Cheatography

x86 Assembly, C Linking, Loading etc Cheat Sheet by rwwagner90 via cheatography.com/2239/cs/635/

ADD Adds <source> to <dest>. <dest> may be a <dest>, register or memory. <source> may Be a register, memory or immediate value. <sourc e> CALL Call a function and return to the next instru ction when finished. <proc> may be a <loc> relative offset from the current location, a register or memory addr. CMP Compare <source> with <dest>. Similar to <dest>, SUB instruction but does not Modify the <dest> operand with the result of the <sourc e> subtraction DFC Subtract 1 from <dest>. <dest> may be a register or memory. <dest> DIV <di Divide the EDX:EAX registers (64-bit combo) by <divisor>. <divisor> may be a visor> register or memory. INC <de Add 1 to <dest>, <dest> may be a register or memory. st> Jump if Equal (ZF=1) to <loc>. JE <loc> Jump if Greater (ZF=0 and SF=OF) to <lo JG <loc> C>. JGE <lo Jump if Greater or Equal (SF=OF) to <loc>. C> JLE <lo Jump is Less or Equal (SF<>OF) to <loc>. C> JMP <lo Jump to <loc>. Unconditional. C> JNE <lo Jump if Not Equal (ZF=0) to <loc>. C> JNZ <lo Jump if Not Zero (ZF=0) to <loc>. C> JZ <loc> Jump if Zero (ZF=1) to <loc> LEA <de Load Effective Address. Gets a pointer to st>, <so the memory expression <source> and stores it in <dest> urce> Move data from <source> to <dest>. <so MOV urce> may be an immediate value, <dest>. register, or a memory address. Dest may <sourc be either a memory address or a register. e> Both <source> and <dest> may not be memory addresses. MOVZBL Zero extend <source> to long and save in <dest>, <dest>. <sourc e> MUL <so Multiply the EDX:EAX registers (64-bit combo) by <source>. <source> may be a urce> register or memory. POP <de Take a 32-bit value from the stack and store it in <dest>. ESP is incremented by 4. st> <dest> may be a register, including segment registers, or memory. PUSH Adds a 32-bit value to the top of the stack. Decrements ESP by 4. <value> may be a <value> register, segment register, memory or immediate value

ROL <de< th=""><th>Bitwise Rotate Left the value in <dest> by</dest></th></de<>	Bitwise Rotate Left the value in <dest> by</dest>
st>, <co< td=""><td><count> bits. <dest> may be a register or</dest></count></td></co<>	<count> bits. <dest> may be a register or</dest></count>

What does a Linker do?

 Merges multiple relocatable (.o) object files into a single executable object file that can loaded and executed by the loader.

 As part of the merging process, resolves external references. • External reference: reference to a symbol defined in another object file.

- Relocates symbols from their relative locations in the .o files to new absolute positions in the executable.

 Updates all references to these symbols to reflect their new positions. • References can be in either code or data

Memory Management

Info

unt>	memory address. <count> may be immediate or CL register.</count>
ROR <dest>, <count></count></dest>	Bitwise Rotate Right the value in <dest> by <count> bits. <dest> may be a register or memory address. <count> may be immediate or CL register.</count></dest></count></dest>
SHL <de st>, <co unt></co </de 	Bitwise Shift Left the value in <dest> by <count> bits. Zero bits added to the least significant bits. <dest> may be reg. or mem. <count> is imm. or CL.</count></dest></count></dest>
SHR <dest>, <count></count></dest>	Bitwise Shift Right the value in <dest> by <count> bits. Zero bits added to the least significant bits. <dest> may be reg. or mem. <count> is imm. or CL.</count></dest></count></dest>
SUB <de st>, <so urce></so </de 	Subtract <source/> from <dest>. <source/> may be immediate, memory or a register. <dest> may be memory or a register. (source = dest)->ZF=1, (source > dest)- >CF=1, (source < dest)->CF=0 and ZF=0</dest></dest>
TEST <dest>, <sourc e></sourc </dest>	Performs a logical OR operation but does not modify the value in the <dest> operand. (source = dest)->ZF=1, (source <> dest)->ZF=0.</dest>
XCHG <dest, <sourc e></sourc </dest, 	Exchange the contents of <source/> and <dest>. Operands may be register or memory. Both operands may not be memory.</dest>
XOR <dest>, <sourc e></sourc </dest>	Bitwise XOR the value in <source/> with the value in <dest>, storing the result in <de st>. <dest> may be reg or mem and <sourc e> may be reg, mem or imm.</sourc </dest></de </dest>
