedure disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values.

### **Syntax**

```
DBMS_XMLTRANSLATIONS.DISABLETRANSLATION;
```

## ENABLETRANSLATION Procedure

This procedure enables translations in the current session. This is the default behavior.

### Syntax

```
DBMS_XMLTRANSLATIONS.ENABLETRANSLATION;
```

## EXTRACTXLIFF Function & Procedure

This function and procedure extracts the translations in XLIFF format from either an XMLTYPE or a resource in the XDB Repository.

### Syntax

```
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF (
  doc      IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

```
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF (
  abspath  IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

### Parameters

**Table 178–2 EXTRACTXLIFF Function Parameters**

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be extracted
xpath	XPATH at which specifies the location of the element that needs to be translated. If no XPATH is specified, the entire document is processed.
namespace	Namespace
abspath	Absolute path of the resource from which the XLIFF is to be extracted

### Return Values

The translations in the XLIFF format

### Examples

#### Extracting the Translation from an XMLTYPE

Let doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <title xml:lang="es">
    Security Class Example - ES
```

```

    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>

```

Let the `xpath = '/securityClass/title'`. The output of `EXTRACTXLIFF` will be as follows:

```

<xliff version='1.1'>
  <file original='' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>

```

### Extracting the Translation from a Resource

Let the resource `'/public/security.xml' =`

```

<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="es">
    Security Class Example - ES
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
  <privlist>
  <privilege name="privilege1"/>
  <aggregatePrivilege name="iStorePOApprover">
    <title>
      iStore Purchase Order Approver
    </title>
    <privilegeRef name="is:privilege1"/>
    <privilegeRef name="oa:submitPO"/>
    <privilegeRef name="oa:privilege3"/>
  </aggregatePrivilege>
  <privilege name="privilege2">
    <title xml:lang="en">
      secondary privilege
    </title>
    <title xml:lang="fr" xdb:srclang="true">
      secondary privilege - FR
    </title>
    <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
    <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
  </privilege>

```

```

    </privilege>
  </privlist>
</securityClass>

```

And let XPATH = "", then the extracted XLIFF is

```

<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
  <file original='/public/security.xml' source-language='fr' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/privilege[@name="privilege2"]/title'>
        <source>secondary privilege - FR</source>
        <alt-trans>
          <target xml:lang='en'>secondary privilege</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>

```

## GETBASEDOCUMENT Function

This function returns the base document with all the translations.

### Syntax

```
DBMS_XMLTRANSLATIONS.GETBASEDOCUMENT (
    doc    IN XMLTYPE)
RETURN XMLTYPE;
```

### Parameters

**Table 178–3** *GETBASEDOCUMENT Function Parameters*

Parameter	Description
doc	Input XMLTYPE

### Return Values

The XMLTYPE which contains the base document with all the translations

### Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

For the above document, this subprogram will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

## MERGEXLIFF Functions

This function merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository.

### Syntax

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
  doc      IN XMLTYPE,
  xliiff   IN XMLTYPE)
RETURN XMLTYPE;
```

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
  xliiff   IN XMLTYPE);
```

### Parameters

**Table 178–4 MERGEXLIFF Function & Procedure Parameters**

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be merged
xliiff	Translations in the XLIFF format

### Return Values

The result of merging 'xliiff' into 'doc' at 'xpath'

### Examples

#### Merge Translations into an XMLTYPE

Consider the following input XMLTYPE:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="es">
    Security Class Example - ES
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
  <privlist>
  <privilege name="privilege1"/>
  <aggregatePrivilege name="iStorePOApprover">
    <title>
      iStore Purchase Order Approver
    </title>
    <privilegeRef name="is:privilege1"/>
    <privilegeRef name="oa:submitPO"/>
  </aggregatePrivilege>
</securityClass>
```

```

        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en">
            secondary privilege
        </title>
        <title xml:lang="fr" xdb:srclang="true">
            secondary privilege - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
    </privilege>
</privlist>
</securityClass>

```

Let the input XLIFF be as follows:

```

<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example Modified</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example Mod - FR</target>
          <target xml:lang='es'>Security Class Example Mod - ES</target>
        </alt-trans>
      </trans-unit>
      <trans-unit id='/securityClass/privilege[@name="privilege2"]/title'>
        <source>secondary privilege modified</source>
        <alt-trans>
          <target xml:lang='fr'>secondary privilege mod - FR</target>
        </alt-trans>
      </trans-unit>
    </body>
  </xliff>

```

The output of merge will be as follows:

```

<securityClass xmlns="http://xmlns.oracle.com/xdm/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example Modified
  </title>
  <title xml:lang="es">
    Security Class Example Mod - ES
  </title>
  <title xml:lang="fr">
    Security Class Example Mod - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
  <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
      <title>
        iStore Purchase Order Approver
      </title>

```

```
<privilegeRef name="is:privilege1"/>
<privilegeRef name="oa:submitPO"/>
<privilegeRef name="oa:privilege3"/>
</aggregatePrivilege>
<privilege name="privilege2">
  <title xml:lang="en" xdb:srclang="true">
    secondary privilege modified
  </title>
  <title xml:lang="fr">
    secondary privilege mod - FR
  </title>
  <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
  <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
</privilege>
</privlist>
</securityClass>
```

### **Merge XLIFF Translations into a Resource**

If the input document in the above example were to be stored in the repository at '/public/security.xml', then merging the above XLIFF will have the same effect.

## SETSOURCELANG Function

This function sets the source language to a particular language at the specified XPATH.

### Syntax

```
DBMS_XMLTRANSLATIONS.SETSOURCELANG (
  doc      IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  lang     IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

### Parameters

**Table 178–5 SETSOURCELANG Function Parameters**

Parameter	Description
doc	XMLTYPE for which the source language is to be set
xpath	XPATH at which the source language is to be set
lang	Source language
namespace	Namespace

### Return Values

The updated document

### Examples

For example, if doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

the statement

```
setSourceLang ( doc, '/securityClass/title', 'fr' )
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
```

```
<name>
  securityClassExample
</name>
<title xml:lang="en">
  Security Class Example
</title>
<title xml:lang="fr" xdb:srclang="true">
  Security Class Example - FR
</title>
<inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

## TRANSLATEXML Function

This function returns the document in the specified language.

### Syntax

```
DBMS_XMLTRANSLATIONS.TRANSULATEXML (
  doc    IN  XMLTYPE,
  lang   IN  VARCHAR2)
RETURN XMLTYPE;
```

### Parameters

**Table 178–6 TRANSLATEXML Function Parameters**

Parameter	Description
doc	Input XMLTYPE
lang	Language

### Return Values

The XMLTYPE which contains the document in the specified language

### Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML (doc, 'fr') will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

## UPDATETRANSLATION Function

This function updates the translation in a particular language at the specified XPATH.

### Syntax

```
DBMS_XMLTRANSLATIONS.UPDATETRANSLATION(
  doc      IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  lang     IN  VARCHAR2,
  value    IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

### Parameters

**Table 178–7** UPDATETRANSLATION Function Parameters

Parameter	Description
doc	XMLTYPE for which the translation is to be updated
xpath	XPATH at which the translation is to be updated
lang	Language for which the translation is to be updated
value	New translation
namespace	Namespace

### Return Values

The updated document

### Examples

For example,

```
updateTranslation ( doc, '/securityClass/title/text()', 'fr', 'Oracle' );
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Oracle
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats. You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views. Finally, it displays plans from a SQL plan baseline.

**See Also:**

- For more information on the `EXPLAIN PLAN` command, the AWR, and SQL tuning set, see *Oracle Database Performance Tuning Guide*.
- For more information on the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS` fixed views, see *Oracle Database Reference*.

This chapter contains the following topics:

- [Using DBMS\\_XPLAN](#)
  - Overview
  - Security Model
  - Examples
- [Summary of DBMS\\_XPLAN Subprograms](#)

## Using DBMS\_XPLAN

- [Overview](#)
- [Security Model](#)
- [Examples](#)

## Overview

The DBMS\_XPLAN package supplies five table functions:

- DISPLAY - to format and display the contents of a plan table.
- DISPLAY\_AWR - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- DISPLAY\_CURSOR - to format and display the contents of the execution plan of any loaded cursor.
- DISPLAY\_SQL\_PLAN\_BASELINE - to display one or more execution plans for the SQL statement identified by SQL handle
- DISPLAY\_SQLSET - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

## Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function `DISPLAY_CURSOR` requires to have select privileges on the following fixed views: `V$SQL_PLAN`, `V$SESSION` and `V$SQL_PLAN_STATISTICS_ALL`.

Using the [DISPLAY\\_AWR Function](#) requires the user to have `SELECT` privileges on `DBA_HIST_SQL_PLAN`, `DBA_HIST_SQLTEXT`, and `V$DATABASE`.

Using the [DISPLAY\\_SQLSET Function](#) requires the user to have the `SELECT` privilege on `ALL_SQLSET_STATEMENTS` and `ALL_SQLSET_PLANS`.

Using [DISPLAY\\_SQL\\_PLAN\\_BASELINE Function](#) requires the user to have the `SELECT` privilege on `DBA_SQL_PLAN_BASELINES` as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

All these privileges are automatically granted as part of the `SELECT_CATALOG` role.

## Examples

### Displaying a Plan Table Using DBMS\_XPLAN.DISPLAY

Execute an explain plan command on a `SELECT` statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
      WHERE e.deptno = d.deptno
      AND e.ename='benoit';
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

Plan hash value: 3693697075

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT		1	57	6 (34)	00:00:01
* 1	HASH JOIN		1	57	6 (34)	00:00:01
* 2	TABLE ACCESS FULL	EMP	1	37	3 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	80	3 (34)	00:00:01

Predicate Information (identified by operation id):

```
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."ENAME"='benoit')
```

15 rows selected.

### Displaying a Cursor Execution Plan Using DBMS\_XPLAN.DISPLAY\_CURSOR

By default, the table function `DISPLAY_CURSOR` formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename FROM emp e, dept d
      WHERE e.deptno = d.deptno
      AND e.empno=7369;
```

ENAME

-----

SMITH

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);
```

This query produces the following output:

Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0

```
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT					
* 1	HASH JOIN		1	16	6 (34)	00:00:01
* 2	TABLE ACCESS FULL	EMP	1	13	3 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	12	3 (34)	00:00:01

Predicate Information (identified by operation id):

- 1 - access("E"."DEPTNO"="D"."DEPTNO")
- 2 - filter("E"."EMPNO"=7369)

21 rows selected.

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';
```

SQL_ID	CHILD_NUMBER
gwp663cqh5qbf	0

Display the execution plan for the cursor:

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0));
```

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0

```
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT				7 (100)	
1	SORT GROUP BY		4	64	7 (43)	00:00:01
* 2	HASH JOIN		14	224	6 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	44	3 (34)	00:00:01
4	TABLE ACCESS FULL	EMP	14	70	3 (34)	00:00:01

Predicate Information (identified by operation id):

- 2 - access("E"."DEPTNO"="D"."DEPTNO")

Instead of issuing two queries, one to get the `sql_id` and `child_number` pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, table(DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number)) t WHERE
sql_text LIKE '%TOTO%';
```

### Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and display\_cursor table functions. In [Displaying a Plan Table Using DBMS\\_XPLAN.DISPLAY](#) on page 179-5, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename = 'hermann'
ORDER BY e.empno;
```

### Display the plan using the DBMS\_XPLAN.DISPLAY table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
Plan hash value: 3693697345
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time	TQ	INOUT	PQ Distrib
0	SELECT STATEMENT		1	117	6 (50)	00:00:01			
1	PX COORDINATOR								
2	PX SEND QC (ORDER)	:TQ10003	1	117	6 (50)	00:00:01	Q1,03	P->S	QC (ORDER)
3	SORT ORDER BY		1	117	6 (50)	00:00:01	Q1,03	PCWP	
4	PX RECEIVE		1	117	5 (40)	00:00:01	Q1,03	PCWP	
5	PX SEND RANGE	:TQ10002	1	117	5 (40)	00:00:01	Q1,02	P->P	RANGE
* 6	HASH JOIN		1	117	5 (40)	00:00:01	Q1,02	PCWP	
7	PX RECEIVE		1	87	2 (50)	00:00:01	Q1,02	PCWP	
8	PX SEND HASH	:TQ10001	1	87	2 (50)	00:00:01	Q1,01	P->P	HASH
9	PX BLOCK ITERATOR		1	87	2 (50)	00:00:01	Q1,01	PCWC	
* 10	TABLE ACCESS FULL	EMP	1	87	2 (50)	00:00:01	Q1,01	PCWP	
11	BUFFER SORT						Q1,02	PCWC	
12	PX RECEIVE		4	120	3 (34)	00:00:01	Q1,02	PCWP	
13	PX SEND HASH	:TQ10000	4	120	3 (34)	00:00:01		S->P	HASH
14	TABLE ACCESS FULL	DEPT	4	120	3 (34)	00:00:01			

Predicate Information (identified by operation id):

```
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
```

When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the statement\_id parameter passed to the display table function (default value is NULL), only the plan corresponding to the last EXPLAIN PLAN command is displayed. Hence, there is no need to purge the plan table after each EXPLAIN PLAN. However, you should purge the plan table regularly to ensure good performance in the execution of the DISPLAY table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for individual users and preserves its content throughout the

lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the EXPLAIN PLAN command:

### **Using a View to Display Last Explain Plan**

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

---

## Summary of DBMS\_XPLAN Subprograms

**Table 179-1 DBMS\_XPLAN Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">DISPLAY Function</a> on page 179-10	Displays the contents of the plan table
<a href="#">DISPLAY_AWR Function</a> on page 179-13	Displays the contents of an execution plan stored in the AWR
<a href="#">DISPLAY_CURSOR Function</a> on page 179-16	Displays the execution plan of any cursor in the cursor cache
<a href="#">DISPLAY_PLAN Function</a> on page 179-19	Displays the contents of the plan table in a variety of formats with CLOB output type
<a href="#">DISPLAY_SQL_PLAN_BASELINE Function</a> on page 179-22	Displays one or more execution plans for the specified SQL handle of a SQL plan baseline
<a href="#">DISPLAY_SQLSET Function</a> on page 179-24	Displays the execution plan of a given statement stored in a SQL tuning set

## DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

### Syntax

```
DBMS_XPLAN.DISPLAY(
  table_name      IN VARCHAR2 DEFAULT 'PLAN_TABLE',
  statement_id    IN VARCHAR2 DEFAULT NULL,
  format          IN VARCHAR2 DEFAULT 'TYPICAL',
  filter_preds    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 179–2** *DISPLAY Function Parameters*

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .
statement_id	Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement.

**Table 179–2 (Cont.) DISPLAY Function Parameters**

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li>■ <b>BASIC</b>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>■ <b>TYPICAL</b>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only <b>PROJECTION</b>, <b>ALIAS</b> and <b>REMOTE SQL</b> information (see below).</li> <li>■ <b>SERIAL</b>: Like <b>TYPICAL</b> except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>■ <b>ALL</b>: Maximum user level. Includes information displayed with the <b>TYPICAL</b> level with additional information (<b>PROJECTION</b>, <b>ALIAS</b> and information about <b>REMOTE SQL</b> if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as <b>PARTITION</b>) or logical additions to the base plan table output (such as <b>PREDICATE</b>). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>■ <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>■ <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>■ <b>COST</b> - if relevant, shows optimizer cost information</li> <li>■ <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>■ <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>■ <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>■ <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>■ <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>■ <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>■ <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see <code>table_name</code> parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view <code>V\$SQL_PLAN_STATISTICS_ALL</code>), additional format keywords can be used to specify which class of statistics to display when using the <b>DISPLAY Function</b>. These additional format keywords are <b>IOSTATS</b>, <b>MEMSTATS</b>, <b>ALLSTATS</b> and <b>LAST</b> (see the <b>DISPLAY_CURSOR Function</b> or the <b>DISPLAY_SQLSET Function</b> for a full description of these four keywords).</p>

**Table 179–2 (Cont.) DISPLAY Function Parameters**

Parameter	Description
<code>filter_preds</code>	<p>SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=&gt;'plan_id = 10'</code></p> <p>Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see <b>WARNING</b> under Usage Notes)</p>

## Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

---

**WARNING:** Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

---

## Examples

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my\_plan\_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as `statement_id='foo'`:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
```

## DISPLAY\_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

### Syntax

```
DBMS_XPLAN.DISPLAY_AWR (
  sql_id          IN      VARCHAR2,
  plan_hash_value IN      NUMBER DEFAULT NULL,
  db_id           IN      NUMBER DEFAULT NULL,
  format          IN      VARCHAR2 DEFAULT TYPICAL);
```

### Parameters

**Table 179–3** *DISPLAY\_AWR Table Function Parameters*

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.
plan_hash_value	Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given SQL_ID.
db_id	Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database is used, as shown in V\$DATABASE.
format	Controls the level of details for the plan. It accepts four values: <ul style="list-style-type: none"> <li>■ <b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>■ <b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>■ <b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>■ <b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul>

**Table 179–3 (Cont.) DISPLAY\_AWR Table Function Parameters**

Parameter	Description
	<p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as <code>PARTITION</code>) or logical additions to the base plan table output (such as <code>PREDICATE</code>). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>■ <code>ROWS</code> - if relevant, shows the number of rows estimated by the optimizer</li> <li>■ <code>BYTES</code> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>■ <code>COST</code> - if relevant, shows optimizer cost information</li> <li>■ <code>PARTITION</code> - if relevant, shows partition pruning information</li> <li>■ <code>PARALLEL</code> - if relevant, shows PX information (distribution method and table queue information)</li> <li>■ <code>PREDICATE</code> - if relevant, shows the predicate section</li> <li>■ <code>PROJECTION</code> -if relevant, shows the projection section</li> <li>■ <code>ALIAS</code> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>■ <code>REMOTE</code> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>■ <code>NOTE</code> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>

## Usage Notes

- To use the `DISPLAY_AWR` functionality, the calling user must have `SELECT` privilege on `DBA_HIST_SQL_PLAN`, `DBA_HIST_SQLTEXT`, and `V$DATABASE`, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the `format` parameter:
  - Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
  - Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
  - Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

## Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
      (DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null, 'ALL' )) tf
WHERE ht.sql_text like '%TOTO%';
```

## DISPLAY\_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as I/O, memory and timing) can be reported (based on the V\$SQL\_PLAN\_STATISTICS\_ALL VIEWS).

### Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
  sql_id          IN VARCHAR2 DEFAULT NULL,
  cursor_child_no IN NUMBER   DEFAULT 0,
  format         IN VARCHAR2  DEFAULT 'TYPICAL');
```

### Parameters

**Table 179–4 DISPLAY\_CURSOR Function Parameters**

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V\$SQL or V\$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V\$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed.
cursor_child_no	Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.
format	Controls the level of details for the plan. It accepts four values: <ul style="list-style-type: none"> <li>■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).</p>

**Table 179-4 (Cont.) DISPLAY\_CURSOR Function Parameters**

Parameter	Description
	Format keywords must be separated by either a comma or a space:
	<ul style="list-style-type: none"> <li>■ ROWS - if relevant, shows the number of rows estimated by the optimizer</li> <li>■ BYTES - if relevant, shows the number of bytes estimated by the optimizer</li> <li>■ COST - if relevant, shows optimizer cost information</li> <li>■ PARTITION - if relevant, shows partition pruning information</li> <li>■ PARALLEL - if relevant, shows PX information (distribution method and table queue information)</li> <li>■ PREDICATE - if relevant, shows the predicate section</li> <li>■ PROJECTION - if relevant, shows the projection section</li> <li>■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>■ NOTE - if relevant, shows the note section of the explain plan</li> <li>■ IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the <code>gather_plan_statistics</code> hint or by setting the parameter <code>statistics_level</code> to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor.</li> <li>■ MEMSTATS - Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</li> <li>■ ALLSTATS - A shortcut for 'IOSTATS MEMSTATS'</li> <li>■ LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution.</li> </ul>
	The following two formats are deprecated but supported for backward compatibility:
	<ul style="list-style-type: none"> <li>■ RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.</li> <li>■ RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor</li> </ul>
	Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

## Usage Notes

- To use the DISPLAY\_CURSOR functionality, the calling user must have SELECT privilege on the fixed views V\$SQL\_PLAN\_STATISTICS\_ALL, V\$SQL and V\$SQL\_PLAN, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

## Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (  
    DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (  
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (  
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST');
```

## DISPLAY\_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

### Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
  table_name      IN   VARCHAR2  DEFAULT 'PLAN_TABLE',
  statement_id    IN   VARCHAR2  DEFAULT NULL,
  format          IN   VARCHAR2  DEFAULT 'TYPICAL',
  filter_preds    IN   VARCHAR2  DEFAULT NULL,
  type            IN   VARCHAR2  DEFAULT 'TEXT')
RETURN CLOB;
```

### Parameters

**Table 179-5** *DISPLAY\_PLAN Function Parameters*

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .
statement_id	Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement.
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=&gt;'plan_id = 10'</code>  Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see <b>WARNING</b> under Usage Notes)

**Table 179–5 (Cont.) DISPLAY\_PLAN Function Parameters**

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li>■ <b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>■ <b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>■ <b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>■ <b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>■ <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>■ <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>■ <b>COST</b> - if relevant, shows optimizer cost information</li> <li>■ <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>■ <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>■ <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>■ <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>■ <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>■ <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>■ <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V\$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the <a href="#">DISPLAY Function</a>. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the <a href="#">DISPLAY_CURSOR Function</a> or the <a href="#">DISPLAY_SQLSET Function</a> for a full description of these four keywords).</p>
type	<p>Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE).</p>

## Return Values

Returns the requested report as CLOB

## Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

---

---

**WARNING:** Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

---

---

## DISPLAY\_SQL\_PLAN\_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

### Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  format          IN VARCHAR2 := 'TYPICAL')
RETURN dbms_xplan_type_table;
```

### Parameters

**Table 179–6** DISPLAY\_SQL\_PLAN\_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies a SQL statement whose plan(s) are to be displayed.
plan_name	Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.
format	Format string determines what information stored in the plan displayed. One of three format values ('BASIC', 'TYPICAL', 'ALL') can be used, each representing a common use case.

### Return Values

A PL/SQL type table

### Usage Notes

This procedure uses plan information stored in the plan baseline to explain and display the plans. It is possible that the `plan_id` stored in the SQL management base may not match with the `plan_id` of the generated plan. A mismatch between stored `plan_id` and generated `plan_id` means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

### Examples

#### Display all plans of a SQL statement identified by the SQL handle 'SYS\_SQL\_b1d49f6074ab95af' using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
  FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(
              'SYS_SQL_b1d49f6074ab95af')) t;
```

#### Display all plans of one or more SQL statements containing the string 'HR2' using BASIC format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
  FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines
```

```
WHERE sql_text like '%HR2%') pb,  
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,  
      'BASIC')) t;
```

## DISPLAY\_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

### Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
  sqlset_name      IN VARCHAR2,
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER := NULL,
  format          IN VARCHAR2 := 'TYPICAL',
  sqlset_owner     IN VARCHAR2 := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

### Parameters

**Table 179–7 DISPLAY\_SQLSET Function Parameters**

Parameter	Description
sqlset_name	Name of the SQL Tuning Set
sql_id	Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function <code>DBMS_SQLTUNE.SELECT_SQLSET</code>
plan_hash_value	Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.
format	Controls the level of details for the plan. It accepts four values: <ul style="list-style-type: none"> <li>▪ <b>BASIC</b>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>▪ <b>TYPICAL</b>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only <code>PROJECTION</code>, <code>ALIAS</code> and <code>REMOTE SQL</code> information (see below).</li> <li>▪ <b>SERIAL</b>: Like <b>TYPICAL</b> except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>▪ <b>ALL</b>: Maximum user level. Includes information displayed with the <b>TYPICAL</b> level with additional information (<code>PROJECTION</code>, <code>ALIAS</code> and information about <code>REMOTE SQL</code> if the operation is distributed).</li> </ul>

**Table 179-7 (Cont.) DISPLAY\_SQLSET Function Parameters**

Parameter	Description
	<p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as <code>PARTITION</code>) or logical additions to the base plan table output (such as <code>PREDICATE</code>). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>■ <code>ROWS</code> - if relevant, shows the number of rows estimated by the optimizer</li> <li>■ <code>BYTES</code> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>■ <code>COST</code> - if relevant, shows optimizer cost information</li> <li>■ <code>PARTITION</code> - if relevant, shows partition pruning information</li> <li>■ <code>PARALLEL</code> - if relevant, shows PX information (distribution method and table queue information)</li> <li>■ <code>PREDICATE</code> - if relevant, shows the predicate section</li> <li>■ <code>PROJECTION</code> - if relevant, shows the projection section</li> <li>■ <code>ALIAS</code> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>■ <code>REMOTE</code> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>■ <code>NOTE</code> - if relevant, shows the note section of the explain plan</li> <li>■ <code>IOSTATS</code> - assuming that basic plan statistics are collected when SQL statements are executed (either by using the <code>gather_plan_statistics</code> hint or by setting the parameter <code>statistics_level</code> to <code>ALL</code>), this format shows IO statistics for <code>ALL</code> (or only for the <code>LAST</code> as shown below) executions of the cursor.</li> <li>■ <code>MEMSTATS</code> - Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</li> <li>■ <code>ALLSTATS</code> - A shortcut for ' <code>IOSTATS MEMSTATS</code> '</li> <li>■ <code>LAST</code> - By default, plan statistics are shown for all executions of the cursor. The keyword <code>LAST</code> can be specified to see only the statistics for the last execution.</li> </ul> <p>The following two formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> <li>■ <code>RUNSTATS_TOT</code> - Same as <code>IOSTATS</code> , that is, displays IO statistics for all executions of the specified cursor.</li> <li>■ <code>RUNSTATS_LAST</code> - Same as <code>IOSTATS LAST</code>, that is, displays the runtime statistics for the last execution of the cursor</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-<code>PROJECTION</code>' excludes projection information.</p>
<code>sqlset_owner</code>	The owner of the SQL tuning set. The default is the current user.

## Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

## Examples

To display the execution plan for the SQL statement associated with SQL ID `'gwp663cqh5qbf'` and PLAN HASH 3693697075 in the SQL Tuning Set called `'OLTP_optimization_0405'`:

```
SELECT * FROM table (  
  DBMS_XPLAN.DISPLAY_SQLSET(  
    'OLTP_optimization_0405', 'gwp663cqh5qbf', 3693697075));
```

To display all execution plans of the SQL ID `'atfwcg8anrykp'` stored in the SQL tuning set:

```
SELECT * FROM table (  
  DBMS_XPLAN.DISPLAY_SQLSET(  
    'OLTP_optimization_0405', 'gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (  
  DBMS_XPLAN.DISPLAY_SQLSET(  
    'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST');
```

## DBMS\_XSLPROCESSOR

The DBMS\_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- [Using DBMS\\_XSLPROCESSOR](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_XSLPROCESSOR Subprograms](#)

**See Also:**

- *Oracle XML DB Developer's Guide*

---

## Using DBMS\_XSLPROCESSOR

This section contains topics which relate to using the DBMS\_XSLPROCESSOR package.

- [Overview](#)
- [Security Model](#)

## Overview

The DBMS\_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

### Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

### Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

### Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

## Security Model

Owned by XDB, the DBMS\_XSLPROCESSOR package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

---

## Summary of DBMS\_XSLPROCESSOR Subprograms

**Table 180–1 DBMS\_XSLPROCESSOR Package Subprograms**

Method	Description
<a href="#">CLOB2FILE Procedure</a> on page 180-6	Writes content of a CLOB into a file
<a href="#">FREEPROCESSOR Procedure</a> on page 180-7	Frees a processor object
<a href="#">FREESTYLESHEET Procedure</a> on page 180-8	Frees a stylesheet object
<a href="#">NEWPROCESSOR Function</a> on page 180-8	Returns a new processor instance
<a href="#">NEWSTYLESHEET Functions</a> on page 180-10	Creates a new stylesheet from input and reference URLs
<a href="#">PROCESSXSL Functions and Procedures</a> on page 180-11	Transforms an input XML document
<a href="#">READ2CLOB Function</a> on page 180-13	Reads content of the file into a CLOB
<a href="#">REMOVEPARAM Procedure</a> on page 180-14	Removes a top-level stylesheet parameter
<a href="#">RESETPARAMS Procedure</a> on page 180-15	Resets the top-level stylesheet parameters
<a href="#">SELECTNODES Function</a> on page 180-16	Selects nodes from a DOM tree that match a pattern
<a href="#">SELECTSINGLENODE Function</a> on page 180-17	Selects the first node from the tree that matches a pattern
<a href="#">SETERRORLOG Procedure</a> on page 180-18	Sets errors to be sent to the specified file
<a href="#">SETPARAM Procedure</a> on page 180-19	Sets a top-level parameter in the stylesheet
<a href="#">SHOWWARNINGS Procedure</a> on page 180-20	Turns warnings on or off
<a href="#">TRANSFORMNODE Function</a> on page 180-21	Transforms a node in a DOM tree using a stylesheet
<a href="#">VALUEOF Function and Procedure</a> on page 180-22	Gets the value of the first node that matches a pattern

---

## CLOB2FILE Procedure

This procedure writes content of a CLOB into a file.

### Syntax

```
DBMS_XSLPROCESSOR.CLOB2FILE(  
  cl          IN  CLOB;  
  flocation  IN  VARCHAR2,  
  fname      IN  VARCHAR2,  
  csid       IN  NUMBER:=0);
```

### Parameters

**Table 180–2 CLOB2FILE Procedure Parameters**

Parameter	Description
CLOB	File directory
flocation	File directory
fname	File name
csid	Character set id of the file <ul style="list-style-type: none"><li>■ Must be a valid Oracle id; otherwise returns an error</li><li>■ If 0, content of the output file will be in the database character set</li></ul>

## **FREEPROCESSOR Procedure**

This procedure Frees a Processor object.

### **Syntax**

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(  
  p IN Processor);
```

### **Parameters**

**Table 180–3** *FREEPROCESSOR Procedure Parameters*

<b>Parameter</b>	<b>Description</b>
p	Processor

## FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

### Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(  
    ss IN Stylesheet);
```

### Parameters

**Table 180–4** *FREESTYLESHEET Procedure Parameters*

Parameter	Description
ss	Stylesheet

## NEWPROCESSOR Function

This function returns a new `Processor` instance. The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

### Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR  
RETURN Processor;
```

## NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance. The options are described in the following table.

### Syntax

Creates and returns a new `stylesheet` instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(  
    xmlDoc IN DOMDOCUMENT,  
    ref    IN VARCHAR2)  
RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(  
    inp    IN VARCHAR2,  
    ref    IN VARCHAR2)  
RETURN Stylesheet;
```

### Parameters

**Table 180–5** *NEWSTYLESHEET Function Parameters*

Parameter	Description
<code>xmlDoc</code>	DOMDocument to use for construction
<code>inp</code>	Input URL to use for construction
<code>ref</code>	Reference URL

## PROCESSXSL Functions and Procedures

This function transforms input `XMLDocument`. Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

### Syntax

Transforms input `XMLDocument` using given `DOMDocument` and `stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p      IN  Processor,
  ss     IN  Stylesheet,
  xmldoc IN  DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as URL and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p      IN  Processor,
  ss     IN  Stylesheet,
  url    IN  VARCHAR2,
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as CLOB and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p      IN  Processor,
  ss     IN  Stylesheet,
  clb    IN  CLOB)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the `stylesheet`, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR. (
  p          IN  Processor,
  ss         IN  Stylesheet,
  xmldoc     IN  DOMDOCUMENT,
  dir        IN  VARCHAR2,
  fileName   IN  VARCHAR2);
```

Transforms input `XMLDocument` using given URL and the `stylesheet`, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p          IN  Processor,
  ss         IN  Stylesheet,
  url        IN  VARCHAR2,
  dir        IN  VARCHAR2,
  fileName   IN  VARCHAR2);
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the `stylesheet`, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p          IN  Processor,
```

```

ss          IN      Stylesheet,
xmldoc     IN      DOMDOCUMENT,
cl         IN OUT  CLOB);

```

Transforms input `XMLDocument` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and returns the resultant document fragment:

```

DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  xmldf     IN      DOMDOCUMENTFRAGMENT)
RETURN DOMDOCUMENTFRAGMENT;

```

Transforms input `XMLDocumentFragment` using given `DOMDocumentFragment` and the stylesheet, and writes the output to the specified file in a specified directory:

```

DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  xmldf     IN      DOMDOCUMENTFRAGMENT,
  dir       IN      VARCHAR2,
  filename  IN      VARCHAR2);

```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a buffer:

```

DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  xmldf     IN      DOMDOCUMENTFRAGMENT,
  buf       IN OUT  VARCHAR2);

```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a CLOB:

```

DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  xmldf     IN      DOMDOCUMENTFRAGMENT,
  cl        IN OUT  CLOB);

```

## Parameters

**Table 180–6** *PROCESSXSL Function and Procedure Parameters*

Parameter	Description
p	Processor instance
ss	Stylesheet instance
xmldoc	XML document being transformed
url	URL for the information being transformed
clb	CLOB containing information to be transformed
dir	Directory where processing output file is saved
filename	Processing output file
cl	CLOB to which the processing output is saved
xmldf	<code>XMLDocumentFragment</code> being transformed

## READ2CLOB Function

This function reads content of a file into a CLOB.

### Syntax

```
DBMS_XSLPROCESSOR.READ2CLOB(  
    flocation    IN    VARCHAR2,  
    fname        IN    VARCHAR2,  
    csid         IN    NUMBER:=0)  
RETURN CLOB;
```

### Parameters

**Table 180–7** *READ2CLOB Function Parameters*

Parameter	Description
flocation	File directory
fname	File name
csid	Character set id of the file <ul style="list-style-type: none"><li>■ Must be a valid Oracle id; otherwise returns an error</li><li>■ If 0, input file is assumed to be in the database character set</li></ul>

## REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

### Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(  
    ss      IN  Stylesheet,  
    name    IN  VARCHAR2);
```

### Parameters

**Table 180–8 REMOVEPARAM Procedure Parameters**

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter

## RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

### Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(  
    ss IN    Stylesheet);
```

### Parameters

**Table 180–9** *RESETPARAMS Procedure Parameters*

Parameter	Description
ss	Stylesheet instance

## SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

### Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(  
  n          IN  DBMS_XMLDOM.DOMNODE,  
  pattern    IN  VARCHAR2,  
  namespace  IN  VARCHAR2 := NULL)  
RETURN DBMS_XMLDOM.DOMNODELIST;
```

### Parameters

**Table 180–10** *SELECTNODES Function Parameters*

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

## SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

### Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(  
  n          IN  DBMS_XMLDOM.DOMNODE,  
  pattern    IN  VARCHAR2,  
  namespace  IN  VARCHAR2 := NULL)  
RETURN DBMS_XMLDOM.DOMNODE;
```

### Parameters

**Table 180–11** *SELECTSINGLENODE Function Parameters*

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

## SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

---

---

**Note:** This subprogram has been deprecated, and is included only for reasons of backward compatibility.

---

---

### Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(  
  p          IN  Processor,  
  fileName  IN  VARCHAR2);
```

### Parameters

**Table 180–12** *SETERRORLOG Procedure Parameters*

Parameter	Description
p	Processor instance
fileName	Complete path of the file to use as the error log

## SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet. The parameter value must be a valid XPath expression. Literal string values must be quoted.

### Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(  
  ss      IN  Stylesheet,  
  name    IN  VARCHAR2,  
  value   IN  VARCHAR2);
```

### Parameters

**Table 180–13** *SETPARAM Procedure Parameters*

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter
value	Value of the parameter

## SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

### Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS (  
  p      IN  Processor,  
  yes   IN  BOOLEAN);
```

### Parameters

**Table 180–14** *SHOWWARNINGS Procedure Parameters*

Parameter	Description
p	Processor instance
yes	Mode to set: TRUE to show warnings, FALSE otherwise

## TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a `DOMDocumentFragment`.

### Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE(  
  n    IN DOMNODE,  
  ss   IN Stylesheet)  
RETURN DOMDocumentFragment;
```

### Parameters

**Table 180–15** TRANSFORMNODE Function Parameters

Parameter	Description
n	DOMNode to transform
ss	Stylesheet to use

## VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

### Syntax

```
DBMS_XSLPROCESSOR.VALUEOF (  
  n          IN      DBMS_XMLDOM.DOMNODE,  
  pattern    IN      VARCHAR2,  
  namespace  IN      VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

```
DBMS_XSLPROCESSOR.VALUEOF (  
  n          IN      DBMS_XMLDOM.DOMNODE,  
  pattern    IN      VARCHAR2,  
  val        OUT     VARCHAR2,  
  namespace  IN      VARCHAR2 := NULL);
```

### Parameters

**Table 180–16** VALUEOF Function and Procedure Parameters

Parameter	Description
n	Node whose value is being retrieved
pattern	Pattern to use
val	Retrieved value
namespace	Namespace to use

The `DEBUG_EXTPROC` package enables you to start up the `extproc` agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- [Using `DEBUG\_EXTPROC`](#)
  - Security Model
  - Operational Notes
  - Rules and Limits
- [Summary of `DEBUG\_EXTPROC` Subprograms](#)

## Using DEBUG\_EXTPROC

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)

## Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

## Operational Notes

To install the package, run the script `DBGEXTP.SQL`.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.

- Ensure that you have execute privileges on package `DEBUG_EXTPROC`

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

---

---

**Note:** These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

---

---

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL\*Plus or OCI program by connecting to ORACLE.
- Execute procedure `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT` to startup the extproc agent in this session; for example, execute `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

## Rules and Limits

---

---

**Note:** DEBUG\_EXTPROC works only on platforms with debuggers that can attach to a running process.

---

---

## Summary of DEBUG\_EXTPROC Subprograms

**Table 181-1** *DEBUG\_EXTPROC Package Subprograms*

Subprogram	Description
<a href="#">STARTUP_EXTPROC_AGENT Procedure</a> on page 181-7	Starts up the extproc agent process in the session

## STARTUP\_EXTPROC\_AGENT Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

### Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

The HTF (hypertext functions) and HTP (hypertext procedures) packages generate HTML tags. For example, the HTF.ANCHOR function generates the HTML anchor tag, <A>.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

This chapter contains the following topics:

- [Using HTF](#)
  - Deprecated Subprograms
  - Operational Notes
  - Rules and Limits
  - Examples
- [Summary of Tags](#)
- [Summary of HTF Subprograms](#)

## Using HTF

- [Deprecated Subprograms](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)

## Deprecated Subprograms

---

---

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

---

The following subprogram is deprecated with Oracle Database 10g:

- [ESCAPE\\_URL Function](#)

## Operational Notes

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE\\_SC Function](#) or the [ESCAPE\\_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE\\_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE\\_URL Function](#).
- The [FORMAT\\_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT\\_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the `HTF.PRINT` function. It then prints its parameters to the generated Web page.

## Rules and Limits

If you use values of the LONG data type in functions such as HTF . PRINT, HTF . PRN, HTF . PA or OWA\_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the function.

## Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.P (HTF.HTMLOPEN); -- generates <HTML>
    HTP.P (HTF.HEADOPEN); -- generates <HEAD>
    HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
    HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
    HTP.P (HTF.BODYOPEN); -- generates <BODY>
    HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
    HTP.P (HTF.BODYCLOSE); -- generates </BODY>
    HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

---

## Summary of Tags

### HTML, HEAD, and BODY Tags

[HTMLOPEN Function](#), [HTMLCLOSE Function](#) - generate <HTML> and </HTML>

[HEADOPEN Function](#), [HEADCLOSE Function](#) - generate <HEAD> and </HEAD>

[BODYOPEN Function](#), [BODYCLOSE Function](#) - generate <BODY> and </BODY>

### Comment Tag

[COMMENT Function](#) - generates <!-- and -->

[http://www.w3.org.BASE Function](#) - generates <BASE>

[LINKREL Function](#) - generates <LINK> with the REL attribute

[LINKREV Function](#) - generates <LINK> with the REV attribute

[TITLE Function](#) - generates <TITLE>

[META Function](#) - generates <META>

[SCRIPT Function](#) - generates <SCRIPT>

[STYLE Function](#) - generates <STYLE>

[ISINDEX Function](#) - generates <ISINDEX>

### Applet Tags

[APPLETOPEN Function](#), [APPLETCLOSE Function](#) - generate <APPLET> and </APPLET>

[PARAM Function](#) - generates <PARAM>

### List Tags

[OLISTOPEN Function](#), [OLISTCLOSE Function](#) - generate <OL> and </OL>

[ULISTOPEN Function](#), [ULISTCLOSE Function](#) - generate <UL> and </UL>

[DLISTOPEN Function](#), [DLISTCLOSE Function](#) - generate <DL> and </DL>

[DLISTTERM Function](#) - generates <DT>

[DLISTDEF Function](#) - generates <DD>

[DIRLISTOPEN Function](#), [DIRLISTCLOSE Function](#) - generate <DIR> and </DIR>

[LISTHEADER Function](#) - generates <LH>

[LISTINGOPEN Function](#), [LISTINGCLOSE Function](#) - generate <LISTING> and </LISTING>

[MENULISTOPEN Function](#) - generate <MENU> and </MENU>

[LISTITEM Function](#) - generates <LI>

### Form Tags

[FORMOPEN Function](#), [FORMCLOSE Function](#) - generate <FORM> and </FORM>

[FORMCHECKBOX Function](#) - generates <INPUT TYPE="CHECKBOX">

[FORMHIDDEN Function](#) - generates <INPUT TYPE="HIDDEN">

[FORMIMAGE Function](#) - generates `<INPUT TYPE="IMAGE">`  
[FORMPASSWORD Function](#) - generates `<INPUT TYPE="PASSWORD">`  
[FORMRADIO Function](#) - generates `<INPUT TYPE="RADIO">`  
[FORMSELECTOPEN Function](#), [FORMSELECTCLOSE Function](#) - generate `<SELECT>`  
and `</SELECT>`  
[FORMSELETOPTION Function](#) - generates `<OPTION>`  
[FORMTEXT Function](#) - generates `<INPUT TYPE="TEXT">`  
[FORMTEXTAREA Function](#) - generate `<TEXTAREA>`  
[FORMTEXTAREAOPEN Function](#), [FORMTEXTAREACLOSE Function](#) - generate  
`<TEXTAREA>` and `</TEXTAREA>`  
[FORMRESET Function](#) - generates `<INPUT TYPE="RESET">`  
[FORMSUBMIT Function](#) - generates `<INPUT TYPE="SUBMIT">`

## Table Tags

[TABLEOPEN Function](#), [TABLECLOSE Function](#) - generate `<TABLE>` and `</TABLE>`  
[TABLECAPTION Function](#) - generates `<CAPTION>`  
[TABLEROWOPEN Function](#), [TABLEROWCLOSE Function](#) - generate `<TR>` and  
`</TR>`  
[TABLEHEADER Function](#) - generates `<TH>`  
[TABLEDATA Function](#) - generates `<TD>`

## IMG, HR, and A Tags

[HR Function](#), [LINE Function](#) - generate `<HR>`  
[IMG Function](#), [IMG2 Function](#) - generate `<IMG>`  
[ANCHOR Function](#), [ANCHOR2 Function](#) - generate `<A>`  
[MAPOPEN Function](#), [MAPCLOSE Function](#) - generate `<MAP>` and `</MAP>`

## Paragraph Formatting Tags

[HEADER Function](#) - generates heading tags (`<H1>` to `<H6>`)  
[PARA Function](#), [PARAGRAPH Function](#) - generate `<P>`  
[PRN Functions](#), [PRINT Functions](#) - generate any text that is passed in  
[PRN Functions](#), [S Function](#) - generate any text that is passed in; special characters in  
HTML are escaped  
[PREOPEN Function](#), [PRECLOSE Function](#) - generate `<PRE>` and `</PRE>`  
[BLOCKQUOTEOPEN Function](#), [BLOCKQUOTECLOSE Function](#) - generate  
`<BLOCKQUOTE>` and `</BLOCKQUOTE>`  
[DIV Function](#) - generates `<DIV>`  
[NL Function](#), [BR Function](#) - generate `<BR>`  
[NOBR Function](#) - generates `<NOBR>`  
[WBR Function](#) - generates `<WBR>`

[PLAINTEXT Function](#) - generates <PLAINTEXT>

[ADDRESS Function](#) - generates <ADDRESS>

[MAILTO Function](#) - generates <A> with the MAILTO attribute

[AREA Function](#) - generates <AREA>

[BGSOUND Function](#) - generates <BGSOUND>

## Character Formatting Tags

[BASEFONT Function](#) - generates <BASEFONT>

[BIG Function](#) - generates <BIG>

[BOLD Function](#) - generates <B>

[CENTER Function](#) - generates <CENTER> and </CENTER>

[CENTEROPEN Function](#), [CENTERCLOSE Function](#) - generate <CENTER> and </CENTER>

[CITE Function](#) - generates <CITE>

[CODE Function](#) - generates <CODE>

[DFN Function](#) - generates <DFN>

[EM Function](#), [EMPHASIS Function](#) - generate <EM>

[FONTOPEN Function](#), [FONTCLOSE Function](#) - generate <FONT> and </FONT>

[ITALIC Function](#) - generates <I>

[KBD Function](#), [KEYBOARD Function](#) - generate <KBD> and </KBD>

[S Function](#) - generates <S>

[SAMPLE Function](#) - generates <SAMP>

[SMALL Function](#) - generates <SMALL>

[STRIKE Function](#) - generates <STRIKE>

[STRONG Function](#) - generates <STRONG>

[SUB Function](#) - generates <SUB>

[SUP Function](#) - generates <SUP>

[TELETYPE Function](#) - generates <TT>

[UNDERLINE Function](#) - generates <U>

[VARIABLE Function](#) - generates <VAR>

## Frame Tags

[FRAME Function](#) - generates <FRAME>

[FRAMESETOPEN Function](#), [FRAMESETCLOSE Function](#) - generate <FRAMESET> and </FRAMESET>

[NOFRAMESOPEN Function](#), [NOFRAMESCLOSE Function](#) - generate <NOFRAMES> and </NOFRAMES>

---

## Summary of HTF Subprograms

**Table 182–1 HTF Package Subprograms**

Subprogram	Description
<a href="#">ADDRESS Function</a> on page 182-16	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
<a href="#">ANCHOR Function</a> on page 182-17	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
<a href="#">ANCHOR2 Function</a> on page 182-18	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
<a href="#">APPLETCLOSE Function</a> on page 182-19	Closes the applet invocation with the </APPLET> tag
<a href="#">APPLETOPEN Function</a> on page 182-20	Generates the <APPLET> tag which begins the invocation of a Java applet
<a href="#">AREA Function</a> on page 182-21	Generates the <AREA> tag, which defines a client-side image map
<a href="#">BASE Function</a> on page 182-22	Generates the <BASE> tag which records the URL of the document
<a href="#">BASEFONT Function</a> on page 182-23	Generates the <BASEFONT> tag which specifies the base font size for a Web page
<a href="#">BGSOUND Function</a> on page 182-24	Generates the <BGSOUND> tag which includes audio for a Web page
<a href="#">BIG Function</a> on page 182-25	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
<a href="#">BLOCKQUOTECLOSE Function</a> on page 182-26	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
<a href="#">BLOCKQUOTEOPEN Function</a> on page 182-27	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
<a href="#">BODYCLOSE Function</a> on page 182-28	Generates the </BODY> tag which marks the end of a body section of an HTML document
<a href="#">BODYOPEN Function</a> on page 182-29	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
<a href="#">BOLD Function</a> on page 182-30	Generates the <B> and </B> tags which direct the browser to display the text in boldface
<a href="#">BR Function</a> on page 182-31	Generates the   tag which begins a new line of text
<a href="#">CENTER Function</a> on page 182-32	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
<a href="#">CENTERCLOSE Function</a> on page 182-33	Generates the </CENTER> tag which marks the end of a section of text to center
<a href="#">CENTEROPEN Function</a> on page 182-34	Generates the <CENTER> tag which mark the beginning of a section of text to center
<a href="#">CITE Function</a> on page 182-35	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
<a href="#">CODE Function</a> on page 182-36	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically

**Table 182-1 (Cont.) HTF Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">COMMENT Function</a> on page 182-37	Generates the comment tags <code>&lt;!-- ctext --&gt;</code>
<a href="#">DFN Function</a> on page 182-38	Generates the <code>&lt;DFN&gt;</code> and <code>&lt;/DFN&gt;</code> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
<a href="#">DIRLISTCLOSE Function</a> on page 182-39	Generates the <code>&lt;/DIR&gt;</code> tag which ends a directory list section
<a href="#">DIRLISTOPEN Function</a> on page 182-40	Generates the <code>&lt;DIR&gt;</code> which starts a directory list section
<a href="#">DIV Function</a> on page 182-41	Generates the <code>&lt;DIV&gt;</code> tag which creates document divisions
<a href="#">DLISTCLOSE Function</a> on page 182-42	Generates the <code>&lt;/DL&gt;</code> tag which ends a definition list
<a href="#">DLISTDEF Function</a> on page 182-43	Generates the <code>&lt;DD&gt;</code> tag, which inserts definitions of terms
<a href="#">DLISTOPEN Function</a> on page 182-44	Generates the <code>&lt;DL&gt;</code> tag which starts a definition list
<a href="#">DLISTTERM Function</a> on page 182-45	Generates the <code>&lt;DT&gt;</code> tag which defines a term in a definition list <code>&lt;DL&gt;</code>
<a href="#">EM Function</a> on page 182-46	Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized
<a href="#">EMPHASIS Function</a> on page 182-47	Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized
<a href="#">ESCAPE_SC Function</a> on page 182-48	Replaces characters that have special meaning in HTML with their escape sequences
<a href="#">ESCAPE_URL Function</a> on page 182-49	Replaces characters that have special meaning in HTML and HTTP with their escape sequences
<a href="#">FONTCLOSE Function</a> on page 182-51	Generates the <code>&lt;/FONT&gt;</code> tag which marks the end of a section of text with the specified font characteristics
<a href="#">FONTOPEN Function</a> on page 182-51	Generates the <code>&lt;FONT&gt;</code> which marks the beginning of section of text with the specified font characteristics
<a href="#">FORMAT_CELL Function</a> on page 182-52	formats column values inside an HTML table using the <a href="#">TABLEDATA Function</a>
<a href="#">FORMCHECKBOX Function</a> on page 182-53	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="checkbox"</code> which inserts a checkbox element in a form
<a href="#">FORMCLOSE Function</a> on page 182-54	Generates the <code>&lt;/FORM&gt;</code> tag which marks the end of a form section in an HTML document
<a href="#">FORMFILE Function</a> on page 182-55	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="file"</code> which inserts a file form element, and is used for file uploading for a given page
<a href="#">FORMHIDDEN Function</a> on page 182-56	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="hidden"</code> which inserts a hidden form element
<a href="#">FORMIMAGE Function</a> on page 182-57	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="image"</code> which creates an image field that the user clicks to submit the form immediately
<a href="#">FORMOPEN Function</a> on page 182-58	Generates the <code>&lt;FORM&gt;</code> tag which marks the beginning of a form section in an HTML document

**Table 182-1 (Cont.) HTF Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">FORMPASSWORD Function</a> on page 182-59	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
<a href="#">FORMRADIO Function</a> on page 182-60	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
<a href="#">FORMRESET Function</a> on page 182-61	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
<a href="#">FORMSELECTCLOSE Function</a> on page 182-62	Generates the </SELECT> tag which marks the end of a Select form element
<a href="#">FORMSELECTOPEN Function</a> on page 182-63	Generates the </SELECT> tag which marks the beginning of a Select form element
<a href="#">FORMSELECTOPTION Function</a> on page 182-64	Generates the <OPTION> tag which represents one choice in a Select element
<a href="#">FORMSUBMIT Function</a> on page 182-65	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
<a href="#">FORMTEXT Function</a> on page 182-66	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
<a href="#">FORMTEXTAREA Function</a> on page 182-67	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
<a href="#">FORMTEXTAREA2 Function</a> on page 182-68	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
<a href="#">FORMTEXTAREACLOSE Function</a> on page 182-69	Generates the </TEXTAREA> tag which ends a text area form element
<a href="#">FORMTEXTAREAOPEN Function</a> on page 182-70	Generates the <TEXTAREA> which marks the beginning of a text area form element
<a href="#">FORMTEXTAREAOPEN2 Function</a> on page 182-71	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
<a href="#">FRAME Function</a> on page 182-72	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
<a href="#">FRAMESETCLOSE Function</a> on page 182-73	Generates the </FRAMESET> tag which ends a frameset section
<a href="#">FRAMESETOPEN Function</a> on page 182-74	Generates the </FRAMESET> tag which begins a frameset section
<a href="#">HEADCLOSE Function</a> on page 182-75	Generates the </HEAD> tag which marks the end of an HTML document head section
<a href="#">HEADER Function</a> on page 182-76	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
<a href="#">HEADOPEN Function</a> on page 182-77	Generates the <HEAD> tag which marks the beginning of the HTML document head section
<a href="#">HR Function</a> on page 182-78	Generates the <HR> tag, which generates a line in the HTML document
<a href="#">HTMLCLOSE Function</a> on page 182-80	Generates the </HTML> tag which marks the end of an HTML document

**Table 182-1 (Cont.) HTF Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">HTMLOPEN Function</a> on page 182-80	Generates the <HTML> tag which marks the beginning of an HTML document
<a href="#">IMG Function</a> on page 182-81	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
<a href="#">IMG2 Function</a> on page 182-82	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
<a href="#">ISINDEX Function</a> on page 182-83	Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program
<a href="#">ITALIC Function</a> on page 182-84	Generates the <I> and </I> tags which direct the browser to render the text in italics
<a href="#">KBD Function</a> on page 182-85	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
<a href="#">KEYBOARD Function</a> on page 182-86	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
<a href="#">LINE Function</a> on page 182-87	Generates the <HR> tag, which generates a line in the HTML document
<a href="#">LINKREL Function</a> on page 182-88	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
<a href="#">LINKREV Function</a> on page 182-89	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
<a href="#">LISTHEADER Function</a> on page 182-90	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
<a href="#">LISTINGCLOSE Function</a> on page 182-91	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
<a href="#">LISTINGOPEN Function</a> on page 182-92	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
<a href="#">LISTITEM Function</a> on page 182-93	Generates the <LI> tag, which indicates a list item
<a href="#">MAILTO Function</a> on page 182-94	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
<a href="#">MAPCLOSE Function</a> on page 182-95	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
<a href="#">MAPOPEN Function</a> on page 182-96	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
<a href="#">MENULISTCLOSE Function</a> on page 182-97	Generates the </MENU> tag which ends a list that presents one line for each item
<a href="#">MENULISTOPEN Function</a> on page 182-98	Generates the <MENU> tag which create a list that presents one line for each item
<a href="#">META Function</a> on page 182-99	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers

**Table 182–1 (Cont.) HTF Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">NL Function</a> on page 182-87	Generates the   tag which begins a new line of text
<a href="#">NOBR Function</a> on page 182-101	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
<a href="#">NOFRAMESCLOSE Function</a> on page 182-102	Generates the </NOFRAMES> tag which marks the end of a no-frames section
<a href="#">NOFRAMESOPEN Function</a> on page 182-103	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
<a href="#">OLISTCLOSE Function</a> on page 182-104	Generates the </OL> tag which defines the end of an ordered list
<a href="#">OLISTOPEN Function</a> on page 182-105	Generates the <OL> tag which marks the beginning of an ordered list
<a href="#">PARA Function</a> on page 182-106	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
<a href="#">PARAGRAPH Function</a> on page 182-107	Adds attributes to the <P> tag
<a href="#">PARAM Function</a> on page 182-108	Generates the <PARAM> tag which specifies parameter values for Java applets
<a href="#">PLAINTEXT Function</a> on page 182-109	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
<a href="#">PRECLOSE Function</a> on page 182-110	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
<a href="#">PREOPEN Function</a> on page 182-111	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
<a href="#">PRINT Functions</a> on page 182-112	Generates the specified parameter as a string terminated with the \n newline character
<a href="#">PRN Functions</a> on page 182-113	Generates the specified parameter as a string
<a href="#">S Function</a> on page 182-114	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
<a href="#">SAMPLE Function</a> on page 182-115	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
<a href="#">SCRIPT Function</a> on page 182-116	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
<a href="#">SMALL Function</a> on page 182-117	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
<a href="#">STRIKE Function</a> on page 182-118	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
<a href="#">STRONG Function</a> on page 182-119	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
<a href="#">STYLE Function</a> on page 182-120	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page

**Table 182-1 (Cont.) HTF Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">SUB Function</a> on page 182-121	Generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript
<a href="#">SUP Function</a> on page 182-122	Generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript
<a href="#">TABLECAPTION Function</a> on page 182-123	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
<a href="#">TABLECLOSE Function</a> on page 182-124	Generates the </TABLE> tag which marks the end of an HTML table
<a href="#">TABLEDATA Function</a> on page 182-125	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
<a href="#">TABLEHEADER Function</a> on page 182-126	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
<a href="#">TABLEOPEN Function</a> on page 182-127	Generates the <TABLE> tag which marks the beginning of an HTML table
<a href="#">TABLEROWCLOSE Function</a> on page 182-128	Generates the </TR> tag which marks the end of a new row in an HTML table
<a href="#">TABLEROWOPEN Function</a> on page 182-129	Generates the <TR> tag which marks the beginning of a new row in an HTML table
<a href="#">TELETYPE Function</a> on page 182-130	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
<a href="#">TITLE Function</a> on page 182-131	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
<a href="#">ULISTCLOSE Function</a> on page 182-132	Generates the </UL> tag which marks the end of an unordered list
<a href="#">ULISTOPEN Function</a> on page 182-133	Generates the <UL> tag which marks the beginning of an unordered list
<a href="#">UNDERLINE Function</a> on page 182-134	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
<a href="#">VARIABLE Function</a> on page 182-135	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
<a href="#">WBR Function</a> on page 182-136	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

## ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

### Syntax

```
HTF.ADDRESS (  
    cvalue          IN          VARCHAR2  
    cnowrap         IN          VARCHAR2  DEFAULT NULL  
    cclear          IN          VARCHAR2  DEFAULT NULL  
    cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–2 ADDRESS Function Parameters**

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

### Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

## ANCHOR Function

This function and the [ANCHOR2 Function](#) functions generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the [ANCHOR2 Function](#) provides a target and therefore can be used for a frame.

### Syntax

```
HTF.ANCHOR (
  curl          IN          VARCHAR2,
  ctext         IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–3 ANCHOR Function Parameters**

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

### Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

## ANCHOR2 Function

This function and the [ANCHOR Function](#) generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this functions provides a target and therefore can be used for a frame.

### Syntax

```
HTF.ANCHOR2 (  
    curl          IN          VARCHAR2,  
    ctext         IN          VARCHAR2,  
    cname         IN          VARCHAR2  DEFAULT NULL,  
    ctarget       in          varchar2  DEFAULT NULL,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–4 ANCHOR2 Function Parameters**

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

### Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

## APPLETCLOSE Function

This function closes the applet invocation with the `</APPLET>` tag. You must first invoke the a Java applet using [APPLETOPEN Function](#) on page 182-20

### Syntax

```
HTF.APPLETCLOSE  
RETURN VARCHAR2;
```

## APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with [APPLETCLOSE Function](#) on page 182-19 which generates the </APPLET> tag.

### Syntax

```
HTF.APPLETOPEN (
    ccode          IN          VARCHAR2,
    cheight        IN          NUMBER,
    cwidth         IN          NUMBER,
    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–5** *APPLETOPEN Function Parameters*

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

### Usage Notes

- Specify parameters to the Java applet using the [PARAM Function](#) function on page 182-108.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

## AREA Function

This function generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

### Syntax

```
HTF.AREA (
  ccoords      IN      VARCHAR2
  cshape       IN      VARCHAR2  DEFAULT NULL,
  chref        IN      VARCHAR2  DEFAULT NULL,
  cnohref      IN      VARCHAR2  DEFAULT NULL,
  ctargt       IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–6 AREA Function Parameters**

Parameter	Description
ccords	The the value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

## BASE Function

This function generates the <BASE> tag which records the URL of the document.

### Syntax

```
HTF.BASE (  
    ctarget          IN          VARCHAR2    DEFAULT NULL,  
    cattributes      IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–7** *BASE Function Parameters*

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

## BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

### Syntax

```
HTF.BASEFONT (  
    nsize    IN    INTEGER)  
    RETURN VARCHAR2;
```

### Parameters

**Table 182–8** *BASEFONT Function Parameters*

Parameter	Description
nsize	The value for the SIZE attribute.

### Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

## BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

### Syntax

```
HTF.BGSOUND (  
    csrc          IN          VARCHAR2,  
    cloop        IN          VARCHAR2  DEFAULT NULL,  
    cattributes  IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–9 BGSOUND Function Parameters**

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

## BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

### Syntax

```
HTF.BIG (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–10** *BIG Function Parameters*

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

## BLOCKQUOTECLOSE Function

This function generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Function](#).

### Syntax

```
HTF.BLOCKQUOTECLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</BLOCKQUOTE>
```

## BLOCKQUOTEOPEN Function

This function generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Function](#).

### Syntax

```
HTF.BLOCKQUOTEOPEN (
  cnowrap      IN      VARCHAR2  DEFAULT NULL,
  cclear       IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–11** *BLOCKQUOTEOPEN Function Parameters*

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

## BODYCLOSE Function

This function generates the `</BODY>` tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the [BODYOPEN Function](#).

### Syntax

```
HTF.BODYCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</BODY>
```

## BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the [BODYCLOSE Function](#).

### Syntax

```
HTF.BODYOPEN (
  cbackground   IN      VARCHAR2   DEFAULT NULL,
  cattributes   IN      VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–12 BODYOPEN Function Parameters**

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

## BOLD Function

This function generates the <B> and </B> tags which direct the browser to display the text in boldface.

### Syntax

```
HTF.BOLD (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–13 BOLD Function Parameters**

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<B cattributes>ctext</B>
```

## BR Function

This function generates the <BR> tag which begins a new line of text. It performs the same operation as the [NL Function](#).

### Syntax

```
HTF.BR(  
  cclear          IN          VARCHAR2  DEFAULT NULL,  
  cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–14 BR Function Parameters**

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

## CENTER Function

This function generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

### Syntax

```
HTF.CENTER (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

### Parameters

**Table 182–15** *CENTER Parameters*

Parameter	Description
ctext	The text that goes between the tags.

### Examples

This function generates

```
<CENTER>ctext</CENTER>
```

## CENTERCLOSE Function

This function generates the `</CENTER>` tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the [CENTEROPEN Function](#).

### Syntax

```
HTF.CENTERCLOSE  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
</CENTER>
```

## CENTEROPEN Function

This function generates the <CENTER> tag which mark the beginning of a section of text to center. You mark the beginning of a of a section of text to center by means of the [CENTERCLOSE Function](#).

### Syntax

```
HTF.CENTEROPEN  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
<CENTER>
```

## CITE Function

This function generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

### Syntax

```
HTF.CITE (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–16** CITE Function Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

## CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

### Syntax

```
HTF.CODE (  
  ctext          IN          VARCHAR2,  
  cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–17** *CODE Function Parameters*

Parameter	Description
<code>ctext</code>	The text to render as code.
<code>cattributes</code>	The other attributes to be included as-is in the tag

### Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

## COMMENT Function

This function generates the comment tags.

### Syntax

```
HTF.COMMENT (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

### Parameters

**Table 182–18** *COMMENT Function Parameters*

Parameter	Description
ctext	The comment.

### Examples

This function generates

```
<!-- ctext -->
```

## DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

### Syntax

```
HTF.DFN (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

### Parameters

**Table 182–19 DFN Function Parameters**

Parameter	Description
ctext	The text to render in italics.

### Examples

This function generates

```
<DFN>ctext</DFN>
```

## DIRLISTCLOSE Function

This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the [DIRLISTOPEN Function](#).

### Syntax

```
HTF.DIRLISTCLOSE  
RETURN VARCHAR2;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Function](#) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This function generates

```
</DIR>
```

## DIRLISTOPEN Function

This function generates the <DIR> which starts a directory list section. You end a directory list section with the [DIRLISTCLOSE Function](#).

### Syntax

```
HTF.DIRLISTOPEN  
    RETURN VARCHAR2;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the [LISTITEM Function](#) so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

### Examples

This function generates

```
<DIR>
```

## DIV Function

This function generates the <DIV> tag which creates document divisions.

### Syntax

```
HTF.DIV (  
    calign          IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–20** *DIV Function Parameters*

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

## DLISTCLOSE Function

This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Function](#).

### Syntax

```
HTF.DLISTCLOSE  
RETURN VARCHAR2;
```

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

### Examples

This function generates

```
</DL>
```

## DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

### Syntax

```
HTF.DLISTDEF (
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–21** *DLISTDEF Function Parameters*

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

## DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the [DLISTCLOSE Function](#).

### Syntax

```
HTF.DLISTOPEN (  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–22** *DLISTOPEN Function Parameters*

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

### Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

## DLISTTERM Function

This function generates the <DT> tag which defines a term in a definition list <DL>.

### Syntax

```
HTF.DLISTTERM (
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear        IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–23** *DLISTTERM Function Parameters*

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

## EM Function

This function generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the [EMPHASIS Function](#).

### Syntax

```
HTF.EM(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–24** *EM Function Parameters*

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<EM cattributes>ctext</EM>
```

## EMPHASIS Function

This function generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the [EM Function](#).

### Syntax

```
HTF.EMPHASIS(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–25 EMPHASIS Function Parameters**

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<EM cattributes>ctext</EM>
```

## ESCAPE\_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;

This function performs the same operation as HTP. [PRINTS Procedure](#) and HTP. [PS Procedure](#).

### Syntax

```
HTF.ESCAPE_SC(  
    ctext          IN          VARCHAR2);
```

### Parameters

**Table 182–26** *ESCAPE\_SC Procedure Parameters*

Parameter	Description
ctext	The text string to convert.

## ESCAPE\_URL Function

---

---

**Note:** This procedure, deprecated in Release 10g, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the [ESCAPE Function](#) in the [UTL\\_URL](#) package.

---

---

This function replaces characters that have special meaning in HTML and HTTP with their escape sequences. The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;
- % to &25

### Syntax

```
HTF.ESCAPE_URL(
    p_url          IN          VARCHAR2);
```

### Parameters

**Table 182–27** *ESCAPE\_URL Procedure Parameters*

Parameter	Description
p_url	The string to convert.

## FONTCLOSE Function

This function generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the [FONTOPEN Function](#).

### Syntax

```
HTF.FONTCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</FONT>
```

## FONTOPEN Function

This function generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the [FONTCLOSE Function](#).

### Syntax

```
HTF.FONTOPEN(
  ccolor      IN      VARCHAR2  DEFAULT NULL,
  cface       IN      VARCHAR2  DEFAULT NULL,
  csize       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–28** *FONTOPEN Function Parameters*

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

## FORMAT\_CELL Function

This function formats column values inside an HTML table using the [TABLEDATA Function](#). It allows for better control over the HTML tables.

### Syntax

```
HTF.FORMAT_CELL(  
    columnValue      IN      VARCHAR2  
    format_numbers  IN      VARCHAR2  DEFAULT NULL  
RETURN VARCHAR2;
```

### Parameters

**Table 182–29** *FORMAT\_CELL Function Parameters*

Parameter	Description
columnValue	The value that needs to be formatted in an HTML table.
format_numbers	The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.

### Examples

This function generates

```
<TD >columnValue</TD>
```

## FORMCHECKBOX Function

This function generates the <INPUT> tag with `TYPE="checkbox"` which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

### Syntax

```
HTF.FORMCHECKBOX(
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2  DEFAULT 'ON',
  cchecked       IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–30** *FORMCHECKBOX Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## FORMCLOSE Function

This function generates the `</FORM>` tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the [FORMOPEN Function](#).

### Syntax

```
HTF.FORMCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</FORM>
```

## FORMFILE Function

This function generates the <INPUT> tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

### Syntax

```
HTF.FORMFILE(
  cname          IN          VARCHAR2,
  caccept        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–31** *FORMFILE Function Parameters*

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

## FORMHIDDEN Function

This function generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

### Syntax

```
HTF.FORMHIDDEN(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–32** *FORMHIDDEN Function Parameters*

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

## FORMIMAGE Function

This function generates the <INPUT> tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

### Syntax

```
HTF.FORMIMAGE (
  cname          IN          VARCHAR2,
  csrc           IN          VARCHAR2,
  calign        IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–33** *FORMIMAGE Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute that specifies the image file.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

## FORMOPEN Function

This function generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the [FORMCLOSE Function](#).

### Syntax

```
HTF.FORMOPEN (
    curl          IN          VARCHAR2,
    cmethod       IN          VARCHAR2  DEFAULT 'POST',
    ctarger       IN          VARCHAR2  DEFAULT NULL,
    cenctype      IN          VARCHAR2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–34 FORMOPEN Function Parameters**

Parameter	Description
curl	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarger	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarger" ENCTYPE="cenctype"
cattributes>
```

## FORMPASSWORD Function

This function generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

### Syntax

```
HTF.FORMPASSWORD(
  cname          IN          VARCHAR2,
  csize          IN          VARCHAR2,
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–35 FORMPASSWORD Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"
VALUE="cvalue" cattributes>
```

## FORMRADIO Function

This function generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

### Syntax

```
HTF.FORMRADIO(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2,  
  cchecked       IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–36 FORMRADIO Function Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## FORMRESET Function

This function generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

### Syntax

```
HTF.FORMRESET(  
  cvalue          IN          VARCHAR2  DEFAULT 'Reset',  
  cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182-37 FORMRESET Function Parameters**

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

## FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Function](#). The values are inserted using [FORMSELECTOPTION Function](#).

### Syntax

```
HTF.FORMSELECTCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</SELECT>
```

as shown under [Examples](#) of the [FORMSELECTOPEN Function](#).

## FORMSELECTOPEN Function

This function generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Function](#). The values are inserted using [FORMSELETOPTION Function](#).

### Syntax

```
HTF.FORMSELECTOPEN (
  cname          IN          VARCHAR2,
  cprompt        IN          VARCHAR2  DEFAULT NULL,
  nsize          IN          INTEGER   DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–38** *FORMSELECTOPEN Function Parameters*

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
  'Pick the greatest player:');
HTF.FORMSELETOPTION('Messier');
HTF.FORMSELETOPTION('Howe');
HTF.FORMSELETOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

## FORMSELETOPTION Function

This function generates the <OPTION> tag which represents one choice in a Select element.

### Syntax

```
HTF.FORMSELETOPTION(  
    cvalue          IN          VARCHAR2,  
    cselected       IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–39** *FORMSELETOPTION Function Parameters*

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under [Examples](#) of the [FORMSELETOPTION Function](#).

## FORMSUBMIT Function

This function generates the <INPUT> tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

### Syntax

```
HTF.FORMSUBMIT(
  cname          IN          VARCHAR2  DEFAULT NULL,
  cvalue         IN          VARCHAR2  DEFAULT 'Submit',
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–40 FORMSUBMIT Function Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

## FORMTEXT Function

This function generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

### Syntax

```
HTF.FORMTEXT(  
  cname          IN          VARCHAR2,  
  csize          IN          VARCHAR2  DEFAULT NULL,  
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,  
  cvalue         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–41** FORMTEXT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"  
cattributes>
```

## FORMTEXTAREA Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the [FORMTEXTAREA2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

### Syntax

```
HTF.FORMTEXTAREA(
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–42** *FORMTEXTAREA Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```

## FORMTEXTAREA2 Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the [FORMTEXTAREA Function](#) except that in that case you cannot specify a wrap style.

### Syntax

```
HTF.FORMTEXTAREA2 (
    cname          IN          VARCHAR2,
    nrows          IN          INTEGER,
    ncolumns       IN          INTEGER,
    calign         IN          VARCHAR2  DEFAULT NULL,
    cwrap          IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–43 FORMTEXTAREA2 Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

## FORMTEXTAREACLOSE Function

This function generates the `</TEXTAREA>` tag which ends a text area form element. You open a text area element by means of either [FORMTEXTAREAOPEN Function](#) or [FORMTEXTAREAOPEN2 Function](#).

### Syntax

```
HTF.FORMTEXTAREACLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</TEXTAREA>
```

## FORMTEXTAREAOPEN Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the [FORMTEXTAREAOPEN2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

### Syntax

```
HTF.FORMTEXTAREAOPEN (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–44** *FORMTEXTAREAOPEN Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

## FORMTEXTAREAOPEN2 Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the [FORMTEXTAREAOPEN Function](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

### Syntax

```
HTF.FORMTEXTAREAOPEN2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cwrap         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–45** *FORMTEXTAREAOPEN2 Function Parameters*

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

## FRAME Function

This function generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag.

### Syntax

```
HTF.FRAME (
  csrc          IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cmarginwidth IN          VARCHAR2  DEFAULT NULL,
  cmarginheight IN        VARCHAR2  DEFAULT NULL,
  cscrolling    IN          VARCHAR2  DEFAULT NULL,
  cnoresize     IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–46** *FRAME Function Parameters*

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

## FRAMESETCLOSE Function

This function generates the `</FRAMESET>` tag which ends a frameset section. You mark the beginning of a frameset section by means of the [FRAMESETOPEN Function](#).

### Syntax

```
HTF.FRAMESETCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</FRAMESET>
```

## FRAMESETOPEN Function

This function generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the [FRAMESETCLOSE Function](#).

### Syntax

```
HTF.FRAMESETOPEN(  
  crows          IN          VARCHAR2  DEFAULT NULL,  
  ccols          IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–47** *FRAMESETOPEN Function Parameters*

Parameter	Description
<code>crows</code>	The value for the <code>ROWS</code> attribute.
<code>ccols</code>	The value for the <code>COLS</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

## HEADCLOSE Function

This function generates the `</HEAD>` tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the [HEADOPEN Function](#).

### Syntax

```
HTF.HEADCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</HEAD>
```

## HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

### Syntax

```
HTF.HEADER(  
  nsize      IN      INTEGER,  
  cheader    IN      VARCHAR2,  
  calign     IN      VARCHAR2  DEFAULT NULL,  
  cnowrap    IN      VARCHAR2  DEFAULT NULL,  
  cclear     IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–48** HEADER Function Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

```
HTF.header (1, 'Overview')  
  RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

## HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the [HEADCLOSE Function](#).

### Syntax

```
HTF.HEADOPEN  
RETURN VARCHAR2;
```

### Examples

This function generates

```
<HEAD>
```

## HR Function

This function generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the [LINE Function](#).

### Syntax

```
HTF.HR (  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  csrc        IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–49** HR Function Parameters

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>csrc</code>	The value for the SRC attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## HTMLCLOSE Function

This function generates the `</HTML>` tag which marks the end of an HTML document. You use the [HTMLOPEN Function](#) to mark the beginning of an HTML document.

### Syntax

```
HTF.HTMLCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</HTML>
```

## HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document. You use the [HTMLCLOSE Function](#) to mark the end of the an HTML document.

### Syntax

```
HTF.HTMLOPEN  
RETURN VARCHAR2;
```

### Examples

This function generates

```
<HTML>
```

## IMG Function

This function generates the <IMG> tag which directs the browser to load an image onto the HTML page. The [IMG2 Function](#) performs the same operation but additionally uses the `cusemap` parameter.

### Syntax

```
HTF.IMG (
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–50** *IMG Function Parameters*

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

## IMG2 Function

This function generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The [IMG Function](#) performs the same operation but does not use the `cusemap` parameter.

### Syntax

```
HTF.IMG2 (
    curl          IN          VARCHAR2    DEFAULT NULL,
    calign        IN          VARCHAR2    DEFAULT NULL,
    calt          IN          VARCHAR2    DEFAULT NULL,
    cismap        IN          VARCHAR2    DEFAULT NULL,
    cusemap       IN          VARCHAR2    DEFAULT NULL,
    cattributes   IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–51** *IMG2 Function Parameters*

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cusemap</code>	The value for the USEMAP attribute which specifies a client-side image map.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

## ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program.

### Syntax

```
HTF.ISINDEX (
  cprompt      IN      VARCHAR2      DEFAULT NULL,
  curl         IN      VARCHAR2      DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–52** *ISINDEX Function Parameters*

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

### Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

## ITALIC Function

This function generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

### Syntax

```
HTF.ITALIC(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–53** *ITALIC Function Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in italics.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates  
`<I cattributes>ctext</I>`

## KBD Function

This function generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the [KEYBOARD Function](#).

### Syntax

```
HTF.KBD(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–54** *KBD Function Parameters*

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

## KEYBOARD Function

This function generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the [KBD Function](#).

### Syntax

```
HTF.KEYBOARD(  
  ctext          IN          VARCHAR2,  
  cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–55** *KEYBOARD Function Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

## LINE Function

This function generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the [HR Function](#).

### Syntax

```
HTF.LINE(
  cclear      IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–56** *LINE Function Parameters*

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of [LINKREV Function](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Function](#).

### Syntax

```
HTF.LINKREL(  
    crel          IN          VARCHAR2,  
    curl          IN          VARCHAR2,  
    ctitle       IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–57 LINKREL Function Parameters**

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

### Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

## LINKREV Function

This function generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the [LINKREL Function](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Function](#).

### Syntax

```
HTF.LINKREV(  
  crev          IN          VARCHAR2,  
  curl          IN          VARCHAR2,  
  ctitle       IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–58** LINKREV Function Parameters

Parameter	Description
crev	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

### Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

## LISTHEADER Function

This function generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

### Syntax

```
HTF.LISTHEADER(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–59 LISTHEADER Function Parameters**

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<LH cattributes>ctext</LH>
```

## LISTINGCLOSE Function

This function generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Function](#).

### Syntax

```
HTF.LISTINGCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</LISTING>
```

## LISTINGOPEN Function

This function generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Function](#).

### Syntax

```
HTF.LISTINGOPEN  
RETURN VARCHAR2;
```

### Examples

This function generates

```
<LISTING>
```

## LISTITEM Function

This function generates the <LI> tag, which indicates a list item.

### Syntax

```
HTF.LISTITEM(
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cdingbat       IN          VARCHAR2  DEFAULT NULL,
  csrc           IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–60** LISTITEM Function Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

## MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

### Syntax

```
HTF.MAILTO(
  address      IN      VARCHAR2,
  ctext       IN      VARCHAR2,
  cname       IN      VARCHAR2,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–61 MAILTO Function Parameters**

Parameter	Description
address	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<A HREF="mailto:address" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

## MAPCLOSE Function

This function generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the [MAPOPEN Function](#).

### Syntax

```
HTF.MAPCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</MAP>
```

## MAOPEN Function

This function generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Function](#).

### Syntax

```
HTF.MAOPEN(  
  cname          IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–62** MAOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

## MENULISTCLOSE Function

This function generates the `</MENU>` tag which ends a list that presents one line for each item. To begin a list of this kind, use the [MENULISTOPEN Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

### Syntax

```
HTF.MENULISTCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</MENU>
```

## MENULISTOPEN Function

This function generates the <MENU> tag which create a list that presents one line for each item. To end a list of this kind, use the [MENULISTCLOSE Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

### Syntax

```
HTF.MENULISTOPEN  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
<MENU>
```

## META Function

This function generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

### Syntax

```
HTF.META(
  chttp_equiv    IN      VARCHAR2,
  cname          IN      VARCHAR2,
  ccontent       IN      VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 182–63 META Function Parameters**

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

### Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

## NL Function

This function generates the <BR> tag which begins a new line of text. It performs the same operation as the [BR Function](#).

### Syntax

```
HTF.NL(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–64 NL Function Parameters**

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

## NOBR Function

This function generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

### Syntax

```
HTF.NOBR (  
  ctext          IN          VARCHAR2)  
  RETURN VARCHAR2;
```

### Parameters

**Table 182–65** *NOBR Function Parameters*

Parameter	Description
c text	The text that is to be rendered on one line.

### Examples

This function generates

```
<NOBR>c text</NOBR>
```

## NOFRAMESCLOSE Function

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the [FRAMESETOPEN Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

### Syntax

```
HTF.NOFRAMESCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</NOFRAMES>
```

## NOFRAMESOPEN Function

This function generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the [FRAMESETCLOSE Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

### Syntax

```
HTF.NOFRAMESOPEN  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
<NOFRAMES>
```

## OLISTCLOSE Function

This function generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the [OLISTOPEN Function](#). Numbered items are added using [LISTITEM Function](#).

### Syntax

```
HTF.OLISTCLOSE  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
</OL>
```

## OLISTOPEN Function

This function generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the [OLISTCLOSE Function](#). Numbered items are added using [LISTITEM Function](#).

### Syntax

```
HTF.OLISTOPEN(
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cwrap       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–66** *OLISTOPEN Function Parameters*

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

## PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the [PARAGRAPH Function](#).

### Syntax

```
HTF.PARA
RETURN VARCHAR2;
```

### Examples

This function generates

```
<P>
```

## PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the [PARA Function](#).

### Syntax

```
HTF.PARAGRAPH(
  calign          IN          VARCHAR2  DEFAULT NULL,
  cnowrap        IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–67 PARAGRAPH Function Parameters**

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

## PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Function](#) to begin the invocation. Use one [PARAM Function](#) for each desired name-value pair, and use [APPLETCLOSE Function](#) to end the applet invocation.

### Syntax

```
HTF.PARAM(  
  cname          IN          VARCHAR2  
  cvalue         IN          VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–68** *PARAM Function Parameters*

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

### Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

## PLAINTEXT Function

This function generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

### Syntax

```
HTF.PLAINTEXT(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–69** *PLAINTEXT Function Parameters*

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

## PRECLOSE Function

This function generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Function](#).

### Syntax

```
HTF.PRECLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</PRE>
```

## PREOPEN Function

This function generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Function](#).

### Syntax

```
HTF.PREOPEN(
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cwidth      IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–70** *PREOPEN Function Parameters*

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

## PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character. The [PRN Functions](#) performs the same operation but does not terminate with a newline character.

### Syntax

```
HTF.PRINT (  
    cbuf      IN      VARCHAR2)  
RETURN VARCHAR2;
```

```
HTF.PRINT (  
    dbuf      IN      DATE)  
RETURN VARCHAR2;
```

```
HTF.PRINT (  
    nbuf      IN      NUMBER)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–71 PRINT Function Parameters**

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

### Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These functions do not have function equivalents.

## PRN Functions

These functions generate the specified parameter as a string. Unlike the [PRINT Functions](#) the string is not terminated with the \n newline character.

### Syntax

```
HTF.PRN (  
    cbuf      IN      VARCHAR2)  
RETURN VARCHAR2;
```

```
HTF.PRN (  
    dbuf      IN      DATE)  
RETURN VARCHAR2;
```

```
HTF.PRN (  
    nbuf      IN      NUMBER)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–72 PRN Function Parameters**

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

### Usage Notes

These functions do not have function equivalents.

## S Function

This function generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as [STRIKE Function](#).

### Syntax

```
HTF.S (  
    ctext          IN          VARCHAR2,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–73 S Function Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<S cattributes>ctext</S>
```

## SAMPLE Function

This function generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

### Syntax

```
HTF.SAMPLE (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–74** *SAMPLE Function Parameters*

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

## SCRIPT Function

This function generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

### Syntax

```
HTF.SCRIPT (  
    cscript          IN          VARCHAR2,  
    clanguage        IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–75** *SCRIPT Function Parameters*

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

### Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

## SMALL Function

This function generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

### Syntax

```
HTF.SMALL (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–76** *SMALL Function Parameters*

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

## STRIKE Function

This function generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as [S Function](#).

### Syntax

```
STRIKE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–77** *STRIKE Function Parameters*

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

## STRONG Function

This function generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold or however "strong" is defined.

### Syntax

```
HTF.STRONG(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–78** *STRONG Function Parameters*

Parameter	Description
<code>ctext</code>	The text to be emphasized.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

## STYLE Function

This function generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page. You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

### Syntax

```
HTF.STYLE(  
    cstyle          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

### Parameters

**Table 182–79** *STYLE Function Parameters*

Parameter	Description
<code>cstyle</code>	The the style information to include.

### Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

## SUB Function

This function generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript.

### Syntax

```
HTF.SUB (
  ctext          IN          VARCHAR2,
  calign         in          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–80 SUB Function Parameters**

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

## SUP Function

This function generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript.

### Syntax

```
HTF.SUP(  
  ctext          IN          VARCHAR2,  
  calign         in          VARCHAR2  DEFAULT NULL,  
  cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–81** SUP Function Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

## TABLECAPTION Function

This function generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

### Syntax

```
HTF.TABLECAPTION(
  ccaption      IN      VARCHAR2,
  calign        in      VARCHAR2  DEFAULT NULL,
  cattributes   IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–82** TABLECAPTION Function Parameters

Parameter	Description
cctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

## TABLECLOSE Function

This function generates the `</TABLE>` tag which marks the end of an HTML table. To define the beginning of an HTML table, use the [TABLEOPEN Function](#) on page 182-127.

### Syntax

```
HTF.TABLECLOSE  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
</TABLE>
```

## TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

### Syntax

```
HTF.TABLEDATA(
  cvalue      IN      VARCHAR2  DEFAULT NULL,
  calign      IN      VARCHAR2  DEFAULT NULL,
  cdp         IN      VARCHAR2  DEFAULT NULL,
  cnowrap     IN      VARCHAR2  DEFAULT NULL,
  crowspan    IN      VARCHAR2  DEFAULT NULL,
  ccolspan    IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–83 TABLEDATA Function Parameters**

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

## TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

### Syntax

```
HTF.TABLEHEADER (
    cvalue      IN      VARCHAR2  DEFAULT NULL,
    calign      IN      VARCHAR2  DEFAULT NULL,
    cdp         IN      VARCHAR2  DEFAULT NULL,
    cnowrap     IN      VARCHAR2  DEFAULT NULL,
    crowspan    IN      VARCHAR2  DEFAULT NULL,
    ccolspan    IN      VARCHAR2  DEFAULT NULL,
    cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–84** TABLEHEADER Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

## TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the [TABLECLOSE Function](#).

### Syntax

```
HTF.TABLEOPEN(
  cborder      IN      VARCHAR2  DEFAULT NULL
  calign       IN      VARCHAR2  DEFAULT NULL,
  cnowrap     IN      VARCHAR2  DEFAULT NULL,
  cclear       IN      VARCHAR2  DEFAULT NULL
  cattributes  IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–85** TABLEOPEN Function Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

## TABLEROWCLOSE Function

This function generates the `</TR>` tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the [TABLEROWOPEN Function](#).

### Syntax

```
HTF.TABLEROWCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</TABLE>
```

## TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the [TABLEROWCLOSE Function](#).

### Syntax

```
HTF.TABLEROWOPEN(
  calign          IN          VARCHAR2  DEFAULT NULL,
  cvalign         IN          VARCHAR2  DEFAULT NULL,
  cdp             IN          VARCHAR2  DEFAULT NULL,
  nowrap          IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–86** *TABLEROWOPEN Function Parameters*

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
nowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

## TELETYPE Function

This function generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

### Syntax

```
HTF.TELETYPE(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–87 TELETYPE Function Parameters**

Parameter	Description
<code>ctext</code>	The text to render in a fixed width typewriter font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TT cattributes>ctext</TT>
```

## TITLE Function

This function generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

### Syntax

```
HTF.TITLE(  
    ctitle          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

### Parameters

**Table 182–88** *TITLE Function Parameters*

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

### Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

## ULISTCLOSE Function

This function generates the `</UL>` tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the [ULISTOPEN Function](#). Add list items with [LISTITEM Function](#).

### Syntax

```
HTF.ULISTCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</UL>
```

## ULISTOPEN Function

This function generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the [ULISTCLOSE Function](#). Add list items with [LISTITEM Function](#).

### Syntax

```
HTF.ULISTOPEN(
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cwrap       IN      VARCHAR2  DEFAULT NULL,
  cdingbat    IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 182–89** *ULISTOPEN Function Parameters*

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

## UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

### Syntax

```
HTF.UNDERLINE(  
  ctext          IN          VARCHAR2,  
  cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–90** *UNDERLINE Function Parameters*

Parameter	Description
<code>ctext</code>	The text to render with an underline.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<U cattributes>ctext</U>
```

## VARIABLE Function

This function generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

### Syntax

```
HTF.VARIABLE(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 182–91** VARIABLE Function Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

## WBR Function

This function generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

### Syntax

```
HTF.WBR  
RETURN VARCHAR2;
```

### Examples

This function generates

```
<WBR>
```

The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, <A>.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

This chapter contains the following topics:

- [Using HTP](#)
  - Operational Notes
  - Rules and Limits
  - Examples
- [Summary of Tags](#)
- [Summary of HTP Subprograms](#)

## Using HTP

- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)

## Operational Notes

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE\\_SC Function](#) or the [ESCAPE\\_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE\\_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE\\_URL Function](#).
- The [FORMAT\\_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT\\_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.PRINT procedure. It then prints its parameters to the generated Web page.

## Rules and Limits

If you use values of the LONG data type in procedures such as `HTP.PRINT`, `HTP.PRN`, `HTP.PRINTS`, `HTP.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the procedure.

## Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN;           -- generates <HTML>
    HTP.HEADOPEN;          -- generates <HEAD>
    HTP.TITLE('Hello');    -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE;        -- generates </HEAD>
    HTP.BODYOPEN;          -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE;         -- generates </BODY>
    HTP.HTMLCLOSE;         -- generates </HTML>
END;
```

## Summary of Tags

### HTML, HEAD, and BODY Tags

[HTMLOPEN Procedure](#), [HTMLCLOSE Procedure](#) - generate <HTML> and </HTML>

[HEADOPEN Procedure](#), [HEADCLOSE Procedure](#) - generate <HEAD> and </HEAD>

[BODYOPEN Procedure](#), [BODYCLOSE Procedure](#) - generate <BODY> and </BODY>

### Comment Tag

[COMMENT Procedure](#) - generates <!-- and -->

### Tags in the <HEAD> Area

[BASE Procedure](#) - generates <BASE>

[LINKREL Procedure](#) - generates <LINK> with the REL attribute

[LINKREV Procedure](#) - generates <LINK> with the REV attribute

[TITLE Procedure](#) - generates <TITLE>

[META Procedure](#) - generates <META>

[SCRIPT Procedure](#) - generates <SCRIPT>

[STYLE Procedure](#) - generates <STYLE>

[ISINDEX Procedure](#) - generates <ISINDEX>

### Applet Tags

[APPLETOPEN Procedure](#), [APPLETCLOSE Procedure](#) - generate <APPLET> and </APPLET>

[PARAM Procedure](#) - generates <PARAM>

### List Tags

[OLISTOPEN Procedure](#), [OLISTCLOSE Procedure](#) - generate <OL> and </OL>

[ULISTOPEN Procedure](#), [ULISTCLOSE Procedure](#) - generate <UL> and </UL>

[DLISTOPEN Procedure](#), [DLISTCLOSE Procedure](#) - generate <DL> and </DL>

[DLISTTERM Procedure](#) - generates <DT>

[DLISTDEF Procedure](#) - generates <DD>

[DIRLISTOPEN Procedure](#), [DIRLISTCLOSE Procedure](#) - generate <DIR> and </DIR>

[LISTHEADER Procedure](#) - generates <LH>

[LISTINGOPEN Procedure](#), [LISTINGCLOSE Procedure](#) - generate <LISTING> and </LISTING>

[MENULISTOPEN Procedure](#) - generate <MENU> and </MENU>

[LISTITEM Procedure](#) - generates <LI>

### Form Tags

[FORMOPEN Procedure](#), [FORMCLOSE Procedure](#) - generate <FORM> and </FORM>

[FORMCHECKBOX Procedure](#) - generates `<INPUT TYPE="CHECKBOX">`  
[FORMHIDDEN Procedure](#) - generates `<INPUT TYPE="HIDDEN">`  
[FORMIMAGE Procedure](#) - generates `<INPUT TYPE="IMAGE">`  
[FORMPASSWORD Procedure](#) - generates `<INPUT TYPE="PASSWORD">`  
[FORMRADIO Procedure](#) - generates `<INPUT TYPE="RADIO">`  
[FORMSELECTOPEN Procedure](#), [FORMSELECTCLOSE Procedure](#) - generate `<SELECT>` and `</SELECT>`  
[FORMSELECTOPTION Procedure](#) - generates `<OPTION>`  
[FORMTEXT Procedure](#) - generates `<INPUT TYPE="TEXT">`  
[FORMTEXTAREA Procedure](#) - generate `<TEXTAREA>`  
[FORMTEXTAREAOPEN Procedure](#), [FORMTEXTAREACLOSE Procedure](#) - generate `<TEXTAREA>` and `</TEXTAREA>`  
[FORMRESET Procedure](#) - generates `<INPUT TYPE="RESET">`  
[FORMSUBMIT Procedure](#) - generates `<INPUT TYPE="SUBMIT">`

## Table Tags

[TABLEOPEN Procedure](#), [TABLECLOSE Procedure](#) - generate `<TABLE>` and `</TABLE>`  
[TABLECAPTION Procedure](#) - generates `<CAPTION>`  
[TABLEROWOPEN Procedure](#), [TABLEROWCLOSE Procedure](#) - generate `<TR>` and `</TR>`  
[TABLEHEADER Procedure](#) - generates `<TH>`  
[TABLEDATA Procedure](#) - generates `<TD>`

## IMG, HR, and A Tags

[HR Procedure](#), [LINE Procedure](#) - generate `<HR>`  
[IMG Procedure](#), [IMG2 Procedure](#) - generate `<IMG>`  
[ANCHOR Procedure](#), [ANCHOR2 Procedure](#) - generate `<A>`  
[MAPOPEN Procedure](#), [MAPCLOSE Procedure](#) - generate `<MAP>` and `</MAP>`

## Paragraph Formatting Tags

[HEADER Procedure](#) - generates heading tags (`<H1>` to `<H6>`)  
[PARA Procedure](#), [PARAGRAPH Procedure](#) - generate `<P>`  
[PRN Procedures](#), [PRINT Procedures](#) - generate any text that is passed in  
[PRINTS Procedure](#), [PS Procedure](#) - generate any text that is passed in; special characters in HTML are escaped  
[PREOPEN Procedure](#), [PRECLOSE Procedure](#) - generate `<PRE>` and `</PRE>`  
[BLOCKQUOTEOPEN Procedure](#), [BLOCKQUOTECLOSE Procedure](#) - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`  
[DIV Procedure](#) - generates `<DIV>`  
[NL Procedure](#), [BR Procedure](#) - generate `<BR>`

[NOBR Procedure](#) - generates <NOBR>  
[WBR Procedure](#) - generates <WBR>  
[PLAINTEXT Procedure](#) - generates <PLAINTEXT>  
[ADDRESS Procedure](#) - generates <ADDRESS>  
[MAILTO Procedure](#) - generates <A> with the MAILTO attribute  
[AREA Procedure](#) - generates <AREA>  
[BGSOUND Procedure](#) - generates <BGSOUND>

## Character Formatting Tags

[BASEFONT Procedure](#) - generates <BASEFONT>  
[BIG Procedure](#) - generates <BIG>  
[BOLD Procedure](#) - generates <B>  
[CENTER Procedure](#) - generates <CENTER> and </CENTER>  
[CENTEROPEN Procedure](#), [CENTERCLOSE Procedure](#) - generate <CENTER> and </CENTER>  
[CITE Procedure](#) - generates <CITE>  
[CODE Procedure](#) - generates <CODE>  
[DFN Procedure](#) - generates <DFN>  
[EM Procedure](#), [EMPHASIS Procedure](#) - generate <EM>  
[FONTOPEN Procedure](#), [FONTCLOSE Procedure](#) - generate <FONT> and </FONT>  
[ITALIC Procedure](#) - generates <I>  
[KBD Procedure](#), [KEYBOARD Procedure](#) - generate <KBD> and </KBD>  
[S Procedure](#) - generates <S>  
[SAMPLE Procedure](#) - generates <SAMP>  
[SMALL Procedure](#) - generates <SMALL>  
[STRIKE Procedure](#) - generates <STRIKE>  
[STRONG Procedure](#) - generates <STRONG>  
[SUB Procedure](#) - generates <SUB>  
[SUP Procedure](#) - generates <SUP>  
[TELETYPE Procedure](#) - generates <TT>  
[UNDERLINE Procedure](#) - generates <U>  
[VARIABLE Procedure](#) - generates <VAR>

## Frame Tags

[FRAME Procedure](#) - generates <FRAME>  
[FRAMESETOPEN Procedure](#), [FRAMESETCLOSE Procedure](#) - generate <FRAMESET> and </FRAMESET>  
[NOFRAMESOPEN Procedure](#), [NOFRAMESCLOSE Procedure](#) - generate <NOFRAMES> and </NOFRAMES>

---

## Summary of HTP Subprograms

**Table 183–1 HTP Package Subprograms**

Subprogram	Description
<a href="#">ADDRESS Procedure</a> on page 183-15	Generate s the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags which specify the address, author and signature of a document
<a href="#">ANCHOR Procedure</a> on page 183-16	Generate s the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link
<a href="#">ANCHOR2 Procedure</a> on page 183-17	Generates the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link
<a href="#">APPLETCLOSE Procedure</a> on page 183-18	Closes the applet invocation with the <code>&lt;/APPLET&gt;</code> tag
<a href="#">APPLETOPEN Procedure</a> on page 183-19	Generates the <code>&lt;APPLET&gt;</code> tag which begins the invocation of a Java applet
<a href="#">AREA Procedure</a> on page 183-20	Generates the <code>&lt;AREA&gt;</code> tag, which defines a client-side image map
<a href="#">BASE Procedure</a> on page 183-21	Generates the <code>&lt;BASE&gt;</code> tag which records the URL of the document
<a href="#">BASEFONT Procedure</a> on page 183-22	Generates the <code>&lt;BASEFONT&gt;</code> tag which specifies the base font size for a Web page
<a href="#">BGSOUND Procedure</a> on page 183-23	Generates the <code>&lt;BGSOUND&gt;</code> tag which includes audio for a Web page
<a href="#">BIG Procedure</a> on page 183-24	Generates the <code>&lt;BIG&gt;</code> and <code>&lt;/BIG&gt;</code> tags which direct the browser to render the text in a bigger font
<a href="#">BLOCKQUOTECLOSE Procedure</a> on page 183-25	Generates the <code>&lt;/BLOCKQUOTE&gt;</code> tag which mark the end of a section of quoted text
<a href="#">BLOCKQUOTEOPEN Procedure</a> on page 183-26	Generates the <code>&lt;BLOCKQUOTE&gt;</code> tag, which marks the beginning of a section of quoted text
<a href="#">BODYCLOSE Procedure</a> on page 183-27	Generates the <code>&lt;/BODY&gt;</code> tag which marks the end of a body section of an HTML document
<a href="#">BODYOPEN Procedure</a> on page 183-28	Generates the <code>&lt;BODY&gt;</code> tag which marks the beginning of the body section of an HTML document
<a href="#">BOLD Procedure</a> on page 183-29	Generates the <code>&lt;B&gt;</code> and <code>&lt;/B&gt;</code> tags which direct the browser to display the text in boldface
<a href="#">BR Procedure</a> on page 183-30	Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text
<a href="#">CENTER Procedure</a> on page 183-31	Generates the <code>&lt;CENTER&gt;</code> and <code>&lt;/CENTER&gt;</code> tags which center a section of text within a Web page
<a href="#">CENTERCLOSE Procedure</a> on page 183-32	Generates the <code>&lt;/CENTER&gt;</code> tag which marks the end of a section of text to center

**Table 183–1 (Cont.) HTP Package Subprograms**

Subprogram	Description
<a href="#">CENTEROPEN Procedure</a> on page 183-33	Generates the <CENTER> tag which mark the beginning of a section of text to center
<a href="#">CITE Procedure</a> on page 183-34	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
<a href="#">CODE Procedure</a> on page 183-35	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
<a href="#">COMMENT Procedure</a> on page 183-36	Generates This procedure generates the comment tags  <!-- ctext -->
<a href="#">DFN Procedure</a> on page 183-37	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
<a href="#">DIRLISTCLOSE Procedure</a> on page 183-38	Generates the </DIR> tag which ends a directory list section
<a href="#">DIRLISTOPEN Procedure</a> on page 183-39	Generates the <DIR> which starts a directory list section
<a href="#">DIV Procedure</a> on page 183-40	Generates the <DIV> tag which creates document divisions
<a href="#">DLISTCLOSE Procedure</a> on page 183-41	Generates the </DL> tag which ends a definition list
<a href="#">DLISTDEF Procedure</a> on page 183-42	Generates the <DD> tag, which inserts definitions of terms
<a href="#">DLISTOPEN Procedure</a> on page 183-43	Generates the <DL> tag which starts a definition list
<a href="#">DLISTTERM Procedure</a> on page 183-44	Generates the <DT> tag which defines a term in a definition list <DL>
<a href="#">EM Procedure</a> on page 183-45	Generates the <EM> and </EM> tags, which define text to be emphasized
<a href="#">EMPHASIS Procedure</a> on page 183-46	Generates the <EM> and </EM> tags, which define text to be emphasized
<a href="#">ESCAPE_SC Procedure</a> on page 183-47	Replaces characters that have special meaning in HTML with their escape sequences
<a href="#">FONTCLOSE Procedure</a> on page 183-48	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
<a href="#">FONTOPEN Procedure</a> on page 183-49	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
<a href="#">FORMCHECKBOX Procedure</a> on page 183-50	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
<a href="#">FORMCLOSE Procedure</a> on page 183-51	Generates the </FORM> tag which marks the end of a form section in an HTML document
<a href="#">FORMOPEN Procedure</a> on page 183-52	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
<a href="#">FORMFILE Procedure</a> on page 183-53	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
<a href="#">FORMHIDDEN Procedure</a> on page 183-54	Generates the <INPUT> tag with TYPE="hidden" which inserts a hidden form element

**Table 183-1 (Cont.) HTP Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">FORMIMAGE Procedure</a> on page 183-55	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
<a href="#">FORMPASSWORD Procedure</a> on page 183-56	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
<a href="#">FORMRADIO Procedure</a> on page 183-57	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
<a href="#">FORMRESET Procedure</a> on page 183-58	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
<a href="#">FORMSELECTCLOSE Procedure</a> on page 183-59	Generates the </SELECT> tag which marks the end of a Select form element
<a href="#">FORMSELECTOPEN Procedure</a> on page 183-60	Generates the </SELECT> tag which marks the beginning of a Select form element
<a href="#">FORMSELETOPTION Procedure</a> on page 183-61	Generates the <OPTION> tag which represents one choice in a Select element
<a href="#">FORMSUBMIT Procedure</a> on page 183-62	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
<a href="#">FORMTEXT Procedure</a> on page 183-63	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
<a href="#">FORMTEXTAREA Procedure</a> on page 183-64	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
<a href="#">FORMTEXTAREA2 Procedure</a> on page 183-65	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
<a href="#">FORMTEXTAREACLOSE Procedure</a> on page 183-66	Generates the </TEXTAREA> tag which ends a text area form element
<a href="#">FORMTEXTAREAOPEN Procedure</a> on page 183-67	Generates the <TEXTAREA> which marks the beginning of a text area form element
<a href="#">FORMTEXTAREAOPEN2 Procedure</a> on page 183-68	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
<a href="#">FRAME Procedure</a> on page 183-69	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
<a href="#">FRAMESETCLOSE Procedure</a> on page 183-70	Generates the </FRAMESET> tag which ends a frameset section
<a href="#">FRAMESETOPEN Procedure</a> on page 183-71	Generates the </FRAMESET> tag which begins a frameset section
<a href="#">HEADCLOSE Procedure</a> on page 183-72	Generates the </HEAD> tag which marks the end of an HTML document head section
<a href="#">HEADER Procedure</a> on page 183-73	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
<a href="#">HEADOPEN Procedure</a> on page 183-74	Generates the <HEAD> tag which marks the beginning of the HTML document head section
<a href="#">HR Procedure</a> on page 183-75	Generates the <HR> tag, which generates a line in the HTML document

**Table 183–1 (Cont.) HTP Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">HTMLCLOSE Procedure</a> on page 183-76	Generates the <code>&lt;/HTML&gt;</code> tag which marks the end of an HTML document
<a href="#">HTMLOPEN Procedure</a> on page 183-77	Generates the <code>&lt;HTML&gt;</code> tag which marks the beginning of an HTML document
<a href="#">IMG Procedure</a> on page 183-78	Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page
<a href="#">IMG2 Procedure</a> on page 183-79	Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the <code>USEMAP</code> attribute
<a href="#">ISINDEX Procedure</a> on page 183-80	Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program
<a href="#">ITALIC Procedure</a> on page 183-81	Generates the <code>&lt;I&gt;</code> and <code>&lt;/I&gt;</code> tags which direct the browser to render the text in italics
<a href="#">KBD Procedure</a> on page 183-82	Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags which direct the browser to render the text in monospace font
<a href="#">KEYBOARD Procedure</a> on page 183-83	Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags, which direct the browser to render the text in monospace font
<a href="#">LINE Procedure</a> on page 183-84	Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document
<a href="#">LINKREL Procedure</a> on page 183-85	Generates the <code>&lt;LINK&gt;</code> tag with the <code>REL</code> attribute which delineates the relationship described by the hypertext link from the anchor to the target
<a href="#">LINKREV Procedure</a> on page 183-86	Generates the <code>&lt;LINK&gt;</code> tag with the <code>REV</code> attribute which delineates the relationship described by the hypertext link from the target to the anchor
<a href="#">LISTHEADER Procedure</a> on page 183-87	Generates the <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> tags which print an HTML tag at the beginning of the list
<a href="#">LISTINGCLOSE Procedure</a> on page 183-88	Generates the <code>&lt;/LISTING&gt;</code> tags which marks the end of a section of fixed-width text in the body of an HTML page
<a href="#">LISTINGOPEN Procedure</a> on page 183-89	Generates the <code>&lt;LISTING&gt;</code> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
<a href="#">LISTITEM Procedure</a> on page 183-90	Generates the <code>&lt;LI&gt;</code> tag, which indicates a list item
<a href="#">MAILTO Procedure</a> on page 183-91	Generates the <code>&lt;A&gt;</code> tag with the <code>HREF</code> set to 'mailto' prepended to the mail address argument
<a href="#">MAPCLOSE Procedure</a> on page 183-92	Generates the <code>&lt;/MAP&gt;</code> tag which marks the end of a set of regions in a client-side image map
<a href="#">MAPOPEN Procedure</a> on page 183-93	Generates the <code>&lt;MAP&gt;</code> tag which mark the beginning of a set of regions in a client-side image map
<a href="#">MENULISTCLOSE Procedure</a> on page 183-94	Generates the <code>&lt;/MENU&gt;</code> tag which ends a list that presents one line for each item
<a href="#">MENULISTOPEN Procedure</a> on page 183-95	Generates the <code>&lt;MENU&gt;</code> tag which create a list that presents one line for each item

**Table 183-1 (Cont.) HTP Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">META Procedure</a> on page 183-96	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
<a href="#">NL Procedure</a> on page 183-97	Generates the   tag which begins a new line of text
<a href="#">NOBR Procedure</a> on page 183-98	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
<a href="#">NOFRAMESCLOSE Procedure</a> on page 183-99	Generates the </NOFRAMES> tag which marks the end of a no-frames section
<a href="#">NOFRAMESOPEN Procedure</a> on page 183-100	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
<a href="#">OLISTCLOSE Procedure</a> on page 183-101	Generates the </OL> tag which defines the end of an ordered list
<a href="#">OLISTOPEN Procedure</a> on page 183-102	Generates the <OL> tag which marks the beginning of an ordered list
<a href="#">PARA Procedure</a> on page 183-103	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
<a href="#">PARAGRAPH Procedure</a> on page 183-104	Adds attributes to the <P> tag
<a href="#">PARAM Procedure</a> on page 183-105	Generates the <PARAM> tag which specifies parameter values for Java applets
<a href="#">PLAINTEXT Procedure</a> on page 183-106	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
<a href="#">PRECLOSE Procedure</a> on page 183-107	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
<a href="#">PREOPEN Procedure</a> on page 183-108	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
<a href="#">PRINT Procedures</a> on page 183-109	Generates the specified parameter as a string terminated with the \n newline character
<a href="#">PRINTS Procedure</a> on page 183-110	Generates a string and replaces the following characters with the corresponding escape sequence
<a href="#">PRN Procedures</a> on page 183-111	Generates the specified parameter as a string
<a href="#">PS Procedure</a> on page 183-112	Generates a string and replaces the following characters with the corresponding escape sequence.
<a href="#">S Procedure</a> on page 183-113	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
<a href="#">SAMPLE Procedure</a> on page 183-114	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
<a href="#">SCRIPT Procedure</a> on page 183-115	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
<a href="#">SMALL Procedure</a> on page 183-116	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font

**Table 183–1 (Cont.) HTP Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">STRIKE Procedure</a> on page 183-117	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
<a href="#">STRONG Procedure</a> on page 183-118	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
<a href="#">STYLE Procedure</a> on page 183-119	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
<a href="#">SUB Procedure</a> on page 183-120	Generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript
<a href="#">SUP Procedure</a> on page 183-121	Generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript
<a href="#">TABLECAPTION Procedure</a> on page 183-122	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
<a href="#">TABLECLOSE Procedure</a> on page 183-123	Generates the </TABLE> tag which marks the end of an HTML table
<a href="#">TABLEDATA Procedure</a> on page 183-124	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
<a href="#">TABLEHEADER Procedure</a> on page 183-125	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
<a href="#">TABLEOPEN Procedure</a> on page 183-126	Generates the <TABLE> tag which marks the beginning of an HTML table
<a href="#">TABLEROWCLOSE Procedure</a> on page 183-127	Generates the </TR> tag which marks the end of a new row in an HTML table
<a href="#">TABLEROWOPEN Procedure</a> on page 183-128	Generates the <TR> tag which marks the beginning of a new row in an HTML table
<a href="#">TELETYPE Procedure</a> on page 183-129	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
<a href="#">TITLE Procedure</a> on page 183-130	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
<a href="#">ULISTCLOSE Procedure</a> on page 183-131	Generates the </UL> tag which marks the end of an unordered list
<a href="#">ULISTOPEN Procedure</a> on page 183-132	Generates the <UL> tag which marks the beginning of an unordered list
<a href="#">UNDERLINE Procedure</a> on page 183-133	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
<a href="#">VARIABLE Procedure</a> on page 183-134	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
<a href="#">WBR Procedure</a> on page 183-135	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

## ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

### Syntax

```
HTP.ADDRESS (
  cvalue      IN      VARCHAR2
  cnowrap     IN      VARCHAR2  DEFAULT NULL
  cclear      IN      VARCHAR2  DEFAULT NULL
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–2 ADDRESS Procedure Parameters**

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

### Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

## ANCHOR Procedure

This procedure and the [ANCHOR2 Procedure](#) procedures generate the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the [ANCHOR2 Procedure](#) provides a target and therefore can be used for a frame.

### Syntax

```
HTP.ANCHOR (  
    curl          IN          VARCHAR2,  
    ctext         IN          VARCHAR2,  
    cname         IN          VARCHAR2  DEFAULT NULL,  
    cattributes  IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–3 ANCHOR Procedure Parameters**

Parameter	Description
<code>curl</code>	The value for the <code>HREF</code> attribute.
<code>ctext</code>	The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

### Usage Notes

This tag accepts several attributes, but either `HREF` or `NAME` is required. `HREF` specifies to where to link. `NAME` allows this tag to be a target of a hypertext link.

## ANCHOR2 Procedure

This procedure and the [ANCHOR Procedure](#) generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this procedure provides a target and therefore can be used for a frame.

### Syntax

```
HTP.ANCHOR2 (
    curl          IN          VARCHAR2,
    ctext         IN          VARCHAR2,
    cname         IN          VARCHAR2  DEFAULT NULL,
    ctarget       IN          varchar2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–4 ANCHOR2 Procedure Parameters**

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

### Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

## APPLETCLOSE Procedure

This procedure closes the applet invocation with the `</APPLET>` tag. You must first invoke the a Java applet using [APPLETOPEN Procedure](#).

### Syntax

```
HTP.APPLETCLOSE;
```

## APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with [APPLETCLOSE Procedure](#) which generates the </APPLET> tag.

### Syntax

```
HTP.APPLETOPEN (
  ccode          IN          VARCHAR2,
  cheight        IN          NUMBER,
  cwidth         IN          NUMBER,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–5** *APPLETOPEN Procedure Parameters*

Parameter	Description
<code>ccode</code>	The the value for the CODE attribute which specifies the name of the applet class.
<code>cheight</code>	The value for the HEIGHT attribute.
<code>cwidth</code>	The value for the WIDTH attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

### Usage Notes

- Specify parameters to the Java applet using the [PARAM Procedure](#) procedure.
- Use the `cattributes` parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.

## AREA Procedure

This procedure generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

### Syntax

```
HTP.AREA (
  ccoords      IN      VARCHAR2
  cshape       IN      VARCHAR2  DEFAULT NULL,
  chref        IN      VARCHAR2  DEFAULT NULL,
  cnohref      IN      VARCHAR2  DEFAULT NULL,
  ctarget      IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–6 AREA Procedure Parameters**

Parameter	Description
<code>ccords</code>	The the value for the COORDS attribute.
<code>cshape</code>	The value for the SHAPE attribute.
<code>chref</code>	The value for the HREF attribute.
<code>cnohref</code>	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
<code>ctarget</code>	The value for the TARGET attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

## BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

### Syntax

```
HTP.BASE (
  ctarget      IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–7** *BASE Procedure Parameters*

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

## BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

### Syntax

```
HTP.BASEFONT (  
    nsize    IN    INTEGER);
```

### Parameters

**Table 183–8** *BASEFONT Procedure Parameters*

Parameter	Description
<code>nsize</code>	The value for the <code>SIZE</code> attribute.

### Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

## BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

### Syntax

```
HTP.BGSOUND (
  csrc          IN          VARCHAR2,
  cloop        IN          VARCHAR2  DEFAULT NULL,
  cattributes  IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–9 BGSOUND Procedure Parameters**

Parameter	Description
csrc	The value for the SRC attribute.
clloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="clloop" cattributes>
```

## BIG Procedure

This procedure generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

### Syntax

```
HTP.BIG (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–10** *BIG Procedure Parameters*

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

## BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Procedure](#).

### Syntax

```
HTP.BLOCKQUOTECLOSE;
```

### Examples

This procedure generates

```
</BLOCKQUOTE>
```

## BLOCKQUOTEOPEN Procedure

This procedure generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Procedure](#).

### Syntax

```
HTP.BLOCKQUOTEOPEN (  
    cnowrap          IN          VARCHAR2  DEFAULT NULL,  
    cclear           IN          VARCHAR2  DEFAULT NULL,  
    cattributes      IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–11** *BLOCKQUOTEOPEN Procedure Parameters*

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

## BODYCLOSE Procedure

This procedure generates the `</BODY>` tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the [BODYOPEN Procedure](#).

### Syntax

```
HTP.BODYCLOSE;
```

### Examples

This procedure generates

```
</BODY>
```

## BODYOPEN Procedure

This procedure generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the [BODYCLOSE Procedure](#).

### Syntax

```
HTP.BODYOPEN (  
    cbackground IN VARCHAR2 DEFAULT NULL,  
    cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 183–12 BODYOPEN Procedure Parameters**

Parameter	Description
<code>cbackground</code>	The value for the <code>BACKGROUND</code> attribute which specifies a graphic file to use for the background of the document.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

## BOLD Procedure

This procedure generates the <B> and </B> tags which direct the browser to display the text in boldface.

### Syntax

```
HTP.BOLD (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–13** *BOLD Procedure Parameters*

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<B cattributes>ctext</B>
```

## BR Procedure

This procedure generates the <BR> tag which begins a new line of text. It performs the same operation as the [NL Procedure](#).

### Syntax

```
HTP.BR(  
    cclear          IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–14 BR Procedure Parameters**

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

## CENTER Procedure

This procedure generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

### Syntax

```
HTP.CENTER (  
    ctext          IN          VARCHAR2);
```

### Parameters

**Table 183–15** *CENTER Parameters*

Parameter	Description
<code>ctext</code>	The text that goes between the tags.

### Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```

## CENTERCLOSE Procedure

This procedure generates the `</CENTER>` tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the [CENTEROPEN Procedure](#).

### Syntax

```
HTP.CENTERCLOSE;
```

### Examples

This procedure generates

```
</CENTER>
```

## CENTEROPEN Procedure

This procedure generates the <CENTER> tag which mark the beginning of a section of text to center. You mark the beginning of a of a section of text to center by means of the [CENTERCLOSE Procedure](#).

### Syntax

```
HTP.CENTEROPEN;
```

### Examples

This procedure generates

```
<CENTER>
```

## CITE Procedure

This procedure generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

### Syntax

```
HTP.CITE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–16 CITE Procedure Parameters**

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

## CODE Procedure

This procedure generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

### Syntax

```
HTP.CODE (  
  ctext      IN      VARCHAR2,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–17** *CODE Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to render as code.
<code>cattributes</code>	The other attributes to be included as-is in the tag

### Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

## COMMENT Procedure

This procedure generates the comment tags.

### Syntax

```
HTP.COMMENT (  
    ctext          IN          VARCHAR2);
```

### Parameters

**Table 183–18** *COMMENT Procedure Parameters*

Parameter	Description
<code>ctext</code>	The comment.

### Examples

This procedure generates

```
<!-- ctext -->
```

## DFN Procedure

This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

### Syntax

```
HTP.DFN (  
    ctext          IN          VARCHAR2);
```

### Parameters

**Table 183–19** *DFN Procedure Parameters*

Parameter	Description
ctext	The text to render in italics.

### Examples

This procedure generates

```
<DFN>ctext</DFN>
```

## DIRLISTCLOSE Procedure

This procedure generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the [DIRLISTOPEN Procedure](#).

### Syntax

```
HTP.DIRLISTCLOSE;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Procedure](#) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This procedure generates

```
</DIR>
```

## DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the [DIRLISTCLOSE Procedure](#).

### Syntax

```
HTP.DIRLISTOPEN;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the [LISTITEM Procedure](#) so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

### Examples

This procedure generates

```
<DIR>
```

## DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

### Syntax

```
HTP.DIV (  
    calign          IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–20 DIV Procedure Parameters**

Parameter	Description
<code>calign</code>	The value for the ALIGN attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

## DLISTCLOSE Procedure

This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Procedure](#).

### Syntax

```
HTP.DLISTCLOSE;
```

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

### Examples

This procedure generates

```
</DL>
```

## DLISTDEF Procedure

This procedure generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

### Syntax

```
HTP.DLISTDEF (  
    ctext          IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 183–21** *DLISTDEF Procedure Parameters*

Parameter	Description
<code>ctext</code>	The definition of the term.
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

## DLISTOPEN Procedure

This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the [DLISTCLOSE Procedure](#).

### Syntax

```
HTP.DLISTOPEN (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–22** *DLISTOPEN Procedure Parameters*

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

### Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

## DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

### Syntax

```
HTP.DLISTTERM (  
    ctext          IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 183–23** *DLISTTERM Procedure Parameters*

Parameter	Description
<code>ctext</code>	The term.
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

## EM Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the [EMPHASIS Procedure](#).

### Syntax

```
HTP.EM(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 183–24** *EM Procedure Parameters*

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates  
<EM *cattributes*>ctext</EM>

## EMPHASIS Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the [EM Procedure](#).

### Syntax

```
HTP.EMPHASIS(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–25 EMPHASIS Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to emphasize.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates  
<EM *cattributes*>*ctext*</EM>

## ESCAPE\_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;

This procedure performs the same operation as [PRINTS Procedures](#) and [PS Procedure](#).

### Syntax

```
HTP.ESCAPE_SC(  
    ctext          IN          VARCHAR2);
```

### Parameters

**Table 183–26** *ESCAPE\_SC Procedure Parameters*

Parameter	Description
ctext	The text string to convert.

## FONTCLOSE Procedure

This procedure generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the [FONTOPEN Procedure](#).

### Syntax

```
HTP.FONTCLOSE;
```

### Examples

This procedure generates

```
</FONT>
```

## FONTOPEN Procedure

This procedure generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the [FONTCLOSE Procedure](#).

### Syntax

```
HTP.FONTOPEN(
  ccolor      IN      VARCHAR2  DEFAULT NULL,
  cface       IN      VARCHAR2  DEFAULT NULL,
  csize       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–27** *FONTOPEN Procedure Parameters*

Parameter	Description
<code>ccolor</code>	The value for the <code>COLOR</code> attribute.
<code>cface</code>	The value for the <code>FACE</code> attribute
<code>csize</code>	The value for the <code>SIZE</code> attribute
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

## FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

### Syntax

```
HTP.FORMCHECKBOX(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2  DEFAULT 'ON',  
  cchecked       IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–28** *FORMCHECKBOX Procedure Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## FORMCLOSE Procedure

This procedure generates the `</FORM>` tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the [FORMOPEN Procedure](#).

### Syntax

```
HTP.FORMCLOSE;
```

### Examples

This procedure generates

```
</FORM>
```

## FORMOPEN Procedure

This procedure generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the [FORMCLOSE Procedure](#).

### Syntax

```
HTP.FORMOPEN (
    curl          IN          VARCHAR2,
    cmethod      IN          VARCHAR2  DEFAULT 'POST',
    ctargget     IN          VARCHAR2  DEFAULT NULL,
    cenctype     IN          VARCHAR2  DEFAULT NULL,
    cattributes  IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–29 FORMOPEN Procedure Parameters**

Parameter	Description
<code>curl</code>	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
<code>cmethod</code>	The value for the METHOD attribute. The value can be "GET" or "POST".
<code>ctargget</code>	The value for the TARGET attribute.
<code>cenctype</code>	The value for the ENCTYPE attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctargget" ENCTYPE="cenctype"
cattributes>
```

## FORMFILE Procedure

This procedure generates the <INPUT> tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

### Syntax

```
HTP.FORMFILE(
  cname          IN          VARCHAR2,
  caccept        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–30 FORMFILE Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>caccept</code>	A comma-delimited list of MIME types for upload.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

## FORMHIDDEN Procedure

This procedure generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

### Syntax

```
HTP.FORMHIDDEN(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–31** *FORMHIDDEN Procedure Parameters*

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

## FORMIMAGE Procedure

This procedure generates the <INPUT> tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

### Syntax

```
HTP.FORMIMAGE (
  cname          IN          VARCHAR2,
  csrc           IN          VARCHAR2,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–32 FORMIMAGE Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute that specifies the image file.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

## FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

### Syntax

```
HTP.FORMPASSWORD(  
  cname          IN          VARCHAR2,  
  csize          IN          VARCHAR2,  
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,  
  cvalue         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–33** *FORMPASSWORD Procedure Parameters*

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"  
VALUE="cvalue" cattributes>
```

## FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

### Syntax

```
HTP.FORMRADIO (
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2,
  cchecked       IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–34 FORMRADIO Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## FORMRESET Procedure

This procedure generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

### Syntax

```
HTP.FORMRESET(  
  cvalue      IN      VARCHAR2  DEFAULT 'Reset',  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–35** *FORMRESET Procedure Parameters*

Parameter	Description
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

## FORMSELECTCLOSE Procedure

This procedure generates the `</SELECT>` tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Procedure](#). The values are inserted using [FORMSELECTOPTION Procedure](#).

### Syntax

```
HTP.FORMSELECTCLOSE;
```

### Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#).

## FORMSELECTOPEN Procedure

This procedure generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Procedure](#). The values are inserted using [FORMSELETOPTION Procedure](#).

### Syntax

```
FORMSELECTOPEN(
  cname          IN          VARCHAR2,
  cprompt        IN          VARCHAR2  DEFAULT NULL,
  nsize          IN          INTEGER   DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–36 FORMSELECTOPEN Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
  'Pick the greatest player:');
HTP.FORMSELETOPTION('Messier');
HTP.FORMSELETOPTION('Howe');
HTP.FORMSELETOPTION('Gretzky');
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

## FORMSELECTOPTION Procedure

This procedure generates the <OPTION> tag which represents one choice in a Select element.

### Syntax

```
HTP.FORMSELECTOPTION(
  cvalue      IN      VARCHAR2,
  cselected   IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–37 FORMSELECTOPTION Procedure Parameters**

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#).

## FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

### Syntax

```
HTP.FORMSUBMIT(  
  cname          IN          VARCHAR2  DEFAULT NULL,  
  cvalue         IN          VARCHAR2  DEFAULT 'Submit',  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–38 FORMSUBMIT Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

## FORMTEXT Procedure

This procedure generates the <INPUT> tag with `TYPE="text"`, which creates a field for a single line of text.

### Syntax

```
HTP.FORMTEXT (
  cname          IN          VARCHAR2,
  csize          IN          VARCHAR2  DEFAULT NULL,
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–39** *FORMTEXT Procedure Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csize</code>	The value for the <code>SIZE</code> attribute.
<code>cmmaxlength</code>	The value for the <code>MAXLENGTH</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"
cattributes>
```

## FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the [FORMTEXTAREA2 Procedure](#) which in addition has the *cwrap* parameter that lets you specify a wrap style.

### Syntax

```
HTP.FORMTEXTAREA(
  cname          IN          VARCHAR2,
  nrows         IN          INTEGER,
  ncolumns      IN          INTEGER,
  calign        , IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–40 FORMTEXTAREA Procedure Parameters**

Parameter	Description
<i>cname</i>	The value for the <i>NAME</i> attribute.
<i>nrows</i>	The value for the <i>ROWS</i> attribute. This is an integer.
<i>ncolumns</i>	The value for the <i>COLS</i> attribute. This is an integer.
<i>calign</i>	The value for the <i>ALIGN</i> attribute.
<i>cattributes</i>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```

## FORMTEXTAREA2 Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the [FORMTEXTAREA Procedure](#) except that in that case you cannot specify a wrap style.

### Syntax

```
HTP.FORMTEXTAREA2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cwrap          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–41 FORMTEXTAREA2 Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

## FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element. You open a text area element by means of either [FORMTEXTAREAOPEN Procedure](#) or [FORMTEXTAREAOPEN2 Procedure](#).

### Syntax

```
HTP.FORMTEXTAREACLOSE;
```

### Examples

This procedure generates

```
</TEXTAREA>
```

## FORMTEXTAREAOPEN Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the [FORMTEXTAREAOPEN2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

### Syntax

```
HTP.FORMTEXTAREAOPEN (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–42** *FORMTEXTAREAOPEN Procedure Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

## FORMTEXTAREAOPEN2 Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the [FORMTEXTAREAOPEN Procedure](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

### Syntax

```
HTP.FORMTEXTAREAOPEN2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cwrap          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–43** *FORMTEXTAREAOPEN2 Procedure Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

## FRAME Procedure

This procedure generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag.

### Syntax

```
HTP.FRAME (
  csrc          IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cmarginwidth  IN          VARCHAR2  DEFAULT NULL,
  cmarginheight IN          VARCHAR2  DEFAULT NULL,
  cscrolling    IN          VARCHAR2  DEFAULT NULL,
  cnoresize     IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–44** *FRAME Procedure Parameters*

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

## FRAMESETCLOSE Procedure

This procedure generates the `</FRAMESET>` tag which ends a frameset section. You mark the beginning of a frameset section by means of the [FRAMESETOPEN Procedure](#).

### Syntax

```
HTP.FRAMESETCLOSE;
```

### Examples

This procedure generates

```
</FRAMESET>
```

## FRAMESETOPEN Procedure

This procedure generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the [FRAMESETCLOSE Procedure](#).

### Syntax

```
HTP.FRAMESETOPEN(
  crows          IN          VARCHAR2  DEFAULT NULL,
  ccols          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–45** *FRAMESETOPEN Procedure Parameters*

Parameter	Description
<code>crows</code>	The value for the <code>ROWS</code> attribute.
<code>ccols</code>	The value for the <code>COLS</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

## HEADCLOSE Procedure

This procedure generates the `</HEAD>` tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the [HEADOPEN Procedure](#).

### Syntax

```
HTP.HEADCLOSE;
```

### Examples

This procedure generates

```
</HEAD>
```

## HEADER Procedure

This procedure generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

### Syntax

```
HTP.HEADER(
  nsize      IN      INTEGER,
  cheader    IN      VARCHAR2,
  calign     IN      VARCHAR2  DEFAULT NULL,
  cnowrap    IN      VARCHAR2  DEFAULT NULL,
  cclear     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–46** *HEADER Procedure Parameters*

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

```
HTP.header (1, 'Overview');
```

produces:

```
<H1>Overview</H1>
```

## HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the [HEADCLOSE Procedure](#).

### Syntax

```
HTP.HEADOPEN;
```

### Examples

This procedure generates

```
<HEAD>
```

## HR Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the [LINE Procedure](#).

### Syntax

```
HTP.HR (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–47 HR Procedure Parameters**

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>csrc</code>	The value for the SRC attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## HTMLCLOSE Procedure

This procedure generates the `</HTML>` tag which marks the end of an HTML document. You use the [HTMLOPEN Procedure](#) to mark the beginning of an HTML document.

### Syntax

```
HTP.HTMLCLOSE;
```

### Examples

This procedure generates

```
</HTML>
```

## HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document. You use the [HTMLCLOSE Procedure](#) to mark the end of the an HTML document.

### Syntax

```
HTP.HTMLOPEN;
```

### Examples

This procedure generates

```
<HTML>
```

## IMG Procedure

This procedure generates the <IMG> tag which directs the browser to load an image onto the HTML page. The [IMG2 Procedure](#) performs the same operation but additionally uses the `cusemap` parameter.

### Syntax

```
HTP.IMG (
    curl          IN          VARCHAR2    DEFAULT NULL,
    calign        IN          VARCHAR2    DEFAULT NULL,
    calt          IN          VARCHAR2    DEFAULT NULL,
    cismap        IN          VARCHAR2
DEFAULT NULL,
    cattributes  IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 183–48** *IMG Procedure Parameters*

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

## IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The [IMG Procedure](#) performs the same operation but does not use the `cusemap` parameter.

### Syntax

```
HTP.IMG2 (
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2
DEFAULT NULL,
  cusemap       IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–49** *IMG2 Procedure Parameters*

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cusemap</code>	The value for the USEMAP attribute which specifies a client-side image map.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

## ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

### Syntax

```
HTP.ISINDEX (  
  cprompt      IN      VARCHAR2  DEFAULT NULL,  
  curl         IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–50 ISINDEX Procedure Parameters**

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

### Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

## ITALIC Procedure

This procedure generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

### Syntax

```
HTP.ITALIC(  
  ctext      IN      VARCHAR2,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–51** *ITALIC Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in italics.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<I cattributes>ctext</I>
```

## KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the [KEYBOARD Procedure](#).

### Syntax

```
HTP.KBD(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–52** *KBD Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

## KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the [KBD Procedure](#).

### Syntax

```
HTP.KEYBOARD(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–53** *KEYBOARD Procedure Parameters*

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

## LINE Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the [HR Procedure](#).

### Syntax

```
HTP.LINE(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  csrc        IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–54** *LINE Procedure Parameters*

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>csrc</code>	The value for the SRC attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## LINKREL Procedure

This procedure generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of [LINKREV Procedure](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Procedure](#).

### Syntax

```
HTP.LINKREL(  
  crel          IN          VARCHAR2,  
  curl          IN          VARCHAR2,  
  ctitle        IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–55 LINKREL Procedure Parameters**

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

### Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

## LINKREV Procedure

This procedure generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the [LINKREL Procedure](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Procedure](#).

### Syntax

```
HTP.LINKREV(  
  crev          IN          VARCHAR2,  
  curl          IN          VARCHAR2,  
  ctitle       IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–56 LINKREV Procedure Parameters**

Parameter	Description
crel	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

### Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

## LISTHEADER Procedure

This procedure generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

### Syntax

```
HTP.LISTHEADER(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–57 LISTHEADER Procedure Parameters**

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates  
<LH cattributes>ctext</LH>

## LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Procedure](#).

### Syntax

```
HTP.LISTINGCLOSE;
```

### Examples

This procedure generates

```
</LISTING>
```

## LISTINGOPEN Procedure

This procedure generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Procedure](#).

### Syntax

```
HTP.LISTINGOPEN;
```

### Examples

This procedure generates

```
<LISTING>
```

## LISTITEM Procedure

This procedure generates the <LI> tag, which indicates a list item.

### Syntax

```
HTP.LISTITEM(  
  ctext          IN          VARCHAR2  DEFAULT NULL,  
  cclear        IN          VARCHAR2  DEFAULT NULL,  
  cdingbat      IN          VARCHAR2  DEFAULT NULL,  
  csrc          IN          VARCHAR2  DEFAULT NULL,  
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–58 LISTITEM Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text for the list item.
<code>cclear</code>	The value for the CLEAR attribute.
<code>cdingbat</code>	The value for the DINGBAT attribute.
<code>csrc</code>	The value for the SRC attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

## MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

### Syntax

```
HTP.MAILTO(
  caddress      IN      VARCHAR2,
  ctext         IN      VARCHAR2,
  cname         IN      VARCHAR2,
  cattributes   IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–59 MAILTO Procedure Parameters**

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

## MAPCLOSE Procedure

This procedure generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the [MAOPEN Procedure](#).

### Syntax

```
HTP.MAPCLOSE;
```

### Examples

This procedure generates

```
</MAP>
```

## MAOPEN Procedure

This procedure generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Procedure](#).

### Syntax

```
HTP.MAOPEN(
  cname          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–60 MAOPEN Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

## MENULISTCLOSE Procedure

This procedure generates the `</MENU>` tag which ends a list that presents one line for each item. To begin a list of this kind, use the [MENULISTOPEN Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

### Syntax

```
HTP.MENULISTCLOSE;
```

### Examples

This procedure generates

```
</MENU>
```

## MENULISTOPEN Procedure

This procedure generates the <MENU> tag which create a list that presents one line for each item. To end a list of this kind, use the [MENULISTCLOSE Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

### Syntax

```
HTP.MENULISTOPEN;
```

### Examples

This procedure generates

```
<MENU>
```

## META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

### Syntax

```
HTP.META(  
  chttp_equiv IN VARCHAR2,  
  cname      IN VARCHAR2,  
  ccontent   IN VARCHAR2);
```

### Parameters

**Table 183–61 META Procedure Parameters**

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

### Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

## NL Procedure

This procedure generates the <BR> tag which begins a new line of text. It performs the same operation as the [BR Procedure](#).

### Syntax

```
HTP.NL(
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–62 NL Procedure Parameters**

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

## NOBR Procedure

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

### Syntax

```
HTP.NOBR (  
  ctext          IN          VARCHAR2) ;
```

### Parameters

**Table 183–63** *NOBR Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text that is to be rendered on one line.

### Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

## NOFRAMESCLOSE Procedure

This procedure generates the `</NOFRAMES>` tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the [FRAMESETOPEN Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

### Syntax

```
HTP.NOFRAMESCLOSE;
```

### Examples

This procedure generates

```
</NOFRAMES>
```

## NOFRAMESOPEN Procedure

This procedure generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the [FRAMESETCLOSE Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

### Syntax

```
HTP.NOFRAMESOPEN;
```

### Examples

This procedure generates

```
<NOFRAMES>
```

## OLISTCLOSE Procedure

This procedure generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the [OLISTOPEN Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

### Syntax

```
HTP.OLISTCLOSE;
```

### Examples

This procedure generates

```
</OL>
```

## OLISTOPEN Procedure

This procedure generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the [OLISTCLOSE Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

### Syntax

```
HTP.OLISTOPEN(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  cwrap       IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–64** *OLISTOPEN Procedure Parameters*

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cwrap</code>	The value for the WRAP attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

## PARA Procedure

This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the [PARAGRAPH Procedure](#).

### Syntax

```
HTP.PARA;
```

### Examples

This procedure generates

```
<P>
```

## PARAGRAPH Procedure

You can use this procedure to add attributes to the <P> tag created by the [PARA Procedure](#).

### Syntax

```
HTP.PARAGRAPH(  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cnowrap        IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 183–65 PARAGRAPH Procedure Parameters**

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	If the value for this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<P ALIGN="align" NOWRAP CLEAR="cclear" cattributes>
```

## PARAM Procedure

This procedure generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Procedure](#) to begin the invocation. Use one [PARAM Procedure](#) for each desired name-value pair, and use [APPLETCLOSE Procedure](#) to end the applet invocation.

### Syntax

```
HTP.PARAM(  
  cname          IN          VARCHAR2  
  cvalue         IN          VARCHAR2);
```

### Parameters

**Table 183–66** *PARAM Procedure Parameters*

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

### Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

## PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

### Syntax

```
HTP.PLAINTEXT(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–67** *PLAINTEXT Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in fixed-width font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

## PRECLOSE Procedure

This procedure generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Procedure](#).

### Syntax

```
HTP.PRECLOSE;
```

### Examples

This procedure generates

```
</PRE>
```

## PREOPEN Procedure

This procedure generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Procedure](#).

### Syntax

```
HTP.PREOPEN(  
    cclear          IN          VARCHAR2  DEFAULT NULL,  
    cwidth         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–68** *PREOPEN Procedure Parameters*

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cwidth</code>	The value for the WIDTH attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

## PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character. The [PRN Procedures](#) performs the same operation but does not terminate with a newline character.

### Syntax

```
HTP.PRINT (
  cbuf      IN      VARCHAR2);
```

```
HTP.PRINT (
  dbuf      IN      DATE);
```

```
HTP.PRINT (
  nbuf      IN      NUMBER);
```

### Parameters

**Table 183–69 PRINT Procedure Parameters**

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

### Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

## PRINTS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- < to &lt;
- > to &gt;
- " to &quot;
- & to &amp;

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure an the [PS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

### Syntax

```
HTP.PRINTS (  
    ctext          IN          VARCHAR2);
```

### Parameters

**Table 183–70 PRINTS Procedure Parameters**

Parameter	Description
ctext	The string where to perform character substitution.

### Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) on page 183-3 for the HTF implementation).

## PRN Procedures

These procedures generate the specified parameter as a string. Unlike the [PRINT Procedures](#) the string is not terminated with the \n newline character.

### Syntax

```
HTP.PRN (
  cbuf      IN      VARCHAR2);
```

```
HTP.PRN (
  dbuf      IN      DATE);
```

```
HTP.PRN (
  nbuf      IN      NUMBER);
```

### Parameters

**Table 183–71 PRN Procedure Parameters**

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

### Usage Notes

These procedures do not have function equivalents.

## PS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- < to &lt;
- > to &gt;
- " to &quot;
- & to &amp;

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PRINTS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

### Syntax

```
HTP.PS (  
    ctext      IN      VARCHAR2);
```

### Parameters

**Table 183–72 PS Procedure Parameters**

Parameter	Description
ctext	The string where to perform character substitution.

### Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) on page 183-3 for the HTF implementation).

## S Procedure

This procedure generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as [STRIKE Procedure](#).

### Syntax

```
HTP.S (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–73 S Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<S cattributes>ctext</S>
```

## SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

### Syntax

```
HTP.SAMPLE (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–74** *SAMPLE Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

## SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

### Syntax

```
HTP.SCRIPT (
  cscript      IN      VARCHAR2,
  clanguage    IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–75** *SCRIPT Procedure Parameters*

Parameter	Description
<code>cscript</code>	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
<code>clanguage</code>	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

### Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

## SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

### Syntax

```
HTP.SMALL (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–76** *SMALL Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in small font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

## STRIKE Procedure

This procedure generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as [S Procedure](#).

### Syntax

```
HTP.STRIKE (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–77** *STRIKE Procedure Parameters*

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

## STRONG Procedure

This procedure generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold or however "strong" is defined.

### Syntax

```
HTP.STRONG(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–78** *STRONG Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be emphasized.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```

## STYLE Procedure

This procedure generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page. You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

### Syntax

```
HTP.STYLE(  
    cstyle          IN          VARCHAR2);
```

### Parameters

**Table 183–79** *STYLE Procedure Parameters*

Parameter	Description
cstyle	The the style information to include.

### Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

## SUB Procedure

This procedure generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

### Syntax

```
HTP.SUB(  
    ctext          IN          VARCHAR2,  
    calign         in          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–80 SUB Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to render in subscript.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

## SUP Procedure

This procedure generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript.

### Syntax

```
HTP.SUP(  
  ctext      IN      VARCHAR2,  
  calign     in      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–81** *SUP Procedure Parameters*

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

## TABLECAPTION Procedure

This procedure generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

### Syntax

```
HTP.TABLECAPTION(  
    ccaption      IN      VARCHAR2,  
    calign        in      VARCHAR2  DEFAULT NULL,  
    cattributes   IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–82 TABLECAPTION Procedure Parameters**

Parameter	Description
cctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>cctext</CAPTION>
```

## TABLECLOSE Procedure

This procedure generates the `</TABLE>` tag which marks the end of an HTML table. To define the beginning of an HTML table, use the [TABLEOPEN Procedure](#).

### Syntax

```
HTP.TABLECLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

### Syntax

```
HTP.TABLEDATA (
    cvalue      IN      VARCHAR2  DEFAULT NULL,
    calign      IN      VARCHAR2  DEFAULT NULL,
    cdp         IN      VARCHAR2  DEFAULT NULL,
    cnowrap     IN      VARCHAR2  DEFAULT NULL,
    crowspan    IN      VARCHAR2  DEFAULT NULL,
    ccolspan    IN      VARCHAR2  DEFAULT NULL,
    cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–83 TABLEDATA Procedure Parameters**

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crowspan	The value for the COLSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

## TABLEHEADER Procedure

This procedure generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

### Syntax

```
HTP.TABLEHEADER (
  cvalue      IN      VARCHAR2  DEFAULT NULL,
  calign      IN      VARCHAR2  DEFAULT NULL,
  cdp         IN      VARCHAR2  DEFAULT NULL,
  cnowrap     IN      VARCHAR2  DEFAULT NULL,
  crowspan    IN      VARCHAR2  DEFAULT NULL,
  ccolspan    IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–84 TABLEHEADER Procedure Parameters**

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

## TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the [TABLECLOSE Procedure](#).

### Syntax

```
HTP.TABLEOPEN (
    cborder      IN      VARCHAR2  DEFAULT NULL
    calign       IN      VARCHAR2  DEFAULT NULL,
    cnowrap     IN      VARCHAR2  DEFAULT NULL,
    cclear       IN      VARCHAR2  DEFAULT NULL
    cattributes  IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–85 TABLEOPEN Procedure Parameters**

Parameter	Description
<code>border</code>	The value for the <code>BORDER</code> attribute.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

## TABLEROWCLOSE Procedure

This procedure generates the `</TR>` tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the [TABLEROWOPEN Procedure](#).

### Syntax

```
HTP.TABLEROWCLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the [TABLEROWCLOSE Procedure](#).

### Syntax

```
HTP.TABLEROWOPEN(
    calign          IN          VARCHAR2    DEFAULT NULL,
    cvalign         IN          VARCHAR2    DEFAULT NULL,
    cdp             IN          VARCHAR2    DEFAULT NULL,
    cnowrap         IN          VARCHAR2    DEFAULT NULL,
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 183–86** *TABLEROWOPEN Procedure Parameters*

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cvalign</code>	The value for the <code>VALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

## TELETYPE Procedure

This procedure generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

### Syntax

```
HTP.TELETYPE(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–87 TELETYPE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to render in a fixed width typewriter font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

## TITLE Procedure

This procedure generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

### Syntax

```
HTP.TITLE(  
    ctitle          IN          VARCHAR2);
```

### Parameters

**Table 183–88** TITLE Procedure Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

### Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

## ULISTCLOSE Procedure

This procedure generates the `</UL>` tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the [ULISTOPEN Procedure](#). Add list items with [LISTITEM Procedure](#).

### Syntax

```
HTP.ULISTCLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## ULISTOPEN Procedure

This procedure generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the [ULISTCLOSE Procedure](#). Add list items with [LISTITEM Procedure](#).

### Syntax

```
HTP.ULISTOPEN(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  cwrap       IN      VARCHAR2  DEFAULT NULL,  
  cdingbat    IN      VARCHAR2  DEFAULT NULL,  
  csrc        IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–89** *ULISTOPEN Procedure Parameters*

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cdingbat</code>	The value for the <code>DINGBAT</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

## UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

### Syntax

```
HTP.UNDERLINE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–90** *UNDERLINE Procedure Parameters*

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<U cattributes>ctext</U>
```

## VARIABLE Procedure

This procedure generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

### Syntax

```
HTP.VARIABLE(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 183–91** VARIABLE Procedure Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

## WBR Procedure

This procedure generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

### Syntax

```
HTP.WBR;
```

### Examples

This procedure generates

```
<WBR>
```

This Oracle Multimedia package supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type. See *Oracle Multimedia DICOM Developer's Guide* for a complete description of the ORDDicom object type.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other content, such as single-frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

The Oracle Multimedia `ORD_DICOM` package provides functions and procedures in the DICOM relational interface to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM content. This Oracle Multimedia package also provides functions and procedures to check DICOM content for conformance based on a set of user-specified conformance rules, and to make DICOM content anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

The Oracle Multimedia `ORD_DICOM` package also provides functions and procedures in the DICOM data model utility interface to operate on the DICOM data model repository. See *Oracle Multimedia DICOM Developer's Guide* for a complete description of the DICOM data model utility interface.

- [Documentation of ORD\\_DICOM](#)

---

## Documentation of ORD\_DICOM

For a complete description of this package within the context of Oracle Multimedia, see ORD\_DICOM in the *Oracle Multimedia DICOM Developer's Guide*.

---

---

## ORD\_DICOM\_ADMIN

This Oracle Multimedia package is used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository.

The DICOM data model repository is a collection of documents. An initial set of documents is loaded during installation. After installation, DICOM administrators can use the procedures and functions provided in the data model repository API of the Oracle Multimedia ORD\_DICOM\_ADMIN package to obtain document content as well as to insert, edit, and delete documents in the data model repository.

- [Documentation of ORD\\_DICOM\\_ADMIN](#)

---

## Documentation of ORD\_DICOM\_ADMIN

For a complete description of this package within the context of Oracle Multimedia, see ORD\_DICOM\_ADMIN in the *Oracle Multimedia DICOM Developer's Guide*.

The OWA\_CACHE package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

**See Also:** For more information about implementation of this package:

## Summary of OWA\_CACHE Subprograms

**Table 186–1 OWA\_CACHE Package Subprograms**

Subprogram	Description
<a href="#">DISABLE Procedure</a> on page 186-5	Disables the cache for this particular request
<a href="#">GET_ETAG Function</a> on page 186-6	Returns the tag associated with the cached content (used in the Validation technique model only)
<a href="#">GET_LEVEL Function</a> on page 186-7	Returns the caching level (used in the Validation technique model only)
<a href="#">SET_CACHE Procedure</a> on page 186-8	Sets up the cache headers for validation model cache type
<a href="#">SET_EXPIRES Procedure</a> on page 186-9	Sets up the cache headers for expires model cache type
<a href="#">SET_NOT_MODIFIED Procedure</a> on page 186-10	Sets up the headers for a not modified cache hit (used in the Validation technique model only)
<a href="#">SET_SURROGATE_CONTROL Procedure</a> on page 186-11	Sets up the headers for a surrogate-control header for Web cache

## **DISABLE Procedure**

This procedure disables the cache for this particular request.

### **Syntax**

```
OWA_CACHE.DISABLE;
```

## GET\_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

### Syntax

```
OWA_CACHE.GET_ETAG  
RETURN VARCHAR2;
```

### Return Values

The tag for cache hit, otherwise NULL.

## GET\_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

### Syntax

```
OWA_CACHE.GET_LEVEL  
RETURN VARCHAR2;
```

### Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

## SET\_CACHE Procedure

This sets up the cache headers for validation model cache type.

### Syntax

```
OWA_CACHE.SET_CACHE (  
    p_etag      IN      VARCHAR2,  
    p_level     IN      VARCHAR2);
```

### Parameters

**Table 186–2 SET\_CACHE Procedure Parameters**

Parameter	Description
p_etag	The etag associated with this content
p_level	The caching level ('USER' or 'SYSTEM').

### Exceptions

VALUE\_ERROR is thrown if

- p\_etag is greater than 55
- p\_level is not 'USER' or 'SYSTEM'

## SET\_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

### Syntax

```
OWA_CACHE.SET_EXPIRES(
  p_expires    IN    NUMBER,
  p_level      IN    VARCHAR2);
```

### Parameters

**Table 186–3 SET\_EXPIRES Procedure Parameters**

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

### Exceptions

VALUE\_ERROR is thrown if

- p\_expires is negative or zero
- p\_level is not 'USER' or 'SYSTEM'
- p\_expires is > 525600 (1 year)

## SET\_NOT\_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

### Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

### Exceptions

VALUE\_ERROR is thrown if If the etag was not passed in

---

## SET\_SURROGATE\_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

### Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(  
    p_value          IN          VARCHAR2);
```

### Parameters

**Table 186-4 SET\_SURROGATE\_CONTROL Procedure Parameters**

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header

### Exceptions

VALUE\_ERROR is thrown if If p\_value is greater than 55 in length.

The OWA\_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Using OWA\\_COOKIE](#)
  - Overview
  - Types
  - Rules and Limits
- [Summary of OWA\\_COOKIE Subprograms](#)

## Using OWA\_COOKIE

- [Overview](#)
- [Types](#)
- [Rules and Limits](#)

## Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA\_CUSTOM package.

## Types

This data type contains cookie name-value pairs. Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL `RECORD` holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.
```

```
TYPE COOKIE IS RECORD (  
    name          VARCHAR2(4000),  
    vals          vc_arr,  
    num_vals      INTEGER);
```

## Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

## Summary of OWA\_COOKIE Subprograms

**Table 187–1 OWA\_COOKIE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">GET Function</a> on page 187-7	Gets the value of the specified cookie
<a href="#">GET_ALL Procedure</a> on page 187-8	Gets all cookie name-value pairs
<a href="#">REMOVE Procedure</a> on page 187-9	Removes the specified cookie
<a href="#">SEND procedure</a> on page 187-10	Generates a "Set-Cookie" line in the HTTP header

## GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA\_COOKIE.COOKIE DATA TYPE.

### Syntax

```
OWA_COOKIE.GET (  
    name          IN          VARCHAR2)  
RETURN COOKIE;
```

### Parameters

**Table 187–2** *GET Procedure Parameters*

Parameter	Description
name	The name of the cookie.

### Return Values

OWA\_COOKIE.COOKIE DATA TYPE.

## GET\_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

### Syntax

```
OWA_COOKIE.GET_ALL(  
  names          OUT      vc_arr,  
  vals           OUT      vc_arr,  
  num_vals       OUT      INTEGER);
```

### Parameters

**Table 187-3** GET\_ALL Procedure Parameters

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

## REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990". This procedure must be called within the context of an HTTP header.

### Syntax

```
OWA_COOKIE.REMOVE(  
  name          IN          VARCHAR2,  
  val           IN          VARCHAR2,  
  path          IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 187-4 REMOVE Procedure Parameters**

Parameter	Description
name	The name of the cookie to expire.
val	The value of the cookie.
path	[Currently unused]

## SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client. This procedure must occur in the context of an HTTP header.

### Syntax

```
OWA_COOKIE.SEND(  
  name          in          varchar2,  
  value         in          varchar2,  
  expires       in          date          DEFAULT NULL,  
  path          in          varchar2     DEFAULT NULL,  
  domain        in          varchar2     DEFAULT NULL,  
  secure        in          varchar2     DEFAULT NULL);
```

### Parameters

**Table 187–5 SEND Procedure Parameters**

Parameter	Description
name	The name of the cookie.
value	The value of the cookie.
expires	The date at which the cookie will expire
path	The value for the path field.
domain	The value for the domain field.
secure	If the value of this parameter is not NULL, the "secure" field is added to the line.

The OWA\_CUSTOM package provides a Global PLSQL Agent Authorization callback function. It is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA\_CUSTOM package.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

## Using OWA\_CUSTOM

- [Constants](#)

## Constants

- `dbms_server_timezone` CONSTANT VARCHAR2(3) := 'PST';
- `dbms_server_gmtdiff` CONSTANT NUMBER := NULL;

---

## Summary of OWA\_CUSTOM Subprograms

**Table 188–1 OWA\_CUSTOM Package Subprograms**

Subprogram	Description
<a href="#">AUTHORIZE Function</a> on page 188-5	Provides a Global PLSQL Agent Authorization callback function

## AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA\_CUSTOM package.

### Syntax

```
OWA_CUSTOM.AUTHORIZE  
RETURN BOOLEAN;
```

The OWA\_IMAGE package provides an interface to access the coordinates where a user clicked on an image.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Summary of OWA\\_IMAGE Subprograms](#)
  - Overview
  - Types
  - Variables
  - Examples
- [Summary of OWA\\_IMAGE Subprograms](#)

## Using OWA\_IMAGE

- [Overview](#)
- [Types](#)
- [Variables](#)
- [Examples](#)

## Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

## Types

This data type (`point`) contain the X and Y values of a coordinate, and so provides the coordinates of a user's click on an imagemap. It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

## Variables

This package variable (`null_point`) of TYPE `POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

## Examples

```
CREATE OR REPLACE PROCEDURE process_image
  (my_img in OWA_IMAGE.POINT)
AS
  x integer := OWA_IMAGE.GET_X(my_img);
  y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
  /* process the coordinate */
END
```

## Summary of OWA\_IMAGE Subprograms

**Table 189–1 OWA\_IMAGE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">GET_X Function</a> on page 189-8	Gets the X value of a point type
<a href="#">GET_Y Function</a> on page 189-9	Gets the Y value of a point type

## GET\_X Function

This function returns the X coordinate of the point where the user clicked on an image map.

### Syntax

```
OWA_IMAGE.GET_X(  
    p          IN          point)  
RETURN INTEGER;
```

### Parameters

**Table 189–2** *GET\_X Procedure Parameters*

Parameter	Description
p	The point where the user clicked.

### Return Values

The X coordinate as an integer.

## GET\_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

### Syntax

```
OWA_IMAGE.GET_Y (  
    p          IN          point)  
RETURN INTEGER;
```

### Parameters

**Table 189-3** *GET\_Y Procedure Parameters*

Parameter	Description
p	The point where the user clicked.

### Return Values

The Y coordinate as an integer.

The OWA\_OPT\_LOCK package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

This chapter contains the following topics:

- [Using OWA\\_OPT\\_LOCK](#)
  - Overview
  - Types
- [Summary of OWA\\_OPT\\_LOCK Subprograms](#)

## Using OWA\_OPT\_LOCK

- [Overview](#)
- [Types](#)

## Overview

The OWA\_OPT\_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The OWA\_OPT\_LOCK package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the `owa_opt_lock.store_values` procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the `owa_opt_lock.checksum` function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

## Types

This data type is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the OWA\_TEXT.VC\_ARR DATA TYPE.

---

## Summary of OWA\_OPT\_LOCK Subprograms

**Table 190–1 OWA\_CACHE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CHECKSUM Functions</a> on page 190-6	Returns the checksum value
<a href="#">GET_ROWID Function</a> on page 190-7	Returns the ROWID value
<a href="#">STORE_VALUES Procedure</a> on page 190-8	Stores unmodified values in hidden fields for later verification
<a href="#">VERIFY_VALUES Function</a> on page 190-9	Verifies the stored values against modified values

## CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit `checksum` based on the Internet 1 protocol.

### Syntax

```
OWA_OPT_LOCK.CHECKSUM(
  p_buff      IN      VARCHAR2)
RETURN NUMBER;
```

```
OWA_OPT_LOCK.CHECKSUM(
  p_owner     IN      VARCHAR2,
  p_tname     IN      VARCHAR2,
  p_rowid     IN      ROWID)
RETURN NUMBER;
```

### Parameters

**Table 190–2** CHECKSUM Procedure Parameters

Parameter	Description
<code>p_buff</code>	The nstring where you want to calculate the <code>checksum</code> .
<code>p_owner</code>	The owner of the table.
<code>p_tname</code>	The table name.
<code>p_rowid</code>	The row in <code>p_tname</code> where you want to calculate the <code>checksum</code> value. Use the <a href="#">GET_ROWID Function</a> to convert VCARRAY values to proper rowids.

## GET\_ROWID Function

This function returns the ROWID data type from the specified OWA\_OPT\_LOCK.VCARRAY DATA TYPE.

### Syntax

```
OWA_OPT_LOCK.GET_ROWID(  
    p_old_values    IN    varray)  
RETURN ROWID;
```

### Parameters

**Table 190-3** *GET\_ROWID Procedure Parameters*

Parameter	Description
p_old_values	This parameter is usually passed in from an HTML form.

## STORE\_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

### Syntax

```
OWA_OPT_LOCK.STORE_VALUES(  
  p_owner      IN      VARCHAR2,  
  p_tname      IN      VARCHAR2,  
  p_rowid      IN      ROWID);
```

### Parameters

**Table 190–4 STORE\_VALUES Procedure Parameters**

Parameter	Description
p_owner	The owner of the table.
p_tname	The name of the table.
p_rowid	The row where you want to store values.

### Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the column value.

See also the [VERIFY\\_VALUES Function](#).

## VERIFY\_VALUES Function

This function verifies whether values in the specified row have been updated since the last query. Use this function with the [STORE\\_VALUES Procedure](#).

### Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
  p_old_values IN varray)
RETURN BOOLEAN;
```

### Parameters

**Table 190–5 VERIFY\_VALUES Procedure Parameters**

Parameter	Description
p_old_values	<p>A PL/SQL table containing the following information:</p> <ul style="list-style-type: none"> <li>▪ p_old_values (1) specifies the owner of the table.</li> <li>▪ p_old_values (2) specifies the table.</li> <li>▪ p_old_values (3) specifies the rowid of the row to verify.</li> </ul> <p>The remaining indexes contain values for the columns in the table.</p> <p>Typically, this parameter is passed in from the HTML form, where you have previously called the <a href="#">STORE_VALUES Procedure</a> to store the row values on hidden form elements.</p>

### Return Values

TRUE if no other update has been performed, otherwise FALSE.

The OWA\_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Using OWA\\_PATTERN](#)
  - Types
  - Operational Notes
- [Summary of OWA\\_PATTERN Subprograms](#)

## Using OWA\_PATTERN

- [Types](#)
- [Operational Notes](#)

## Types

You can use a pattern as both an input and output parameter. Thus, you can pass the same regular expression to OWA\_PATTERN function calls, and it only has to be parsed once.

- OWA\_PATTERN.PATTERN

## Operational Notes

The OWA\_PATTERN subprograms are overloaded. Specifically, there are six versions of MATCH, and four each of AMATCH and CHANGE. The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a `owa_text.multi_line` data type.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the `owa_pattern.change` function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- [Wildcards](#)
- [Quantifiers](#)
- [Flags](#)

### Wildcards

Wildcard tokens match something other than themselves:

**Table 191-1 Wildcard tokens recognized by OWA\_PATTERN package**

Token	Description
<code>^</code>	Matches newline or the beginning of the target
<code>\$</code>	Matches newline or the end of the target
<code>\n</code>	Matches newline
<code>.</code>	Matches any character except newline
<code>\t</code>	Matches tab
<code>\d</code>	Matches digits [0-9]
<code>\D</code>	Matches non-digits [not 0-9]
<code>\w</code>	Matches word characters (0-9, a-z, A-Z, or <code>_</code> )
<code>\W</code>	Matches non-word characters (not 0-9, a-z, A-Z, or <code>_</code> )
<code>\s</code>	Matches whitespace characters (blank, tab, or newline).
<code>\S</code>	Matches non-whitespace characters (not blank, tab, or newline)
<code>\b</code>	Matches "word" boundaries (between <code>\w</code> and <code>\W</code> )
<code>\x&lt;HEX&gt;</code>	Matches the value in the current character set of the two hexadecimal digits
<code>\&lt;OCT&gt;</code>	Matches the value in the current character set of the two or three octal digits
<code>\</code>	Followed by any character not covered by another case matches that character
<code>&amp;</code>	Applies only to CHANGE. This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under <a href="#">CHANGE Functions and Procedures</a> .

## Quantifiers

Any tokens except & can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals:

**Table 191–2 Quantifiers**

Quantifier	Description
?	0 or 1 occurrence(s)
*	0 or more occurrences
+	1 or more occurrence(s)
{n}	Exactly <i>n</i> occurrences
{n, }	At least <i>n</i> occurrences
{n, m}	At least <i>n</i> , but not more than <i>m</i> , occurrences

## Flags

In addition to targets and regular expressions, the OWA\_PATTERN functions and procedures use flags to affect how they are interpreted.

**Table 191–3 Flags**

Flag	Description
i	This indicates a case-insensitive search.
g	This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

## Summary of OWA\_PATTERN Subprograms

**Table 191-4 OWA\_CACHE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">AMATCH Function</a> on page 191-7	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
<a href="#">CHANGE Functions and Procedures</a> on page 191-9	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
<a href="#">GETPAT Procedure</a> on page 191-11	Generates a pattern data type from a VARCHAR2 type
<a href="#">MATCH Function</a> on page 191-12	Determines if a string contains the specified pattern

## AMATCH Function

This function specifies if a pattern occurs in a particular location in a string. There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern data type.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern data type.

---

---

**Note:** If multiple overlapping strings match the regular expression, this function takes the longest match.

---

---

### Syntax

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2,
  from_loc      IN          INTEGER,
  pat           IN          VARCHAR2,
  flags        IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2,
  from_loc      IN          INTEGER,
  pat           IN OUT     PATTERN,
  flags        IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2
  from_loc      IN          INTEGER
  pat           IN          varchar2
  backrefs      OUT         owa_text.vc_arr
  flags        IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2
  from_loc      IN          INTEGER
  pat           IN OUT     PATTERN
  backrefs      OUT         owa_text.vc_arr
  flags        IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

### Parameters

**Table 191–5** *AMATCH Procedure Parameters*

Parameter	Description
<code>line</code>	The text to search in.

**Table 191–5 (Cont.) AMATCH Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
from_loc	The location (in number of characters) in line where the search is to begin.
pat	The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

**Return Values**

The index of the character after the end of the match, counting from the beginning of line. If there was no match, the function returns 0.

## CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` data type. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

### Syntax

```
OWA_PATTERN.CHANGE (
  line          IN OUT  VARCHAR2,
  from_str      IN      VARCHAR2,
  to_str        IN      VARCHAR2,
  flags         IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE (
  line          IN OUT  VARCHAR2,
  from_str      IN      VARCHAR2,
  to_str        IN      VARCHAR2,
  flags         IN      VARCHAR2  DEFAULT NULL);
```

```
owa_pattern.change (
  mline        IN OUT  owa_text.multi_line,
  from_str     IN      VARCHAR2,
  to_str       IN      VARCHAR2,
  flags        IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE (
  mline        IN OUT  owa_text.multi_line,
  from_str     IN      VARCHAR2,
  to_str       IN      VARCHAR2,
  flags        IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 191–6** *CHANGE Procedure Parameters*

Parameter	Description
<code>line</code>	The text to search in. The output value of this parameter is the altered string.
<code>mline</code>	The text to search in. This is a <code>owa_text.multi_line</code> data type. The output value of this parameter is the altered string.
<code>from_str</code>	The regular expression to replace.
<code>to_str</code>	The substitution pattern.
<code>flags</code>	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "i" is specified, the search is case-insensitive. If "g" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

### Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

## Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

### Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found      INTEGER;
BEGIN
    theline := 'what is the goal?';
    num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
    HTP.PRINT(num_found); -- num_found is 1
    HTP.PRINT(theline); -- theline is 'what is the idea?'
END;
/
SHOW ERRORS
```

## GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA\_PATTERN.PATTERN DATA TYPE.

### Syntax

```
OWA_PATTERN.GETPAT (  
  arg      IN      VARCHAR2,  
  pat      IN OUT  pattern);
```

### Parameters

**Table 191-7 GETPAT Procedure Parameters**

Parameter	Description
arg	The string to convert.
pat	the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.

## MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

### Syntax

```
owa_pattern.match(
  line          IN          VARCHAR2,
  pat           IN          VARCHAR2,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  line          IN          VARCHAR2,
  pat           IN OUT     PATTERN,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  line          IN          VARCHAR2,
  pat           IN          VARCHAR2,
  backrefs      OUT         owa_text.vc_arr,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
  line          IN          VARCHAR2,
  pat           IN OUT     PATTERN,
  backrefs      OUT         owa_text.vc_arr,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  mline         IN          owa_text.multi_line,
  pat           IN          VARCHAR2,
  rlist         OUT         owa_text.row_list,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
  mline         IN          owa_text.multi_line,
  pat           IN OUT     pattern,
  rlist         OUT         owa_text.row_list,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 191–8** *CHANGE Procedure Parameters*

Parameter	Description
line	The line to search in.
mline	The text to search in. This is a <code>owa_text.multi_line</code> data type..

**Table 191–8 (Cont.) CHANGE Procedure Parameters**

Parameter	Description
pat	The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

## Return Values

TRUE if a match was found, FALSE otherwise.

## Examples

KAZOO is the target where it is searching for the zoo.\* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext VARCHAR2(256);
pat      VARCHAR2(256);

sometext := 'what is the goal?';
pat      := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
THEN
    HTP.PRINT('Match found');
ELSE
    HTP.PRINT('Match not found');
END IF;
```

## Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA\_PATTERN.PATTERN DATA TYPE. Create an OWA\_PATTERN.PATTERN DATA TYPE from a string using the OWA\_PATTERN.GETPAT procedure.
- Create a MULTI\_LINE DATA TYPE from a long string using the OWA\_TEXT.STREAM2MULTI procedure. If a multi\_line is used, the rlist parameter specifies a list of chunks where matches were found.

- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

The OWA\_SEC package provides an interface for custom authentication.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Using OWA\\_SEC](#)
  - Operational Notes
- [Summary of OWA\\_SEC Subprograms](#)

## Using OWA\_SEC

---

- [Operational Notes](#)

## Operational Notes

Parameters that have default values are optional.

## Summary of OWA\_SEC Subprograms

**Table 192–1 OWA\_SEC Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">GET_CLIENT_HOSTNAME Function</a> on page 192-5	Returns the client's hostname
<a href="#">GET_CLIENT_IP Function</a> on page 192-6	Returns the client's IP address
<a href="#">GET_PASSWORD Function</a> on page 192-7	Returns the password that the user entered
<a href="#">GET_USER_ID Function</a> on page 192-8	Returns the username that the user entered
<a href="#">SET_AUTHORIZATION Procedure</a> on page 192-9	Enables the PL/SQL application to use custom authentication
<a href="#">SET_PROTECTION_REALM Procedure</a> on page 192-10	Defines the realm that the page is in

## GET\_CLIENT\_HOSTNAME Function

This function returns the hostname of the client.

### Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME  
RETURN VARCHAR2;
```

### Return Values

The hostname.

## GET\_CLIENT\_IP Function

This function returns the IP address of the client.

### Syntax

```
OWA_SEC.GET_CLIENT_IP  
    RETURN OWA_UTIL.IP_ADDRESS;
```

### Return Values

The IP address. The `owa_util.ip_address` data type is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is 123.45.67.89 and the variable `ipaddr` is of the `owa_util.ip_address` data type, the variable would contain the following values:

```
ipaddr(1) = 123  
ipaddr(2) = 45  
ipaddr(3) = 67  
ipaddr(4) = 89
```

## GET\_PASSWORD Function

This function returns the password that the user used to log in.

### Syntax

```
OWA_SEC.GET_PASSWORD  
RETURN VARCHAR2;
```

### Return Values

The password.

### Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

## GET\_USER\_ID Function

This function returns the username that the user used to log in.

### Syntax

```
OWA_SEC.GET_USER_ID  
RETURN VARCHAR2;
```

### Return Values

The username.

## SET\_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the [OWA\\_CUSTOM](#) package, sets the authorization scheme for the PL/SQL Gateway. This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

### Syntax

```
OWA_SEC.SET_AUTHORIZATION(
    scheme          IN          INTEGER);
```

### Parameters

**Table 192–2 SET\_AUTHORIZATION Procedure Parameters**

Parameter	Description
scheme	<p>The authorization scheme. It is one of the following schemes for <code>SET_AUTHORIZATION</code>:</p> <ul style="list-style-type: none"> <li>■ <code>OWA_SEC.NO_CHECK</code> - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.</li> <li>■ <code>OWA_SEC.GLOBAL</code> - Defines an <code>authorize</code> function that is called for all users and all procedures. This is the <a href="#">OWA_CUSTOM.AUTHORIZE Function</a> in the "sys" schema.</li> <li>■ <code>OWA_SEC.PER_PACKAGE</code> - Define an <code>authorize</code> function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the <code>package.AUTHORIZE</code> function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous <code>authorize</code> function in the user's schema is called.</li> <li>■ <code>OWA_SEC.CUSTOM</code> - Implements different <code>authorize</code> functions for each user. The function <a href="#">OWA_CUSTOM.AUTHORIZE Function</a> in the user's schema is called to authorize the user. If the user's schema does not contain an <code>OWA_CUSTOM.AUTHORIZE Function</code>, the PL/SQL Gateway looks for it in the "sys" schema.</li> </ul> <p>The custom <code>authorize</code> function has the following signature:</p> <pre>FUNCTION AUTHORIZE     RETURN BOOLEAN;</pre> <p>If the function returns <code>TRUE</code>, authentication succeeded. If it returns <code>FALSE</code>, authentication failed. If the <code>authorize</code> function is not defined, the Gateway returns an error and fails.</p>

## SET\_PROTECTION\_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

### Syntax

```
OWA_SEC.SET_PROTECTION_REALM(  
    realm      IN      VARCHAR2);
```

### Parameters

**Table 192–3** *SET\_PROTECTION\_REALM Procedure Parameters*

Parameter	Description
realm	The realm where the page belongs. This string is displayed to the user.

The OWA\_TEXT package contains subprograms used by OWA\_PATTERN for manipulating strings. They are externalized so you can use them directly.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Using OWA\\_TEXT](#)
  - Types
- [Summary of OWA\\_TEXT Subprograms](#)

## Using OWA\_TEXT

- [Types](#)

## Types

- [MULTI\\_LINE DATA TYPE](#)
- [ROW\\_LIST DATA TYPE](#)
- [VC\\_ARR DATA TYPE](#)

### MULTI\_LINE DATA TYPE

This data type is a PL/SQL record that holds large amounts of text. The rows field, of type OWA\_TEXT.VC\_ARR DATA TYPE, contains the text data in the record.

```
TYPE multi_line IS RECORD (  
    rows          vc_arr,  
    num_rows      INTEGER,  
    partial_row    BOOLEAN);
```

### ROW\_LIST DATA TYPE

This is the data type for holding data to be processed.

```
TYPE row_list IS RECORD (  
    rows          int_arr,  
    num_rows      INTEGER);
```

```
int_arr IS DEFINED AS:
```

```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

### VC\_ARR DATA TYPE

This is a component of the [MULTI\\_LINE DATA TYPE](#) and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

## Summary of OWA\_TEXT Subprograms

**Table 193–1 OWA\_TEXT Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">ADD2MULTI Procedure</a> on page 193-5	Adds text to an existing <code>multi_line</code> type
<a href="#">NEW_ROW_LIST Function and Procedure</a> on page 193-6	Creates a new <code>row_list</code>
<a href="#">PRINT_MULTI Procedure</a> on page 193-7	Prints out the contents of a <code>multi_list</code>
<a href="#">PRINT_ROW_LIST Procedure</a> on page 193-8	Prints out the contents of a <code>row_list</code>
<a href="#">STREAM2MULTI Procedure</a> on page 193-9	Converts a <code>varchar2</code> to a <code>multi_line</code> type

## ADD2MULTI Procedure

This procedure adds content to an existing [MULTI\\_LINE DATA TYPE](#).

### Syntax

```
OWA_TEXT.ADD2MULTI (  
    stream          IN          VARCHAR2,  
    mline          IN OUT    multi_line,  
    continue       IN          BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 193–2** *ADD2MULTI Procedure Parameters*

Parameter	Description
stream	The text to add.
mline	The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <i>stream</i> .
continue	If TRUE, the procedure appends <i>stream</i> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <i>stream</i> in a new row.

## NEW\_ROW\_LIST Function and Procedure

This function or procedure creates a new `OWA_TEXT.ROW_LIST` DATA TYPE. The function version uses no parameters and returns a new empty `row_list`. The procedure version creates the `row_list` data type as an output parameter.

### Syntax

```
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist OUT row_list);
```

### Parameters

**Table 193–3** *NEW\_ROW\_LIST Procedure Parameters*

Parameter	Description
<code>rlist</code>	This is an output parameter containing the new <code>row_list</code> data type

### Return Values

The function version returns the new `row_list` data type.

## PRINT\_MULTI Procedure

This procedure uses the [PRINT Procedures](#) or the [PRN Procedures](#) to print the "rows" field of the OWA\_TEXT.MULTI\_LINE DATA TYPE.

### Syntax

```
OWA_TEXT.PRINT_MULTI(  
    mline          IN          multi_line);
```

### Parameters

**Table 193–4 PRINT\_MULTI Procedure Parameters**

Parameter	Description
<code>mline</code>	The <code>multi_line</code> data type to print.

### Return Values

The contents of the `multi_line`.

## PRINT\_ROW\_LIST Procedure

This procedure uses the [PRINT Procedures](#) or the [PRN Procedures](#) to print the "rows" field of the OWA\_TEXT.ROW\_LIST DATA TYPE.

### Syntax

```
OWA_TEXT.PRINT_ROW_LIST(  
    rlist          IN          multi_line);
```

### Parameters

**Table 193–5 PRINT\_ROW\_LIST Procedure Parameters**

Parameter	Description
rlist	The row_list data type to print.

### Return Values

The contents of the row\_list.

## STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` data type.

### Syntax

```
OWA_TEXT.STREAM2MULTI(  
  stream      IN      VARCHAR2  
  mline      OUT     multi_line);
```

### Parameters

**Table 193–6** *STREAM2MULTI Procedure Parameters*

Parameter	Description
<code>stream</code>	The string to convert.
<code>mline</code>	The stream in <code>OWA_TEXT.MULTI_LINE DATA TYPE</code> format

The OWA\_UTIL package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

This chapter contains the following topics:

- [Using OWA\\_UTIL](#)
  - Overview
  - Types
- [Summary of OWA\\_UTIL Subprograms](#)

## Using OWA\_UTIL

- [Overview](#)
- [Types](#)

## Overview

The OWA\_UTIL package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a data type by the Oracle database.

## Types

- [DATETYPE Data Type](#)
- [IDENT\\_ARR Data Type](#)
- [IP\\_ADDRESS Data Type](#)

### DATETYPE Data Type

The [TODATE Function](#) converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure [CHOOSE\\_DATE Procedure](#) enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

### IDENT\_ARR Data Type

This data type is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

### IP\_ADDRESS Data Type

This data type is used by the [GET\\_CLIENT\\_IP Function](#) in the "OWA\_SEC" package on page 192-1.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

---

## Summary of OWA\_UTIL Subprograms

**Table 194–1 OWA\_UTIL Package Subprograms**

Subprogram	Description
<a href="#">BIND_VARIABLES Function</a> on page 194-6	Prepares a SQL query and binds variables to it
<a href="#">CALENDARPRINT Procedures</a> on page 194-7	Prints a calendar
<a href="#">CELLSPRINT Procedures</a> on page 194-8	Prints the contents of a query in an HTML table
<a href="#">CHOOSE_DATE Procedure</a> on page 194-10	Generates HTML form elements that allow the user to select a date
<a href="#">GET_CGI_ENV Function</a> on page 194-11	Returns the value of the specified CGI environment variable
<a href="#">GET_OWA_SERVICE_PATH Function</a> on page 194-12	Returns the full virtual path for the PL/SQL Gateway
<a href="#">GET_PROCEDURE Function</a> on page 194-13	Returns the name of the procedure that is invoked by the PL/SQL Gateway
<a href="#">HTTP_HEADER_CLOSE Procedure</a> on page 194-14	Closes the HTTP header
<a href="#">LISTPRINT Procedure</a> on page 194-15	Generates a HTML form element that contains data from a query
<a href="#">MIME_HEADER Procedure</a> on page 194-16	Generates the Content-type line in the HTTP header
<a href="#">PRINT_CGI_ENV Procedure</a> on page 194-17	Generates a list of all CGI environment variables and their values
<a href="#">REDIRECT_URL Procedure</a> on page 194-18	Generates the Location line in the HTTP header
<a href="#">SHOWPAGE Procedure</a> on page 194-19	Prints a page generated by the HTP and HTF packages in SQL*Plus
<a href="#">SHOWSOURCE Procedure</a> on page 194-20	Prints the source for the specified subprogram
<a href="#">SIGNATURE procedure</a> on page 194-21	Prints a line that says that the page is generated by the PL/SQL Agent
<a href="#">STATUS_LINE Procedure</a> on page 194-22	Generates the Status line in the HTTP header
<a href="#">TABLEPRINT Function</a> on page 194-23	Prints the data from a table in the database as an HTML table
<a href="#">TODATE Function</a> on page 194-26	Converts dateType data to the standard PL/SQL date type
<a href="#">WHO_CALLED_ME Procedure</a> on page 194-27	Returns information on the caller of the procedure.

## BIND\_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

### Syntax

```
OWA_UTIL.BIND_VARIABLES (
    theQuery      IN      VARCHAR2  DEFAULT NULL,
    bv1Name       IN      VARCHAR2  DEFAULT NULL,
    bv1Value      IN      VARCHAR2  DEFAULT NULL,
    bv2Name       IN      VARCHAR2  DEFAULT NULL,
    bv2Value      IN      VARCHAR2  DEFAULT NULL,
    bv3Name       IN      VARCHAR2  DEFAULT NULL,
    bv3Value      IN      VARCHAR2  DEFAULT NULL,
    ...
    bv25Name      IN      VARCHAR2  DEFAULT NULL,
    bv25Value     IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

### Parameters

**Table 194–2 BIND\_VARIABLES Function Parameters**

Parameter	Description
theQuery	The SQL query statement which must be a SELECT statement
bv1Name	The name of the variable
bv1Value	The value of the variable

### Return Values

An integer identifying the opened cursor.

## CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the [BIND\\_VARIABLES Function](#).

### Syntax

```
OWA_UTIL.CALENDARPRINT (
  p_query          IN          VARCHAR2,
  p_mf_only        IN          VARCHAR2  DEFAULT 'N' );
```

```
OWA_UTIL.CALENDARPRINT (
  p_cursor         IN          INTEGER,
  p_mf_only        IN          VARCHAR2  DEFAULT 'N' );
```

### Parameters

**Table 194–3 CALENDARPRINT Procedure Parameters**

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

### Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

## CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table. There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the [FORMAT\\_CELL Function](#) in the "HTF" package on page 182-1.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

### Syntax

```
OWA_UTIL.CELLSPRINT (
  p_colCnt      IN    INTEGER,
  p_resultTbl   IN    vc_arr,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery     IN    VARCHAR2,
  p_max_rows     IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theCursor    IN    INTEGER,
  p_max_rows     IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery     IN    VARCHAR2,
  p_max_rows     IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_skip_rec     IN    NUMBER    DEFAULT 0,
  p_more_data    OUT   BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT (
  p_theCursor    IN    INTEGER,
  p_max_rows     IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_skip_rec     IN    NUMBER    DEFAULT 0,
  p_more_data    OUT   BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery     IN    VARCHAR2,
  p_max_rows     IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_reccnt      OUT   NUMBER);
```

```
OWA_UTIL.CELLSPRINT (
```

```

p_theCursor      IN    INTEGER,
p_max_rows      IN    NUMBER    DEFAULT 100,
p_format_numbers IN    VARCHAR2  DEFAULT NULL,
p_reccnt       OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
  p_theQuery      IN    VARCHAR2,
  p_max_rows      IN    NUMBER    DEFAULT 100,
  p_format_numbers IN    VARCHAR2  DEFAULT NULL,
  p_skip_rec      IN    NUMBER    DEFAULT 0,
  p_more_data     OUT   BOOLEAN,
  p_reccnt       OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
  p_theCursor      IN    INTEGER,
  p_max_rows      IN    NUMBER    DEFAULT 100,
  p_format_numbers IN    VARCHAR2  DEFAULT NULL,
  p_skip_rec      IN    NUMBER    DEFAULT 0,
  p_more_data     OUT   BOOLEAN,
  p_reccnt       OUT   NUMBER);

```

## Parameters

**Table 194–4** *CELLSPRINT Procedure Parameters*

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the <a href="#">BIND_VARIABLES Function</a> .
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_reccnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

## Examples

This function generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

## CHOOSE\_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

### Syntax

```
OWA_UTIL.CHOOSE_DATE (
  p_name      IN      VARCHAR2,
  p_date      IN      DATE      DEFAULT SYSDATE) ;
```

### Parameters

**Table 194–5 CHOOSE\_DATE Procedure Parameters**

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

### Usage Notes

- The parameter in the procedure that receives the data from these elements must be a [GET\\_CGI\\_ENV Function](#).
- Use the [TODATE Function](#) to convert the [GET\\_CGI\\_ENV Function](#) value to the standard Oracle DATE data type.

### Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
...
<OPTION value="2002">2002
</SELECT>
```

## GET\_CGI\_ENV Function

This function returns the value of the specified CGI environment variable.

### Syntax

```
OWA_UTIL.GET_CGI_ENV(  
    param_name      IN      VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 194–6** GET\_CGI\_ENV Function Parameters

Parameter	Description
param_name	The name of the CGI environment variable. It is case-insensitive.

### Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns NULL.

## GET\_OWA\_SERVICE\_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

### Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH  
RETURN VARCHAR2;
```

### Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

## GET\_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

### Syntax

```
OWA_UTIL.GET_PROCEDURE  
RETURN VARCHAR2;
```

### Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

## HTTP\_HEADER\_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

### Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

### Return Values

A newline character, which closes the HTTP header.

### Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as [MIME\\_HEADER Procedure](#), [REDIRECT\\_URL Procedure](#), or [STATUS\\_LINE Procedure](#)
- The HTTP header must be closed before any `HTTP.PRINT` or `HTTP.PRN` calls.

## LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query. There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the [BIND\\_VARIABLES Function](#).

### Syntax

```
OWA_UTIL.LISTPRINT (
  p_theQuery      IN      VARCHAR2,
  p_cname         IN      VARCHAR2,
  p_nsize         IN      NUMBER,
  p_multiple      IN      BOOLEAN  DEFAULT FALSE);
```

```
OWA_UTIL.LISTPRINT (
  p_theCursor     IN      INTEGER,
  p_cname         IN      VARCHAR2,
  p_nsize         IN      NUMBER,
  p_multiple      IN      BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 194–7 LISTPRINT Procedure Parameters**

Parameter	Description
p_theQuery	The SQL query.
p_theCursor	The cursor ID. This can be the return value from the <a href="#">BIND_VARIABLES Function</a> .
p_cname	The name of the HTML form element.
p_nsize	The size of the form element (this controls how many items the user can see without scrolling).
p_multiple	Whether multiple selection is permitted.

### Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

### Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
...
</SELECT>
```

## MIME\_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any `HTP.PRINT` or `HTP.PRN` calls to direct the script not to use the default MIME header.

### Syntax

```
OWA_UTIL.MIME_HEADER(
  ccontent_type  IN      VARCHAR2  DEFAULT 'text/html',
  bclose_header  IN      BOOLEAN    DEFAULT TRUE,
  ccharset       IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 194–8** *MIME\_HEADER Procedure Parameters*

Parameter	Description
<code>ccontent_type</code>	The MIME type to generate
<code>bclose_header</code>	Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
<code>ccharset</code>	The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

### Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

## PRINT\_CGI\_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

### Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

### Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

## REDIRECT\_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

### Syntax

```
OWA_UTIL.REDIRECT_URL(  
    curl          IN          VARCHAR2  
    bclose_header IN          BOOLEAN    DEFAULT TRUE);
```

### Parameters

**Table 194–9 REDIRECT\_URL Function Parameters**

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

### Usage Notes

This procedure must come before any HTTP procedure or HTTP function call.

### Examples

This procedure generates

```
Location: <curl>\n\n
```

## SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL\*Plus. The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

### Syntax

```
OWA_UTIL.SHOWPAGE;
```

### Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the [DBMS\\_OUTPUT](#) package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

### Examples

The output of htp procedure is displayed in SQL\*Plus, SQL\*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

## SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

### Syntax

```
OWA_UTIL.SHOWSOURCE (  
    cname          IN      VARCHAR2);
```

### Parameters

**Table 194–10** *SHOWSOURCE Procedure Parameters*

Parameter	Description
cname	The function or procedure whose source you want to show.

## SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document. If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the [SHOWSOURCE Procedure](#).

### Syntax

```
OWA_UTIL.SIGNATURE;  
  
OWA_UTIL.SIGNATURE (  
    cname          IN          VARCHAR2);
```

### Parameters

**Table 194–11 SIGNATURE Procedure Parameters**

Parameter	Description
cname	The function or procedure whose source you want to show.

### Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30  
View PL/SQL Source
```

## STATUS\_LINE Procedure

This procedure sends a standard HTTP status code to the client. This procedure must come before any `http.print` or `http.prn` calls so that the status code is returned as part of the header, rather than as "content data".

### Syntax

```
OWA_UTIL.STATUS_LINE(  
  nstatus      IN      INTEGER,  
  creason      IN      VARCHAR2  DEFAULT NULL,  
  bclose_header IN      BOOLEAN  DEFAULT TRUE);
```

### Parameters

**Table 194–12 STATUS\_LINE Procedure Parameters**

Parameter	Description
<code>nstatus</code>	The status code.
<code>creason</code>	The string for the status code.
<code>bclose_header</code>	Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

### Examples

This procedure generates

```
Status: <nstatus> <creason>\n\n
```

## TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

### Syntax

```
OWA_UTIL.TABLEPRINT (
  ctable          IN          VARCHAR2,
  cattributes     IN          VARCHAR2  DEFAULT NULL,
  ntable_type     IN          INTEGER   DEFAULT HTML_TABLE,
  ccolumns        IN          VARCHAR2  DEFAULT '*',
  cclauses        IN          VARCHAR2  DEFAULT NULL,
  ccol_aliases    IN          VARCHAR2  DEFAULT NULL,
  nrow_min        IN          NUMBER    DEFAULT 0,
  nrow_max        IN          NUMBER    DEFAULT NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 194–13** TABLEPRINT Function Parameters

Parameter	Description
ctable	The database table.
cattributes	Other attributes to be included as-is in the tag.
ntable_type	How to generate the table. Specify <code>HTML_TABLE</code> to generate the table using <code>&lt;TABLE&gt;</code> tags or <code>PRE_TABLE</code> to generate the table using the <code>&lt;PRE&gt;</code> tags. These are constants: <ul style="list-style-type: none"> <li>■ <code>HTML_TABLE CONSTANT INTEGER := 1;</code></li> <li>■ <code>PRE_TABLE CONSTANT INTEGER := 2;</code></li> </ul>
ccolumns	A comma-delimited list of columns from <code>ctable</code> to include in the generated table.
cclauses	WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.
ccol_aliases	A comma-delimited list of headings for the generated table.
nrow_min	The first row, of those retrieved, to display.
nrow_max	The last row, of those retrieved, to display.

### Return Values

Returns `TRUE` if there are more rows beyond the `nrow_max` requested, `FALSE` otherwise.

### Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, `cattributes` is the second rather than the last parameter.

## Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

<http://myhost:7777/pls/hr/showemps>

returns to the following to the client:

<PRE>

```
-----
| EMPNO | ENAME | JOB      | MGR  | HIREDATE | SAL  | COMM | DEPTNO |
-----
| 7369 | SMITH | CLERK    | 7902 | 17-DEC-80 | 800  |      | 20     |
| 7499 | ALLEN | SALESMAN | 7698 | 20-FEB-81 | 1600 | 300  | 30     |
| 7521 | WARD  | SALESMAN | 7698 | 22-FEB-81 | 1250 | 500  | 30     |
| 7566 | JONES | MANAGER  | 7839 | 02-APR-81 | 2975 |      | 20     |
| 7654 | MARTIN | SALESMAN | 7698 | 28-SEP-81 | 1250 | 1400 | 30     |
| 7698 | BLAKE | MANAGER  | 7839 | 01-MAY-81 | 2850 |      | 30     |
| 7782 | CLARK | MANAGER  | 7839 | 09-JUN-81 | 2450 |      | 10     |
| 7788 | SCOTT | ANALYST  | 7566 | 09-DEC-82 | 3000 |      | 20     |
| 7839 | KING  | PRESIDENT |      | 17-NOV-81 | 5000 |      | 10     |
| 7844 | TURNER | SALESMAN | 7698 | 08-SEP-81 | 1500 | 0    | 30     |
| 7876 | ADAMS | CLERK    | 7788 | 12-JAN-83 | 1100 |      | 20     |

| 7902 | FORD  | ANALYST  | 7566 | 03-DEC-81 | 3000 |      | 20     |
| 7934 | MILLER | CLERK    | 7782 | 23-JAN-82 | 1300 |      | 10     |
-----
```

</PRE>

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
  ignore_more BOOLEAN;
begin
  ignore_more := OWA_UTIL.TABLEPRINT
    ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
     'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
     'Employee Number, Name, Salary');
END;
```

A request for a URL like

[http://myhost:7777/pls/hr/showemps\\_10](http://myhost:7777/pls/hr/showemps_10)

would return the following to the client:

<PRE>

```
-----
| Employee Number | Name   | Salary |
-----
| 7782            | CLARK | 2450   |
| 7839            | KING  | 5000   |
| 7934            | MILLER | 1300   |
-----
```

```
</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showdept
```

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

## TODATE Function

This function converts the [DATETYPE Data Type](#) to the standard Oracle `DATE` type.

### Syntax

```
OWA_UTIL.TODATE (  
    p_dateArray      IN      dateType)  
RETURN DATE;
```

### Parameters

**Table 194–14** *TODATE Function Parameters*

Parameter	Description
<code>p_dateArray</code>	The value to convert.

## WHO\_CALLED\_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

### Syntax

```
OWA_UTIL.WHO_CALLED_ME (
  owner          OUT          VARCHAR2,
  name           OUT          VARCHAR2,
  lineno        OUT          NUMBER,
  caller_t      OUT          VARCHAR2);
```

### Parameters

**Table 194–15** WHO\_CALLED\_ME Procedure Parameters

Parameter	Description
owner	The owner of the program unit.
name	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.
lineno	The line number within the program unit where the call was made.
caller_t	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

The `SDO_CS` package contains functions and procedures for working with coordinate systems. You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

- [Documentation of SDO\\_CS](#)

---

## Documentation of SDO\_CS

For a complete description of this package within the context of Oracle Spatial, see SDO\_CS in the *Oracle Spatial Developer's Guide*.

---

---

## SDO\_CSW\_PROCESS

The SDO\_CSW\_PROCESS package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

- [Documentation of SDO\\_CSW\\_PROCESS](#)

---

## Documentation of SDO\_CSW\_PROCESS

For a complete description of this package within the context of Oracle Spatial, see SDO\_CSW\_PROCESS in the *Oracle Spatial Developer's Guide*.

The SDO\_GCDR package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

- [Documentation of SDO\\_GCDR](#)

---

## Documentation of SDO\_GCDR

For a complete description of this package within the context of Oracle Spatial, see SDO\_GCDR in *Oracle Spatial Developer's Guide*.

The SDO\_GEOM package contains the geometry functions, which can be grouped into the following categories (with examples of each):

- Relationship (True/False) between two objects: RELATE, WITHIN\_DISTANCE
- Validation: VALIDATE\_GEOMETRY\_WITH\_CONTEXT, VALIDATE\_LAYER\_WITH\_CONTEXT
- Single-object operations: SDO\_ARC\_DENSIFY, SDO\_AREA, SDO\_BUFFER, SDO\_CENTROID, SDO\_CONVEXHULL, SDO\_LENGTH, SDO\_MBR, SDO\_POINTONSURFACE
- Two-object operations: SDO\_DISTANCE, SDO\_DIFFERENCE, SDO\_INTERSECTION, SDO\_UNION, SDO\_XOR

This chapter contains the following topic:

- [Documentation of SDO\\_GEOM](#)

---

## Documentation of SDO\_GEOM

For a complete description of this package within the context of Oracle Spatial, see SDO\_GEOM in the *Oracle Spatial Developer's Guide*.

The `SDO_GEOR` package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

- [Documentation of SDO\\_GEOR](#)

---

## Documentation of SDO\_GEOR

For complete description of this package within the context of Oracle Spatial, see SDO\_GEOR in the *Oracle Spatial GeoRaster Developer's Guide*.

---

---

## SDO\_GEOR\_ADMIN

The SDO\_GEOR\_ADMIN package contains subprograms for administrative operations related to GeoRaster.

- [Documentation of SDO\\_GEOR\\_ADMIN](#)

---

## Documentation of SDO\_GEOR\_ADMIN

For a complete description of this package within the context of Oracle Spatial, see SDO\_GEOR\_ADMIN in the *Oracle Spatial GeoRaster Developer's Guide*.

---

---

## SDO\_GEOR\_UTL

The SDO\_GEOR\_UTL package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

- [Documentation of SDO\\_GEOR\\_UTL](#)

---

## Documentation of SDO\_GEOR\_UTL

For complete description of this package within the context of Oracle Spatial, see SDO\_GEOR\_UTL in the *Oracle Spatial GeoRaster Developer's Guide*.

The SDO\_LRS package contains functions that create, modify, query, and convert linear referencing elements.

- [Documentation of SDO\\_LRS](#)

---

## Documentation of SDO\_LRS

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial Developer's Guide*.

The SDO\_MIGRATE package lets you upgrade geometry tables from previous releases of Oracle Spatial.

- [Documentation of SDO\\_MIGRATE](#)

---

## Documentation of SDO\_MIGRATE

For a complete description of this package within the context of Oracle Spatial, see SDO\_MIGRATE in the *Oracle Spatial Developer's Guide*.

The SDO\_NET package contains functions and procedures for working with data modeled as nodes and links in a network.

- [Documentation of SDO\\_NET](#)

---

## Documentation of SDO\_NET

For a complete description of this package within the context of Oracle Spatial, see SDO\_NET in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

---

---

## SDO\_NET\_MEM

The SDO\_NET\_MEM package contains functions and procedures for performing editing and analysis operations on network data using a network memory object.

- [Documentation of SDO\\_NET\\_MEM](#)

---

## Documentation of SDO\_NET\_MEM

For a complete description of this package within the context of Oracle Spatial, see SDO\_NET\_MEM in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

The SDO\_OLS package contains subprograms for Spatial OpenLS support.

- [Documentation of SDO\\_OLS](#)

---

## Documentation of SDO\_OLS

For a complete description of this package within the context of Oracle Spatial, see SDO\_OLS in the *Oracle Spatial Developer's Guide*.

The SDO\_PC\_PKG package contains subprograms to support the use of point clouds in Spatial.

- [Documentation of SDO\\_PC\\_PKG](#)

---

## Documentation of SDO\_PC\_PKG

For a complete description of this package within the context of Oracle Spatial, see SDO\_PC\_PKG in the *Oracle Spatial Developer's Guide*.

The SDO\_SAM package contains functions and procedures for spatial analysis and data mining.

- [Documentation of SDO\\_SAM](#)

---

## Documentation of SDO\_SAM

For a complete description of this package within the context of Oracle Spatial, see SDO\_SAM in the *Oracle Spatial Developer's Guide*.

---

## SDO\_TIN\_PKG

The SDO\_TIN\_PKG package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

- [Documentation of SDO\\_TIN\\_PKG](#)

---

## Documentation of SDO\_TIN\_PKG

For a complete description of this package within the context of Oracle Spatial, see SDO\_TIN\_PKG in the *Oracle Spatial Developer's Guide*.

The SDO\_TOPO package contains subprograms for creating and managing Oracle Spatial topologies.

- [Documentation of SDO\\_TOPO](#)

---

## Documentation of SDO\_TOPO

For a complete description of this package within the context of Oracle Spatial, see SDO\_TOPO in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

---

---

## SDO\_TOPO\_MAP

The SDO\_TOPO\_MAP package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

- [Documentation of SDO\\_TOPO\\_MAP](#)

---

## Documentation of SDO\_TOPO\_MAP

For a complete description of this package within the context of Oracle Spatial, see SDO\_TOPO\_MAP in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

The SDO\_TUNE package contains Spatial tuning functions and procedures.

- [Documentation of SDO\\_TUNE](#)

---

## Documentation of SDO\_TUNE

For complete description of this package within the context of Oracle Spatial, see SDO\_TUNE in the *Oracle Spatial Developer's Guide*.

The SDO\_UTIL package contains the utility functions and procedures for Oracle Spatial.

- [Documentation of SDO\\_UTIL](#)

---

## Documentation of SDO\_UTIL

For complete description of this package within the context of Oracle Spatial, see SDO\_UTIL in the *Oracle Spatial Developer's Guide*.

---

---

## SDO\_WFS\_LOCK

The SDO\_WFS\_LOCK package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

- [Documentation of SDO\\_WFS\\_LOCK](#)

---

## Documentation of SDO\_WFS\_LOCK

For a complete description of this package within the context of Oracle Spatial, see SDO\_WFS\_LOCK in the *Oracle Spatial Developer's Guide*.

---

---

## SDO\_WFS\_PROCESS

The SDO\_WFS\_PROCESS package contains subprograms for various processing operations related to support for Web Feature Services.

- [Documentation of SDO\\_WFS\\_PROCESS](#)

---

## Documentation of SDO\_WFS\_PROCESS

For a complete description of this package within the context of Oracle Spatial, see SDO\_WFS\_PROCESS in the *Oracle Spatial Developer's Guide*.

The SEM\_APIS package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

- [Documentation of SEM\\_APIS](#)

---

## Documentation of SEM\_APIS

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM\_APIS in the *Oracle Database Semantic Technologies Developer's Guide*.

The SEM\_PERF package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

- [Documentation of SEM\\_PERF](#)

---

## Documentation of SEM\_PERF

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM\_PERF in the *Oracle Database Semantic Technologies Developer's Guide*.

The SEM\_RDFCTX package contains subprograms for managing extractor policies and semantic indexes created for documents.

- [Documentation of SEM\\_RDFCTX](#)

---

## Documentation of SEM\_RDFCTX

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM\_RDFCTX in the *Oracle Database Semantic Technologies Developer's Guide*.

The SEM\_RDFSA package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

- [Documentation of SEM\\_RDFSA](#)

---

## Documentation of SEM\_RDFSA

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM\_RDFSA in the *Oracle Database Semantic Technologies Developer's Guide*.

The UTL\_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- [Summary of UTL\\_COLL Subprograms](#)

---

## Summary of UTL\_COLL Subprograms

**Table 220–1 UTL\_COLL Package Subprograms**

Subprogram	Description
<a href="#">IS_LOCATOR Function</a> on page 220-3	Determines whether a collection item is actually a locator or not

## IS\_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

### Syntax

```
UTL_COLL.IS_LOCATOR (
  coln IN STANDARD)
  RETURNS BOOLEAN;
```

### Pragmas

Asserts WNDS, WNPS and RNPS pragmas

### Parameters

**Table 220–2 IS\_LOCATOR Function Parameters**

Parameter	Description
coln	Nested table or varray item.

### Return Values

**Table 220–3 IS\_LOCATOR Function Return Values**

Return Value	Description
1	Collection item is indeed a locator.
0	Collection item is not a locator.

### Examples

```
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
  pno number,
  ph list_t );
/

CREATE TABLE phone_book OF phone_book_t
  NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
  NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
  plist list_t;
  plist1 list_t;
BEGIN
  SELECT ph INTO plist FROM phone_book WHERE pno=1;

  SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

  IF (UTL_COLL.IS_LOCATOR(plist)) THEN
    DBMS_OUTPUT.PUT_LINE('plist is a locator');
```

```
ELSE
  DBMS_OUTPUT.PUT_LINE('plist is not a locator');
END IF;

IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
  DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
ELSE
  DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

The UTL\_COMPRESS package provides a set of data compression utilities.

This chapter contains the following topics:

- [Using UTL\\_COMPRESS](#)
  - Constants
  - Exceptions
  - Operational Notes
- [Summary of UTL\\_COMPRESS Subprograms](#)

## Using UTL\_COMPRESS

- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)

## Constants

Define max number of handles for piecewise operations:

```
UTLCOMP_MAX_HANDLE  CONSTANT  PLS_INTEGER := 5;
```

## Exceptions

**Table 221–1** *UTL\_COMPRESS Exceptions*

<b>Exception</b>	<b>Description</b>
BUFFER_TOO_SMALL	The compressed representation is too big.
DATA_ERROR	The input or output data stream was found to be an invalid format.
INVALID_ARGUMENT	One of the arguments was an invalid type or value.
INVALID_HANDLE	Invalid handle for piecewise compress or uncompress.
STREAM_ERROR	An error occurred during compression or uncompression of the data stream

## Operational Notes

- It is the caller's responsibility to free the temporary LOB returned by the LZ\* functions with `DBMS_LOB.FREETEMPORARY` call.
- A `BFILE` passed into `LZ_COMPRESS*` or `LZ_UNCOMPRESS*` has to be opened by `DBMS_LOB.FILEOPEN`.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the `UTL_COMPRESS` subprograms may be the same size, or even slightly larger than, the input.
- The output of the `UTL_COMPRESS` compressed data is compatible with `gzip`(with `-n` option)/`gunzip` on a single file.

---

## Summary of UTL\_COMPRESS Subprograms

**Table 221–2 UTL\_COMPRESS Package Subprograms**

Subprogram	Description
<a href="#">ISOPEN Function</a> on page 221-7	Checks to see if the handle to a piecewise (un)compress context is open or closed
<a href="#">LZ_COMPRESS Functions and Procedures</a> on page 221-8	Compresses data using Lempel-Ziv compression algorithm
<a href="#">LZ_COMPRESS_ADD Procedure</a> on page 221-10	Adds a piece of compressed data
<a href="#">LZ_COMPRESS_CLOSE</a> on page 221-11	Closes and finishes piecewise compress operation
<a href="#">LZ_COMPRESS_OPEN</a> on page 221-12	Initializes a piecewise context that maintains the compress state and data
<a href="#">LZ_UNCOMPRESS Functions and Procedures</a> on page 221-13	Accepts compressed input, verifies it to be a valid and uncompresses it
<a href="#">LZ_UNCOMPRESS_EXTRACT Procedure</a> on page 221-14	Extracts a piece of uncompressed data
<a href="#">LZ_UNCOMPRESS_OPEN Function</a> on page 221-15	Initializes a piecewise context that maintains the uncompress state and data
<a href="#">LZ_UNCOMPRESS_CLOSE Procedure</a> on page 221-16	Closes and finishes the piecewise uncompress

## ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

### Syntax

```
UTL_COMPRESS.ISOPEN(  
    handle in binary_integer)  
RETURN BOOLEAN;
```

### Parameters

**Table 221–3 ISOPEN Function Parameters**

Parameter	Description
handle	The handle to a piecewise uncompress context.

### Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

### Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then  
    UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);  
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN  
    UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);  
END IF;
```

## LZ\_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

### Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      RAW,
  quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      BLOB,
  quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      BLOB,
  dst      IN OUT NOCOPY BLOB,
  quality  IN      BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      BFILE,
  quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      BFILE,
  dst      IN OUT NOCOPY BLOB,
  quality  IN      BINARY_INTEGER DEFAULT 6);
```

### Parameters

**Table 221–4 LZ\_COMPRESS Function and Procedures Parameters**

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

**Usage Notes**

- `quality` is an optional compression tuning value. It allows the `UTL_COMPRESS` user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

## LZ\_COMPRESS\_ADD Procedure

This procedure adds a piece of compressed data.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (  
    handle IN          BINARY_INTEGER,  
    dst    IN OUT NOCOPY BLOB,  
    src    IN          RAW);
```

### Parameters

**Table 221-5 LZ\_COMPRESS\_ADD Procedure Parameters**

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.
src	The input data to be compressed.

### Exceptions

- `invalid_handle` - out of range invalid or unopened handle.
- `invalid_argument` - NULL handle, src, dst, or invalid dst.

## LZ\_COMPRESS\_CLOSE

This procedure closes and finishes piecewise compress operation.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (  
  handle IN          BINARY_INTEGER,  
  dst      IN OUT NOCOPY BLOB);
```

### Parameters

**Table 221–6** LZ\_COMPRESS\_CLOSE Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.

### Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, dst, or invalid dst.

## LZ\_COMPRESS\_OPEN

This function initializes a piecewise context that maintains the compress state and data.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (  
    dst          IN OUT NOCOPY BLOB,  
    quality      IN          BINARY_INTEGER DEFAULT 6)  
RETURN BINARY_INTEGER;
```

### Parameters

**Table 221–7 LZ\_COMPRESS\_OPEN Function Parameters**

Parameter	Description
dst	User supplied LOB to store compressed data.
quality	Speed versus efficiency of resulting compressed output. <ul style="list-style-type: none"><li>Valid values are the range 1..9, with a default value of 6.</li><li>1=fastest compression, 9=slowest compression and best compressed file size.</li></ul>

### Return Values

A handle to an initialized piecewise compress context.

### Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL `dst` or invalid quality specified.

### Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.

## LZ\_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

### Syntax

This function returns uncompressed data as RAW:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN RAW)
RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB,
    dst IN OUT NOCOPY BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE,
    dst IN OUT NOCOPY BLOB);
```

### Parameters

**Table 221–8 LZ\_UNCOMPRESS Function and Procedures Parameters**

Parameter	Description
src	Compressed data.
dst	Destination for uncompressed data.

## LZ\_UNCOMPRESS\_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

### Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(  
  handle IN          BINARY_INTEGER,  
  dst    OUT NOCOPY RAW);
```

### Parameters

**Table 221–9 LZ\_UNCOMPRESS\_EXTRACT Function Parameters**

Parameter	Description
handle	The handle to a piecewise uncompress context.
dst	The uncompressed data.

### Exceptions

- no\_data\_found - finished uncompress.
- invalid\_handle - out of range invalid or uninitialized handle.
- invalid\_argument - NULL handle.

## LZ\_UNCOMPRESS\_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

### Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(  
    src IN BLOB)  
RETURN BINARY_INTEGER;
```

### Parameters

**Table 221–10 LZ\_UNCOMPRESS\_OPEN Function Parameters**

Parameter	Description
src	The input data to be uncompressed.

### Return Values

A handle to an initialized piecewise compress context.

### Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL src.

### Usage Notes

Close the opened handle with `LZ_UNCOMPRESS_CLOSE`

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.

## LZ\_UNCOMPRESS\_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

### Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(  
    handle IN BINARY_INTEGER);
```

### Parameters

**Table 221–11 LZ\_UNCOMPRESS\_CLOSE Procedure Parameters**

Parameter	Description
handle	The handle to a piecewise uncompress context.

### Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

The UTL\_ENCODE package provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts. You can use UTL\_ENCODE functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- [Summary of UTL\\_ENCODE Subprograms](#)

---

## Summary of UTL\_ENCODE Subprograms

**Table 222–1 UTL\_ENCODE Package Subprograms**

Subprogram	Description
<a href="#">BASE64_DECODE Function</a> on page 222-3	Reads the base 64-encoded RAW input string and decodes it to its original RAW value
<a href="#">BASE64_ENCODE Function</a> on page 222-4	Encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string
<a href="#">MIMEHEADER_DECODE Function</a> on page 222-5	Decodes a string from mime header format
<a href="#">MIMEHEADER_ENCODE Function</a> on page 222-6	Encodes a string into mime header format
<a href="#">QUOTED_PRINTABLE_DECODE Function</a> on page 222-7	Reads the varchar2 quoted printable format input string and decodes it to the corresponding RAW string
<a href="#">QUOTED_PRINTABLE_ENCODE Function</a> on page 222-8	Reads the RAW input string and encodes it to the corresponding quoted printable format string
<a href="#">TEXT_DECODE Function</a> on page 222-9	Decodes a character set sensitive text string
<a href="#">TEXT_ENCODE Function</a> on page 222-10	Encodes a character set sensitive text string
<a href="#">UUDECODE Function</a> on page 222-11	Reads the RAW uuencode format input string and decodes it to the corresponding RAW string
<a href="#">UUENCODE Function</a> on page 222-12	Reads the RAW input string and encodes it to the corresponding uuencode format string

## BASE64\_DECODE Function

This function reads the base 64-encoded RAW input string and decodes it to its original RAW value.

### Syntax

```
UTL_ENCODE.BASE64_DECODE (
    r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES (base64_decode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 222–2 BASE64\_DECODE Function Parameters**

Parameter	Description
r	The RAW string containing base 64-encoded data. There are no defaults or optional parameters.

### Return Values

**Table 222–3 BASE64\_DECODE Function Return Values**

Return	Description
RAW	Contains the decoded string

## BASE64\_ENCODE Function

This function encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string.

### Syntax

```
UTL_ENCODE.BASE64_ENCODE (  
    r IN RAW)  
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES (base64_encode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 222-4** *BASE64\_ENCODE Function Parameters*

Parameter	Description
r	The RAW value to be encoded. There are no defaults or optional parameters.

### Return Values

**Table 222-5** *BASE64\_ENCODE Function Return Values*

Return	Description
RAW	Contains the encoded base 64 elements

## MIMEHEADER\_DECODE Function

This function accepts as input an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The <encoded text> is encapsulated in mime header tags which give the MIMEHEADER\_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

### Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
  buf    IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

### Parameters

**Table 222–6** *MIMEHEADER\_DECODE Function Parameters*

Parameter	Description
buf	The encoded text data with mime header format tags.

### Return Values

**Table 222–7** *MIMEHEADER\_DECODE Function Return Values*

Return	Description
data	The encoded text data with mime header format tags

### Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?');
```

## MIMEHEADER\_ENCODE Function

This function returns as an output an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=-
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The `<encoding>` value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The `ENCODING` input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

### Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
    buf          IN VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
    encoding     IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

### Parameters

**Table 222–8** *MIMEHEADER\_ENCODE Function Parameters*

Parameter	Description
<code>buf</code>	The text data.
<code>encode_charset</code>	The target character set.
<code>encoding</code>	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code> .

### Return Values

**Table 222–9** *MIMEHEADER\_ENCODE Function Return Values*

Return	Description
<code>string</code>	A <code>VARCHAR2</code> encoded string with mime header format tags.

## QUOTED\_PRINTABLE\_DECODE Function

This function reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string.

### Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
    r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 222–10 QUOTED\_PRINTABLE\_DECODE Function Parameters**

Parameters	Description
<code>r</code>	The <code>RAW</code> string containing a quoted printable data string. There are no defaults or optional parameters.

### Return Values

**Table 222–11 QUOTED\_PRINTABLE\_DECODE Function Return Values**

Return	Description
<code>RAW</code>	The decoded string

## QUOTED\_PRINTABLE\_ENCODE Function

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

### Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (  
    r IN RAW)  
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 222–12 QUOTED\_PRINTABLE\_ENCODE Function Parameters**

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

### Return Values

**Table 222–13 QUOTED\_PRINTABLE\_ENCODE Function Return Values**

Return	Description
RAW	Contains the quoted printable string

## TEXT\_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`. The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If `NULL`, quoted-printable is selected as a default decoding format. If `encode_charset` is not `NULL`, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

### Syntax

```
UTL_ENCODE.TEXT_DECODE(
  buf          IN VARCHAR2 CHARACTER SET ANY_CS,
  encode_charset IN VARCHAR2 DEFAULT NULL,
  encoding     IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

### Parameters

**Table 222–14** TEXT\_DECODE Function Parameters

Parameter	Description
<code>buf</code>	The encoded text data.
<code>encode_charset</code>	The source character set.
<code>encoding</code>	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code> .

### Return Values

**Table 222–15** QUOTED\_PRINTABLE\_ENCODE Function Return Values

Return	Description
<code>string</code>	A <code>VARCHAR2</code> decoded text string.

### Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
  'Here is some text',
  WE8ISO8859P1,
  UTL_ENCODE.BASE64);
```

## TEXT\_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL. The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if `ENCODING` is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

### Syntax

```
UTL_ENCODE.TEXT_ENCODE (
    buf          IN VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
    encoding     IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

### Parameters

**Table 222–16 TEXT\_ENCODE Function Parameters**

Parameter	Description
<code>buf</code>	The text data.
<code>encode_charset</code>	The target character set.
<code>encoding</code>	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code>

### Return Values

**Table 222–17 TEXT\_ENCODE Function Return Values**

Return	Description
<code>string</code>	A <code>VARCHAR2</code> encoded string with mime header format tags.

### Examples

```
v2:=utl_encode.text_encode(
    'Here is some text',
    'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```

## UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string. See "[UUENCODE Function](#)" on page 222-12 for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

### Syntax

```
UTL_ENCODE.UUDECODE (
    r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 222–18 UUDECODE Function Parameters**

Parameter	Description
r	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

### Return Values

**Table 222–19 UUDECODE Function Return Values**

Return	Description
RAW	The decoded RAW string

## UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string. The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

### Syntax

```
UTL_ENCODE.UUENCODE (
  r          IN RAW,
  type       IN PLS_INTEGER DEFAULT 1,
  filename   IN VARCHAR2 DEFAULT NULL,
  permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 222–20 UUENCODE Function Parameters**

Parameter	Description
r	RAW string
type	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece
filename	Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt
permission	Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).

### Return Values

**Table 222–21 UUENCODE Function Return Values**

Return	Description
RAW	Contains the uuencode format string

With the UTL\_FILE package, PL/SQL programs can read and write operating system text files. UTL\_FILE provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- [Using UTL\\_FILE](#)
  - Security Model
  - Operational Notes
  - Rules and Limits
  - Exceptions
  - Examples
- [Data Structures](#)
- [Summary of UTL\\_FILE Subprograms](#)

## Using UTL\_FILE

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Exceptions](#)
- [Examples](#)

## Security Model

The set of files and directories that are accessible to the user through UTL\_FILE is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user. The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both READ and WRITE access to the directory object USER\_DIR, the user can open a file located in the operating system directory described by USER\_DIR, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

UTL\_FILE provides file access both on the client side and on the server side. When run on the server, UTL\_FILE provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, UTL\_FILE provides access to operating system files that are accessible from the client.

In the past, accessible directories for the UTL\_FILE functions were specified in the initialization file using the UTL\_FILE\_DIR parameter. However, UTL\_FILE\_DIR access is no longer recommended. Oracle recommends that you instead use the directory object feature, which replaces UTL\_FILE\_DIR. Directory objects offer more flexibility and granular control to the UTL\_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE ANY DIRECTORY privilege is granted only to SYS and SYSTEM by default.

---

---

**Note:** Use the CREATE DIRECTORY feature instead of UTL\_FILE\_DIR for directory access verification.

---

---

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL\_FILE subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

---

---

**Caution:** The privileges needed to access files in a directory object are operating system specific. UTL\_FILE directory object privileges give you read and write access to all files within the specified directory.

---

---

## Operational Notes

The file location and file name parameters are supplied to the `FOPEN` function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an `ALL_DIRECTORIES` object.

`UTL_FILE` implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a `GET_LINE` call. For example, the `len` parameter of `UTL_FILE.GET_LINE` specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The `GET_LINE len` parameter, or
- The number of bytes until the next line terminator character, or
- The `max_linesize` parameter specified by `UTL_FILE.FOPEN`

The `FOPEN max_linesize` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The `GET_LINE len` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of `max_linesize`. If `max_linesize` and `len` are defined to be different values, then the lesser value takes precedence.

`UTL_FILE.GET_RAW` ignores line terminators.

`UTL_FILE` expects that files opened by `UTL_FILE.FOPEN` in text mode are encoded in the database character set. It expects that files opened by `UTL_FILE.FOPEN_NCHAR` in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of `NLS_LANG`) that it is encoded in another character set, the result is indeterminate. If `NLS_LANG` is set, it should therefore be the same as the database character set.

## Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL\_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET\_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

---

---

**Note:** The UTL\_FILE package is similar to the client-side TEXT\_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL\_FILE and TEXT\_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

---

---

## Exceptions

**Table 223–1 UTL\_FILE Package Exceptions**

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The <code>open_mode</code> parameter in <code>FOPEN</code> is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Destination buffer too small, or operating system error occurred during the read operation
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using <code>FOPEN_NCHAR</code> , but later I/O operations use nonchar functions such as <code>PUTF</code> or <code>GET_LINE</code> .
FILE_OPEN	The requested operation failed because the file is open.
INVALID_MAXLINESIZE	The <code>MAX_LINESIZE</code> value for <code>FOPEN()</code> is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.
INVALID_OFFSET	Causes of the <code>INVALID_OFFSET</code> exception: <ul style="list-style-type: none"> <li>■ <code>ABSOLUTE_OFFSET = NULL</code> and <code>RELATIVE_OFFSET = NULL</code>, or</li> <li>■ <code>ABSOLUTE_OFFSET &lt; 0</code>, or</li> <li>■ Either offset caused a seek past the end of the file</li> </ul>
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in `UTL_FILE` can also raise predefined PL/SQL exceptions such as `NO_DATA_FOUND` or `VALUE_ERROR`.

## Examples

### Example 1

---

---

**Note:** The examples are UNIX-specific.

---

---

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;
```

```
SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

### Example 2

```
DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is
  -- seen.
  F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R', 256);
  UTL_FILE.GET_LINE(F1, V1, 32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is
  -- seen.
  F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
```

```
UTL_FILE.GET_LINE(F1,V1,32767);
UTL_FILE.FCLOSE(F1);
```

-- In this example, GET\_LINE doesn't specify a number of bytes, so it defaults to  
to  
-- the same value as FOPEN's MAX\_LINESIZE which is NULL in this case and  
defaults to 1024.  
-- So the number of bytes returned will be 1024 or less if a line terminator is  
seen.

```
F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
UTL_FILE.GET_LINE(F1,V1);
UTL_FILE.FCLOSE(F1);
END;
```

## Data Structures

---

The `UTL_FILE` package defines a `RECORD` type.

### Record Types

- [FILETYPE Record Type](#)

## FILETYPE Record Type

The contents of `FILE_TYPE` are private to the `UTL_FILE` package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (  
    id          BINARY_INTEGER,  
    datatype    BINARY_INTEGER,  
    byte_mode   BOOLEAN);
```

### Fields

**Table 223–2** *FILE\_TYPE* Fields

Field	Description
<code>id</code>	A numeric value indicating the internal file handle number
<code>datatype</code>	Indicates whether the file is a CHAR file, Nchar file or other (binary)
<code>byte_mode</code>	Indicates whether the file was open as a binary file, or as a text file

---

---

**Caution:** Oracle does not guarantee the persistence of `FILE_TYPE` values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have indeterminate outcomes.

---

---

---

## Summary of UTL\_FILE Subprograms

**Table 223–3 UTL\_FILE Subprograms**

Subprogram	Description
<a href="#">FCLOSE Procedure</a> on page 223-13	Closes a file
<a href="#">FCLOSE_ALL Procedure</a> on page 223-14	Closes all open file handles
<a href="#">FCOPY Procedure</a> on page 223-15	Copies a contiguous portion of a file to a newly created file
<a href="#">FFLUSH Procedure</a> on page 223-16	Physically writes all pending output to a file
<a href="#">FGETATTR Procedure</a> on page 223-17	Reads and returns the attributes of a disk file
<a href="#">FGETPOS Function</a> on page 223-18	Returns the current relative offset position within a file, in bytes
<a href="#">FOPEN Function</a> on page 223-19	Opens a file for input or output
<a href="#">FOPEN_NCHAR Function</a> on page 223-21	Opens a file in Unicode for input or output
<a href="#">FREMOVE Procedure</a> on page 223-22	Deletes a disk file, assuming that you have sufficient privileges
<a href="#">FRENAME Procedure</a> on page 223-23	Renames an existing file to a new name, similar to the UNIX mv function
<a href="#">FSEEK Procedure</a> on page 223-24	Adjusts the file pointer forward or backward within the file by the number of bytes specified
<a href="#">GET_LINE Procedure</a> on page 223-25	Reads text from an open file
<a href="#">GET_LINE_NCHAR Procedure</a> on page 223-26	Reads text in Unicode from an open file
<a href="#">GET_RAW Procedure</a> on page 223-27	Reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read
<a href="#">IS_OPEN Function</a> on page 223-28	Determines if a file handle refers to an open file
<a href="#">NEW_LINE Procedure</a> on page 223-29	Writes one or more operating system-specific line terminators to a file
<a href="#">PUT Procedure</a> on page 223-30	Writes a string to a file
<a href="#">PUT_LINE Procedure</a> on page 223-31	Writes a line to a file, and so appends an operating system-specific line terminator
<a href="#">PUT_LINE_NCHAR Procedure</a> on page 223-32	Writes a Unicode line to a file
<a href="#">PUT_NCHAR Procedure</a> on page 223-33	Writes a Unicode string to a file
<a href="#">PUTF Procedure</a> on page 223-34	A PUT procedure with formatting

**Table 223-3 (Cont.) UTL\_FILE Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">PUTF_NCHAR Procedure</a> on page 223-36	A <code>PUT_NCHAR</code> procedure with formatting, and writes a Unicode string to a file, with formatting
<a href="#">PUT_RAW Procedure</a> on page 223-37	Accepts as input a <code>RAW</code> data value and writes the value to the output buffer

## FCLOSE Procedure

This procedure closes an open file identified by a file handle.

### Syntax

```
UTL_FILE.FCLOSE (  
    file IN OUT FILE_TYPE);
```

### Parameters

**Table 223–4 FCLOSE Procedure Parameters**

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

### Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE\_ERROR exception when closing a file.

### Exceptions

```
WRITE_ERROR  
INVALID_FILEHANDLE
```

## FCLOSE\_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

### Syntax

```
UTL_FILE.FCLOSE_ALL;
```

### Usage Notes

---

---

**Note:** FCLOSE\_ALL does not alter the state of the open file handles held by the user. This means that an IS\_OPEN test on a file handle after an FCLOSE\_ALL call still returns TRUE, even though the file has been closed. No further read or write operations can be performed on a file that was open before an FCLOSE\_ALL.

---

---

### Exceptions

```
WRITE_ERROR
```

## FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file. By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

### Syntax

```
UTL_FILE.FCOPY (
  src_location      IN VARCHAR2,
  src_filename     IN VARCHAR2,
  dest_location    IN VARCHAR2,
  dest_filename    IN VARCHAR2,
  start_line       IN BINARY_INTEGER DEFAULT 1,
  end_line         IN BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 223–5** *FCOPY Procedure Parameters*

Parameters	Description
<code>src_location</code>	Directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive)
<code>src_filename</code>	Source file to be copied
<code>dest_location</code>	Destination directory where the destination file is created
<code>dest_filename</code>	Destination file created from the source file
<code>start_line</code>	Line number at which to begin copying. The default is 1 for the first line
<code>end_line</code>	Line number at which to stop copying. The default is <code>NULL</code> , signifying end of file

### Exceptions

```
INVALID_FILENAME
INVALID_PATH
INVALID_OPERATION
INVALID_OFFSET
READ_ERROR
WRITE_ERROR
```

## FFLUSH Procedure

FFLUSH physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The FFLUSH procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

### Syntax

```
UTL_FILE.FFLUSH (  
    file IN FILE_TYPE);
```

### Parameters

**Table 223–6 FFLUSH Procedure Parameters**

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

### Exceptions

```
INVALID_FILENAME  
INVALID_MAXLINESIZE  
INVALID_OPERATION  
WRITE_ERROR
```

## FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

### Syntax

```
UTL_FILE.FGETATTR(
  location      IN VARCHAR2,
  filename      IN VARCHAR2,
  fexists       OUT BOOLEAN,
  file_length   OUT NUMBER,
  block_size    OUT BINARY_INTEGER);
```

### Parameters

**Table 223–7 FGETATTR Procedure Parameters**

Parameters	Description
location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
filename	Name of the file to be examined
fexists	A BOOLEAN for whether or not the file exists
file_length	Length of the file in bytes. NULL if file does not exist.
block_size	File system block size in bytes. NULL if the file does not exist.

### Exceptions

```
INVALID_PATH
INVALID_FILENAME
INVALID_OPERATION
READ_ERROR
ACCESS_DENIED
```

## FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

### Syntax

```
UTL_FILE.FGETPOS (  
    file IN FILE_TYPE)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 223–8 FGETPOS Parameters**

Parameters	Description
file	Directory location of the source file

### Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

### Exceptions

INVALID\_FILEHANDLE  
INVALID\_OPERATION  
READ\_ERROR

### Usage Notes

If file is opened for byte mode operations, then the INVALID\_OPERATION exception is raised.

## FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously. See also [FOPEN\\_NCHAR Function](#) on page 223-21.

### Syntax

```
UTL_FILE.FOPEN (
  location      IN VARCHAR2,
  filename      IN VARCHAR2,
  open_mode     IN VARCHAR2,
  max_linesize IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

### Parameters

**Table 223–9 FOPEN Function Parameters**

Parameter	Description
location	Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.
filename	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.
open_mode	Specifies how the file is opened. Modes include: <ul style="list-style-type: none"> <li>▪ r -- read text</li> <li>▪ w -- write text</li> <li>▪ a -- append text</li> <li>▪ rb -- read byte mode</li> <li>▪ wb -- write byte mode</li> <li>▪ ab -- append byte mode</li> </ul> If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.

### Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL\_FILE package, and individual components should not be referenced or changed by the UTL\_FILE user.

**Table 223–10 FOPEN Function Return Values**

Return	Description
FILE_TYPE	Handle to open file

## Exceptions

INVALID\_MAXILINESIZE

INVALID\_MODE

INVALID\_OPERATION

INVALID\_PATH

## Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL\_DIRECTORIES view of accessible directory objects.

## FOPEN\_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. You can have a maximum of 50 files open simultaneously. With this function, you can read or write a text file in Unicode instead of in the database character set.

Even though the contents of an NVARCHAR2 buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. UTL\_FILE converts between UTF8 and AL16UTF16 as necessary.

See also [FOPEN Function](#) on page 223-19.

### Syntax

```
UTL_FILE.FOPEN_NCHAR (
    location      IN VARCHAR2,
    filename      IN VARCHAR2,
    open_mode     IN VARCHAR2,
    max_linesize  IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

### Parameters

**Table 223–11 FOPEN\_NCHAR Function Parameters**

Parameter	Description
location	Directory location of file
filename	File name (including extension)
open_mode	Open mode (r,w,a,rb,wb,ab)
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767)

### Return Values

FOPEN\_NCHAR returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL\_FILE package, and individual components should not be referenced or changed by the UTL\_FILE user.

**Table 223–12 FOPEN\_NCHAR Function Return Values**

Return	Description
FILE_TYPE	Handle to open file

### Exceptions

```
INVALID_MAXILINESIZE
INVALID_MODE
INVALID_OPERATION
INVALID_PATH
```

## FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

### Syntax

```
UTL_FILE.FREMOVE (  
    location IN VARCHAR2,  
    filename IN VARCHAR2);
```

### Parameters

**Table 223–13** *FREMOVE Procedure Parameters*

Parameters	Description
location	Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)
filename	Name of the file to be deleted

### Exceptions

ACCESS\_DENIED  
DELETE\_FAILED  
INVALID\_FILENAME  
INVALID\_OPERATION  
INVALID\_PATH

### Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

## FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX `mv` function.

### Syntax

```
UTL_FILE.FRENAME (
    src_location    IN  VARCHAR2,
    src_filename   IN  VARCHAR2,
    dest_location  IN  VARCHAR2,
    dest_filename  IN  VARCHAR2,
    overwrite      IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 223–14** *FRENAME Procedure Parameters*

Parameters	Description
<code>src_location</code>	Directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive)
<code>src_filename</code>	Source file to be renamed
<code>dest_location</code>	Destination directory of the destination file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive)
<code>dest_filename</code>	New name of the file
<code>overwrite</code>	Default is <code>FALSE</code> . Permission on both the source and destination directories must be granted. You can use the <code>overwrite</code> parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is <code>FALSE</code> for no overwrite.

### Exceptions

```
ACCESS_DENIED
INVALID_FILENAME
INVALID_PATH
RENAME_FAILED
```

## FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

### Syntax

```
UTL_FILE.FSEEK (
    file           IN OUT  UTL_FILE.FILE_TYPE,
    absolute_offset IN     PL_INTEGER DEFAULT NULL,
    relative_offset IN     PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 223–15 FSEEK Procedure Parameters**

Parameters	Description
file	File handle
absolute_offset	Absolute location to which to seek; default = NULL
relative_offset	Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL

### Exceptions

INVALID\_FILEHANDLE  
 INVALID\_OFFSET  
 INVALID\_OPERATION  
 READ\_ERROR

### Usage Notes

- Using FSEEK, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If *relative\_offset*, the procedure seeks forward. If *relative\_offset* > 0, or backward, if *relative\_offset* < 0, the procedure seeks through the file by the number of *relative\_offset* bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an INVALID\_OFFSET error is raised.
- If *absolute\_offset*, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

## GET\_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

### Syntax

```
UTL_FILE.GET_LINE (
    file          IN  FILE_TYPE,
    buffer        OUT VARCHAR2,
    len           IN  PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 223–16** *GET\_LINE Procedure Parameters*

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> call. The file must be open for reading (mode <code>r</code> ); otherwise an <code>INVALID_OPERATION</code> exception is raised.
<code>buffer</code>	Data buffer to receive the line read from the file
<code>len</code>	The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> .

### Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`NO_DATA_FOUND`

`READ_ERROR`

### Usage Notes

If the line does not fit in the buffer, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`.

If unspecified, Oracle supplies a default value of 1024. See also "[GET\\_LINE\\_NCHAR Procedure](#)" on page 223-26.

## GET\_LINE\_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype, such as NCHAR, NCLOB, or VARCHAR2 is specified, PL/SQL will perform standard implicit conversion from NVARCHAR2 after the text is read.

See also [GET\\_LINE Procedure](#) on page 223-25

### Syntax

```
UTL_FILE.GET_LINE_NCHAR (
    file          IN  FILE_TYPE,
    buffer        OUT NVARCHAR2,
    len           IN  PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 223–17** GET\_LINE\_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Data buffer to receive the line read from the file
len	The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.

### Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
NO_DATA_FOUND
READ_ERROR
```

## GET\_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL\_FILE.GET\_RAW ignores line terminators.

### Syntax

```
UTL_FILE.GET_RAW (
    file      IN          UTL_FILE.FILE_TYPE,
    buffer    OUT NOCOPY RAW,
    len       IN          PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 223–18** GET\_RAW Procedure Parameters

Parameters	Description
file	File handle
buffer	RAW data
len	The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.

### Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
LENGTH_MISMATCH
NO_DATA_FOUND
READ_ERROR
```

### Usage Notes

The subprogram will raise `No_Data_Found` when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```
PROCEDURE Sys.p (n IN VARCHAR2) IS
    h      UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
    Buf    RAW(32767);
    Amnt   CONSTANT PLS_INTEGER := 32767;
BEGIN
    LOOP
        BEGIN
            Utl_File.Get_Raw(h, Buf, Amnt);
            -- Do something with this chunk
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;
    END LOOP;
    UTL_FILE.FCLOSE (h);
END;
```

## IS\_OPEN Function

This function tests a file handle to see if it identifies an open file. `IS_OPEN` reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

### Syntax

```
UTL_FILE.IS_OPEN (  
    file IN FILE_TYPE)  
RETURN BOOLEAN;
```

### Parameters

**Table 223–19** *IS\_OPEN Function Parameters*

Parameter	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call

### Return Values

TRUE or FALSE

### Exceptions

`INVALID_FILEHANDLE`

## NEW\_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle. This procedure is separate from `PUT` because the line terminator is a platform-specific character or sequence of characters.

### Syntax

```
UTL_FILE.NEW_LINE (  
    file      IN FILE_TYPE,  
    lines     IN BINARY_INTEGER := 1);
```

### Parameters

**Table 223–20** *NEW\_LINE Procedure Parameters*

Parameters	Description
file	Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call
lines	Number of line terminators to be written to the file

### Exceptions

```
INVALID_FILEHANDLE  
INVALID_OPERATION  
WRITE_ERROR
```

## PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. No line terminator is appended by PUT; use `NEW_LINE` to terminate the line or use `PUT_LINE` to write a complete line with a line terminator. See also "[PUT\\_NCHAR Procedure](#)" on page 223-33.

### Syntax

```
UTL_FILE.PUT (  
    file      IN FILE_TYPE,  
    buffer    IN VARCHAR2);
```

### Parameters

**Table 223–21** PUT Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for writing.
<code>buffer</code>	Buffer that contains the text to be written to the file. User must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised.

### Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

### Exceptions

```
INVALID_FILEHANDLE  
INVALID_OPERATION  
WRITE_ERROR
```

## PUT\_LINE Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle. The file must be open for write operations. `PUT_LINE` terminates the line with the platform-specific line terminator character or characters.

See also "[PUT\\_LINE\\_NCHAR Procedure](#)" on page 223-32.

### Syntax

```
UTL_FILE.PUT_LINE (
    file      IN FILE_TYPE,
    buffer    IN VARCHAR2,
    autoflush IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 223–22 PUT\_LINE Procedure Parameters**

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> call
<code>buffer</code>	Text buffer that contains the lines to be written to the file
<code>autoflush</code>	Flushes the buffer to disk after the <code>WRITE</code>

### Exceptions

`INVALID_FILEHANDLE`  
`INVALID_OPERATION`  
`WRITE_ERROR`

### Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

## PUT\_LINE\_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set. This procedure is equivalent to the [PUT\\_NCHAR Procedure](#), except that the line separator is appended to the written text. See also [PUT\\_LINE Procedure](#) on page 223-31.

### Syntax

```
UTL_FILE.PUT_LINE_NCHAR (
    file      IN FILE_TYPE,
    buffer    IN NVARCHAR2);
```

### Parameters

**Table 223–23 PUT\_LINE\_NCHAR Procedure Parameters**

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for writing.
<code>buffer</code>	Text buffer that contains the lines to be written to the file

### Exceptions

INVALID\_FILEHANDLE  
 INVALID\_OPERATION  
 WRITE\_ERROR

### Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

## PUT\_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before writing the text.

See also [PUT Procedure](#) on page 223-30

### Syntax

```
UTL_FILE.PUT_NCHAR (
    file      IN FILE_TYPE,
    buffer    IN NVARCHAR2);
```

### Parameters

**Table 223–24 PUT\_NCHAR Procedure Parameters**

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.
<code>buffer</code>	Buffer that contains the text to be written to the file. User must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised.

### Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

### Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

## PUTF Procedure

This procedure is a formatted PUT procedure. It works like a limited `printf()`. See also [PUTF\\_NCHAR Procedure](#) on page 223-36.

### Syntax

```
UTL_FILE.PUTF (
    file      IN FILE_TYPE,
    format    IN VARCHAR2,
    [arg1     IN VARCHAR2  DEFAULT NULL,
    . . .
    arg5      IN VARCHAR2  DEFAULT NULL]);
```

### Parameters

**Table 223–25** *PUTF Procedure Parameters*

Parameters	Description
file	Active file handle returned by an FOPEN call
format	Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code>
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument.

### Usage Notes

- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.
- The format string can contain any text, but the character sequences `%s` and `\n` have special meaning.

Character Sequence	Meaning
<code>%s</code>	Substitute this sequence with the string value of the next argument in the argument list.
<code>\n</code>	Substitute with the appropriate platform-specific line terminator.

### Exceptions

`INVALID_FILEHANDLE`  
`INVALID_OPERATION`  
`WRITE_ERROR`

### Examples

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.
```

```
my_world varchar2(4) := 'Zork';  
...  
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',  
      my_world,  
      'greetings for all earthlings');
```

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.

## PUTF\_NCHAR Procedure

This procedure is a formatted version of a [PUT\\_NCHAR Procedure](#). Using `PUTF_NCHAR`, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements `\n` and `%s`, and up to five arguments to be substituted for consecutive instances of `%s` in the format string. The expected datatype of the format string and the arguments is `NVARCHAR2`.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

### Syntax

```
UTL_FILE.PUTF_NCHAR (
    file      IN FILE_TYPE,
    format    IN NVARCHAR2,
    [arg1     IN NVARCHAR2  DEFAULT NULL,
    . . .
    arg5      IN NVARCHAR2  DEFAULT NULL]);
```

### Parameters

**Table 223–26** *PUTF\_NCHAR Procedure Parameters*

Parameters	Description
file	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code> ). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.
format	Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code>
arg1..arg5	From one to five operational argument strings.  Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string.  If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument.

### Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

### Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

## PUT\_RAW Procedure

This procedure accepts as input a RAW data value and writes the value to the output buffer.

### Syntax

```
UTL_FILE.PUT_RAW (
    file          IN    UTL_FILE.FILE_TYPE,
    buffer        IN    RAW,
    autoflush     IN    BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 223–27 PUT\_RAW Procedure Parameters**

Parameters	Description
file	File handle
buffer	The RAW data written to the buffer
autoflush	If TRUE, then performs a flush after writing the value to the output buffer; default is FALSE.

### Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

### Usage Notes

You can request an automatic flush of the buffer by setting the third argument to TRUE.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

The UTL\_HTTP package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the orapki utility. Non-HTTPS fetches do not require an Oracle wallet.

## Using UTL\_HTTP

This section contains topics which relate to using the UTL\_HTTP package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Datatypes](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)

## Overview

With the `UTL_HTTP` package, you can write PL/SQL programs that communicate with Web (HTTP) servers. And `UTL_HTTP` contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

## Security Model

This package is an invoker's rights package and the invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

---

---

**Note:** For more information, see *Managing Fine-grained Access to External Network Services* in *Oracle Database Security Guide*

---

---

## Constants

The UTL\_HTTP package uses the constants shown in following tables.

- [UTL\\_HTTP Constants - HTTP Versions](#)
- [UTL\\_HTTP Constants - Default Ports](#)
- [UTL\\_HTTP Constants - HTTP 1.1 Status Codes](#)

**Table 224–1 UTL\_HTTP Constants - HTTP Versions**

Name	Type	Value	Description
HTTP_VERSION_1_0	VARCHAR2(10)	'HTTP /1.0'	Denotes HTTP version 1.0 that can be used in the function BEGIN_REQUEST.
HTTP_VERSION_1_1	VARCHAR2(10)	'HTTP /1.1'	Denotes HTTP version 1.1 that can be used in the function BEGIN_REQUEST.

**Table 224–2 UTL\_HTTP Constants - Default Ports**

Name	Type	Value	Description
DEFAULT_HTTP_PORT	PLS_INTEGER	80	The default TCP/IP port (80) at which a Web server or proxy server listens
DEFAULT_HTTPS_PORT	PLS_INTEGER	443	The default TCP/IP port (443) at which an HTTPS Web server listens

**Table 224–3 UTL\_HTTP Constants - HTTP 1.1 Status Codes**

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED CONSTANT	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.

**Table 224-3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

<b>Name</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
HTTP_NON_AUTHORITATIVE_INFO	PLS_INTEGER	203	The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.
HTTP_MULTIPLE_CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.
HTTP_MOVED_PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND_CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARY_REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_REQUIRED	PLS_INTEGER	402	This code is reserved for future use.

**Table 224–3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

<b>Name</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.
HTTP_NOT_ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_REQUIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.
HTTP_REQUEST_TIMEOUT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_REQUIRED	PLS_INTEGER	411	The server refuses to accept the request without a defined Content-Length.
HTTP_PRECONDITION_FAILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.
HTTP_REQUEST_ENTITY_TOO_LARGE_CONSTANT	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_TOO_LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_MEDIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQ_RANGE_NOT_SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.
HTTP_EXPECTATION_FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.

**Table 224–3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

<b>Name</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request
HTTP_SERVICE_UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.
HTTP_GATEWAY_TIME_OUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.
HTTP_VERSION_NOT_SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

## Datatypes

- [REQ Type](#)
- [RESP Type](#)
- [COOKIE and COOKIE\\_TABLE Types](#)
- [CONNECTION Type](#)
- [REQUEST\\_CONTEXT\\_KEY Type](#)

### REQ Type

Use this PL/SQL record type to represent an HTTP request.

#### Syntax

```
TYPE req IS RECORD (
  url          VARCHAR2(32767),
  method      VARCHAR2(64),
  http_version VARCHAR2(64));
```

#### Parameters

**Table 224–4 REQ Type Parameters**

Parameter	Description
url	The URL of the HTTP request. It is set after the request is created by <code>BEGIN_REQUEST</code> .
method	The method to be performed on the resource identified by the URL. It is set after the request is created by <code>BEGIN_REQUEST</code> .
http_version	The HTTP protocol version used to send the request. It is set after the request is created by <code>BEGIN_REQUEST</code> .

#### Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

### REQUEST\_CONTEXT\_KEY Type

This type is used to represent the key to a request context. A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

#### Syntax

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

#### Usage Notes

To provide enhanced security, `UTL_HTTP` allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when

making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

## RESP Type

This PL/SQL record type is used to represent an HTTP response.

### Syntax

```
TYPE resp IS RECORD (
    status_code    PLS_INTEGER,
    reason_phrase  VARCHAR2(256),
    http_version   VARCHAR2(64));
```

### Parameters

**Table 224–5** *RESP Type Parameters*

Parameter	Description
status_code	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
reason_phrase	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
http_version	The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.

### Usage Notes

The information returned in RESP from the interface GET\_RESPONSE is read-only. There are other fields in the RESP record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the UTL\_HTTP package. You should not modify the fields.

## COOKIE and COOKIE\_TABLE Types

The COOKIE type is the PL/SQL record type that represents an HTTP cookie. The COOKIE\_TABLE type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

### Syntax

```
TYPE cookie IS RECORD (
    name  VARCHAR2(256),
    value VARCHAR2(1024),
    domain VARCHAR2(256),
    expire TIMESTAMP WITH TIME ZONE,
    path  VARCHAR2(1024),
    secure BOOLEAN,
    version PLS_INTEGER,
    comment VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

## Fields of COOKIE Record Type

Table 224–6 shows the fields for the `COOKIE` and `COOKIE_TABLE` record types.

**Table 224–6 Fields of `COOKIE` and `COOKIE_TABLE` Type**

Field	Description
<code>name</code>	The name of the HTTP cookie
<code>value</code>	The value of the cookie
<code>domain</code>	The domain for which the cookie is valid
<code>expire</code>	The time by which the cookie will expire
<code>path</code>	The subset of URLs to which the cookie applies
<code>secure</code>	Should the cookie be returned to the Web server using secured means only.
<code>version</code>	The version of the HTTP cookie specification the cookie conforms. This field is <code>NULL</code> for Netscape cookies.
<code>comment</code>	The comment that describes the intended use of the cookie. This field is <code>NULL</code> for Netscape cookies.

## Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the `UTL_HTTP` package. The cookies are maintained by the package transparently. They are maintained inside the `UTL_HTTP` package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using `GET_COOKIES`, store them persistently in a database table, and re-store the cookies back in the package using `ADD_COOKIES` in the next database session. All the fields in the `cookie` record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "[Retrieving and Restoring Cookies](#)" on page 224-22.

## CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. `connection_table` is a PL/SQL table of `connection`.

For a direct HTTP persistent connection to a Web server, the `host` and `port` fields contain the host name and TCP/IP port number of the Web server. The `proxy_host` and `proxy_port` fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the `proxy_host` and `proxy_port` fields contain the host name and TCP/IP port number of the proxy server. The `host` and `port` fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The `SSL` field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the `host` and `port` fields contain the host name and TCP/IP port number of the target HTTPS Web server and

the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

**Syntax**

```
TYPE connection IS RECORD (  
    host VARCHAR2(256),  
    port PLS_INTEGER,  
    proxy_host VARCHAR2(256),  
    proxy_port PLS_INTEGER,  
    ssl BOOLEAN);
```

```
TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

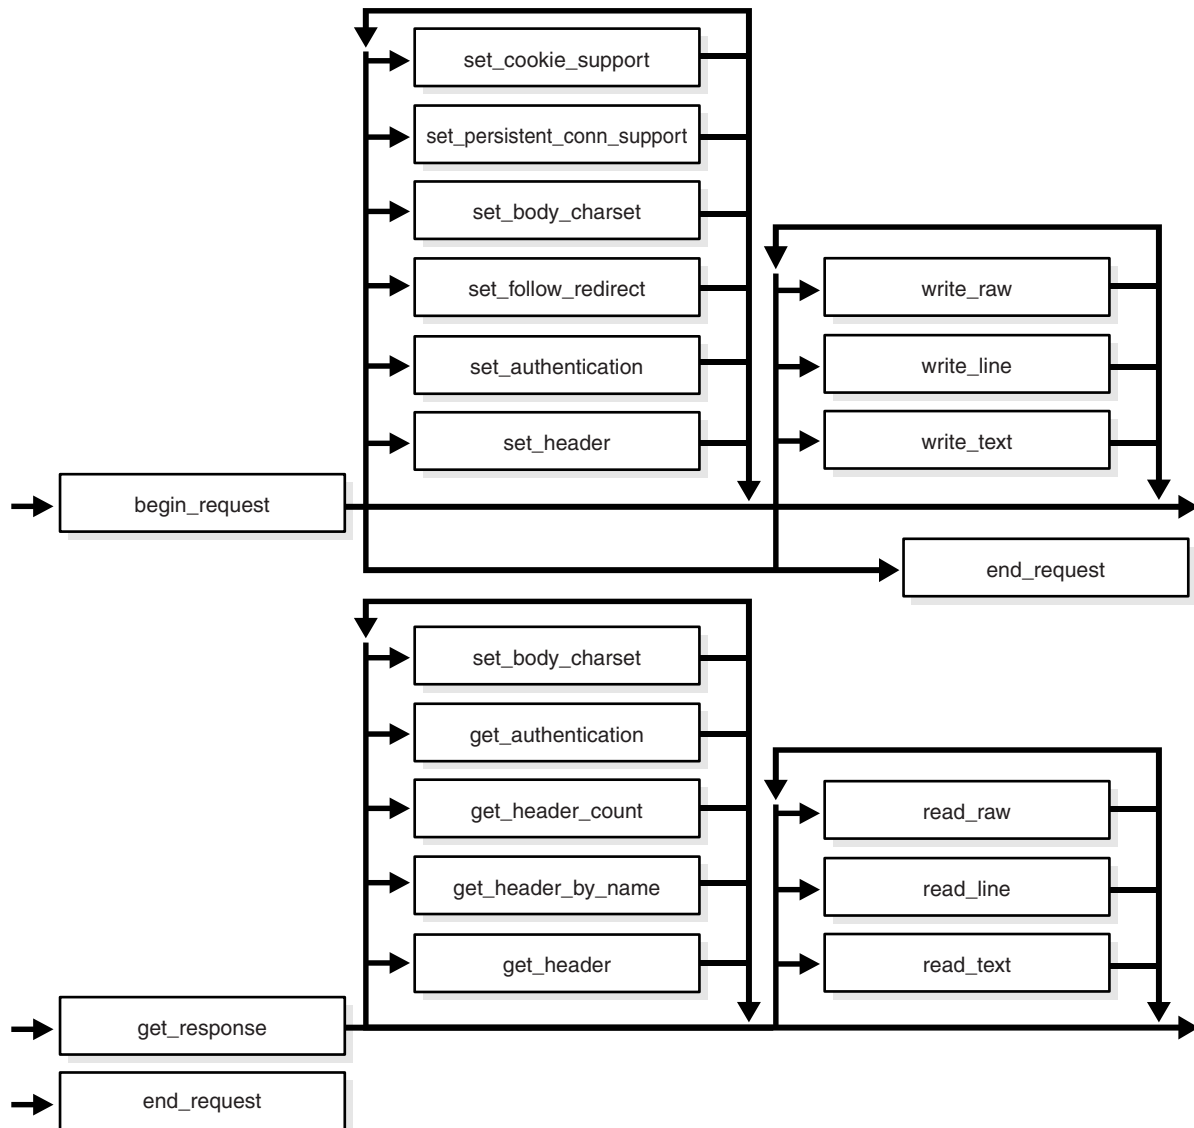

## Operational Notes

- [Operational Flow](#)
- [Simple HTTP Fetches](#)
- [HTTP Requests](#)
- [HTTP Responses](#)
- [HTTP Persistent Connections](#)
- [Error Conditions](#)
- [Session Settings](#)
- [Request Context](#)
- [External Password Store](#)

## Operational Flow

The UTL\_HTTP package provides access to the HTTP protocol. The interfaces must be called in the order shown in [Figure 224-1](#), or an exception will be raised.

Figure 224-1 Flow of the Core UTL\_HTTP Package

This illustration describes execution flow in UTL\_HTTP that has two phases: (1) beginning with "begin\_request" and ending with "end\_request", (2) beginning with "get\_response" and ending with "end\_response". Key to the symbols used:

- ... -> denotes "continue to next step", for example, "begin\_request" -> "get\_response"
- ... material enclosed in double quotation marks denotes an action, for example "PARSE"
- ... material enclosed in single quotation marks denotes a choice point, for example, 'perform pre-response set operations': Yes/No
- ... material unenclosed denotes a choice of direction, for example, Yes

-----  
PHASE #1.

- "begin\_request" -> 'perform pre-response set operations': Yes/No
  - 'perform set operations': Yes -> "set\_cookie\_support" (optional with option to repeat multiple times) -> "set\_persistent\_conn\_support" (optional with option to repeat multiple times)-> "set\_body\_charset" (optional with option to repeat multiple times) -> "set\_follow\_redirect" (optional with option to repeat multiple times) ->"set\_authentication" (optional with option to repeat multiple times) -> "set\_header" (optional with option to repeat multiple times) -> 'perform pre-response write operations':Yes/No
  - 'perform set operations': No -> 'perform write operations':Yes/No
- 'perform pre-response write operations':Yes -> "write\_raw" (optional with option to repeat multiple times) -> "write\_line" (optional with option to repeat multiple times) -> "write\_text" (optional with option to repeat multiple times) -> "end\_request"
- 'perform pre-response write operations': No -> "end\_request"

#### PHASE #2.

- "get\_response" -> 'perform get operations': Yes/No
  - 'perform get operations': Yes -> "set\_body\_charset" (optional with option to repeat multiple times) -> "get\_authentication" (optional with option to repeat multiple times) -> "get\_header\_count" (optional with option to repeat multiple times) ->"get\_header\_by\_name" (optional with option to repeat multiple times) -> 'perform read operations':Yes/No
  - 'perform get operations': No -> 'perform read operations':Yes/No
- 'perform read operations':Yes -> "read\_raw" (optional with option to repeat multiple times) ->"read\_line" (optional with option to repeat multiple times) -> "read\_text" (optional with option to repeat multiple times) -> end\_response
- 'perform read operations':No -> end\_response

\*\*\*\*\*

The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - GET\_COOKIE\_COUNT
  - GET\_COOKIES
  - ADD\_COOKIES
  - CLEAR\_COOKIES
- Persistent connections
  - GET\_PERSISTENT\_CONN\_COUNT
  - GET\_PERSISTENT\_CONNS
  - CLOSE\_PERSISTENT\_CONN
  - CLOSE\_PERSISTENT\_CONNS
- Interfaces that manipulate attributes and configurations of the UTL\_HTTP package in the current session
  - SET\_PROXY
  - GET\_PROXY

- SET\_COOKIE\_SUPPORT
- GET\_COOKIE\_SUPPORT
- SET\_FOLLOW\_REDIRECT
- GET\_FOLLOW\_REDIRECT
- SET\_BODY\_CHARSET
- GET\_BODY\_CHARSET
- SET\_PERSISTENT\_CONN\_SUPPORT
- GET\_PERSISTENT\_CONN\_SUPPORT
- SET\_DETAILED\_EXCP\_SUPPORT
- GET\_DETAILED\_EXCP\_SUPPORT
- SET\_WALLET
- SET\_TRANSFER\_TIMEOUT
- GET\_TRANSFER\_TIMEOUT
- Interfaces that retrieve the last detailed exception code and message UTL\_HTTP package in the current session
  - GET\_DETAILED\_SQLCODE
  - GET\_DETAILED\_SQLERRM

---

---

**NOTE:** Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

---

---

## Simple HTTP Fetches

REQUEST and REQUEST\_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect REQUEST or REQUEST\_PIECES to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If REQUEST or REQUEST\_PIECES fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each REQUEST or REQUEST\_PIECES call using the optional proxy parameter.

---

---
